Subject: Third U.S. Climate Action Report

Mr. Harvey:

I offer the following disconcerting observation regarding Greenhouse Gases.

When preparing the inventory of Greenhouse Gases for the captioned report, the U.S. must acknowledge the fact methane is the most efficient greenhouse gas. The primary source of methane is wetlands, because true wetlands are anaerobic. In spite of this fact, we continue to replace or build new wetlands. If we are serious about reducing greenhouse gases, we can not encourage generation of methane from wetlands. It appear we have an anomaly in our reasoning.

Regards

George
