General Comment

It's unclear what the long-term impact of this well may be -- effects on groundwater and property values of nearby places. The EPA should study the issue further before granting a permit. (ADM has a similar well on its site near Decatur. Its pipes corroded and leaked after only a few years of operation.) Has any testing been done to determine the extent of damage or ill effects due to leaking?

Also, the proposed permit would only require monitoring the site for 12 years after they've injected the CO2. Wouldn't it be reasonable to continue monitoring for as long as the site is in use?
