The basis of production originally reported in 2004 was as follows:

“Weighted index of gold & silver refining and pound of sweeps material processed.”

CORRECTION:

Please note that the “*pounds of sweeps material*” is one (1) of various materials used in the process of recovering and refining gold and silver products. Therefore, the *sweeps* are not the end product but merely one (1) of various materials used for recovery and refining of gold, silver and platinum, which are the end products.

Other materials used are for example:

Silverware
Coins
Jewelry

Furthermore, the basis quantity set in 2004 was the amount of Sodium dimethyl dithiocarbamate used in the process of recovery and refinement (not an end product).

Since Republic Metals Corporation has several end products and by-products (i.e. gold, silver, platinum, copper, etc.) we have selected to edit and correct the basis of production with the amount of **GOLD** product, which is the largest quantity and main product.

The amount of refined GOLD in 2004 was 672,586 ounces. Please reset the 2004 basis to 672,586.
