Re: Supplemental Submission of Final Report to 8EHQ-02-15088
TSCA Section 8(e) Notification of Substantial Risk:
Octamethylcyclotetrasiloxane

CONTAINS NO CBI

Dear Docket Clerk:

In accordance with the provisions of Section 8(e) of the Toxic Substances Control Act (TSCA), as interpreted in the Statement of Interpretation and Enforcement Policy (40 FR 11110, 16 March 1978), Dow Corning is submitting the following recently issued final study report as a supplemental submission to our initial TSCA Section 8(e) notification of February 20, 2002 (8EHQ-02-15088). This final study report has also been submitted to the Agency as a follow-up to submissions made concerning octamethylcyclotetrasiloxane under TSCA Section 8(d) (health and safety data reporting). The information presented in this submission was generated as part of our Siloxane Research Program. This program was the subject of a memorandum of understanding, dated April 9, 1996, between Dow Corning and EPA.

Chemical Substance:

556-67-2 Octamethylcyclotetrasiloxane

Manufacturer:

Dow Corning Corporation
2200 West Salzburg Road

Final Study Report:

24-MONTH COMBINED CHRONIC TOXICITY AND ONCOGENICITY WHOLE BODY VAPOR INHALATION STUDY OF OCTAMETHYLCYCLOTETRA-SILOXANE (D4) IN FISCHER 344 RATS

Dow Corning Corporation
2004-I0000-54091
August 16, 2004

Summary:

Preliminary results from an ongoing 24-month combined chronic/oncogenicity study with octamethylcyclotetrasiloxane (OMCTS, D_4) in Fischer 344 rats were submitted to the Agency as a TSCA Section 8(e) notification (February 20, 2002). The preliminary results indicated test article-related effects in the kidney (male and female) and uterus of rats exposed for 12 to 24 months. These effects included increased kidney weight and severity of chronic nephropathy, increased uterine weight, increased incidence of endometrial epithelial hyperplasia, and an increased incidence of endometrial adenomas. All of the effects were limited to the 700-ppm exposure group. Dow Corning is now submitting the final study report for the recently completed 24-month combined chronic/oncogenicity study as a supplemental submission to our previous TSCA Section 8(e) notification.

Inhalation exposure of Fischer 344 rats to OMCTS for up to 24-months resulted in notable affects in the uterus, kidney, liver, upper respiratory tract, and on survival.

A statistically significant decrease in survival was apparent for males in the 700-ppm dose group. The decrease was attributed to an increase in mononuclear cell leukemia related deaths. However the total incidence of mononuclear cell leukemia was not different from controls when assessed over the 24-month duration of the study. A statistically significant lymphocytic leukocytosis was present in the 700-ppm dose group males and females at 3, 6, and 12 months.

A statistically significant increase in uterine weight and increased incidence of endometrial epithelial cell hyperplasia was apparent in the 700-ppm dose group at 24-months. Endometrial adenomas were present in 4 out of 35 animals in the 700-ppm dose group surviving to the 24-month necropsy. No uterine adenomas were present in the 25 animals that died prior to the scheduled 24-month necropsy in this dose group, or in any of the animals in the control or intermediate dose groups. A trend analysis indicated that this incidence was statistically significant (Peto Mortality-Prevalence Test, $p<0.05$). No treatment-related uterine affects were apparent at 12 months or in the recovery group.

04 NOV -9 AM 11:04

RECEIVED
OPPT CBIC

A modest statistically significant elevation (≤ 15%) in kidney weight was present for 700-ppm dose group males and females at 12 and 24 months of exposure and for 150-ppm dose group females at 24 months. A statistically significant increase in kidney weight was apparent for 700-ppm females in the recovery group. Chronic nephropathy was common in animals surviving to 24 months and a statistically significant increase in incidence and severity grade was present for the 150-ppm and 700-ppm dose group females. Likewise a statistically significant increase in severity grade was identified for males in the 24-month exposure group (700-ppm) and in the recovery group at exposure concentrations of 30 ppm and higher.

Statistically significant liver weight increases were apparent at 6 months in males exposed to 30 ppm and greater and in the 700-ppm group females. At 12 months of exposure, a significant liver weight increase was observed in males and females exposed to 150-ppm and 700-ppm of OMCTS. Males exposed for 24 months to 700-ppm and females exposed at 150-ppm and 700-ppm also showed a significant increase in liver weight. Hepatocyte centrilobular hypertrophy was unique to the 700-ppm dose group males and the incidence varied with exposure duration (60% of the 700-ppm dose group males at 12 months and 8% of the 700-ppm dose group males at 24 months). No treatment-related liver affects were apparent for recovery group animals.

Treatment-related effects within the nasal cavity after 12-months included increased incidence and/or severity of goblet cell hyperplasia, squamous epithelial cell hyperplasia, suppurative inflammation, and eosinophilic globules at exposure concentrations of 150-ppm and 700-ppm. Continued exposure for 24 months resulted in increased incidence and/or severity of goblet cell hyperplasia, squamous epithelial cell hyperplasia, and eosinophilic globules at exposure concentrations of 150-ppm and 700-ppm for males and at exposure concentrations of 30-ppm and higher in females. Recovery group animals showed an increase in severity of eosinophilic globules (700-ppm males and females) and an increase in incidence of goblet cell hyperplasia (700-ppm males) and nasolacrimal duct suppurative inflammation (150-ppm and 700-ppm males).

Because the findings related to the liver, kidney, nasal cavity, and survival are of doubtful toxicological relevance to humans and that lesions in the uterus emerged upon chronic exposure to 700-ppm OMCTS, an exposure level greatly exceeding typical workplace or consumer exposures, we do not believe the results of this study represent a substantial risk to health or the environment. Nevertheless, we are reporting them to EPA to ensure our compliance with the letter and spirit of TSCA Section 8(e).

Details:

Study Design:

Male and female Fischer 344 rats were exposed to vapor concentrations of 0-, 10-, 30-, 150-, or 700-ppm OMCTS for 6 hr/day, 5 days/week, for up to 24-months. The study animals were divided into four groups. Group A animals (6/sex/dose level) were exposed for six months and then sacrificed for the determination of the OMCTS concentration in liver, fat, and plasma. Group B animals (10/sex/dose level) were exposed to OMCTS for 12 months and then sacrificed. Group C animals (20/sex/dose level) were exposed to OMCTS for 12 months only and then observed for an additional 12 months to determine the possible reversibility of any effects. Group D animals (60/sex/dose level), were exposed to OMCTS for 24 months. Group C and D animals were sacrificed at 24 months. A complete histopathology examination was performed on all animals in groups B, C, and D that either were sacrificed or died *in extremis*.

Results:

Survival was unaffected by treatment for all groups except the 700-ppm group D males. Survival for group D males was 58, 60, 58, 58, and 38% for exposure concentrations of 0, 10-, 30-, 150-, and 700-ppm OMCTS, respectively. The increase in early deaths was attributed to an increase in Fischer rat mononuclear cell leukemia induced morbidity/mortality. However the total incidence of mononuclear cell leukemia in the 700-ppm group D males was not different from the control group when evaluated for the entire study period (24 months). Treatment related effects on body weight were minimal (< 10%), expressed only in the last few months of the study, and were generally limited to the 700-ppm group D males. Fischer rat mononuclear cell leukemia is a common age-related neoplasia in rats expressed at very high incidence rates especially in males. This type of leukemia is generally considered non-relevant to humans. Chronic exposure to OMCTS did not result in an increased incidence of mononuclear cell leukemia.

Clinical pathology assessments at 3, 6, and 12 months demonstrated a consistent lymphocytic leukocytosis in 700-ppm group males with a 25-29% increase in the number of lymphocytes. Lymphocyte leukocytosis was also present in the 150-ppm and 700-ppm females with a 32-48% and 56-64% increase in lymphocytes, respectively. There was also a consistent decrease in serum alanine aminotransferase, aspartate aminotransferase, and lactate dehydrogenase activities in the 700-ppm group males and females.

Statistically significant increases in kidney weight were observed in males and females in each of the three exposure paradigms; 12-months (Group B), 24-months (Group D), and 12-months exposure/12-months recovery (Group C). The effect in Group B was greater in males (~12% increase) than females (~5% increase) and limited to the 700-ppm groups. Increased kidney weight in Group D was ~ 15% for males and females at 700-ppm and ~ 6% for females at 150-ppm. Kidney weight increases of ~8% in Group C were limited to 700-ppm males and females. Chronic nephropathy was diagnosed in 80-100% of males and 40-80% of females in Group B and in 95-100% of males and 85-98% of females in Group D. All of the males and 75-90% of the females in Group C were diagnosed with chronic nephropathy. The incidence of chronic nephropathy in OMCTS-exposed groups was not statistically different from control in Groups B, C, or D except for the 150-ppm and 700-ppm Group D females. The increase in incidence for Group D females was ~12% and was accompanied by statistically significant increases in severity grade (~0.5 grade). Statistically significant severity grade increases were demonstrated for 700-ppm Group D males (~1 grade) and Group C males (~0.5 grade) at exposure concentrations of 30 ppm and higher. These data demonstrate that chronic exposure to OMTCS can increase kidney weight in male and female rats and elevate the incidence/severity of chronic nephropathy, a common age-related renal lesion. The effects on the kidney were minimal in character and incidence and as such, are not considered to be of toxicological significance with regard to human health.

A statistically significant increase in mean uterine weight was observed in female rats exposed to 700-ppm for 24 months. Statistically significant increases in uterine weight were also present in recovery group females. However, the increases were not considered to be treatment-related for lack of dose-responsiveness. Uterine weight for females exposed to OMCTS for 12 months was not different from controls. Associated with the increased organ weight at 24-months was a marked increase in incidence (19% in control; 50% at 700-ppm) and severity (1.7 for control; 2.5 for 700-ppm) of uterine endometrial epithelial cell hyperplasia. Uterine endometrial epithelial cell hyperplasia was not observed at 12 months of exposure. In contrast, this lesion was present in each of the recovery groups, but the incidence among dose groups was not dose-related. Accompanying the increase in uterine weight and endometrial epithelial cell hyperplasia at 700-ppm was an increased incidence of uterine endometrial adenoma. Four of the 35 females that survived to the 24-month necrospy were diagnosed with this lesion. Uterine adenomas were not present in any of the females that died prior to the scheduled necropsy from this dose group. Uterine adenomas were also not detected in females at the 12-month necropsy or in any of the other dose groups within the 24-month exposure group. However, there were two findings within the recovery group animals, a uterine adenoma was detected in a 30-ppm dose group animal and a uterine adenocarcinoma was detected in a 150-ppm dose group animal. The incidence of uterine adenoma in the 700-ppm dose group was not statistically different from control; however, the incidence trend across the dose groups was significant (Peto Mortality-Prevalence Test, $p<0.05$). The combination of increased uterine weight, increased incidence of endometrial epithelial hyperplasia and significant trend of a rare tumor supports the conclusion that chronic exposure to 700-ppm OMCTS induces a hyperplastic/neoplastic response in the rat

uterus. Research focused on understanding the possible mechanisms responsible for the uterine response to OMCTS exposure and relevance to humans is ongoing.

Statistically significant and dose-responsive liver weight increases ranging between 14 and 30 percent were apparent at 6 months for males exposed to 30-ppm OMCTS and higher and for females exposed to 700-ppm. Following 12 months of exposure, liver weight increases were seen in male and females exposed at 150 and 700 ppm. A liver weight increase was seen at 24 months in males exposed to 700 ppm and in females exposed to 150 and 700 ppm. Hepatocyte centrilobular hypertrophy was present in the 700-ppm dose group males and the incidence varied greatly with exposure duration (60% of the 700-ppm Group B males; 8% of the 700-ppm Group D males). Reports demonstrating the effect of OMCTS exposure on liver weight and hepatocyte hypertrophy in the rat exist in the open literature and the results obtained in this bioassay are generally consistent with those reports. The information born out of this bioassay extends that knowledge base and has demonstrated that chronic inhalation exposure to OMCTS induces a prolonged adaptive hepatic response without induction of hepatic neoplasia.

There were a number of histopathological changes identified in the nasal cavity tissue of OMCTS exposed groups. In exposure group B both males and females in the 700-ppm dose groups had statistically significant increases in incidence and severity grade of eosinophilic globules, respiratory epithelium goblet cell hyperplasia, squamous epithelium hyperplasia, and suppurative inflammation (males only). The only finding not limited to the high dose group was eosinophilic globules in the 150-ppm dose group females for which the severity grade was statistically greater than that of the control. In exposure group D the incidence and severity grade for eosinophilic globules was elevated significantly in the 700-ppm dose group males and in females exposed at 30 ppm and higher. The incidence and severity of this lesion was also greater than control in the 10-ppm dose group females however only the severity grade proved to be statistically significant. Other statistically significant differences included an increase in the incidence of respiratory epithelium goblet cell hyperplasia for males (150- and 700-ppm dose groups) and females (700-ppm dose group) and an increase in the incidence of squamous epithelium hyperplasia for males in the 700-ppm dose group. A statistically significant increase in incidence of eosinophilic globules (~0.5 grade) was present for males and females in Group C at 700-ppm. There was also a modest 15% increase in the incidence of nasolacrimal duct suppurative inflammation at 150 ppm and 700 ppm and respiratory epithelium goblet cell hyperplasia (700-ppm) in treated males. These findings are consistent with that expected for chronic inhalation exposure to materials with slight irritant properties, such as OMCTS.

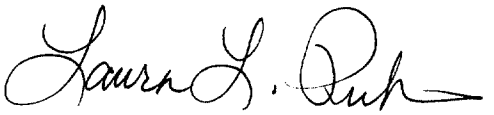
Actions:

Dow Corning is conducting further studies to determine the potential relevance of these findings. Additionally, Dow Corning is revising its current exposure assessment to provide support for a quantitative risk assessment. These findings will be communicated to appropriate internal and external audiences.

Dow Corning will notify EPA of any further relevant information that may be developed concerning this material. Dow Corning also will provide EPA the final copy of the report for this study when it is available.

If you have any questions concerning any of the aforementioned studies, please contact Dr. Robert G. Meeks, Scientific Director of Toxicology and Risk Assessment at 989-496-8629 or at the address provided herein. If you require further general information regarding this submission, please contact Michael E. Thelen, Manager of U.S. EPA Regulatory Affairs, at 989-496-4168 or at the address provided herein.

Sincerely,



Laura L. Perkins, Ph.D.

BATTELLE STUDY NO. N003441A
DOW CORNING STUDY NO. 9106

1/11/1999

24-MONTH COMBINED CHRONIC TOXICITY AND ONCOGENICITY WHOLE BODY VAPOR INHALATION STUDY OF OCTAMETHYLCYCLOTETRASILOXANE (D_4) IN FISCHER 344 RATS

1. OBJECTIVE

The objective of the study is to evaluate the possible chronic toxicity and oncogenic effects of the test article when administered to Fischer 344 rats for 12 and 24 months via whole body inhalation exposure of D4 vapor. Plasma and fat levels of D4 immediately following an exposure period will also be evaluated after six months of exposure. The study design was modeled after OPPTS Guideline #870.4300.

2. STUDY SCHEDULE

Exposure Initiation Date:	Thursday, 1/21/99
Interim Sacrifices:	
6-Months:	Week of 7/19/99
12-Months:	Week of 1/17/00
Terminal Necropsies:	Week of 1/22/01
Draft Study Report:	Friday, 10/26/01
Final Study Report:	Within two months after receiving the Sponsor's comments on the draft study report.

[&H] Changed 4/10/03 by Amendment H

4. TEST ARTICLE

Test Article:	Octamethylcyclotetrasiloxane (D_4). Test article will be supplied as Dow Corning® 244 fluid.
Physical Description:	Clear, colorless liquid
CAS Number:	000556-67-2
Lot Number:	LL098271
Expiration Date:	March 21, 2001.
Stability:	Material is stable until the expiration date when stored according to manufacturer's specifications.
Purity:	Furnished by the Sponsor prior to initiation of testing and included in the final report.
Purity Verification:	Purity verification will be performed by Battelle. Samples of test article will be collected twice from each 55-gallon drum, once upon first opening and then again when the container is nearly empty. The initial sample collected from the first drum will be analyzed before initiation of animal exposures to ensure that the test article is acceptable for use. Initial analysis from the first drum will be comprised of two methods, gas chromatography with thermoconductivity detection [(GC-TCD)][+D] for area percent determination and gas chromatography with mass selective detection for identification of the major component(s). Subsequent purity verification analyses will involve [~~only~~ GC-TCD][&D] area percent determination utilizing retention times for peak identification. Gas chromatography with mass selective detection will be utilized to confirm component identity when identification can not be made with confidence from peak retention times. Sample analysis will commence within three days of collection.

[+D] Added 7/12/99 by Amendment D
[&D] Changed 7/12/99 by Amendment D

[Purity verification will be performed on samples collected from the exposure generator reservoir. As with subsequent purity verification, analysis will involve area percent determination utilizing GC-TCD. These verification analyses will coincide with the end of drum analyses for the first 3 drums of test material. These analyses will be used to show the test material purity in the exposure generator reservoirs remains acceptable through the use of 3 drums of test material. Following use of 3 drums of test material, the generator reservoirs will be completely emptied and cleaned by rinsing with fresh test material. This cleaning will be repeated after every 3 drums of use.][+D]

In the event that any purity verification analysis results in a purity <99%: 1) the Study Director and the Sponsor Representative will be promptly informed; and 2) the use of material from the drum in question will be discontinued until further evaluation to determine the potential effect on the study.

How Supplied: 55-gallon drums

[+D] Added 7/12/99 by Amendment D

Storage Conditions:	The test article will be stored at 18-30°C with a mean maximum temperature of 25°C in 55-gallon drums in the Chemical Storage and Transfer Facility, Battelle, Richland, WA. After opening, the head-space will be flushed with nitrogen.
Archive Sample(s):	A ~100-g archive sample will be removed from each 55-gallon drum of test article used for in-life testing. Battelle will maintain archive sample(s) under a nitrogen headspace at controlled room temperature for the duration of the study.
Final Disposition:	At the end of the study, and after receiving approval from the Sponsor Representative, excess quantities of test article will be shipped to the Sponsor. Empty 55-gallon test article containers will also be returned to the Sponsor. In addition, the ~100-g archive samples will be shipped to a Sponsor-designated site.

4.1 Test Article Documentation

Documentation regarding the identity, supplier, batch number, storage conditions, and stability will be provided by the Sponsor.

4.2. Inhalation Exposure System

4.2.1. Exposure Room

Room 424, LSL-II Building

4.2.2. Generation System

Test article will be pumped by precision metering pumps (one for each exposure chamber) through individual delivery lines from the generator cabinet located in the exposure control room to the exposure room. There, the test article will be vaporized on the heated surface of Battelle-designed generators located in the inlet airstream of each exposure chamber. The temperature of each generator's evaporation surface will be adjusted to the minimum required to vaporize the required amount of test article. The internal temperatures of the generators will be controlled by temperature controllers that are routinely monitored and their operating temperature recorded daily. When the exposure is to start, the metering pumps will be turned on, dispensing test article to the preheated surfaces of the generators. The concentration in each chamber will be adjusted by the pump rate and/or the dilution airflow into the chamber.

4.2.3. Inhalation Chambers

The test animals will be housed and exposed in Battelle-designed live-in exposure chambers (Model H-2000, Harford Systems, Inc., Aberdeen, MD).

These chambers are 2000 liters in volume, constructed of glass and stainless steel, and are designed to provide suitable test atmosphere distribution and mixing for each tier of animals. Removable feed troughs and an automatic watering system are built into each chamber, which allows animals to be housed in the chambers continuously during exposure and non-exposure periods. Rack position will be rotated weekly to minimize possible effects of cage position (Figure 1).

Sample ports are located above each level, front and back, permitting the chamber atmosphere to be sampled from representative locations near the breathing zone of the animals on all levels. All routine chamber atmosphere monitoring will be from the same port near the breathing zone of the animals.

4.3. Physical and Chemical Characterizations of the Exposure Atmosphere

4.3.1. Nominal Concentration

During the pre-exposure characterization tests, the nominal concentration for each exposure chamber will be determined from the gravimetrically determined quantity of test article consumed by each generator and the average chamber airflow measured during the same period. The results will be used to confirm the analytical instrument's determination of the average chamber concentration.

4.3.2 On-Line Monitoring of Vapor Concentration

4.3.2.1. General Considerations

Exposure concentrations within all chambers (including the control) will be measured using a validated online gas chromatographic method. The method will be validated by the testing laboratory during pre-exposure characterization of the exposure atmosphere. Results from the on-line monitor will be immediately compared to target and alarm values. If alarm conditions are detected, the data will be displayed on the system monitor and the appropriate alarms and relays will be triggered. Each result recorded will include the time and date of the measurement, the sampling location, and the study number.

4.3.2.2. Calibration

The on-line GC will be calibrated by correlating the concentration of test article in the chambers (established from independent analysis of grab samples taken directly from the exposure chambers) and the on-line GC response (taken at the time of grab sampling). Collection efficiency and recovery with this sampling media will be fully validated during pre-exposure characterization. The chamber atmosphere grab samples will be analyzed using an independent off-line GC method.

The on-line GC will be recalibrated at least once every 6 weeks. In addition, a constant concentration stream of test article vapor, used only to detect drift in instrument calibration, will be provided to the on-line monitor using a diffusion generator. The concentration of chemical vapor delivered by the diffusion cell generator will be adjusted to produce a target setting in the middle of the exposure concentration range. This on-line standard will be monitored at least once per hour throughout the animal exposure by the on-line monitor. It will also be checked before the start of each exposure generation day. If the concentration of the on-line standard vapor reported by the on-line monitor exceeds ±5% of the assigned target concentration, the lead chemist will be informed and will assess instrument calibration. Unless a problem can be found and corrected that accounted for a temporary shift in instrument response, the lead chemist will initiate instrument recalibration.

4.3.3. Pre-Exposure Characterization of Exposure Atmosphere

The pre-animal exposure characterization of the generation system will include demonstrating vapor concentrations determined by calibrated chromatographic methods, and confirmation of these results by a determination of nominal concentration, measuring temporal and spatial variations in target vapor concentrations, and verification that the test atmospheres is free of aerosol of the test article.

The buildup of vapor concentration in the chamber at the beginning of exposure to 90% of its stable final concentration (T_{90}) will be determined prior to the start of animal exposures.

Satisfactory temporal stability is defined as less than 10 percent coefficient of variation (%CV) within a 6-hour exposure period. To determine temporal stability, vapor concentration will be monitored at least once per hour using the calibrated on-line monitor.

Satisfactory spatial uniformity is defined as less than 5%CV for between-port concentration variability. Samples of the chamber atmosphere will be taken from two locations (front and back) per tier in each exposure chamber to demonstrate spatial uniformity.

Final verification of the system performance will include a minimum of three, 6-hour trial generation periods. Prestart data, in the form of figures and tables with explanatory notes, will be reviewed by the Study Director and Sponsor Representative prior to the Sponsor Representative's approval to start the study. This review will be documented in the form of a note to the Study File.

4.3.4. Characterization of Exposure Atmosphere during the Study Period

During animal exposures vapor concentrations will be monitored at least once per hour by the on-line monitor. Typical operation will monitor the exposure chambers, control chambers, and on-line standard about every 32 minutes. The

control range will be: target exposure concentration ±10%. The critical limits will be: an alarm if chamber concentration exceeds ±20% target exposure concentration; and, alarm and exposure interruption if chamber concentration exceeds 120% target concentration. A daily exposure summary will be produced indicating the daily mean, standard deviation, percent of target, relative standard deviation, maximum and minimum readings, and the number of readings. Chamber atmosphere sample line flowrates are indicated by flow monitors in the control room and are checked before each exposure. Study Director will be immediately informed of any events reaching or exceeding the critical limits.

In Weeks 15, 30, 45, 60, 75 and 90 (±1 week) the spatial uniformity measurements will be repeated in all exposure chambers during the exposure to verify all animals are receiving the same vapor concentration.

4.4. Environmental Monitoring

4.4.1. Air Supply

Room air will be HEPA-filtered. Chamber intake air will be conditioned by passage through HEPA, Purafil, and charcoal filters.

4.4.2 Oxygen Content

Oxygen content of the exposure atmosphere will be measured and recorded before the start of the study. Minimum acceptable level is 19%.

4.4.3. Temperature

Temperatures where animals are housed will be maintained at 74±4°F; temperature will be recorded approximately every 30 min.

4.4.4. Relative Humidity

The relative humidity (RH) in each exposure chamber and animal room will be maintained at 50±20% and recorded approximately every 30 min.

4.4.5. Airflow

Chamber air flow rate will be maintained at 15±3 air changes per hour and recorded approximately every 30 minutes.

5. TEST SYSTEM

5.1.	**Species**	Rattus norvegicus
	Strain:	Fischer 344
	Supplier:	Charles River Laboratories, Raleigh, NC
	Total Number of Study Animals:	480 male and 480 female

Total Number of Animals Ordered:	565 male and 565 female
Age at Exposure	~6-8 weeks
Body Weight at Exposure Start:	Males ~120-180 grams Females ~90-140 grams
Randomization:	Animals will be randomized into five groups on the basis of body weight using the Xybion PATH/TOX System. Animals outside ±20% of the group mean will be excluded from the study. Animals not used for the study will be euthanized by inhalation of CO_2. The disposition of these rats will be recorded on the Animal Disposition Record and retained in the study files.
Identification:	Tail Tattoo
Animal Husbandry:	Rat shipping crates will be examined upon arrival for evidence of conditions likely to permit exposure to pathogens (soiled, wet, or otherwise damaged). The uncrating will be conducted at the door of the animal room. While being removed from the crates, the rats will be examined for evidence of shipping stress. The rats will be housed approximately 5 rats per cage in hanging wire cages prior to randomization and identification at which time they will be housed individually in stainless steel wire cage units. Rats will remain individually housed in wire cage units throughout the study. Animals on exposure will be maintained in whole-body exposure chambers 24 hours/day. During the recovery period, rats in the Recovery Group (Group C) will be housed in wire cage units hung on open racks in a separate animal room. General procedures for care and housing will meet current AAALAC standards, current requirements stated in the ILAR "Guide for Care and Use of Laboratory Animals" [6], and the U.S. Department of Agriculture through the Animal Welfare Act (Public Law 91-579). Temperature and relative humidity (RH) of the animal rooms and exposure chambers are specified in Section [~~4.5~~ 4.4][&A]. There will be at least 10 changes/hr of air in the rooms. Approximately twelve hours of light and 12 hours of dark will be provided in the animal rooms. A fluorescent light source will be used, with lights turned on at approximately 6:00 AM

[&A] Changed 1/22/99 by Amendment A

each day. The light cycle may be extended briefly, on an as needed basis, to allow for completion of study activities (e.g., clinical observation).

The rats will be acclimated in room [~~429~~ 531][&A] of the LSL-II Building for at least 5 days prior to the start of exposure. The rats will be on quarantine status until the results of the 3-week health screen are received.

Health Evaluation: A report on the health status of the rat colony, from which the study rats were obtained, will be provided by the supplier. This report will be placed in the study records.

Within 48 hours of arrival, 5 rats/sex will be examined by gross necropsy and histopathology for evidence of disease. A serum sample from each of these rats will be frozen until analyzed (if necessary) or acceptance of the final report and then discarded. Rats will be released for study if the health screen doesn't provide evidence of disease. The clinical veterinarian will make a visual inspection of the rats to be used in the study just prior to their release for the study.

Approximately 3 weeks after arrival, blood and serum will be obtained from 5 rats/sex (selected from the extras). These rats will then be necropsied and reevaluated for evidence of disease or pathogens. The clinical veterinarian will release the rats from quarantine if there is no evidence of pathogens or disease.

Blood and serum will also be obtained from 5 rats/sex in Groups A, B, and D at terminal sacrifice for viral serology. The resultant serum will be divided into two aliquots, one for immediate serological testing and one that will be stored at ~-70°C for possible future evaluations. The stored samples will be discarded upon the acceptance of the final report.

Sera will be tested for antibodies to CAR Bacillus (CARB), H-1 virus, Kilham rat virus (KRV), Mycoplasma pulmonis, rat parvovirus, pneumonia virus of mice (PVM), sialodacryoadenitis/rat coronavirus (SDA/RCV), Sendai virus, and Clostridium piliforme (Tyzzer's) at BioReliance Corporation, Rockville, MD.

Drinking Water: Fresh tap water (City of Richland) will be supplied *ad libitum*. An automatic watering system (Edstrom Industries, Waterford, WI) will be used during the quarantine/acclimatization period and throughout the study.

[&A] Changed 1/22/99 by Amendment A

Representative samples of animal drinking water from the LSL-II facility will be analyzed for contaminants approximately every six months. Copies of the results of the water analyses will be placed in the study records and provided to the Sponsor's Representative. Study Director review of the analysis results will be documented in the study records. There are no known contaminants in the drinking water which could be expected to alter the outcome of the study.

Diet: Purina pelleted 5002 certified rodent diet will be used. Food will be provided *ad libitum* except during the inhalation exposures.

Analysis of each lot of feed used will be provided by the manufacturer. Copies of the results of each feed analysis will be placed in the study records and provided to the Sponsor Representative. Study Director review of the analysis results will be documented in the study records. Feed with levels of contaminates known or believed to have the potential to adversely effect the study will not be utilized.

5.2. Humane Treatment of Animals

The procedures described in this protocol have been approved by the Battelle Northwest Operations Animal Care and Use Committee (PHS Assurance #A3353-01).

5.3. Justifications

This species and strain of animal is recognized as appropriate for chronic and oncogenicity studies. This strain will be utilized because it is a widely used strain for which significant historical control data are available and was the strain of choice on previous studies.[1,2] The inhalation route of administration was chosen on the basis that this route is the most relevant for potential human exposure.

The Sponsor signature on this protocol documents for the Study Director the Sponsor's assurance that the study described in this protocol does not unnecessarily duplicate previous experiments.

6. EXPERIMENTAL DESIGN

6.1. Route of Administration and Reason for Selection

The rats will be exposed by whole-body inhalation to the test article vapor at target concentrations of 0 ppm (filtered air control), 10, 30, 150, and 700 ppm for 6 hours + T_{90} per day, 5 days/week for 6, 12, or 24 months (excluding holidays).

The exposure levels were determined from the results of previous studies using this test article. Rats of this strain have been used for previous toxicity studies of this compound.

6.2. Duration

The duration of the study will be 24 months. However, termination of the study is acceptable when the number of survivors of the lower dose or control group reaches 25 percent. For the purpose of terminating the study in which there is an apparent sex difference in response, each sex should be considered a separate study.

6.3. Study Design

Group Number	Target Exposure Concentration (ppm)	Number of Rats per Group	Identification Number
1	0 (filtered air control)	96 (M) 96 (F)	1-96 101-196
2	10	96 (M) 96 (F)	201-296 301-396
3	30	96 (M) 96 (F)	401-496 501-596
4	150	96 (M) 96 (F)	601-696 701-796
5	700	96 (M) 96 (F)	801-896 901-996

The 96 rats/sex/group will be divided into 4 subgroups within each treatment groups as follows:

Subgroup	Time Removed from Exposure [a]	Number of Rats/Group	Recovery Time	Time of Terminal Sacrifice [a]	Purpose
A (Tissue Levels)	6 months	6M/6F	--	6 months	Tissue level evaluations after 6 months of exposure (see Section 9.0 for details)
B (Chronic)	12 months	10M/10F	--	12 months	Interim necropsy after 12 months of exposure. This is the chronic toxicity portion of the study.
C (Recovery)	12 months	20M/20F	12 months	24 months	Sacrificed after 12 months of exposure followed by a 12-month recovery period.
D (Onco-genicity)	24 months	60M/60F	--	24 months	Sacrificed after 24 months of exposure. This is the oncogenicity portion of the study.

[a] Expressed as time from initiation of exposure.

[Subgroup animal assignment

Exposure Concentration (ppm)	Animal Identification Numbers			
	Subgroup A	Subgroup B	Subgroup C	Subgroup D
0 (filtered air control)	91-96 (males) 191-196 (females)	81-90 (males) 181-190 (females)	61-80 (males) 161-180 (females)	1-60 (males) 101-160 (females)
10	291-296 (males) 391-396 (females)	281-290 (males) 381-390 (females)	261-280 (males) 361-380 (females)	201-260 (males) 301-360 (females)
30	491-496 (males) 591-596 (females)	481-490 (males) 581-590 (females)	461-480 (males) 561-580 (females)	401-460 (males) 501-560 (females)
150	691-696 (males) 791-796 (females)	681-690 (males) 781-790 (females)	661-680 (males) 761-780 (females)	601-660 (males) 701-760 (females)
700	891-896 (males) 991-996 (females)	881-890 (males) 981-990 (females)	861-880 (males) 961-980 (females)	801-860 (males) 901-960 (females)]^C

7. DATA COLLECTION

7.1. Mortality/Moribundity

Examinations for moribundity and mortality will be performed twice daily on all rats. Rats determined to be moribund will be subject to immediate euthanasia for humane reasons and to limit the potential loss of tissue due to autolysis.

7.2. Body Weights

Individual body weights will be recorded approximately one week prior to exposure start, at the time of randomization, weekly during the first 14 weeks, and every [~~two~~ four]^&A weeks thereafter. Body weights will also be collected just

^&A Changed 1/22/99 by Amendment A
^C Added 3/23/99 by Amendment C

prior to scheduled necropsies. Body weight data will be collected using the Xybion PATH/TOX System.

7.3. Clinical Observations

Clinical observations will be recorded weekly during the first 14 weeks and every [[~~two four~~][&A] two][&B] weeks thereafter. This will include the recording of appearance, size, and location of masses. Clinical observation data will be collected using the Xybion PATH/TOX System.

7.4. Clinical Pathology

Hematology, serum chemistry, and urinalysis will be conducted on 10 rats/sex/group (the first 10 rats of each sex/group will be assigned) from Subgroup C at 3, 6, and 12 months. PTT and APTT tests only will be conducted on Subgroup B animals at the time of necropsy.

[7.4.1. Clinical Pathology to be Performed After 9-Months of Exposure

A serum chemistry evaluation will be conducted on 10 rats/sex/group (the first 10 rats of each sex/group) from Subgroup C at 9 months. This evaluation will be performed in the same manner as that performed at 3 and 6 months. In addition, an aliquot (~1 mL) of the serum from each rat will be placed into a separate vial for shipment to Dow Corning. This additional aliquot will be stored at ~5°C prior to shipping. Serum samples will be shipped (packed with blue ice to try and maintain ~5°C conditions) to the Sponsor's representative within ~24 hours of collection. The Sponsor will evaluate the serum samples. The data generated from the Sponsor will be reviewed by the Sponsor's Quality Assurance (QA) unit and provided to Battelle (accompanied by a QA statement) for inclusion in the final study report.][+E]

[&A] Changed 1/22/99 by Amendment A
[&B] Changed 3/1/99 by Amendment B
[+E] Added 9/27/99 by Amendment E

At the time of blood collection rats fasted overnight will be anesthetized with 70% CO_2 and blood samples will be collected from the orbital plexus. (Clinical pathology blood collections will take place at least 24 hours prior to scheduled necropsy.) For hematological evaluations, tubes containing potassium EDTA will be used. For serum chemistry evaluations, tubes with no anticoagulant, but containing a serum separator gel, will be used. At the time of scheduled necropsy, the rats will be anesthetized with sodium pentobarbital and blood collected from the vena cava into tubes with sodium citrate for prothrombin time and activated partial thromboplastin time evaluations. [Urine will be collected overnight (~16-hour sample) at each scheduled timepoint.][+C]

The following parameters will be evaluated:

Hematology	
Hemoglobin	Differential leukocyte count
Hematocrit	Platelet count
Erythrocyte count	Reticulocyte count
MCH	Nucleated erythrocytes count
MCV	Erythrocyte morphology
MCHC	Prothrombin time [a]
Total leukocyte count	Activated partial thromboplastin time [a]

[a] To be conducted only at the 12-month evaluation on Subgroup B.

[+C] Added 3/23/99 by Amendment C

Serum Chemistry	
Aspartate aminotransferase	Albumin
Alanine aminotransferase	Globulin (by calculation)
Alkaline phosphatase	A/G ratio (by calculation)
Phosphorus	Calcium
Glucose	Chloride
Urea nitrogen	Potassium
Creatinine	Sodium
Total cholesterol	Creatine kinase
Gamma glutamyl transferase	LDH
Total bilirubin	Lipoprotein [a]
Total protein	Triglycerides

[a] To be conducted only at the 12-month evaluation on Subgroup [B C][&G].

Urinalysis	
Color	Microscopy of sediment
Appearance	Specific gravity
Protein	Volume
Ketones	pH
Bilirubin	Occult blood
Nitrites	Glucose
Urobilinogen	

7.5 Ophthalmologic Examinations

Ocular examinations will be conducted (treated with a mydriatic agent) using an indirect ophthalmoscope. Examinations will be performed prior to exposure start on Subgroup B animals and designated animals from Subgroup D (10/sex/group; the first 10 animals in each group). [At Within two weeks prior to][&F] necropsy of the 12-month (Subgroup B), and 24-month (Subgroup D) groups, only the control and high dose groups will be examined. If significant findings are present in the high dose group at the 12- and 24-month evaluations, then the 10, 30, and 150 ppm groups may also be examined.

[&F] Changed 1/11/00 by Amendment F
[&G] Changed 2/3/00 by Amendment G

1/11/1999

8. POSTMORTEM OBSERVATIONS AND MEASUREMENTS

8.1. Necropsy

A complete necropsy will be performed on all study rats, with the exception of the rats in Subgroup A. Findings will be recorded on an Individual Animal Necropsy Record (IANR) form and on the Xybion PATH/TOX System. Rats will be anesthetized with sodium pentobarbital and then exsanguinated. Necropsies will include an external examination of all body orifices, an examination of tissues/organs, and fixation in 10% neutral buffered formalin (NBF) of the following tissues:

Adrenal glands (2)	Pancreas
Aorta	Parathyroid
Bile duct (common)	Penis
Bone marrow smear [a]	Pharynx
Bone with marrow (sternum and femur)	Pituitary gland
Brain	Prepuce
Cervix	Preputial gland
Esophagus	Prostate gland
Extra-orbital lachrymal gland	Salivary glands
Eyes with optic nerve (2) [b]	Sciatic nerve
Gross lesions and tissue masses	Seminal vesicles
Heart	Skeletal muscle
Intestine, large (cecum, colon, rectum)	Skin
Intestine, small (duodenum, jejunum, ileum)	Spinal cord (3 levels)
Kidneys (2)	Spleen
Larynx	Stomach
Liver [e]	Testes (with epididymides)
Lungs (including bronchi) [c]	Thymus (if present)
Lymph nodes (mandibular, mesenteric, tracheobronchial, and mediastinal)	Thyroid gland
Mammary gland (females)	Trachea
Nasal cavities [d]	Urinary bladder [c]
[~~Nose (external surface)~~ Nasal vestibule][&A]	Uterus
Ovaries	Vagina
	Zymbals gland

[a] Bone marrow smears will be obtained at all necropsies [(except animals found dead)][+A]. They will be evaluated at the discretion of the Sponsor's Representative, pathologist, and the Study Director.

[b] Preserved in Davidson's solution.

[c] Inflated with fixative at the time of collection.

[d] [~~Four~~ Five][&A] cross-sections of the nasal cavities will be prepared for microscopic examination, [four][+A] in general accordance with the method described by Morgan [3,4] [The fifth section will be through the nasal vestibule, anterior to the incisor teeth.][+A]

[e] At the 12-month sacrifice (Group B), after weighing the liver, ~1 g liver will be collected and promptly flash frozen in liquid nitrogen and stored at –70 °C. The liver tissue samples will be stored for possible evaluation at a later date.

[&A] Changed 1/22/99 by Amendment A
[+A] Added 1/22/99 by Amendment A

8.2. Organ Weights

The following organs from all animals from moribund and scheduled sacrifices [with the exception of the rats in Subgroup A][+A] will be weighed (weight to the nearest): adrenal glands (0.001 g), brain (0.01 g),

[+A] Added 1/22/99 by Amendment A

liver (0.01 g), lungs (0.01 g), kidneys (0.01g), ovaries (0.001 g), spleen (0.01 g), testes (0.001 g), heart (0.01 g), uterus (0.001 g), [pituitary gland (from rats up to and including the 12-month timepoint only) (0.001g),][+A] and epididymides (0.001 g). Paired organs will be weighed together. Organ to body weight ratios and organ to brain weight ratios will be calculated and reported.

8.3. Histopathology

Organs/tissues from Section 8.1 will be processed to slides and stained with hematoxylin and eosin for complete histopathologic examination for all early death rats (except Group A), and for all rats in the control and 700 ppm groups (including recovery groups). Lungs, liver, kidneys, nasal cavities, tissue masses, and gross lesions will be examined from all 10, 30, and 150 ppm groups rats (including recovery groups). If a treatment-related lesion is suspected in the high level group, this lesion will be examined in all groups. Slides may be peer-reviewed by a Sponsor-selected pathologist.

[Slides containing the adrenal gland from the Subgroup D female control and 700 ppm groups will be subjected to a third-party formal review (FR). The FR will be conducted by Dr. Karen Regan (Regan Path/Tox Services, 1457 Township Rd 853; Ashland, Ohio 44805 [419 207-0559]). Slides will be shipped from Battelle Toxicology Northwest to Regan Path/Tox Services for review and, upon completion of the review, returned.

The review will consist of an initial assessment of the control group to obtain a perspective on the range of "normal" morphology, followed by a blinded read of the entire set of slides (control and 700 ppm group combined). Once completed, the findings will be collated and compared with the study pathologist's initial peer-reviewed diagnoses. If discrepancies exist, they will be documented, along with the activities (further reviews by the study pathologist and peer-review pathologists) associated with building consensus. Regan Path/Tox Services will issue a contributing scientist report (audited by Regan Path/Tox Services QAU). A statistical analysis of the final data may be performed by Environ International (see Amendment H pg 17 for statistical analysis details).][+I]

9. TISSUE LEVELS

After six months of exposure, plasma and [~~fat~~ tissue][&D] samples will be collected from 6 rats/sex/group (Subgroup A). [~~Following sample collection these rats will be discarded without necropsy~~.][-D]

On the day of scheduled sample collection, each rat will be anesthetized (using 100% CO_2) as quickly as possible following exposure and a blood sample obtained via cardiac puncture. [~~The fat sample~~ Peri-renal, abdominal, and brown fat samples][&D] will then be obtained from each rat. The time of exposure termination, blood collection, and fat sample collection will be accurately recorded for each rat. [The weight of each fat sample will be recorded.][+D] The blood and fat samples will be processed using centrifugation and plasma collected.

[+A] Added 1/22/99 by Amendment A
[&D] Changed 7/12/99 by Amendment D
[-D] Deleted 7/12/99 by Amendment D
[+D] Added 7/12/99 by Amendment D
[+I] Added 1/21/04 by Amendment I

The plasma and fat samples will be analyzed for the presence of test article using a validated gas chromatographic/mass spectroscopy method. The samples will be extracted and analyzed as soon as possible after collection.

[Following the plasma and fat sample collections, the tissues shown below will be collected, fixed in 10% NBF, and stored. The stored tissues will be [~~either discarded at the end of the study or, at the discretion of the Sponsor, processed into blocks/slides for evaluation~~ submitted to the Sponsor. The tissues will be sent to:

Linda Meeker CO3101
Dow Corning Corporation
2200 W. Salzburg Road
Auburn, MI 48611]$^{\&J}$

Organ weights for the pituitary gland (0.001g) and the liver (0.01g) will be recorded.

Cervix	Prepuce
Kidneys (both)	Preputial gland
Larynx	Prostate gland
Liver [a]	Seminal vesicles
Lungs (including bronchi)	Testes (with epididymides
Mammary gland (male and female)	Thyroid gland
Nasal cavities	Trachea
Ovaries	Uterus
Penis	Vagina
Pharynx	Zymbals gland
Pituitary gland	

[a] After weighing, ~1 g liver will be collected and promptly flash frozen in liquid nitrogen and stored at ~-70°C. These liver tissue samples will be stored for possible evaluation at a later date.]$^{+D}$

[9.1. LIVER D_4 CONTENT

Liver samples collected (flash frozen) from Subgroup A rats during the six month sacrifice will be shipped (packed in sufficient dry ice to ensure all samples remain frozen) to the Sponsor's representative for determination of D_4 content. Processing and analysis will be conducted following established procedures and validated methodologies.]$^{+E}$

$^{+D}$ Added 7/12/99 by Amendment D
$^{+E}$ Added 9/27/99 by Amendment E
$^{\&J}$ Changed 7/9/04 by Amendment J

10. STATISTICAL ANALYSIS

Results from this study will include:

Incidence tables of clinical observations, gross lesions, and histopathological observations. Tabulation of findings from ophthalmologic exams.

Group means will be calculated for:

Body weight
Body weight gain
Organ weight
Organ to body weight ratio
Organ to brain weight ratio
Hematology and clinical chemistry parameters
Urinalysis results

Group variances for body weight, clinical pathology, and organ weight data will be compared using Bartlett's test. When the differences between group variances are not significant ($p>0.01$), a one-way analysis of variance (ANOVA) will be performed. If significant differences ($p\leq0.10$) among the means are indicated by the ANOVA, Dunnett's t-test will be used to determine if any treatment means are significantly different from the control group mean. Significance will be declared at the 0.05 and 0.01 alpha levels.

In the event that Bartlett's or the F-max test indicates significant differences between groups variances for a given parameter ($p<0.01$), the mean values between the control and each concentration group will be compared using the Behrens-Fisher t-test (Satterthwaite's method will be used to adjust for degrees of freedom). Significance will be declared at the 0.05 and the 0.01 alpha levels if the 'p' value is less than alpha divided by the number of comparisons made (Bonferroni's adjustment for multiple comparisons [5]).

The percent difference in mean body weights (MBW) and mean body weight gains (MBWG) between treated and control animals will be calculated as follows (e.g. for MBW):

$$MBW = \frac{\text{MBW of Exposed Group} - \text{MBW of Control Group}}{\text{MBW of Control Group}} \times 100\%$$

[The following additional statistical analyses may be conducted per Sponsor request: survival analysis, analysis of neoplastic and non-neoplastic lesion incidences, and dose-response modeling. These analyses will be conducted at the following facility designated by the Sponsor:

Environ International
602 East Georgia St.
Ruston, LA 71270
(318) 251-6981

A Contributing Scientist Report (CSR) will be prepared that details the methods and results of the analyses conducted at Environ International (EI). The CSR will be submitted for inclusion in the Final Study Report as an appendix. Data and study records generated at EI will be sent to Battelle for inclusion with the other study records.][+H]

11. STUDY CONDUCT AND RECORDS RETENTION

11.1. Study Conduct

Documentation will be maintained in such a manner that confidentiality for the Sponsor, in all aspects of the study conduct, will be assured.

This protocol will be the controlling document. The Study Director is to be notified immediately for clarification if discrepancies occur between the protocol and the SOPs.

[+H] Added 4/10/03 by Amendment H

Any changes to this protocol will be made in the following manner. If Battelle initiates the change, not associated with cost, verbal (telephonic) approval will be obtained from the Sponsor followed by written documentation by Battelle to the Sponsor. Any change which impacts the cost or schedule of the study will be documented in writing and approved by the Sponsor Representative's signature prior to implementation. The Sponsor may initiate modification to the protocol by telephonic authorization to Battelle followed by written documentation as stated above.

This study will be conducted in compliance with Code of Federal Regulations, EPA 40 CFR 792, Toxic Substances Control Act, GLP Standards. [An exception will be the statistical analysis of the survival and neoplastic/non-neoplastic lesion incidence data, and the dose-response modeling conducted at EI. The data input for these statistical analyses will be verified by EI. However, the software and statistical analysis methods used will not meet GLP standards. In addition, the statistical analysis methods, results, and any study records generated by EI will not be audited by the Battelle Toxicology Northwest Quality Assurance Unit.][+H]

~~[All paraffin blocks and wet tissues resulting from any portion of this study will be retained by Battelle until six months after acceptance of the final report at which time they will be submitted to the Sponsor. [If requested by the sponsor, all All][&C] microscopic slides will be submitted to the Sponsor with the final report.~~ All study records resulting from any portion of this study will be retained by Battelle and/or contributing laboratory/facility.

Within six months after acceptance of the final report all study records not already in Sponsor possession will be submitted to the Sponsor for permanent archive within Dow Corning's Health and Environmental Sciences Department's archive at 2200 West Salzburg Road, Midland, MI 48686.][&J]

[&C] Changed 3/23/99 by Amendment C
[+H] Added 4/10/03 by Amendment H
[&J] Changed 7/9/04 by Amendment J

11.2. Records to be Maintained

~~[All data resulting from any portion of this study will be retained by Battelle until six months after acceptance of the final report at which time they will be submitted to the Sponsor.]~~[-J] Materials to be maintained will include, but are not limited to:

- Protocol and protocol amendments
- Deviations and corrective actions
- General notes and Sponsor/Study Director correspondence
- Test article data and chain of custody information
- Animal receipt, husbandry, allocation, and identification records
- Exposure system monitoring
- Clinical observations
- Body weight records
- Ophthalmic examinations
- Clinical pathology records
- Gross necropsy records, including organ weights
- Histology records
- Histopathology records
- [Paraffin blocks, wet tissues, and microscopic slides][+J]

12. REPORTS

A QAU audited draft report will be issued within 9 months after the final necropsy. After discussion with the Sponsor, a final report will be issued.

The final report will include, but not be limited to:

- The name and address of the Sponsor, the testing facility, and the study schedule.
- The names of all personnel involved in the study.
- The signatures of all professional scientists involved in the study.
- The identification of the test article, lot/batch number, and physical properties.
- The concentration, purity, and composition of the test article.
- A description of the test system, including species, strain, source, allocation, sex, body weight range, age, and method of identification.
- A description of the exposure system, exposure regimen, route of administration, and duration of the exposure.
- A description of all results including the test environment data.
- A summary and assessment of all toxic symptoms.
- Individual and summary body weight and survival graphs.
- Individual and summary mortality data, ophthalmoscopic examinations, clinical pathology data, organ weights, gross and histopathologic findings.
- A description of all circumstances that may have affected the quality or integrity of the study.
- A copy of the protocol and protocol amendments.
- A listing of any/all deviations and reflecting their impact (if any) on the study.
- A signed Quality Assurance Unit statement.

[-J] Deleted 7/9/04 by Amendment J
[+J] Added 7/9/04 by Amendment J

- A Statement of Compliance signed by the Study Director.
- The storage locations of all raw data, specimens, and the report.

From Terryl J. Mast, Study Director

Subject N003441A - Protocol Deviations (Light Cycle)

The list below reflects deviations from the study protocol defined light-dark cycle in the D_4 Chronic Rat Study (N003441A).

Date	Deviation	Total Time Lights On	Reason	Study Director Review
JB 1/25/99	Lights off 0518 - 0727	11 hours 51min	Possible obstruction of light sensor	TJMast 3/1/99
JB 1/27/99	Lights on 0554 - 0103	12 hours 9 min	Exposure person in room to perform temperature check	TJMast 3/1/99
JB 3/29/99	Lights on 0524 - 0538	12 hours 14 min	Exposure person in room to check chamber humidity	TJMast 3/29/99
JB 5/2/99	Lights on 2150 - 2205	12 hours 15 min	temperature adjustment on D4 chamber	TJMast 6/2/99
JB 5/27/99	Lights on 1800-1813	12 hours 13 min	Repair on-line GC	TJMast 6/2/99
8/23/99 JB 7/16/99	Lights off 0741-0751	11 hours 30 min	Power outage	TJMast 8/26/99
JB 8/23/99	Lights on 0607-1800	11 hours 53 min	Light timer out of sync, adjusted	TJMast 8/26/99

These light cycle deviations will not have an adverse effect on the study.

From Terryl J. Mast - Study Director

Subject Protocol Deviations

Health Evaluation:

Page 9 of the study protocol states "Within 48 hours of arrival, 5 rats/sex will be examined by gross necropsy and histopathology for evidence of disease". Five rats/sex were examined by gross necropsy for evidence of disease within 48 hours of arrival. However, the histopathology evaluation was not completed until ~5 days after arrival. No evidence of disease was found in either examination. This deviation will have no adverse effect on the study.

Animal Replacement:

Based on the pre-test eye examination results, one male rat from the 700 ppm exposure group (#802) was replaced prior to the second day of exposure. It is a common practice to replace animals in the first week of a long-term study and provision for this is normally included in the study protocol. However, in this case, this provision was inadvertently omitted from the study protocol. The replacement of this rat was approved by both the Study Director and the Sponsor Representative. This deviation will have no adverse effect on the study.

Subject Test Article Storage Deviation in CSTF

Test article D4, (Battelle ID 13660-9-1 and 9-2), are currently stored in the CSTF barrel room, while additional test article, (Battelle ID 13660-9-3 & 9-4, and 13660-6-6 through 6-12), are stored in the main room.

On Friday, 4/2/99 and Saturday, 4/3/99, this test article was subject to a storage deviation at the lower temperature limit (18.0°C).

> Barrel Room Temperature Excursion: From ~19:16 hrs on 4/2/99 to ~00:51 hrs on 4/3/99 the temperature of the barrel room ranged from 13.5 to 17.9°C.
>
> Main Room Temperature Excursion: From ~21:31 hrs on 4/2/99 to ~00:46 hrs on 4/3/99 the temperature of the main room ranged from 15.1 to 17.9°C.

The reason for this drop in temperature is detailed in the attached e-mail correspondence from Barry Hayden, 4/3/99. Corrective action was taken as also detailed in the referenced e-mail to fix the heating problem. To ensure appropriate action is taken should this problem occur in the future, the Lower Control Limit (LCL), which initiates the temperature monitoring paging system of LLMS has been raised from 15°C to 19.5°C for the CSTF. In addition, two drums of test article (13660-9-1 & 9-2), were agitated to mix as label directions indicate should be done if the test article were to freeze. As we discussed, all the remaining drums have agitated in the same manner.

This short-term deviation in storage temperature is not expected to adversely impact the integrity of the test article.

Subject: RE: CSTF Barrel Room Temp (D4 Storage)

Attached is an Excel Plot of the barrel room temperature during the time the heating system failed.

TempChart.xls

I contacted Terry Mast on 4-3-99. At her direction, I agitated the Drums of D4 in the barrel room by slightly tipping the drums several times and have issued this e-mail message indicating the material is fit for use as exposure test chemical. I have removed the "do not use" sign on the active test material drum. The ID of the active and full D4 drums in the barrel room are 13660-9-1 and 2.

Subject: CSTF Barrel Room Temp (D4 Storage)

Early Saturday morning (~00:30, 4-3-99) I received a page from LLMS. The CSTF Barrel room had reached temperatures below 15 deg C. I conferred with the power operator who checked systems and found a problem with the heating system to the facility (to the best of my understanding a pump used to supply hot water to the heater system tripped out and the auxiliary pump failed to kick in automatically, the operator had to switch pumps manually). The operator said there appeared to have been a problem with the Metasys communication which prevented him from receiving notification of the problem.

I will pursue documentation of the exact temperature readings in the barrel room but basically at around 18:00 on 4-2-99 the temperature began to fall from ~20 deg C to a low of ~ 13.5 deg C at ~00:45 4-3-99. After manual switching of the heating system the barrel room quickly returned to ~20 deg C.

By slightly tipping the drums of D4 in the barrel room, I verified that the contents of the D4 drums appeared to be liquid (at ~1:00 4-3-99). HOWEVER, if at all possible, do NOT refill the D4 reservoirs until receiving approval from Terry Mast. I will attempt to notify Terry of the temperature discrepancy on 4-3-99. I have placed a sign on the active D4 drum indicating Renee Johnson or Barry Hayden should be notified prior to removing test article and have include my pager number (544-4753).

Subject: FW: CSTF Barrel Room Temp Deviation (Test Article Temperature Storage Deviations)

I have raised the CSTF Lower Control Limit (LCL) of the LLMS temperature monitoring system so that it will now issue a page if the temperature drops below 19.5°C for one continuous hour. This will allow some time for BTNW staff responding to the page to alert the power operator of the problem before the D4 low limit is reached. As a note, historical temperature data for CSTF was reviewed prior to selecting 19.5°C as a new LCL. The data indicates that the temperature is very stable at ~22°C, excursions below 19.5°C are not expected.

The D4 temperature low limit is 18°C.

The PGMBE, Decalin, and Stoddard Solvent II-C low limit is 15°C.

I am in the process of completing SOP deviation memos to each study file involved. These deviation memos will be signed by the appropriate Principal Investigator and Study Director.

Subject: RE: CSTF Barrel Room Temp

Renee,

We began experiencing communication problems with the entire METASYS system for the whole complex on 4-1-99 and after extensive troubleshooting located the cause and corrected it on 4-6-99. There is no guarantee but we believe this will not happen again.

Bear in mind that all Metasys is doing in CSTF is monitoring the temperature. It controls nothing. If it alarms on temperature it prompts the operator to check things out and take appropriate action to correct the problem.

Mike

Mike,
Can we find out what has been done to correct this in the future?
Some concern has been expressed that the system (METASYS) failed to maintain the proper temperature, and then it apparently didn't notify the power operators that the temperature was dropping. Double trouble. Can you let me know if I can follow this up with anyone?

Subject Protocol Deviation

Diet:

Page 10 of the study protocol states "Food will be provided *ad libitum* except during the inhalation exposures". On the morning of March 30, 1999, LAR staff found the feeder had not been replaced the previous afternoon in Unit D of the 10 ppm female rat chamber. The feeder was placed in the unit and the rats allowed to eat for ~2 hours prior to exposure. The feeder was then removed and the exposure conducted. The weekly body weight collection for that group was conducted on March 29, 1999; therefore, this deviation will not have an adverse effect on the conduct of the study.

Subject D4 24-Month Study: No Exposure Deviation

Exposures were not conducted on May 27, 1999, which was a scheduled exposure day.

The online GC was being repaired throughout the day and was not available to monitor exposure concentrations. Exposures are not conducted without the online monitor.

The problem was with the valving that directs chamber samples to the GC column.. Troubleshooting included disassembly and reassembly of both the stream-select and sample loop valves; replacement of the multi-position actuator; and reconnection of the GC column. Following the completion of the repairs, the response of the GC had shifted, which required an alteration of the GC method. During the exposure the following day, chamber samples were collected in order to recalibrate the GC. The exposure operating parameters were not changed during the exposure. Following the analysis of the chamber samples and the determination of new calibration factors, the actual chamber concentrations will be calculated using the new factors.

The root cause of the valving problems have not been determined. The possible causes could be a design or manufacturing flaw in the valves/actuators or an effect of sampling the specific test material. Spare parts are available in case of another failure and we expect the repairs to be done more rapidly on subsequent occasions so that the exposure will not be interrupted.

This is not expected to have any significant effect on the rats or their response to the test material.

negative
There is no impact on the study.

Subject D4 24-Month Study: No Exposure Deviation

Exposures were not conducted on May 27, 1999, which was a scheduled exposure day.

The online GC was being repaired throughout the day and was not available to monitor exposure concentrations. Exposures are not conducted without the online monitor

The monitoring problem was with the valving system that directs chamber samples to the GC column, the sample flow through the sampling system was inadequate and the stream select valve actuator was sporadically malfunctioning. Corrective action included disassembly, cleaning and re-assembly of both the stream-select and sample loop valves; as well as replacement of the multi-position actuator and the capillary tubing between the sample loop valve and the flow meter. Following these efforts the sample flow was returned to adequate levels. However, we did not observe the same chromatographic retention time following valve replacement.

Therefore, we adjusted column temperature (from 100 °C to 130 °C) and pressure (from 9 to 10 psi) to bring the peak back into the desired retention window. The peak area for the on-line standard and retention time for the on-line standard was very stable. However, the response for the GC appeared to have diminished. Therefore, the next exposure day, calibration samples were acquired and the calibration of the on-line instrument was updated. The retention time and the calibration of the GC have continued to remain very stable following these adjustments. However, we have not identified the root cause for the retention time shift and will follow-up by reproducing the conditions on a separate GC. A second instrument will be set up with the same type column and we will determine the chromatographic behavior of D4 on that system with both the initial and present chromatographic conditions. If we find retention behavior consistent with the initial conditions, we will replace the present D4 column with the new column. If the GC column exchange does not result in the initial retention behavior we may propose a wholesale change out of the on-line GC to the Principle Investigator. These activities will be performed in conjunction with the next regularly scheduled on-line monitor re-calibration.

These changes do not have a significant effect on the accuracy of the measurement of test material concentration in the exposure chamber.

This memo explains in further detail the stream select valve problem mentioned in Rich Weigel's memo of May 28, 1999.

Subject D4 24-Month Study: Detection of Trace Amounts of D4 in 0 ppm Female Chamber

At the start of exposure on June 18, 1999, the online GC detected ~0.13 ppm in the 0 ppm F chamber. The concentration in ppm was calculated from an integrated chromatographic area of ~8.8 area counts. The quantitation limit for the monitor is 0.6 ppm; the limit of detection is 0.07 ppm. The chromatogram was checked and the peak was visually confirmed as D4, as it had the correct retention time and peak shape. D4 was not detected in the 0 ppm Male chamber, nor in the room. Visual check of the chromatograms from these locations confirmed that no peak was present.

We verified that the D4 was indeed from the chamber and not a contaminated sample system by removing the sample line from the 0 ppm Female sample port and allowing it to sample room air. Three readings were obtained between 10:33 and 10:36 that had no peaks due to D4.

The D4 concentration persisted in the 0 ppm Female chamber throughout the exposure day, ranging from ~0.13 ppm (8.8 area counts) at the start of the exposure day to ~0.11 ppm (7.4 area counts) 21 minutes before exposures were completed..

The study director was informed of the problem and we discussed the engineering details of the control chamber air supply system. Control chambers are connected to an independent exhaust system rather than to the chamber exhaust system that receives contaminated air from the remaining exposure chambers. This eliminates the possibility of diffusion of test chemical from the exhaust system into the control chamber. Supply air passes through charcoal, and Purafil beds prior to being HEPA-filtered.

Following the completion of exposures at 15:11, the online GC continued to detect D4 in the 0 ppm Female chamber for an additional 12 minutes before it reported 0 ppm. To confirm this, the 0 ppm Male sample line was inserted into the 0 ppm Female chamber between 15:26 and 15:30 (3 readings), and again the online GC reported 0 ppm in the Female chamber. At this point, Dr. Mast and I agreed that the contamination was gone and Dr. Mast directed the ARC personnel to proceed with their normal afternoon animal care activities.

A short time later, a visual check was made of the chromatograms from the 0 ppm Female chamber that had just reported 0 ppm and we observed a peak at the retention time associated with D4 that was slightly smaller than earlier peaks that had been reported as D4. Clearly, the detection threshold of the online GC had been reached. The peak height was only slightly

smaller than the quantified peaks. The D4 contamination in the chamber had, in fact, not left but had dropped below the detection limit.

At this point, Dr. Mast instructed ARC to change out the chamber and cage units the following morning. The GC was locked onto the 0 ppm Female sampling location and allowed to sample continuously throughout the remainder of the weekend.

The chromatograms showed a D4 peak that was not integrated throughout the remainder of the night. The following morning (6/19/99), normal animal care activities were conducted. Following that, a replacement chamber was brought into the exposure room and the 0 ppm Female chamber animals were transferred to the this cleaned chamber at 10:00. Immediately after the chamber replacement, the peak disappeared. There were no additional peaks detected by visual inspection for the remainder of the monitoring period that continued until 21:00 on 6/20/99.

In conclusion, from the online GC chromatogram data, there was a visually identified peak at the retention time assigned for D4 that was a result of a contaminated chamber or a component within the chamber. The maximum concentration detected in the 0 ppm Female chamber was 0.13 ppm. This peak was below the integration threshold of the GC with the exception of the time when exposures were being conducted and the GC was required to sample from an extended range of D4 concentrations. The contamination persisted in the chamber even when exposures were not being conducted as determined by a visual inspection of the chromatograms. The removal of the contaminated chamber approximately 24 hours after it was first detected eliminated. Cleaned female chambers had been brought into the exposure room on the morning when the contamination was detected. Apparently, the chamber assigned to the 0 ppm Female group or a component within the chamber had become contaminated during the time when the chamber was being cleaned, dried, and leak-checked. Note that control chambers are assigned specifically as such. They are clearly labeled and never used as an exposure chamber. There are three control chambers assigned to the D4 chronic study and they are exchanged so that, at any time, one is being cleaned while the other two house the male and female control groups.

Study Director Comments:

Due to the very low level of D4 in the control chamber and the short duration, this event will not have an adverse effect on the study.

Subject Study Protocol deviations for Study N003441A (9106)

1. The Individual Animal Necropsy Record (IANR) has to be printed and in the room BEFORE the study starts. The original list of tissues listed in the study protocol, 8.1. POSTPORTEM OBSERVATIONS AND MEASUREMENTS. NECROPSY, is used to list the tissues on the IANR. Included in the list of tissues was mammary gland for females only, it did not list fat (peri-renal, abdominal and brown fat). The IANR's did not have the following tissues listed:
   mammary – male,
   fat (peri-renal, abdominal and brown fat) for males
   fat (peri-renal, abdominal and brown fat) for females
   but the tissues were taken at necropsy. The fat sections were taken and weighed and the mammary sections are taken with the skin sections and we save the carcass of all animals.

2. According to Amendment D, during the 6 month sacrifice of Subgroup A, a list of twenty-two tissues was listed that were to be collected, fixed in 10% NBF, and stored. We saved all remaining tissues and the carcass in the tub along with the required twenty-two tissues. The IANR for these animals lists all the tissues that were taken and has a necropsy code of "A" for normal besides each tissue.

This deviation has no impact on the study results.

Protocol Deviation Report

Date: 1/10/00

Sponsor Project Identification: SN 9105

Laboratory Project Identification: N003441A

Description of Deviation: Body weights and clinical observations deviate from protocol-specified schedule.

Body Weights and Clinical Observations:

Amended Page 12a of the study protocol states "Clinical observations will be recorded weekly during the first 14 weeks and every two weeks thereafter." Clinical observation collection is scheduled for the week of 1/17/2000. That week is also the week for the scheduled 12-month sample collections. Due to the large amount of study-related activity required by these sample collections (blood samples, urine samples, and terminal sacrifices), the clinical observation collection scheduled for the week of 1/17/2000 has been eliminated with the Sponsor's permission.

A similar situation occurred during the week of July 12, 1999, when body weights and clinical observations scheduled for the week of July 19, 1999 were moved forward to the week of July 12, 1999 with the Sponsor's permission.

There was no impact on the quality or integrity of study data.

Impact on Study: Yes No

If yes, provide explanation here:

Corrective Action: None

Study Director (Signature/Date): 1/11/00

Protocol Deviation Report

Date: 1/12/2000

Sponsor Project Identification: D4 Chronic Study

Laboratory Project Identification: N003441A

Description of Deviation:

Environmental data (temperature, relative humidity and chamber airflow) from the Metasys system were not logged between 05:10 and 13:10, an 8 hour period. The last logged data was at 04:40; logging resumed at 13:30. The problem was due to a faulty instruction set that was transmitted from the control room workstation computer to the system companion unit (On-board computer). This occurred when Henry DeFord, the system administrator, attempted to increase the system sample rate to 1 minute per record for system QC measurements.

Note that all data and alarm functions and inputs remained operational to the control room computer during this period. Only the logging to the system buffers was disabled. No alarms were recorded to the suite system printer which indicates that no environmental alarm limits were exceeded during the missing period in the data file.

Impact on Study: Yes (No)

If yes, provide explanation here:

Corrective Action:

This was a non-routine operation with no expected reoccurrence, therefore no specific corrective action was taken. However, the system administrator continues to improve his understanding of the Metasys environmental monitoring program. In the event that other non-routine operations are required, he is more aware of the components of the software that can lead to problems.

Protocol Deviation Report

Date: 3/6/00

Client Project Identification: 9106

Laboratory Project Identification: N003441A

Description of Deviation:

The study protocol states that "Fresh tap water (City of Richland) will be supplied *ad libitum*".

The rats designated for the recovery portion of this study were moved from the exposure room (room 424) to their designated holding room (room 323) on Friday January 21, 2000. Following this, it was discovered that room 323 was still being supplied with fresh softened water (from an ion exchange softener) rather than with fresh tap water. The water supply for room 323 was changed to fresh tap water on 2/25/00.

Thus, the recovery rats for this study were supplied with fresh softened water instead of tap water from 1/21/00 until 2/25/00.

Impact on Study: Yes (No) (circle one)

If yes, provide explanation here:

Corrective Action:

None required. Water supply has been modified to provide correct type of water.

Note to file written by (Signature/Date): 3/6/00

Technical Center Manager (Signature/Date): 3/6/00

Study Director (Signature/Date): 3/6/00

Protocol Deviation Report

Date: 05/02/2000

Sponsor Project Identification: D4 Chronic Study

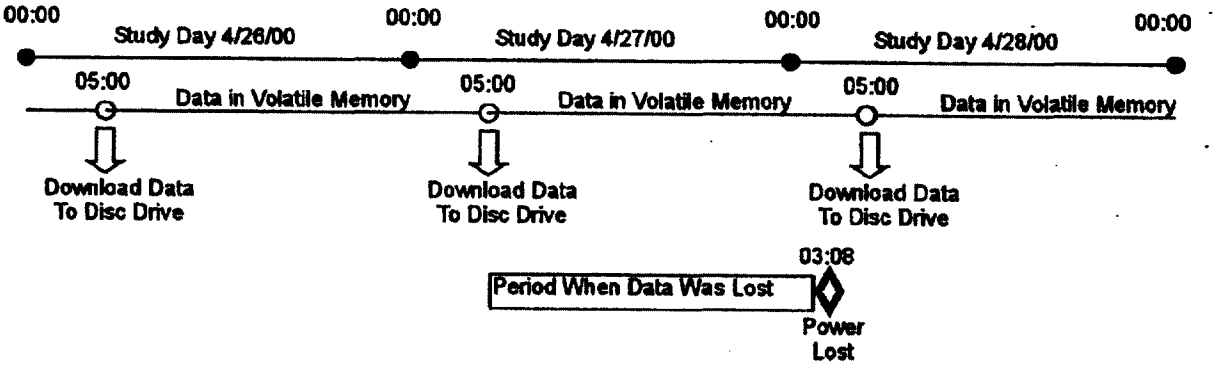
Laboratory Project Identification: N003441A

Description of Deviation:

Environmental data (temperature, relative humidity and chamber airflow) from the Metasys system were lost between 4/27/00 05:00 and 4/28/00 03:08, a duration of 21 hours 38 minutes. The Metasys system acquires and stores the data in volatile memory until it is downloaded to permanent storage every 24 hours. The data was lost from the volatile memory when the Metasys system power was lost do to a city power failure

Note that all data and alarm functions and inputs remained operational to the control room computer during this period (except during the short power outage). Only the data logged to the system buffers was lost. No alarms were recorded to the suite system printer, which indicates that no environmental alarm limits were exceeded during the missing period in the data file. No critical facility environmental control systems were lost during the power outage; all were covered by the facility emergency power system.

The following figure shows the relationship between a study day, which runs from 00:00 to 24:00 and a data logging period, which runs from ~05:00 of the study day to ~05:00 of the following day. When the system lost power, and hence the logged data in its buffers, it lost all data from 05:00 to the time of the outage. Following the outage, data logging resumed.



The Metasys logging unit was specified to be plugged into the emergency power circuit nearby. This circuit, plus the internal battery, would preserve the data in a typical power outage. This system had functioned successfully in previous outages. However, at some time prior to this latest power outage, the unit's plug had been moved into an adjacent power outlet that was not on emergency power.

Impact on Study: Yes (No)

If yes, provide explanation here:

Corrective Action:

The power source for the Metasys unit has now been changed to an uninterruptible power supply (UPS). The UPS is located out of reach on a system rack ~7 feet above the floor. The UPS is powered by the buildings emergency power system.

Note to file written by (Signature/Date): [signature] 5-2-00

Technical Center Manager (Signature/Date): [signature] 5-3-00

Study Director (Signature/Date): [signature] 5/3/00

Protocol Deviation Report

Date: 5/4/00

Client Project Identification: N003441

Laboratory Project Identification: N003441-AEXP

Description of the Event:
Power was lost to the LSLII building at ~3:07am on 28 April 2000 due to a failed city transformer. Emergency power systems energized immediately but power problems apparently began with a momentary surge to one phase of the building feed. This surge caused main facility breakers to open that would normally remain closed and continue to supply power from the facility emergency generator during a power outage. The facility power operator manually closed the breakers and restored emergency power circuits within minutes.

Description of the Deviation:
Emergency power failure duration exceeded the reserve capacity of the lighting system's Network Control Module (NCM) uninterruptible power supply (UPS). The NCM shut off and Room 404 and 315 lights properly remained OFF during this period. Once power was restored, the NCM initiated its normal power-up routine causing the lamps in room 424 to pulse ON for a period of approximately two minutes during the early morning hours when they are scheduled to remain OFF.

Impact on Study: Yes (No) (circle one)

If yes, provide explanation here:

Corrective Action:
A higher capacity UPS will be installed on the lighting system to support the NCM should the main breakers open during a future power failure.

Protocol Deviation Report

Date: 7/25/00

Client Project Identification: N003441-A

Laboratory Project Identification: N003441-ALAR

Description of Deviation:

This study went without cage board from 7/22/00 to 7/25/00 due to a manufacturer delay. The excreta pans were replaced every morning with clean ones as required by SOP but cage board was not used.

Since I acquired the responsibility for ordering cage board, the manufacturer has been shipping cage board within 4 weeks of ordering. Since cage board has been ordered/received on a monthly basis at a rate of 7,000 sheets/order without delay, a 2-week back-up supply (~3,500 sheets) of cage board has been maintained in the storage area.

The back-up supply of cage board was depleted due to a 3-week manufacturer delay. A supply of cage board was also stored in the warehouse, that material was utilized starting on 7/25/00, just prior to receiving the expected shipment that arrived late in the afternoon on 7/26/00. Even with the back-up supply in house and the warehouse supply, we would have run out of cage board.

Impact on Study: Yes (No) (circle one)

If yes, provide explanation here:

Use of cage board reduces the NH3 production in the exposure chambers. However, since the chambers are well ventilated, NH3 would not be expected to reach levels that would significantly impact the health of the animals.

Corrective Action:

A standing order will be placed with the supplier for monthly deliveries of cage board. Follow-up calls will be placed approximately 2-months prior to delivery to assure the order is being processed as planned.

A 6-weeks supply of cage board will be ordered and maintained in-house to assure that there is no lapse in supply of cage board. Approximately two-thirds of the back-up supply of cage board was ordered on 7/24/00. In addition, the ordering and inventory status form maintained on the file server for key study personnel to review will be updated to include current inventories/orders by 8/1/00.

A secondary supplier will be identified to assure a continuous cage board supply should the primary supplier fail to deliver as scheduled.

Protocol Deviation Report

Date(s) of Occurrence: November 2000

Client Project Identification: DCC Study No. 9106

Laboratory Project Identification: N003441A

Description of Deviation:

Per the study protocol, body weights are scheduled to be collected weekly during the first 14 weeks and every four weeks thereafter. Clinical observations will be recorded weekly during the first 14 weeks and every two weeks thereafter. This schedule results in one scheduled body weight collection (week of 11/9/00) and two scheduled clinical observation collections (week of 11/9/00 and week of 11/23/00) in November 2000. Due to staffing requirements for this and other studies being conducted at the Toxicology Northwest facility, this schedule will be modified as follows. A single body weight and clinical observation collection will be conducted in November (week of 11/16/00). The original schedule will be followed for the remainder of the study.

One less set of clinical observations will be collected for this study that original scheduled, however, this will not have an adverse impact on the study.

Impact on Study: Yes **No** (circle one)

If yes, provide explanation here:

Corrective Action: None required.

STUDY: D4 2-Year Inhalation Study (N003441A)

REPORTING PERIOD: January 21,1999 – January 31, 1999

COMPILED BY: R. J. Weigel (Task Leader) **DATE:** 02/01/99

REVIEWED BY: T. J. Mast (Study Directory) **DATE:** 03/23/99

DATE	DISCUSSION OR EXPLANATION
01/22/99	Concentration in the 150 ppm F chamber (102 ppm at 10:11) exceeded the low alarm limit (120 ppm). Concentration was slow to reach a stable concentration at the start of the exposure. An adjustment was made to the chemical pump delivery rate.
01/25/99	Concentration in the 10 ppm M chamber (6.3 ppm at 10:08 and 7.6 ppm at 11:06) exceeded the low alarm limit (8 ppm). Relative standard deviation (RSD) for the chamber was 14%. Concentration was slow to reach a stable concentration at the start of the exposure. Adjustments were made to the chemical pump delivery rate. In addition, bubbles were detected in the delivery line that may have been reducing the output of the pump.
01/27/99	Concentration in the 700 ppm F chamber (544 ppm at 10:49 and 536 ppm at 11:18; RSD was 12%) exceeded the low alarm limit (560 ppm). The generator's temperature controller lost its temperature sensor input. As a result, the generator heater was turned off. Some of the chemical delivered to the generator during this time was not vaporized but was collected in the trap below the generator. The sensor was rewired and concentration was returned to the target range. Concentration in the 10 ppm F chamber (12.9 ppm at 13:56; RSD was 11%) exceeded the high alarm limit (12 ppm). An adjustment was made prior to the high reading to increase the chamber's concentration. This adjustment was too large. A subsequent lowering of the pump output returned the chamber concentration to the target range.
01/29/99	Concentration in the 30 ppm F chamber (17.5 ppm at 09:16) exceeded the low alarm limit (24 ppm). Concentration was slow to reach a stable concentration at the start of the exposure. An adjustment was made to the chemical pump delivery rate.

STUDY: D4 2-Year Inhalation Study (N003441A)

REPORTING PERIOD: February 1,1999 – February 14, 1999

COMPILED BY: R. J. Weigel (Task Leader) **DATE:** 03 / 03 / 99

REVIEWED BY: T. J. Mast (Study Directory) **DATE:** 3/23/99

DATE — DISCUSSION OR EXPLANATION

General Comment:

Operational problems are occurring almost entirely at the start of an exposure. On some occasions, the output of a metering pump appears to be low at the start but eventually stabilizes at an output that produces the target concentration. To compensate for this problem, the pumps have been activated prior to the start of the exposure with their output directed to a waste reservoir (not to the generator). The lowest output pumps are activated for a longer duration than the higher output pumps.

02/01/99 At the start of the exposure, concentration in the 10 ppm F, 10 ppm M and 30 ppm M chambers were slow to buildup. For the two 10 ppm chambers, target concentration was not reached until ~2 hours into the exposure. For the 30 ppm chamber, the concentration was at target by the second round of online monitor readings. This was a Monday exposure and we believe that the pump efficiency drops after several days without activity. We have implemented a procedure to begin operating the 10 ppm pumps ~2 hrs before the scheduled exposure start time; we will be pumping into the waste reservoir. The following readings exceeded their alarm limit:

Chamber	Time	Concentration	Alarm Limit	% Target	%RSD
10 ppm F	09:25	<QL	8 ppm (L)	74%	62%
	09:54	<QL			
	10:23	<QL			
	10:52	2.8 ppm			
	11:03	4.5 ppm			
	11:22	12.1 ppm	12 ppm (H)		
10 ppm M	09:23	0.6 ppm	8 ppm (L)	76%	51%
	09:52	0.6 ppm			
	10:21	0.6 ppm			
	10:50	5.2 ppm			
	10:56	6.8 ppm			
	10:58	7.0 ppm			
	11:00	7.3 ppm			
30 ppm M	09:50	11.8 ppm	24 ppm (L)		19%

02/04/99 Concentration in the 10 ppm F chamber (6.8 ppm at 08:10) exceeded the low alarm limit (8 ppm). Relative standard deviation (RSD) for the chamber was 11%. Concentration was slow to reach a stable concentration at the start of the exposure. Adjustments were made to the chamber airflow to raise the concentration.

02/09/99 Concentration in the 150 ppm M chamber (117 ppm at 09:05) exceeded the low alarm limit (120 ppm). Concentration was slow to reach a stable concentration at the start of the exposure. No adjustment was made and the concentration continued to increase to the target range.

02/11/99 Concentration in the 150 ppm M chamber (81.6 ppm at 08:54) exceeded the low alarm limit (120 ppm). Relative standard deviation (RSD) for the chamber was 14%. Concentration was slow to reach a stable concentration at the start of the exposure. Adjustments were made to the chamber airflow to raise the concentration.

02/14/99 Concentration in the 150 ppm M chamber (97.6 ppm at 08:53) and in the 150 ppm F chamber (99.4 ppm at 08:55) exceeded the low alarm limit (120 ppm). Concentration was slow to reach a stable concentration at the start of the exposure. No adjustments were made; subsequent readings were above the low alarm point.

STUDY: D4 2-Year Inhalation Study (N003441A)

REPORTING PERIOD: February 15, 1999 – February 28, 1999

COMPILED BY: R. J. Weigel (Task Leader) **DATE:** 03 / 03 / 99

REVIEWED BY: T. J. Mast (Study Directory) **DATE:** 3/23/99

DATE DISCUSSION OR EXPLANATION

General Comment:

Operational problems are occurring almost entirely at the start of an exposure. On some occasions, the output of a metering pump appears to be low at the start but eventually stabilizes at an output that produces the target concentration. To compensate for this problem, the pumps have been activated prior to the start of the exposure with their output directed to a waste reservoir (not to the generator). The lowest output pumps are activated for a longer duration than the higher output pumps.

02/17/99 A brief building wide power loss and subsequent drop in the chamber exhaust system's vacuum level caused the exposure system to turn off at ~09:13. Normal exposure operations resumed at 09:47, resulting in a 34 minute interruption in the 6 hour exposure day.

02/22/99 At the start of the exposure, concentration in the 10 ppm F chamber was slow to buildup and did not reach target concentration until ~57 minutes into the exposure. This was a Monday exposure and we followed the procedure to begin operating the 10 ppm pumps ~2 hrs before the scheduled exposure start time. After the completion of the day's exposure, the delivery line to the 10 ppm F chamber was replaced with one of twice the diameter to reduce the back pressure on the valve.

The following readings exceeded their alarm limit:

Chamber	Time	Concentration	Alarm Limit	% Target	%RSD
10 ppm F	09:19	<QL	8 ppm (L)	83%	45%
	09:40	0.8 ppm			
	09:55	3.3 ppm			

02/23/99 At the start of the exposure, concentration in the 10 ppm F chamber was slow to buildup and did not reach target concentration until ~55 minutes into the exposure. The exposure duration was extended by 55 minutes for the 10 ppm F chamber only to compensate for the period when no vapor was delivered to the chamber. The change of delivery lines had the expected effect of reducing the back pressure on the valve and increasing pumping efficiency. The operators made a series of adjustments to lower the pump delivery rate, however there were two readings that exceeded the high alarm limit:

Chamber	Time	Concentration	Alarm Limit	%RSD
10 ppm F	10:58	12.6 ppm	12 ppm (H)	11%
	11:02	12.5 ppm		

02/25/99 At the start of the exposure, concentration in the 10 ppm F chamber was slow to buildup and required several adjustments to the pump delivery rate to find the proper setting to obtain the target concentration. There were three readings that exceeded the alarm limits during this process. The pump was changed out after the exposure was completed in an effort to increase reliability. The following readings exceeded their alarm limit:

Chamber	Time	Concentration	Alarm Limit	%RSD
10 ppm F	08:48	1.6 ppm	8 ppm (L)	29%
	09:17	4.5 ppm		
	10:36	12.5 ppm	12 ppm (H)

STUDY: D4 2-Year Inhalation Study (N003441A)

REPORTING PERIOD: March 1,1999 – March 14, 1999

COMPILED BY: R. J. Weigel (Task Leader) **DATE:** 03 / 16 / 99

REVIEWED BY: T. J. Mast (Study Directory) **DATE:** 03/23/99

DATE DISCUSSION OR EXPLANATION

General Comment:

Operational problems are occurring almost entirely at the start of an exposure. On some occasions, the output of a metering pump appears to be low at the start but eventually stabilizes at an output that produces the target concentration. To compensate for this problem, the pumps have been activated prior to the start of the exposure with their output directed to a waste reservoir (not to the generator). The lowest output pumps are activated for a longer duration than the higher output pumps. In addition, one of the 10 ppm pumps appeared to have a leak that decreased its output efficiency and gave an inconsistent output rate over time. This pump was replaced on 3/12/99.

03/01/99 Concentration in the 30 ppm F chamber (23.2 ppm at 08:53) exceeded the low alarm limit (24 ppm). Concentration was slow to reach a stable concentration at the start of the exposure. No adjustments were made and subsequent readings were acceptable.

03/09/99 At the start of the exposure, concentration in the 10 ppm F chamber was slow to buildup and did not reach 90% of target until 48 min. after the scheduled T90 time. Exposure duration was extended only for this chamber so that there was 6 hours of exposure after reaching T90. Since the pump efficiency (output flow at a pump setting) was very poor during the morning, the output setting of the pump was increased to reach target. While setting the pump to maintain the target concentration, a low reading occurred when the pump output was lowered too much. The following reading exceeded the alarm limits:

Chamber	Time	Concentration	Alarm Limit	% Target	%RSD
10 ppm F	09:36	6.7 ppm	8 ppm (L)	99%	11%

03/10/99 Again, at the start of the exposure, concentration in the 10 ppm F chamber was slow to buildup and did not reach 90% of target until 1 hr. 38 min. after the scheduled T90 time. Exposure duration was extended only for this chamber so that there was 5 hours of exposure after reaching T90. Since the pump efficiency (output flow at a pump setting) was very poor during the morning, the output setting of the pump was increased to reach target. A subsequent high reading occurred when the pump output increased unexpectedly after target concentration was met at the new setting. The following readings exceeded their alarm limits:

Chamber	Time	Concentration	Alarm Limit	% Target	%RSD
10 ppm F	11:40	15.8 ppm	12 ppm (H)	100%	17%
	11:47	6.6 ppm	8 ppm (L)		
	11:49	5.9 ppm			

03/11/99 Concentration in the 10 ppm F chamber (7.5 ppm at 08:38) exceeded the low alarm limit (8 ppm). This was the first reading after T90 and buildup to final concentration was slow. Adjustments were made to the metering pump to increase concentration.

03/12/99 Concentration in the 10 ppm F chamber (6.7 ppm at 08:53) exceeded the low alarm limit (8 ppm). Relative standard deviation (RSD) for the chamber was 12%. This was the first reading after T90 and buildup to final concentration was slow. Several adjustments were made to the metering pump before a stable concentration at target was reached. Following the completion of the exposure, the metering pump was replaced with an alternative model that has a smaller maximum delivery volume.

STUDY: D4 2-Year Inhalation Study (N003441A)

REPORTING PERIOD: April 12,1999 – April 25, 1999

COMPILED BY: R. J. Weigel (Task Leader) **DATE:** 04/27/99

REVIEWED BY: T. J. Mast (Study Directory) **DATE:** 4/29/99

DATE	DISCUSSION OR EXPLANATION
04/23/99	At the start of the exposure, concentration in the 10 ppm M chamber (7.9 ppm at 11:26) exceeded the critical low alarm limit (8 ppm) and then stabilized at ~80 to 85% of target. We found that a bypass valve that is inserted between the chemical pump and the chamber was diverting a portion of the pumped chemical to the bypass. This problem was corrected so that chamber concentration was at target within ~90 minutes of the exposure start.

STUDY: D4 2-Year Inhalation Study (N003441A)

REPORTING PERIOD: April 26,1999 – May 9, 1999

COMPILED BY: R. J. Weigel (Task Leader) **DATE:** 05 / 13 / 99

REVIEWED BY: T. J. Mast (Study Directory) **DATE:** 5/13/99

DATE	DISCUSSION OR EXPLANATION
04/27/99	Concentration in the 10 ppm M chamber (7.7 ppm at 14:46 and 7.8 ppm at 15:10) exceeded the low alarm limit (8 ppm). Near the end of the day's exposure, the chamber's concentration dropped. After checking that the sampling system was not the problem, adjustments to the pump output rate were made however a stable concentration at target was not reached before exposure termination. After the completion of the exposure on 4/26/99, the pump was updated to a smaller piston model as was previously done for the 10 ppm F.
05/03/99	Concentration in the 10 ppm M chamber (7.8 ppm at 12:23) exceeded the low alarm limit (8 ppm). Daily mean concentration was 88% of target. During the day's exposure, the chamber's concentration dropped. After checking that the sampling system was not the problem, several adjustments to the pump output rate were made throughout the remainder of the day. After the completion of the exposure, the pump was replaced with a similar model. In addition, the delivery line between the pump and the chamber was replaced with one of a larger diameter which will reduce the back pressure on the pump. The following day's exposure went well.

STUDY: D4 2-Year Inhalation Study (N003441A)

REPORTING PERIOD: May 10,1999 – May 23, 1999

COMPILED BY: R. J. Weigel (Task Leader) **DATE:** 05 / 26 / 99

REVIEWED BY: T. J. Mast (Study Director) **DATE:** 05 / 26 / 99

DATE — DISCUSSION OR EXPLANATION

05/10/99 — At the start of the exposure, concentration in the 30 ppm M and 30 ppm F chambers was slow to buildup and did not reach the operating range until ~55 min. after the scheduled T90 time. The generation system was checked and bubbles were found and then removed from the pumps. A source of the bubbles could not be determined. To aid in detection if bubbles occur in the future, the delivery line between the pump and the 3-way purge valve just after the pump was replaced with a translucent teflon tube through which bubbles can be observed. The following reading exceeded the alarm limits:

Chamber	Time	Concentration	Alarm Limit	% Target	%RSD
30 ppm F	09:09	5.6 ppm	24 ppm (L)	95%	25%
30 ppm M	09:11	16.1 ppm	24 ppm (L)	97%	14%

STUDY: D4 2-Year Inhalation Study (N003441A)

REPORTING PERIOD: May 24,1999 – June 6, 1999

COMPILED BY: R. J. Weigel (Task Leader) **DATE:** 06 / 09 / 99

REVIEWED BY: T. J. Mast (Study Director) **DATE:** 6/10/99

DATE	DISCUSSION OR EXPLANATION
05/27/99	Exposures were not conducted on this scheduled exposure day. The online GC was being repaired throughout the day and was not available to monitor exposure concentrations. Exposures are not conducted without the online monitor. The problem was with the valving that directs chamber samples to the GC column.. Troubleshooting included disassembly and reassembly of both the stream-select and sample loop valves; replacement of the multi-position actuator; and reconnection of the GC column. Following the completion of the repairs, the response of the GC had shifted, which required an alteration of the GC method. During the exposure the following day, chamber samples were collected in order to recalibrate the GC. The exposure operating parameters were not changed during the exposure. Following the analysis of the chamber samples and the determination of new calibration factors, the actual chamber concentrations was calculated using the new factors. The root cause of the valving problems have not been determined. The possible causes could be a design or manufacturing flaw in the valves/actuators or an effect of sampling the specific test material. Spare parts are available in case of another failure and we expect the repairs to be done more rapidly on subsequent occasions so that the exposure will not be interrupted.

STUDY: D4 2-Year Inhalation Study (N003441A)

REPORTING PERIOD: June 7,1999 – June 20, 1999

COMPILED BY: R. J. Weigel (Task Leader) **DATE:** 06/22/99

REVIEWED BY: T. J. Mast (Study Director) **DATE:** 6/28/99

DATE	DISCUSSION OR EXPLANATION
06/07/99	Concentration in the 30 ppm M chamber (21.3 ppm at 09:30) exceeded the low alarm limit (24 ppm). Concentration was slow to reach a stable concentration at the start of the exposure. An adjustment was made to lower the chamber airflow rate which increases chamber concentration. Subsequent readings were acceptable.
06/14/99	Concentration in the 30 ppm F chamber (18.4 ppm at 08:56; RSD was 11%) exceeded the low alarm limit (24 ppm). Concentration was slow to reach a stable concentration at the start of the exposure. No adjustment was made and subsequent readings were acceptable. This problem appears to follow after the weekend without exposures. Therefore, on exposure days following the weekend, the chemical pumps will be operated for a longer period prior to starting exposures, with the expectation that the pump efficiency will return to normal given the additional running time.
06/18/99	During the exposure, a trace amount of test article (≤0.13 ppm; QL is 0.6 ppm) was detected in the 0 ppm F chamber. While the D4 level in the chamber dropped below the integration threshold ~12 minutes after exposures were completed, a peak was visually observed on the chromatograms that persisted until the chamber and associated cage units were changed out the following day, 6/19/99, at 10:00. Further details of this problem are in the Protocol Deviation memo: "D4 24-Month Study: Detection of Trace Amounts of D4 in 0 ppm Female Chamber", dated 6/22/99.

STUDY: D4 2-Year Inhalation Study (N003441A)

REPORTING PERIOD: June 21,1999 – July 4, 1999

COMPILED BY: R. J. Weigel (Task Leader) **DATE:** 07/12/99

REVIEWED BY: T. J. Mast (Study Director) **DATE:** 7/12/99

DATE	DISCUSSION OR EXPLANATION

There were no problems or excursions to report for the two-week period of this report.

EXPOSURE OPERATION DISCUSSION SHEET

INCLUDES DISCUSSIONS AND/OR EXPLANATIONS OF PROBLEMS AFFECTING EXPOSURES. EXPLANATIONS ARE INCLUDED FOR DATA IN WHICH THERE WERE EXCURSIONS OF DAILY MEAN OR STANDARD DEVIATION BEYOND ALLOWABLE OPERATING LIMITS OR EXCURSIONS OF INDIVIDUAL DATUM BEYOND CRITICAL LIMITS. THESE EXCURSIONS HAD NO NEGATIVE IMPACT ON THE STUDY UNLESS OTHERWISE SPECIFIED.

STUDY: D4 2-Year Inhalation Study (N003441A)

REPORTING PERIOD: July 5,1999 – July 18, 1999

COMPILED BY: R. J. Weigel (Task Leader) **DATE:** 07/20/99

REVIEWED BY: T. J. Mast (Study Director) **DATE:** 8/10/99

DATE	DISCUSSION OR EXPLANATION
07/09/99	Exposure duration for the 150 ppm M chamber was 4 hr. 14 min. Concentration in that chamber (87.8 ppm at 10:37; RSD was 14%) exceeded the low alarm limit (120 ppm). At the start of the day's exposure, no concentration was detected in the chamber. The chamber exposure valve was closed while the problem was diagnosed; all other chamber exposures continued. The problem was that the pump had become disconnected from the motor drive shaft. The low reading occurred following the repair of the pump while concentration rose to its target concentration.
07/13/99	Exposures were interrupted for ~20 minutes. The Facility Air compressors went down (09:55) for approximately 3 minutes, causing a loss of compressed air to the generation systems. The exposure system automatically shut down and was left off until all temperatures and flows returned to normal. The compressor problem was the result of the Electricians gathering data in order to understand the cause of a problem that had occurred the previous night with one of the two Air Compressors. It was being performed in order to plan for the repairs to be conducted following completion of the day's exposures. While gathering the necessary data the leads from a voltage meter inadvertently shorted across two terminals causing the control fuses to blow resulting in both Air Compressors going down.. The fuses were replaced and the compressors brought back on line. Following the resumption of the exposure at ~10:15, the GC reported very low readings in both 700 ppm chambers. The operator found that the chemical delivery line at the pump heads had become disconnected. The pumped chemical was being collected in the secondary containers below each pump. All chemical pumps were shut off at ~10:30. The delivery lines were reconnected and the exposure was resumed at ~10:40. The delivery lines are believed to have become disconnected due to an over-pressurization of the lines caused by the exposure valve partially closing as the pneumatic pressure dropped that operates the valves open/.close mechanism. The following table lists the readings that were below the low alarm level:

Chamber	Time	Concentration	Alarm Limit	% of Target	% RSD
700 ppm F	10:21	6.8 ppm	560 ppm (L)	83	34
	10:46	246 ppm			
700 ppm M	10:23	9.8 ppm	560 ppm (L)	85	30
	10:48	429 ppm

STUDY: D4 2-Year Inhalation Study (N003441A)

REPORTING PERIOD: July 19,1999 – August 1, 1999

COMPILED BY: R. J. Weigel RJW (Task Leader) **DATE:** 08 / 16 / 99

REVIEWED BY: T. J. Mast TJMast (Study Director) **DATE:** 8/18/99

DATE	DISCUSSION OR EXPLANATION
07/22/99	Test chemical was detected in the 0 ppm F chamber at a concentration less than the Quantitation Limit (0.6 ppm) at 16:17. Several of the exposure chamber doors had been opened briefly just prior to the reading in order to collect animals for the toxicokinetic study.
07/23/99	Test chemical was detected at 15:27 in the 0 ppm F chamber and in the 0 ppm M chamber at 15:29 at a concentration less than the Quantitation Limit (0.6 ppm). Concentration in the 700 ppm F chamber (559 ppm at 15:10) exceeded the low alarm limit (560 ppm). Several of the exposure chamber doors had been opened briefly just prior to the readings in order to collect animals for the toxicokinetic study.

STUDY: D4 2-Year Inhalation Study (N003441A)

REPORTING PERIOD: August 16,1999 – August 29, 1999

COMPILED BY: R. J. Weigel (Task Leader) **DATE:** 08 / 30 / 99

REVIEWED BY: T. J. Mast (Study Director) **DATE:** 9/2/99

DATE	DISCUSSION OR EXPLANATION
08/16/99	Concentration in the 30 ppm F chamber (10.5 ppm at 10:11) exceeded the low alarm limit (24 ppm). The daily RSD for the chamber was 19%. During the buildup phase prior to expiration of T90, we noted that there was no reported concentration in the chamber. The pump for the 30 ppm F chamber was shut off for ~10 minutes while it was checked for leaks or airlocks. Some air was found in the pump lines and was removed. Pumping was resumed and concentration in the chamber reached the operating range ~28 minutes after expiration of T90. The cause of the air bubbles in the pump could not be determined.

STUDY: D4 2-Year Inhalation Study (N003441A)

REPORTING PERIOD: September 13, 1999 – September 26, 1999

COMPILED BY: R. J. Weigel RJW (Task Leader) **DATE:** 09/29/99

REVIEWED BY: T. J. Mast KMLee for TJM (Study Director) **DATE:** 10-4-99

DATE	DISCUSSION OR EXPLANATION
09/21/99	Concentration in the 150 ppm M chamber (183 ppm at 10:15) exceeded the high alarm limit (180 ppm). The cause of the high reading was a low chamber airflow (~12.5 CFM). The technicians had been calibrating the chamber flow orifices prior to the start of the exposure and had neglected to return the flow to the normal level of 15 CFM. The flow was adjusted immediately and the next concentration reading from the chamber at 10:20 was at 103% of the target level.

STUDY: D4 2-Year Inhalation Study (N003441A)

REPORTING PERIOD: September 27, 1999 – October 10, 1999

COMPILED BY: R. J. Weigel (Task Leader) **DATE:** 10 / 12 / 99

REVIEWED BY: T. J. Mast (Study Director) **DATE:** 10/12/99

DATE	DISCUSSION OR EXPLANATION
10/04/99	Concentration in the 10 ppm F chamber (7.6 ppm at 08:55; alarm limit: 8 ppm) and in the 30 ppm M chamber (23.0 ppm at 08:52; alarm limit: 24 ppm) exceeded their low alarm limits. The cause of the low readings was high chamber airflows caused by an increase in the vacuum level in the chamber exhaust system . A sensor line that is used to measure the chamber exhaust system's vacuum was disconnected during a maintenance process. The vacuum controller then responded by increasing the vacuum in the exhaust system to compensate. The sensor line was reconnected and chamber flows returned to normal ~12 minutes after the initial problem.
10/05/99	Concentration in the 30 ppm M chamber (0.6 ppm at 14:15) exceeded the low alarm limit (24 ppm). The cause of the low reading was an air lock in the chemical delivery pump that stopped the delivery of test chemical to the generator. The technicians purged the pump of air but could not check the effectiveness of the repair because the problem arose ~8 minutes before the completion of the exposure. The following morning, prior to the exposure start, the pump and delivery lines were checked and were observed to be bubble-free. There has been no reoccurrence of the problem as of 10/11/99.

STUDY: D4 2-Year Inhalation Study (N003441A)

REPORTING PERIOD: October 25, 1999 – November 7, 1999

COMPILED BY: R. J. Weigel (Task Leader) **DATE:** 11/10/99

REVIEWED BY: T. J. Mast for TJM (Study Director) **DATE:** 11-15-99

DATE	DISCUSSION OR EXPLANATION
11/01/99	In preparation for the recalibration of the GC, the standard generator was reloaded at ~13:30. This resulted in a drop in the generator output that increased during the remainder of the day until it reached a new equilibrium level at ~97% of the former target level. After the recalibration is completed, a new standard target will be assigned. The visual basic program that communicates with the GC (BEDAC) was upgraded prior to the exposure start. A memo was placed in the study file that describes the changes. Because of a change in the format of the way the concentration summary data is stored, it was necessary to separate the biweekly concentration summary report into two sets: October 25 to October 31, 1999 and November 1 to November 7, 1999.

STUDY: D4 2-Year Inhalation Study (N003441A)

REPORTING PERIOD: December 6, 1999 – December 19, 1999

COMPILED BY: R. J. Weigel (Task Leader) **DATE:** 12/30/99

REVIEWED BY: T. J. Mast (Study Director) **DATE:** 2/28/00

DATE	DISCUSSION OR EXPLANATION
12/07/99	Concentration from the standard generator dropped below 95% of target for several readings during the exposure day. Chemistry personnel serviced the standard generator after exposures were completed. A GC calibration was scheduled for the following exposure day.
12/08/99	Concentration from the standard generator dropped below 95% of target at the start of the exposure day. Subsequent standard generator readings were within the acceptable range. Chemistry personnel had serviced the standard generator the previous evening prior to a scheduled GC calibration to be conducted later in the exposure day. Subsequent analysis of the calibration samples showed that there was no change needed in the calibration factors but a correction was required for the standard target level. However, the update of the standard target in the exposure parameters was delayed while we investigated the source of a leak in the sample collection system for the 150 ppm female chamber. The leak had resulted in low grab sample concentrations for that chamber only. The leak was thought to be fixed and samples from that chamber were collected on 12/10/99 and again on 12/13/99. Analysis of these samples showed the leak was still present. On 12/14/99, the leak was eliminated by changing out all fittings in the sample system. Results demonstrated that the repair had been successful and the grab samples contained the expected concentration of test chemical. The leak did not affect the normal online concentration readings from the chamber as verified by taking readings from the chamber before and after the repair was made.
12/16/99	Concentration from the standard generator dropped below 95% of target for one reading during the exposure day. The updated standard target was assigned prior to exposures on the following day.

STUDY: D4 2-Year Inhalation Study (N003441A)

REPORTING PERIOD: December 20, 1999 – January 2, 2000

COMPILED BY: R. J. Weigel (Task Leader) **DATE:** 01 / 03 / 00

REVIEWED BY: T. J. Mast (Study Director) **DATE:** 3/28/00

DATE	DISCUSSION OR EXPLANATION
12/29/99	Concentration in the 150 ppm F chamber had critical high and low readings due to a problem with the chamber's generator. The generator temperature was operating below its normal setting which allowed chemical to accumulate on the generator wick instead of immediately vaporizing. Before the low temperature was noticed, the technicians reported a high reading when they increased the chamber airflow (it was at ~14 CFM instead of the target 15 CFM). Apparently, this increased the vaporization rate from the generator surface and thus, a high reading of 121% of target. When the low operating temperature was noted, the power was manually increased to the heater (it is normally regulated by an automatic temperature controller). The chemical pump was then turned off for ~5 minutes to dry the wick, then pumping was resumed. Chamber concentration then stabilized at ~101% after a low reading while the chamber concentration built up. The entire problem took approximately 1 hr to resolve. After exposure was completed, the heater circuit for the chamber was checked and the relay to the generator's heater was replaced. The following are the readings that exceeded the alarm limits:

Chamber	Time	Concentration	Alarm Limit	%RSD
150 ppm F	10:50	183 ppm	180 ppm (H)	13
150 ppm F	11:36	92 ppm	120 ppm (L)

STUDY: D4 2-Year Inhalation Study (N003441A)

REPORTING PERIOD: January 17, 2000 – January 30, 2000

COMPILED BY: R. J. Weigel (Task Leader) **DATE:** 01/31/00

REVIEWED BY: T. J. Mast (Study Director) **DATE:** 1/31/00

DATE	DISCUSSION OR EXPLANATION
01/28/00	Concentration in the 700 ppm F chamber (233 ppm at 14:06; alarm limit: 560 ppm; RSD was 19%) and in the 150 ppm F chamber (32.6 ppm at 14:14; alarm limit: 120 ppm; RSD was 22%) exceeded their low alarm limits. The low readings occurred within 9 minutes of the end of the exposure day and were the result of running out of chemical in one of the generator reservoirs dedicated to the female chambers. The technician realized the problem immediately and added additional chemical to the reservoir; however the exposure was completed before we could investigate whether the remaining female chambers also experienced a low concentration. Because the delivery rates for the remaining chamber are much lower, it is probable that there was sufficient chemical remaining in these chambers to complete the exposure day. The technician recalls that she had been called away just prior to the midday reservoir check and had forgotten to complete the check and refill the reservoir. We have adjusted the fill mark on the reservoir so that under normal operating conditions, there will be sufficient chemical to complete an exposure day if filled to the mark.

COMPILED BY: R. J. Weigel (Task Leader) **DATE:** 02 / 28 / 00

REVIEWED BY: T. J. Mast (Study Director) **DATE:** 2/28/00

DATE	DISCUSSION OR EXPLANATION
02/22/00	Concentration in the 30 ppm M chamber (23.9 ppm at 08:44) exceeded the low alarm limit (24 ppm). The cause of the low reading was an air lock in the chemical delivery pump that slowed the delivery of test chemical to the generator. The low reading was noticed during the buildup to target concentration prior to reaching T90. The technicians purged the pump of air and refilled the delivery line with chemical. These actions delayed the concentration buildup so that this first concentration reading after expiration of T90 did not reach the operating range.

REVIEWED BY: T. J. Mast TJM (Study Director) **DATE:** 5/23/00

05/12/00	At 14:44, 32 minutes after exposures were completed, a concentration of 0.1 ppm was detected in the exposure room. Animal care had been servicing the chambers
05/10/00 to 05/16/00	The standard generator diffusion tubes were reloaded with D4 chemical late in the day on 5/10/00 (the day before grab samples were collected for calibration of the on-line monitor). The tubes were overfilled, which resulted in high and unstable on-line standard readings. On 5/16/00, a small amount of D4 chemical was removed from each of the four generator diffusion tubes. This corrective action stabilized the standard generator reading at ~100% of the target value. Meanwhile, on 5/16/00 duplicate grab samples were collected and analyzed from a mid concentration exposure chamber to show that exposure concentrations had not changed during the time the standard generator had been unstable. The on-line monitor had shown that exposure concentrations remained at target through the entire time the standard generator was malfunctioning. Analysis of the two additional grab samples confirmed the values reported by the on-line monitor were correct.

REVIEWED BY: T. J. Mast (Study Director) **DATE:** 6/16/00

05/31/00 For the period 5/31/00 at 16:27 to 6/1/00 at 07:57, accurate chamber flow data was not collected for the 150 ppm F chamber. One of the pressure connections to the chamber inlet orifice that measures chamber airflow was disconnected while repairs were being made to equipment nearby. The Metasys program detected the flow and triggered the alarm. However, we were also having alarms due to a low temperature in the 30 ppm F chamber and the low flow alarm was acknowledged along with the temperature alarm. Once acknowledged, the alarm cannot be re-triggered unless the condition returns to normal first. To prevent this from occurring again, the alarm will be automatically reset every 30 minutes by the executive computer.

EXPOSURE OPERATION DISCUSSION SHEET

INCLUDES DISCUSSIONS AND/OR EXPLANATIONS OF PROBLEMS AFFECTING EXPOSURES. EXPLANATIONS ARE INCLUDED FOR DATA IN WHICH THERE WERE EXCURSIONS OF DAILY MEAN OR STANDARD DEVIATION BEYOND ALLOWABLE OPERATING LIMITS OR EXCURSIONS OF INDIVIDUAL DATUM BEYOND CRITICAL LIMITS. THESE EXCURSIONS HAD NO NEGATIVE IMPACT ON THE STUDY UNLESS OTHERWISE SPECIFIED.

STUDY: D4 2-Year Inhalation Study (N003441A)

REPORTING PERIOD: June 19, 2000 – July 2, 2000

COMPILED BY: R. J. Weigel (Task Leader) **DATE:** 08 / 11 / 00

REVIEWED BY: T. J. Mast (Study Director) **DATE:** 8/15/00

06/20/00	Four readings from the standard generator between 14:22 and 15:40 were above the non-critical alarm limit of 105% of target. At the time, we thought the standard generator had been bumped by the exposure technician while he was cleaning in the area. By the following morning, the standard was ~102% of target.
06//21/00 to 06/24/00	The standard generator output continued to run above the target setpoint with more instability than normal. Chemistry personnel were informed and made adjustments to the instrument. Then a recalibration was taken on 06/23/00, which resulted in a revised standard target being assigned before exposures on 6/26/00.
06/26/00	After the exposure was completed for the day, chemistry personnel worked on the standard generator. For approximately 75 minutes following the maintenance work, the online GC continuously sampled the standard generator until its output had stabilized. During this period, the output was unstable and outside of the target range.

REPORTING PERIOD: July 31, 2000 – August 13, 2000

COMPILED BY: R. J. Weigel (Task Leader) **DATE:** 08 / 15 / 00

REVIEWED BY: T. J. Mast (Study Director) **DATE:** 8/16/00

07/31/00	Critical low concentration was detected in the 30-ppm M chamber shortly after expiration of T_{90}. The low concentration was the apparent result of air bubbles in the chemical delivery line feeding the inlet wick vapor generator. During the approximately 45 minutes it took to prime the delivery line and remove the bubbles, two critical low concentrations were reported. At 09:15, a concentration of 15.0 ppm was reported, and at 09:45, the concentration was reported to be 22.0 ppm. No further problems were encountered for the remainder of the exposure period. Daily %RSD for this chamber was 16%.
08/10/00	Critical low concentrations were measured in the 700 ppm F chamber (499 ppm at 11:43; alarm limit: 560 ppm) and in the 700 ppm M chamber (552 ppm at 11:45; alarm limit: 560 ppm). The generators were turned off automatically for ~5 minutes, starting at 11:35. The cause was a drop in the chamber exhaust vacuum level that occurred when the building critical exhaust fan turned off after it sensed an over-current condition probably caused by nearby lightening. The backup critical exhaust fan came online and permission was then given to resume the exposure at ~11:40.

REVIEWED BY: T. J. Mast (Study Director) **DATE:** 10/13/00

09/25/00	Concentration in the 150 ppm F chamber (94.9 ppm at 9:17 and 114 ppm at 9:19) exceeded the critical low alarm limit (120 ppm). The daily RSD was 12%. These readings were at the start of the exposure (T90 was 09:14) and an air blockage in the pump may have temporarily blocked the delivery of chemical to the generator. The operator checked the delivery line and did not notice bubbles or other problems. No other actions were taken and the concentration was at target on the next round of data at 09:34.

REPORTING PERIOD: December 4, 2000 – December 17, 2000

COMPILED BY: R. J. Weigel (Task Leader) **DATE:** 12/18/00

REVIEWED BY: T. J. Mast (Study Director) **DATE:** 1/3/01

12/11/00 Concentration in the 30 ppm F chamber (22.7ppm at 8:52) exceeded the critical low alarm limit (24 ppm). The low reading was at the start of the exposure (T90 was 08:28). An air blockage in the pump may have temporarily blocked the delivery of chemical to the generator. The operator checked the delivery line and did not notice bubbles or other problems. No other actions were taken and the concentration was at target on the next round of data at 09:17. Since the problem of slowed delivery has occurred on a Monday twice in the last several weeks, the startup procedure has been modified so the pump is started several minutes earlier than normal on Monday mornings.

12/14/00 Due to technician errors, the online monitor was locked onto and continuously monitored the 700 ppm F chamber for 1 hour 43 minutes. The concentrations in the remaining chambers were not monitored for approximately 2 hrs 14 minutes, at which time all chamber concentrations were determined to be within 2% of their target concentrations.

REVIEWED BY: T. J. Mast TJM (Study Director) **DATE:** 2/19/01

12/18/00 Concentration in the 30 ppm M chamber (14.9 ppm at 9:05 and 20.6 ppm at 09:24) exceeded the critical low alarm limit (24 ppm). The RSD for the chamber was 16%. The low readings were at the start of the exposure (T90 was 08:42). The operator checked the delivery line and did not notice bubbles or other problems. No other actions were taken and the concentration was at target at 09:41 (duration of the problem was approximately 1 hr). The startup procedure had been modified so the pump was started several minutes earlier than normal on this Monday morning. Therefore, the following additional step will be taken on the first day after more than one day off. The chemical delivery lines for both 30 ppm chambers will be manually primed with test chemical prior to starting the delivery pumps. The pumps will then be operated for an extended duration prior to startup.

D4 Chronic [N003441A] Daily Environmental Data Summary
2/16/99

Comment by John Rossignol (02/17/99): High RH and low chamber air flow 21:59 to 22:59 due to chamber doors open due to bld. Power outage.
Comment by Richard Weigel (02/17/99): The power outage resulted in loss of chamber airflow as the exhaust fans were affected. The chamber doors were opened for approximately 30 minutes to insure that chamber temperatures and oxygen levels were maintained.

Report from 03-29-99 to 04-11-99

File	TagName	Date	Time	Value	Units	Alarm
D4 Chronic [N003441A] Daily Environmental Data Summary **3/29/99**						
Comment by Richard Weigel (03/30/99): At 10:10, additional air was directed over the outer surface of the 700 ppm M chamber to lower its temperature.						
85	700ppm M Tm.Value	3/29/99	09:19:00	78.3	Deg(F)	High
85	700ppm M Tm.Value	3/29/99	09:49:00	78.6	Deg(F)	High
D4 Chronic [N003441A] Daily Environmental Data Summary **3/30/99**						
Comment by Richard Weigel (04/01/99): Two actions were taken in response to the 150 ppm M high temperature alarm: at ~22:55, the room temperature was lowered ~1 deg F; at 23:05, the airflow was increased in the chamber for ~15 minutes.						
88	150ppm M Tm.Value	3/30/99	22:19:00	78.1	Deg(F)	High
88	150ppm M Tm.Value	3/30/99	22:49:00	78.2	Deg(F)	High
D4 Chronic [N003441A] Daily Environmental Data Summary **3/31/99**						
Comment by Richard Weigel (04/01/99): Exposure specialist responded to the alarm and adjusted the RH control valve to increase the ratio of dry to wet air entering the chamber.						
84	700ppm M RH.Value	3/31/99	04:19:00	70.8	% RH	High
D4 Chronic [N003441A] Daily Environmental Data Summary **4/2/99**						
Comment by John Rossignol (04/05/99): High temp at 20:49 (O ppm M chamber) the chamber air flow was adjusted up and the warm water to the chamber inlet heater was turned off.						
97	0ppm M Tm.Value	4/2/99	20:49:00	78.1	Deg(F)	High
D4 Chronic [N003441A] Daily Environmental Data Summary **4/8/99**						
Comment by Richard Weigel (04/09/99): All data between 5:19 and 12:15 were lost from the Metasys buffer file before they could be transferred to permanent storage. The system operator was resetting the buffer's clock and this action unexpectedly deleted the entire buffer file.

File	TagName	Date	Time	Value	Units	Alarm
D4 Chronic [N003441A] Daily Environmental Data Summary **4/14/99**						
Comment by John Rossignol (04/15/99): 700 ppm M chamber temperature adjusted by increasing the cooling air to the chamber while the exposure is online. Set up an automatic system that will turn on cool air to the top of the chamber when the exposure is online and off the cooling air when the exposure is off. This was the first day of setting the air flow.						
85	700ppm M Tm.Value	4/14/99	08:47:00	78.2	Deg(F)	High
85	700ppm M Tm.Value	4/14/99	09:17:00	78.7	Deg(F)	High
85	700ppm M Tm.Value	4/14/99	09:47:00	78.7	Deg(F)	High
D4 Chronic [N003441A] Daily Environmental Data Summary **4/15/99**						
Comment by Richard Weigel (04/16/99): Temperatures in the 30 ppm F chamber and 150 ppm F chambers were raised by increasing the flow of warm water through the radiator in the inlet assembly to the chambers.						
100	30ppm F Tm.Value	4/15/99	16:17:00	69.4	Deg(F)	Low
D4 Chronic [N003441A] Daily Environmental Data Summary **4/17/99**						
Comment by John Rossignol (04/19/99): Low chamber temperatures for the 10 ppm chambers. Raised the room temperature at 22:25. The room temperature adjustment perfomed previously due to the high temperature reading was too extreme.						
72	10ppm F Tm.Value	4/17/99	22:17:00	69.7	Deg(F)	Low
72	10ppm F Tm.Value	4/17/99	22:47:00	69.4	Deg(F)	Low
Comment by John Rossignol (04/19/99): High chamber temperatures for the 700 ppm chambers. Decreased the room temperature at 20:30.						
81	700ppm F Tm.Value	4/17/99	20:47:00	78.0	Deg(F)	High
D4 Chronic [N003441A] Daily Environmental Data Summary **4/18/99**						
Comment by John Rossignol (04/19/99): Low chamber temperatures for the 10 ppm chambers. Raised the room temperature setpoint at 11:30 on 4/18/99. On 4/19/99, increased the warm water flow to the chamber inlet heaters to further increase chamber temperature.						
72	10ppm F Tm.Value	4/18/99	07:47:00	69.9	Deg(F)	Low
94	10ppm M Tm.Value	4/18/99	07:47:00	69.8	Deg(F)	Low
D4 Chronic [N003441A] Daily Environmental Data Summary **4/19/99**						
Comment by Richard Weigel (04/20/99): Prior to the start of exposure, the vapor generators are preheated. This adds additional heat to the chambers, elevating their temperatures. The 700 PPM chambers require the highest generator temperatures to evaporate all delivered test chemical, therefore, their temperatures rise the most. On this day, the increased heat load from the generators resulted in the high readings. Auxiliary cooling air is turned on and directed over these chambers at exposure startup; however during the preheating time, the cooling air is not turned on. This cooling system is scheduled to be changed during the week of 4/26/99 so that the cooling air comes on with the generator heaters.						
81	700ppm F Tm.Value	4/19/99	08:47:00	78.8	Deg(F)	High
81	700ppm F Tm.Value	4/19/99	09:17:00	79.3	Deg(F)	High
85	700ppm M Tm.Value	4/19/99	08:47:00	78.6	Deg(F)	High
85	700ppm M Tm.Value	4/19/99	09:17:00	78.6	Deg(F)	High

D4 Chronic [N003441A] Daily Environmental Data Summary 4/20/99						
Comment by Richard Weigel (04/21/99): Prior to the start of exposure, the vapor generators are preheated. This adds additional heat to the chambers, elevating their temperatures. The 700 PPM chambers require the highest generator temperatures to evaporate all delivered test chemical, therefore, their temperatures rise the most. Due to a delayed exposure start, the generators were on longer than normal, causing the high temperatures due to the increased heat load. Auxiliary cooling air is turned on and directed over these chambers at exposure startup; however during the preheating time, the cooling air is not turned on. This cooling system is scheduled to be changed during the week of 4/26/99 so that the cooling air comes on with the generator heaters.						
81	700ppm F Tm.Value	4/20/99	09:17:00	79.3	Deg(F)	High
85	700ppm M Tm.Value	4/20/99	09:17:00	79.1	Deg(F)	High

D4 Chronic [N003441A] Daily Environmental Data Summary **6/30/99**						
Comment by Richard Weigel (07/02/99): High temperatures in 150 ppm M are the result of an over-adjustment of the hot water radiator valve used to raise chamber temperature at 08:04. The chamber temperature had been running at the low end of the range. A second adjustment was made at 10:26 to lower the temperature as the operator saw that the chamber temperature was rising too high.

File	TagName	Date	Time	Value	Units	Alarm
D4 Chronic [N003441A] Daily Environmental Data Summary **7/19/99**						
Comment by Richard Weigel (07/22/99): The low temperature readings occurred in the hour after chamber doors were closed following animal care. In addition, a researcher increased the exposure room temperature and also increased the warm water flowrate through the inlet radiator of the 150 ppm F chamber in order to raise that chamber's temperature.						
78	150ppm F Tm.Value	7/19/99	16:40:00	68.9	Deg(F)	Low
78	150ppm F Tm.Value	7/19/99	17:10:00	70.0	Deg(F)	Low
D4 Chronic [N003441A] Daily Environmental Data Summary **7/25/99**						
Comment by Richard Weigel (08/10/99): High relative humidity in 150 ppm F chamber continued to decline throughout the morning following completion of ARC activities. No direct action was taken.						
77	150ppm F RH.Value	7/25/99	10:40:00	77.4	% RH	High
77	150ppm F RH.Value	7/25/99	11:10:00	72.6	% RH	High
D4 Chronic [N003441A] Daily Environmental Data Summary **7/27/99**						
Comment by Richard Weigel (08/10/99): A scheduled building maintenance procedure required that certain building airflows be reduced by ~50%, including the D4 exposure room. Chamber airflows were not affected. The drop in room airflow caused the room temperature to rise, which affected chamber temperatures, leading to the high temperature in the 10 ppm F chamber. Personnel were present to respond but airflows returned to normal soon after the high temperature.						
72	10ppm F Tm.Value	7/27/99	20:10:00	78.7	Deg(F)	High

D4 Chronic [N003441A] Daily Environmental Data Summary
8/17/99

Comment by Richard Weigel (08/18/99): In order to do maintenance work on the building's emergency power system, one of the exhaust fans was shut down temporarily. This resulted in a brief drop in chamber airflows below the operating range until the exhaust dampers could be manually adjusted to compensate for the change. The control chambers' airflows were not affected because they are controlled by an independent exhaust system unaffected by the shutdown.

D4 Chronic [N003441A] Daily Environmental Data Summary
9/28/99

Comment by Richard Weigel (09/30/99): The high airflows in the chambers between 21:10 and 22:10 occurred when the backup exhaust fan turned on without a know cause while the main exhaust fan remained on. The on/off status of the fans and the positioning of flow dampers that maintain the correct vacuum in the exhaust system are controlled by a computerized system. When the engineers responded to the alarm, they found the control computer in an incorrect state. The computer was reset and all systems returned to the normal operating level. The control computer is being replaced by the facility Metasys system later this year as it is not Y2K compliant.

D4 Chronic [N003441A] Daily Environmental Data Summary
11/8/99

Comment by Richard Weigel (11/10/99): The 700 ppm M chamber temperature exceeded the high alarm limit during the time between the completion of animal care activities and the start of the exposure. During this time the generator was being preheated, adding heat to the chamber environment, but the auxiliary blower was not active until the exposure actually began. The room temperature was lowered 1Deg(F) and additional room air was directed over the chamber to assist in cooling it.

85	700ppm M Tm.Value	11/8/99	09:10:00	79.0	Deg(F)	High
85	700ppm M Tm.Value	11/8/99	09:40:00	79.1	Deg(F)	High

D4 Chronic [N003441A] Daily Environmental Data Summary
11/15/99

Comment by Richard Weigel (11/17/99): There was an unexpected delay in the start of the exposure while equipment was being replaced. At the start of the delay, the generator heaters were already on and being warmed. This added an additional heat load to the chamber that caused the high temperature reading. The generator heaters were then turned off until the repair was completed. Normally, during an exposure, the added heat from the generator is relieved by two agents: evaporative cooling as the test chemical is vaporized and the activation of a compressed air blower that increases the air movement over the outer surface of the chamber. The air blower was activated with the commencement of the exposure. We are now changing the activation signal to the time when the generator heaters are turned on.

81	700ppm F Tm.Value	11/15/99	08:40:00	78.2	Deg(F)	High

Comment by Richard Weigel (11/17/99): Chamber airflow was increased in order to speed the reduction in chamber temperature caused by the generator heater. This was done prior to the start of the exposure and chamber flow was lowered prior to the exposure start.

82	700ppm F FL.Value	11/15/99	08:40:00	18.9	CFM	High

D4 Chronic [N003441A] Daily Environmental Data Summary
11/18/99

Comment by Richard Weigel (11/22/99): The technician noted the high chamber temperature and reduced the warm water flow through the chamber inlet radiator. Also, with the completion of the exposure at this time, the heat load to the chamber was reduced.

81	700ppm F Tm.Value	11/18/99	14:40:00	78.2	Deg(F)	High

Comment by Richard Weigel (11/22/99): I responded to the low temperature alarm and noted that the temperature was climbing and was within the normal operating limits. No adjustments were made.

D4 Chronic [N003441A] Daily Environmental Data Summary
1/26/00

Comment by Richard Weigel (01/28/00): The operator responded to the high temperature alarm by adjusting the warm water flow to the chamber inlet radiator. This had an immediate affect on the chamber temperature; the next reading was 76.8 Deg(F). However, the chamber temperature then began climbing again, resulting in the second temperature alarm. The operator made a second adjustment to the water flow. This time the temperature stayed in the range of 73 to 75 Deg(F).

78	150ppm F Tm.Value	1/26/00	09:00:00	78.1	Deg(F)	High
78	150ppm F Tm.Value	1/26/00	11:00:00	78.1	Deg(F)	High

D4 Chronic [N003441A] Daily Environmental Data Summary
1/28/00

Comment by Richard Weigel (01/31/00): High temperature reading occurred in the 700 ppm M chamber when the generator heater, in the inlet airstream to the chamber, raised the chamber temperature. During the prestart period. the heater is on but the chemical delivery is waiting for the start of exposure. During the exposure period, the generator heater's heat load is compensated by two factor: the evaporation of the test chemical and the operation of a blower that moves additional air over the outside surface of the chamber. The blower is active during the exposure period. These mitigating factors are not present to the prestart heating period. The activation of the blower is being changed so that it will be on whenever the generator heater is on. For this occasion, the technicians also entered the exposure room and lowered the warm water flow through the inlet radiator.

D4 Chronic [N003441A] Daily Environmental Data Summary **5/9/00**						
Comment by Richard Weigel (05/10/00): In order to fix a broken steam fitting, the building's steam supply was shut off for approximately two hours. This left Rm 323 without temperature control. To compensate, the building's supply air temperature was raised 6 to 9 degrees F. The low room temperature was a result of this outage. Temperature in the room returned to normal levels rapidly after the outage.						
54	Rm323 Temp.Value	5/9/00	17:57:00	69.8	Deg(F)	Low
54	Rm323 Temp.Value	5/9/00	18:27:00	69.8	Deg(F)	Low
D4 Chronic [N003441A] Daily Environmental Data Summary **5/11/00**						
Comment by Bill Forsythe (05/12/00): High RH in room 323 due to floor washdown after morning ARC activity. No adjustments made.						
53	Rm323 RH.Value	5/11/00	07:27:00	78.9	%RH	High
D4 Chronic [N003441A] Daily Environmental Data Summary **5/15/00**						
Comment by Richard Weigel (05/16/00): The operator had lowered the flow of warm water through the 150 ppm F chamber's inlet radiator at ~13:00 in order to lower the chamber temperature to the middle of the operating range. The adjustment was too extreme and resulted in the low alarm reading reported at 18:07. The warm water flow was then raised and subsequent chamber temperatures were in the operating range.						
78	150ppm F Tm.Value	5/15/00	17:57:00	69.9	Deg(F)	Low
D4 Chronic [N003441A] Daily Environmental Data Summary **5/18/00**						
Comment by Bill Forsythe (05/19/00): Low temperatures between 16:27 and 17:57 in 150ppm F were due to a temperature adjustment made earlier to correct for high temperatures in 30ppm M and 30ppm F chambers. This problem was corrected by diverting the cooling airflow over the chamber. The temperature returned within normal operating range.						
Comment by Bill Forsythe (05/19/00): Correction to time previously indicated is 16:57 not 16:27 as entered.						
78	150ppm F Tm.Value	5/18/00	16:57:00	68.1	Deg(F)	Low
78	150ppm F Tm.Value	5/18/00	17:27:00	69.0	Deg(F)	Low
78	150ppm F Tm.Value	5/18/00	17:57:00	69.9	Deg(F)	Low
Comment by Bill Forsythe (05/19/00): High temperatures in 30ppm M chamber between times 10:27 and 15:27 acknowledged. Technician made temperature adjustment at time 13:45. No alarm response was indicated for this high temperature. This alarm response is being checked out. The room temperature adjustment just after 15:30 brought the temperature within normal operating range.						
91	30ppm M Tm.Value	5/18/00	10:27:00	78.3	Deg(F)	High
91	30ppm M Tm.Value	5/18/00	10:57:00	78.1	Deg(F)	High

Comment by John Rossignol (05/22/00): Adjusted room temp up to increase chamber temp up.						
81	700ppm F Tm.Value	5/19/00	16:57:00	68.7	Deg(F)	Low
Comment by John Rossignol (05/22/00): Adjusted room temp up to increase chamber temp.						
100	30ppm F Tm.Value	5/19/00	16:57:00	68.3	Deg(F)	Low

General Comment by Richard J Weigel (5/23/00): There were several days when temperature control was difficult and resulted in readings outside of the operating limits. Many of the problems are occurring when chamber temperatures drop after afternoon animal care. The operators then respond to the low levels by increasing chamber or room temperatures. Then later, temperatures shift upward and there are high temperature problems. We are looking at methods to reduce the temperature swings.

D4 Chronic [N003441A] Daily Environmental Data Summary **7/26/00**						
Comment by John Rossignol (07/27/00): Reading taken at the time arc was washing the floor.						
53	Rm323 RH.Value	7/26/00	08:27:00	76.7	%RH	High
D4 Chronic [N003441A] Daily Environmental Data Summary **7/28/00**						
Comment by Richard Weigel (08/11/00): Exposure chambers for the females were changed out in the morning. The high RH and low temperature in the 150 ppm female chamber was attributed to the state of the chamber before it was brought into the exposure room. With no adjustments, the RH dropped in the chamber to a minimum of 58% at 14:27. Temperature in the chamber increased only to a maximum of 71.0 deg(F) by 13:57; therefore, an adjustment was made to the inlet radiator at 13:45 to raise the temperature.						
Comment by Richard Weigel (04/25/01): The above comment is revised to remove the discussion of an adjustment to the inlet radiator. There is no documentation to support this statement.						
77	150ppm F RH.Value	7/28/00	08:27:00	92.7	% RH	High
77	150ppm F RH.Value	7/28/00	08:57:00	87.4	% RH	High
77	150ppm F RH.Value	7/28/00	09:27:00	78.2	% RH	High
77	150ppm F RH.Value	7/28/00	09:57:00	72.4	% RH	High
Comment by Richard Weigel (08/11/00): Exposure chambers for the females were changed out in the morning. The high RH and low temperature in the 150 ppm female chamber was attributed to the state of the chamber before it was brought into the exposure room. With no adjustments, the RH dropped in the chamber to a minimum of 58% at 14:27. Temperature in the chamber increased only to a maximum of 71.0 deg(F) by 13:57; therefore, an adjustment was made to the inlet radiator at 13:45 to raise the temperature.

D4 Chronic [N003441A] Daily Environmental Data Summary
8/18/00

Comment by John Rossignol (08/21/00): Cleaned chambers were brought in before the exposure, leading to the high RH reading at 8:27 and 8:57. No action was taken because relative humidity readings were returning to operating range.

77	150ppm F RH.Value	8/18/00	08:27:00	83.5	% RH	High
77	150ppm F RH.Value	8/18/00	08:57:00	75.9	% RH	High

Comment by Richard Weigel (10/19/01): Temperature and relative humidity data after 04:57 until the following day at 0:27 for Rm 323 lost during processing. This problem was not noted until data was reviewed after completion of the study.

D4 Chronic [N003441A] Daily Environmental Data Summary
8/25/00

Comment by Richard Weigel (08/28/00): Temperature in the 0 ppm F chamber dropped below the alarm limit after animal care changed out chambers in the morning. The exposure technicians acknowledged the initial alarm at 8:57 but, because there were several low flow alarms that occurred when chamber doors were open during animal care activities, he did not notice that one of these alarms was low temperature. Subsequent low temperature readings from the chamber did not sound an audible alarm because the initial low alarm reading had been acknowledged. The problem was noted at ~1330 and the flow of hot water through the chamber inlet assembly was increased to raise the chamber temperature. To insure a more timely response in situations like this, there is now a check sheet that must be initialed hourly during the work day by a technician stating that a review of the current environmental data has been conducted.

File	TagName	Date	Time	Value	Units	Alarm
D4 Chronic [N003441A] Daily Environmental Data Summary **9/29/00**						
Comment by Richard Weigel (10/05/00): Chambers had been changed out during morning ARC activities and had not equilibrated at this time. Subsequent readings were acceptable.						
77	150ppm F RH.Value	9/29/00	08:27:00	73.2	% RH	High
D4 Chronic [N003441A] Daily Environmental Data Summary **10/5/00**						
Comment by Richard Weigel (10/06/00): During the morning, temperature in the 30 ppm M chamber had been at the high end of the acceptable operating range. The technicians made several adjustments to lower the chamber temperature. The adjustments were too extreme and caused the low chamber temperatures. Further adjustments were then made to raise the chamber temperature. After these adjustments, temperature returned to the middle of the operating range.						
91	30ppm M Tm.Value	10/5/00	15:27:00	69.0	Deg(F)	Low
91	30ppm M Tm.Value	10/5/00	15:57:00	69.2	Deg(F)	Low
91	30ppm M Tm.Value	10/5/00	16:27:00	69.9	Deg(F)	Low

Comment by Greg Hayden (11/27/00): Room 523 RH high due to washing of floor. No action taken.						
53	Rm323 RH.Value	11/26/00	06:57:00	77.3	%RH	High
D4 Chronic [N003441A] Daily Environmental Data Summary 11/27/00						
Comment by Greg Hayden (11/28/00): RH noted high. ARC washing floor at this time.						
53	Rm323 RH.Value	11/27/00	13:57:00	80.2	%RH	High
Comment by Richard Weigel (11/29/00): Cool room intake air was inadvertently directed at the room temperature sensor. The temperature control system responded by raising the room's temperature, which led to the rise in chamber temperature. When the air stream was directed away from the sensor, the room and chamber temperatures returned to normal levels.						
69	0ppm F Tm.Value	11/27/00	09:27:00	78.2	Deg(F)	High

File	TagName	Date	Time	Value	Units	Alarm
D4 Chronic [N003441A] Daily Environmental Data Summary 11/29/00						
Comment by Greg Hayden (11/30/00): Room 323 RH high noted. ARC washing down floor at this time.						
53	Rm323 RH.Value	11/29/00	07:57:00	71.0	%RH	High
D4 Chronic [N003441A] Daily Environmental Data Summary 11/30/00						
Comment by Richard Weigel (12/04/00): Rm 323 high RH reading noted. ARC washing down floor at this time.						
53	Rm323 RH.Value	11/30/00	07:27:00	81.4	%RH	High
Comment by Richard Weigel (12/04/00): Two events led to the high temperature readings. During the morning, the warm water flow through the radiator was increased to raise the chamber temperature, which had been lower than optimum during the previous night. Then, the solenoid valve that controls the compressed air used to provide cooling air over the chamber to counteract the heat produced during the exposure failed and needed to be replaced. When this repair was completed, the chamber temperature returned to the target level.						
85	700ppm M Tm.Value	11/30/00	13:57:00	78.8	Deg(F)	High
85	700ppm M Tm.Value	11/30/00	14:27:00	79.0	Deg(F)	High
D4 Chronic [N003441A] Daily Environmental Data Summary 12/1/00						
Comment by Greg Hayden (12/04/00): Room 323 RH value noted high. ARC washing floor at this time. Room humidifier fan speed reduced to low.						
53	Rm323 RH.Value	12/1/00	11:27:00	75.0	%RH	High

The term "Less Than" is used to signify the lower limit of quantitation of the procedure under the conditions employed. The use of the term "Less Than" does not imply that traces of Analyte were present. Samples submitted to Ralston Analytical Laboratories for routine analysis will be retained for a minimum of thirty (30) days after the report of analysis is issued. Extended storage requirements must be brought to the attention of Ralston Analytical Laboratories prior to or at the time of sample submission.

The term "Less Than" is used to signify the lower limit of quantitation of the procedure under the conditions employed. The use of the term "Less Than" does not imply that traces of Analyte were present. Samples submitted to Ralston Analytical Laboratories for routine analysis will be retained for a minimum of thirty (30) days after the report of analysis is issued. Extended storage requirements must be brought to the attention of Ralston Analytical Laboratories prior to or at the time of sample submission.

Battelle Toxicology Northwest Facilities Monitoring: WATER ANALYSIS

LAB NO. D-14

Building: LSL2
Room: 308
Study: D4 Chronic (N003441A)

Date collected: 03/01/00

Status: Recovery rats were moved from the exposure room (Room 424) to their designated holding room (Room 323) on Friday January 21, 2000. Following this, it was discovered that Room 323 was still being supplied with fresh softened water rather than fresh tap water. The water supply was changed to fresh tap water on 02/25/2000. Both supplies originate from the same City of Richland water line supplying LSL-II. However, the softened water passes through a salt type ion exchange water softener for removal of Ca++ and Mg++ that are replaced with Na+.

In order to demonstrate that the softened water did not contain contaminants that might impact the study, a sample of softened water was submitted for analysis. The analysis was done by an off site laboratory that provided bottles for water collection. We did not wait for the bottles before switching over the water supply in Room 323. Therefore, it was necessary to collect the sample from another room (Room 308). Room 308 is used as a laundry room but is on the same corridor as Room 323 and its supply of soft water is from the same pipe that had supplied Room 323.

Sampling site: Collected from the soft water line in Room 308 into bottles provided by Lancaster Laboratories.

Results: Attached are the analytical results from Lancaster laboratories.

Summary: The sodium content of the softened water from Room 308 was found to be 34.7 mg/L. Calcium was at < 0.20 mg/L and magnesium was at < 0.10 mg/L. For comparison, LSL-II animal drinking water (unsoftened) collected on 02/22/2000 from Room 436 contained 21.0 mg/L calcium and 4.96 mg/L magnesium. The sodium content of this water was 2.32 mg/L.

COMMENT

Male chambers and cages were last washed four days prior to sampling; female, three days. The water culture findings indicate very good sanitary maintenance of the water lines.

COMMENT

The mainline water culture indicates good sanitary maintence of the water lines. Male chambers and cages were last washed four days prior to sampling; female, five days. Pseudomonas is a common intestinal tract resident in the rat and generally causes no clinical illness. These animals were from a production room (Charles River) that has had a background positive for pseudomonas. The water culture findings indicate very good sanitary maintenance of these water lines.
