

GOV. MSG. NO. 743

EXECUTIVE CHAMBERS

HONOLULU

LINDA LINGLE GOVERNOR

June 16, 2009

The Honorable Colleen Hanabusa, President and Members of the Senate Twenty-Fifth State Legislature State Capitol, Room 409 Honolulu, Hawaii 96813

Dear Madam President and Members of the Senate:

This is to inform you that on June 16, 2009, the following bill was signed into law:

SB1008 SD1 HD2

A BILL FOR AN ACT RELATING TO WATER QUALITY STANDARDS. ACT 126 (09)

Sincerely,

LINDA LINGLE

Approved by the Governor on _____JUN 1 6 2009

THE SENATE TWENTY-FIFTH LEGISLATURE, 2009 STATE OF HAWAII ACT 126 S.B. NO. 5.D. 1 H.D. 2

A BILL FOR AN ACT

RELATING TO WATER QUALITY STANDARDS.

BE IT ENACTED BY THE LEGISLATURE OF THE STATE OF HAWAII:

- 1 SECTION 1. The purpose of this Act is to revise certain
- 2 state water quality standards for inland and marine waters on an
- 3 interim basis to conform to levels recommended by the State and
- 4 the United States Environmental Protection Agency, until the
- 5 state department of health proposes, and the United States
- 6 Environmental Protection Agency approves, standards for the
- 7 pollutants and indicator organism identified in this Act,
- 8 pursuant to the review of state water quality standards mandated
- 9 under Section 303(c) of the Federal Water Pollution Control Act
- 10 of 1972, as amended. The legislature finds that these revisions
- 11 are important to the economic and social development of the
- 12 State and that these revised standards are adequate to fully
- 13 protect the designated and existing uses of the State's inland
- 14 and marine waters.
- 15 SECTION 2. (a) In accordance with Section 303(c) of the
- 16 Federal Water Pollution Control Act of 1972, as amended, the
- 17 water quality criteria in the 2006 United States Environmental
- 18 Protection Agency National Recommended Water Quality Criteria, SB1008 HD2 HMS 2009-3705

S.B. NO. 5.D. 1 H.D. 2

| | | | | | | | | |

- 2 Priority Toxic Pollutants and Non-Priority Pollutants for the
- 3 protection of aquatic life in surface water (acute and chronic
- 4 effects in fresh water and salt water), and for the protection
- 5 of human health for consumption (organism only), are hereby
- 6 adopted by the State as water quality standards and apply to all
- 7 state inland and marine waters, except for:
- 8 (1) The 2006 National Recommended Water Quality Criteria
- for arsenic, cadmium, chromium, chromium III, chromium
- 10 VI, copper, lead, mercury, nickel, selenium, silver,
- and zinc; and
- 12 (2) The 2006 National Recommended Water Quality Criteria
- for non-priority pollutants not currently listed in
- chapter 11-54, Hawaii Administrative Rules.
- 15 (b) When there is no nationally recommended criterion
- 16 promulgated for a Priority or Non-Priority Pollutant, relevant
- 17 provisions in chapter 11-54, Hawaii Administrative Rules,
- 18 relating to that pollutant shall not be repealed by virtue of,
- 19 or deemed as being inconsistent with, this Act and shall remain
- 20 in effect.
- 21 (c) The following table of numeric standards for toxic
- 22 pollutants applicable to all waters fully incorporates the water

- ${f 1}$ quality standards adopted by the State pursuant to subsections
- 2 (a) and (b) and the relevant provisions of chapter 11-54, Hawaii
- 3 Administrative Rules, that are not repealed or not deemed
- 4 inconsistent with this Act and shall remain in effect. The
- 5 freshwater standards shall apply where the dissolved inorganic
- $\mathbf{6}$ ion concentration is less than 0.5 parts per thousand and the
- 7 saltwater standards shall apply above 0.5 parts per thousand.
- 8 Values for metals refer to the dissolved fraction. All values
- 9 are expressed in micrograms per liter.

Numerical Standards for Toxic Pollutants Applicable to All Naters (A)

- * The Value listed is the minimum standard. Depending upon the receiving water CaCO3 hardness, higher standards may be calculated using the respective formula in the USEPA publication Quality Criteria for Water (EPA 44/5-86-001, Revised May 1, 1987)
- 8 This criterion has been revised to reflect The Environmental Protection Agency's ql* or RfD, as contained in the Integrated Risk Information System (IRIS) as of May 17, 2002. The fish tissue bioconcentration factor (BCF) from the 1980 Ambient Water Quality Criteria document was retained in each case.
- C This criterion is based on carcinogenicity of 10° risk. Alternate risk levels may be obtained by moving the decimal point (e.g., for a risk level of 10°, move the decimal point in the recommended criterion one place to the right).
- D Freshwater and saltwater criteria for metals are expressed in terms of the dissolved metal in the water column. The recommended water quality criteria value was calculated by using the previous 304(a) aquatic life criteria expressed in terms of total recoverable metal, and multiplying it by a conversion factor (CF). The term "Conversion Factor" (CF) represents the recommended conversion factor for converting a metal criterion expressed as the total recoverable fraction in the water column to a criterion expressed as the dissolved fraction in the water column. (Conversion Factors for saltwater CCCs are not currently available. Conversion factors derived for saltwater CMCs have been used for both saltwater CMCs and CCCs). See "Office of Water Policy and Technical Guidance on Interpretation and Implementation of Aquatic Life Metals Criteria" October 1, 1993, by Martha G. Prothro, Acting Assistant Administrator for Water, available from the Water Resource Center and 40CFRS11.36(b) (1). Conversion Factors applied in the table can be found in Appendix A to the Preamble- Conversion Factors for Dissolved Metals.
- P Freshwater aquatic life values for pentachiorophenol are expressed as a function of pH, and are calculated as follows: CMC = exp(1.005(pH)-4.869); CCC = exp(1.005(pH)-5.134). Values displayed in table correspond to a pH of 7.8.
- G This Criterion is based on 304(a) aquatic life criterion issued in 1980, and was issued in one of the following documents:
 Aldrin/Dieldrin (EPA 440/5-80-019), Chlordane EPA 440/5-80-027), DDT (EPA 440/5-80-038), Endosulfan (EPA 440/5-80-046), Endrin (EPA
 440/5-80-047), Heptachlor (EPA 440/5-80-052), Hexachlorocyclohexane (EPA 440/5-80-054), Silver (EPA 440/5-80-071), The Minimum Data
 Requirements and derivation procedures were different in the 1980 Guidelines than in the 1985 Guidelines. For example, a "CMC"
 derived using the 1980 Guidelines was derived to be used as an instantaneous maximum. If assessment is to be done using an
 averaging period, the values given should be divided by 2 to obtain a value that is more comparable to a CMC derived using the 1985
- M No criterion for protection of human health from consumption of aquatic organisms excluding water was presented in the 1980 criteria document or in the 1986 Quality Criteria for Water. Nevertheless, sufficient information was presented in the 1980 document to allow the calculation of a criterion, even though the results of such a calculation were not shown in the document.
- J This fish tissue residue criterion for methylmercury is based on a total fish consumption rate of 0.0175 kg/day
- R This recommended criterion is based on a 304(a) aquatic life criterion that was issued in the 1995 Updates: Water Quality Criteria Documents for the Protection of Aquatic Life in Ambient Water, (EPA-820-B-96-001, September 1996). This value was derived using the GLI Guidelines (SOFRIS193-15399, March 23, 1995; 40CFRI32 Appendix A); the difference between the 1985 Guidelines and the GLI Guidelines are explained on page iv of the 1995 Updates. None of the decisions concerning the derivation of this criterion were affected by any considerations that are specific to the Great Lakes.
- N This criterion applies to total pobs. (e.g., the sum of all congener or all isomer or homolog or Aroclor analyses.)
- O The derivation of the CCC for this pollutant (Endrin) did not consider exposure through the diet, which is probably important for aquatic life occupying upper trophic levels.
- P Although a new RfD is available in IRIS, the surface water criteria will not be revised until the National Primary Drinking Water Regulations: Stage 2 Disinfectants and Disinfection Byproducts Rule (Stage 2 DBPR) is completed, since public comment on the relative source contribution (RSC) for chloroform is anticipated.
- Q This recommended water quality criterion is expressed as g free cyanide (as CN)/L.
- U The organoleptic effect criterion is more stringent than the value for priority toxic pollutants.

Office of Science and Technology, 2006, National Recommended Water Quality Criteria, U.S. Environmental Protection Agency, Office of Water (4304T).

T This value was derived from data for endosulfan and is most appropriately applied to the sum of alpha-endosulfan and betaendosulfan

as This criterion is based on a 304(a) aquatic life criterion issued in 1980 or 1986, and was issued in one of the following documents: Aldrin/Dieldrin (EPA 440/5-80-019), Chlordane (EPA 440/5-80-027), DDT (EPA 440/5-80-036), Endrin (EPA 440/5-80-047), Heptachlor (EPA 440/5-80-052), Polychlorinated biphenyls (EPA 440/5-80-068), Toxaphene (EPA 440/5-80-006). This CCC is currently based on the Final Residue Value (FRV) procedure. Since the publication of the Great Lakes Apparic Life Criteris Guidelines in 1995 (60FR15393-15399, March 23, 1995), the Agency no longer uses the Final Residue Value procedure for deriving CCCs for new or revised 304(a) aquatic life criteria. Therefore, the Agency anticipates that future revisions of this CCC will not be based on the FRV procedure.

bb This water quality criterion is based on a 304(a) squatic life criterion that was derived using the 1965 Guidelines for Deriving Numerical National Water Quality Criteria for the Protection of Aquatic Organisms and Their Uses, P885-227049, January 1985) and was issued in one of the following criteria documents: Arsenic (EPA 440/5-84-033), Cadmium (EPA-822-R-01-001), Chromium (EPA 440/5-84-029), Copper(EPA 440/5-84-031), Cyanide(EPA 440/5-84-028), Lead (EPA 440/5-027), Nickel (EPA 440/5-86-004), Pentachlorophenol (EPA 440/5-86-009), Toxaphene, (EPA 440/5-86-006), Zinc (EPA 440/5-87-003).

mee This recommended water quality criterion was derived on page 43 of the mercury criteria document (EPA 440/5-84-026, January 1985). The saltwater CCC of 0.025 ug/L given on page 23 of the criteria document is based on the Final Residue Value procedure in the 1985 Guidelines. Since the publication of the Great Lakes Aquatic Life Criteria Guidelines in 1995 (60FR15393-15399, March 23, 1995), the Agency no longer uses the Final Residue Value procedure for deriving CCCs for new or revised 304(a) aquatic life criteria.

hh This recommended water quality criterion was derived from data for inorganic mercury (II), but is applied here to total mercury. If a substantial portion of the mercury in the water column is methylmercury, this criterion will probably be under protective. In addition, even though inorganic mercury is converted to methylmercury and methylmercury bioaccumulates to a great extent, this criterion does not account for uptake via the food chain because sufficient data were not available when the criterion was derived.

jj This recommended water quality criterion is expressed as total cyanide, even though the IRIS RPD we used to derive the criterion is based on free cyanide. The multiple forms of cyanide that are present in ambient water have significant differences in toxicity due to their differing abilities to liberate the CN-moiety. Some complex cyanides require even more extreme conditions than refluxing with sulturic acid to liberate the CN-moiety. Thus, these complex cyanides are expected to have little or no 'bioavailability' to humans. If a substantial fraction of the cyanide present in a water body is present in a complexed form (e.g., Pe₄[Pe(CN)₄]₃), this criterion may be over conservative.

PROTNOTES

Numerical Standards for Toxic Pollutants Applicable to All Waters [8]

A This human health criterion is the same as originally published in the Red Book which predates the 1980 methodology and did not utilize the fish ingestion BCF approach. This same criterion value is now published in the Gold Book.

E This criterion has been revised to reflect EPA's qi' or RID, as contained in the Integrated Risk Information System (IRIS) as of May 17, 2002. The fish tissue bioconcentration factor (BCF) used to derive the original criterion was retained in each case.

F The derivation of this value is presented in the Red Book (EPA 440/9-76-023, July, 1976).

G This value is based on a 304(a) aquatic life criterion that was derived using the 1985 Guidelines (Guidelines for Deriving Numerical National Water Quality Criteria for the Protection of Aquatic Organisms and Their Uses, PB85-227049, January 1985) and was issued in one of the following criteria documents: Aluminum (EPA 440/5-86-008); Chloride (EPA 440/5-88-001); Chloropyrifos (EPA 440/5-86-005). (EPA 440/5-86-005).

- H This criterion is based on carcinogenicity of 10⁻⁶ risk. Alternate risk levels may be obtained by moving the decimal point (e.g., for a risk level of 10⁻⁵, move the decimal point in the recommended criterion one place to the right). I This value for aluminum is expressed in terms of total recoverable metal in the water column.

 J This value is based on a 304(a) aquatic life criterion that was issued in the 1995 Updates: Water Quality Criteria Documents for the Protection of Aquatic Life in Ambient Water (EPA-820-B-96-001). This value was derived using the GLI Guidelines (60FRIS39)-15399, March 23, 1995; 40CFRI32 Appendix A); the differences between the 1985 Guidelines and the GLI Guidelines are explained on page iv of the 1995 Updates. No decision concerning this criterion was affected by any considerations that are specific to the Great Lakes.
- L There are three major reasons why the use of Water-Effect Ratios might be appropriate.
- 1. The value of 87 µg/l is based on a toxicity test with the striped bass in water with pH = 6.5-6.6 and hardness <10 mg/L. Data in "Aluminum Water-Effect Ratio for the 3M Plant Effluent Discharge, Middleway, West Virginia" (May 1994) indicate that aluminum is substantially less toxic at higher pH and hardness, but the effects of pH and hardness are not well quantified at this time.

 2. In tests with the brook trout at low pH and hardness, effects increased with increasing concentrations of total aluminum even though the concentration of dissolved aluminum was constant, indicating that total recoverable is a more appropriate measurement

Office of Science and Technology, 2006, National Recommended Water Quality Criteria, U.S.Environmental Protection Agency, Office of Water (43041),

than dissolved, at least when particulate aluminum is primarily aluminum hydroxide particles. In surface waters, however, the total recoverable procedure might measure aluminum associated with clay particles, which might be less toxic than aluminum associated with aluminum hydroxide.

3. EPA is aware of field data indicating that many high quality waters in the U.S. contain more than 87 g aluminum/L, when either total recoverable or dissolved is measured.

Q EPA announced the availability of a draft updated tributyltin (TBT) document on August 7, 1997 (62FR42554). The Agency has reevaluated this document and anticipates releasing an updated document for public comment in the near future.

Note - Compounds listed in the plural in the Pollutant column represent complex mixtures of isomers. Numbers listed to the right of these compounds refer to the total allowable concentration of any combination of isomers of the compound, not only to concentrations of individual isomers.

- 1 SECTION 3. (a) In accordance with 40 Code of Federal
- 2 Regulations, Section 131.41, the State designates as
- 3 coastal recreation waters all waters up to three miles from
- 4 shore to a depth of thirty-three meters, excluding areas
- 5 where water contact recreational activities are prohibited
- 6 by state or federal law or regulation.
- 7 (b) In coastal recreation waters within five hundred
- 8 meters from the shoreline, enterococcus content shall not exceed
- 9 a geometric mean of thirty-five colony forming units per one
- 10 hundred milliliters in no fewer than five samples, which shall
- 11 be spaced to cover a period between twenty-five and thirty
- 12 days. No single sample shall exceed the single sample maximum
- 13 of one hundred and four colony forming units per one hundred
- 14 milliliters or the site-specific one-sided seventy-five per cent
- 15 confidence limit.
- (c) Coastal recreation waters between five hundred meters
- 17 and three miles from shore shall be designated as infrequent use
- 18 coastal recreation waters, and enterococcus content in these
- 19 waters shall not exceed a geometric mean of thirty-five colony
- 20 forming units per one hundred milliliters in no fewer than five
- 21 samples, which shall be spaced to cover a period between twenty-
- 22 five and thirty days. No single sample shall exceed the single

- 1 sample maximum of five hundred and one colony forming units per
- 2 one hundred milliliters or the site-specific one-sided ninety-
- 3 five per cent confidence limit.
- 4 (d) At locations where samples are taken less frequently
- 5 than five samples for each twenty-five to thirty days, no single
- 6 sample shall exceed the single sample maximum nor shall the
- 7 geometric mean of these samples taken during the twenty-five to
- 8 thirty-day period exceed thirty-five colony forming units per
- 9 one hundred milliliters.
- 10 SECTION 4. Except as provided in section 2(b) of this Act,
- 11 to the extent any provision in chapter 11-54, Hawaii
- 12 Administrative Rules, is inconsistent with this Act, that
- 13 provision shall be superseded upon approval by the United States
- 14 Environmental Protection Agency of a corresponding provision or
- 15 standard. Water quality standards not inconsistent with this
- 16 Act shall remain in effect.
- 17 SECTION 5. If any provision of this Act, or the
- 18 application thereof to any person or circumstances is held
- 19 invalid, the invalidity does not affect other provisions or
- 20 applications of the Act which can be given effect without the
- 21 invalid provision or application, and to this end the provisions
- 22 of this Act are severable.

| 1 | SECT | ION 6. This Act shall take effect upon approval; |
|----|----------|--|
| 2 | provided | that: |
| 3 | (1) | The specific water quality standards prescribed in |
| 4 | | this Act shall take effect upon their approval by the |
| 5 | | United States Environmental Protection Agency; |
| 6 | (2) | Any water quality standard adopted in section 2 or |
| 7 | | section 3 of this Act shall be repealed upon a same or |
| 8 | | corresponding standard being adopted, amended, or |
| 9 | | repealed by rules adopted under chapter 91, Hawaii |
| 10 | | Revised Statutes, by the department of health, and the |
| 11 | | rule being approved by the United States Environmental |
| 12 | | Protection Agency; provided further that the remaining |
| 13 | | standards specified in this Act shall remain in |
| 14 | | effect; and |
| 15 | (3) | This Act shall be repealed on June 30, 2011. |

day of APPROVED this
