[Reference:]

Dear Sir:

This submission contains additional findings and supporting evidence for submission [

]. In our earlier submission of adverse findings in juvenile female rats, we identified the following adverse effects after treatment:

- an acceleration of vaginal perforation
- a decrease in uterine blotted and/or wet weights
- decreased ovary weight
- increased adrenal weight
- increased liver weight

It was concluded that materials containing [

], were having estrogenic effects at a dose as low as 30 mg/kg/day.

Data from subsequent female pubertal assay studies being submitted (see Attachment 1) support these findings and, to better understand the mechanism of action, examines additional endpoints associated with reproductive and endocrine health. Endpoints examined in these new studies, not measured in the originally submitted studies, include age at first estrus, ovarian histology (corpus lutea, granulosa cell morphology, oocyte morphology), uterine histology, and thyroid histology. Hormone level analyses (estradiol, lutenizing hormone, T4, and TSH) and thymus, thyroid gland, and pituitary weights were also measured.

To better understand the toxicological significance of organ weight changes observed in earlier studies, the histology of the ovary and uterus were examined. The following histological changes occurred at doses as low as 60 mg/kg/day with mixtures containing [ ]:

- absence of corpus lutea

If you have received this communication in error, please call us immediately to arrange for its return to us.

307491

- oocyte degeneration
- granulosa cell necrosis
- uterine atrophy
- uterine hypotrophy

Onset of first estrus occurred earlier and corresponded with earlier onset of puberty. Changes in Estradiol, T4, and TSH occurred, but were variable throughout studies and were not a requirement for an earlier onset of puberty. Changes in weight and histology of the thyroid gland, changes in the weight of the pituitary, thymus gland, and the spleen also occurred, but did so inconsistently among studies.

The new studies being submitted have [ ]. In general, increasing [ ] still caused estrogenic effects but at higher doses compared to [ ]. A dose with no adverse pubertal effects for [ ] was determined using data from the new studies. Doses of 10 mg/kg/day in two studies and 20 mg/kg/day in another did not elicit estrogenic effects.

The implications from [ ] estrogenic action resulting in premature sexual maturation on reproductive health are still uncertain. A one-generation reproductive study in rats with [ ], did not result in any changes to rat fertility. This study is in the draft report stage and will be submitted upon request. [ ] was previously determined to cause an early onset of sexual maturation in a rat female pubertal assay, the results of which were communicated to the EPA in submission [ ] on April 19, 2004. This indicates that there may be no consequences to reproductive health from the estrogenic action of [ ]. Additional one-generation studies in the rat with [ ] to determine whether this is a valid conclusion are currently in progress.

If you have any questions, please contact me at [ ]

Sincerely,

[ ]

F. Study Protocol 374

1. SUMMARY

1.1. OBJECTIVE

The objective of the study was to evaluate the ability of the test articles to induce effects on pubertal development in the intact juvenile female rat.

1.2. STUDY DESIGN

[ ] or [ ], in the vehicle, Mazola® corn oil, was administered orally by gavage once daily for 20 consecutive days to three groups each of 15 Crl:CD®(SD)[1] immature female rats. Dosage levels for [ ] were 60, 250 and 1000 mg/kg/day and dosage levels for [ ] were 5, 20 and 60 mg/kg/day. The dose volume for all groups was 5 mL/kg. A concurrent control group received the vehicle on a comparable regimen. These dosage levels were determined from the results of previous studies and were provided by the sponsor representative after consultation with the WIL study director.

Dosing procedures were performed from November 16 through December 7, 2004, when the animals were 22 to 41 days of age; the study start was staggered, based on age. At the initiation of dose administration, individual body weights ranged from 44.8 g to 61.1 g. The following table presents the study group assignment:

Group Number	Test Article	Dosage Level (mg/kg/day)	Dose Concentration (mg/mL)	Dose Volume (mL/kg)	Number of Females
1	Corn Oil	0	0	5	15
2	[ ]	60	12	5	15
3	[ ]	250	50	5	15
4	[ ]	1000	200	5	15
5	[ ]	5	1	5	15
6	[ ]	20	4	5	15
7	[ ]	60	12	5	15

[1] Prior to January 1, 2005, this strain of rat was designated the Crl:CD®(SD)IGS BR rat.

Due to spacing constraints, the dose group names are presented on the tables and figures as corn oil, [ ]/60, [ ]/250, [ ]/1000, [ ]/5, [ ]/20 and [ ]/60 for the vehicle control, 60, 250 and 1000 mg/kg/day [ ] and 5, 20 and 60 mg/kg/day [ ] groups, respectively.

Preparation, storage and sampling of the control and test article formulations were conducted as follows. For the control group, the appropriate amount of the vehicle (100% pure corn oil, exp. dates 2/2/05 and 3/19/06) was dispensed into a storage container and stirred throughout use. The [ ] and [ ] dosing formulations were prepared by weighing an appropriate amount of test article for each group into a tared, calibrated storage container. A stir bar and approximately 80% of the vehicle were added to the storage container, and the mixture was stirred until uniform. The appropriate volume of vehicle was added to bring each formulation to the calibration mark, and the preparations were stirred until uniform and throughout use. The [ ] and [ ] dosing formulations were prepared approximately weekly, divided into aliquots for daily dispensation and stored at room temperature. Three samples from the control group and three sets of samples from the test article formulations were collected prior to the initiation of dose administration. Two sets of samples for concentration verification were collected on the first day of each preparation and two sets were collected on the last day of use of each preparation. Two sets of homogeneity/stability samples and six sets of concentration samples were shipped under ambient conditions to the sponsor for homogeneity, stability and concentration analyses; the remaining samples were stored under normal laboratory conditions at WIL Research Laboratories, LLC, for possible future analysis.

Thirteen dams with 10 female pups each (130 pups total) were received from Charles River Laboratories, Inc., Raleigh, North Carolina, on November 2, 2004. The pups were 6 to 8 days old upon receipt. Pups were identified by tail tattoo and initially housed in plastic maternity cages (by litter with their own or a fostering dam) during the acclimation period (14 to 16 days) until randomization of the pups on postnatal day

(PND) 21. Following randomization, the female pups were weaned, identified by metal eartag and housed three per cage in plastic maternity cages. Environmental controls were set to maintain an average daily temperature of 71±5°F and an average daily relative humidity of 50±20%. Actual mean daily temperatures ranged from 70.4°F to 70.8°F (21.3°C to 21.6°C), and mean daily relative humidity ranged from 35.3% to 46.6%. Light timers were calibrated to provide a 12-hour light (6 a.m. to 6 p.m.)/12-hour dark photoperiod. Air handling units were set to provide approximately 10 fresh air changes per hour. PMI Nutrition International, LLC, Certified Rodent LabDiet® 5002 and reverse-osmosis-purified water were offered *ad libitum*.

All animals were observed twice daily for appearance, behavior, mortality and moribundity. A detailed physical examination was performed at the time of randomization. The rats were also observed daily (prior to dosing). Clinical findings at the time of dose administration and approximately 1 hour following dose administration were recorded when observed. Individual body weights were recorded daily. Each female pup was observed daily for attainment of vaginal patency beginning on PND 25 (Adams, *et al.*, 1985). Examination continued daily until vaginal patency was observed. Body weights were recorded on the day that vaginal patency was noted. Beginning on the day that vaginal patency was observed, vaginal lavages were performed daily, through the day of euthanasia, and the slides were examined to determine the stage of estrus. The mean estrous cycle length was calculated and reported for complete estrous cycles *(i.e.*, the total number of returns to metestrus [M] or diestrus [D] from estrus [E] or proestrus [P] until the day of euthanasia), beginning on the day vaginal patency was observed. Estrous cycle length was determined by counting the number of days from the first M or D in a cycle to the first M or D in a subsequent cycle. In addition, the mean age at the onset of the first estrous cycle was calculated using the first day each animal was observed to be in estrus. A gross necropsy was performed only on animals that were found dead. All surviving animals were euthanized on PND 42 by carbon dioxide inhalation; blood was collected via the vena cava for evaluation of serum thyroxine (T_4)

and thyroid stimulating hormone (TSH). The uterus (wet and blotted), ovaries/oviducts, liver, kidney, pituitary gland, adrenal glands and thyroid glands were weighed. Luminal fluid weight was calculated by subtracting the blotted uterus weight from the wet uterus weight. The blotted uterus weight was greater than the wet uterus weight for female no. 69173-06 (60 mg/kg/day [ ] group). Therefore, the uterine weights for this female were not included in calculation of the means, and luminal fluid weight could not be calculated. The ovaries, uterus (horns and body), cervix, vagina, pituitary gland, thyroid glands and gross lesions were retained from all females, including those found dead. After fixation, the ovaries, cervix, uterus (body and horns) and thyroid glands were trimmed according to standard operating procedures and the protocol. At the time of trimming, the cassettes containing the uterus, ovaries, vagina and pituitary for female nos. 69168-05, 69169-04 and 69173-05 (5 mg/kg/day [ ] group) were open and it could not be determined which organs belonged to the appropriate animal. The tissues being processed for microscopic evaluation for these females were arbitrarily assigned to each female. This event had no impact on the outcome of the study because all of these females were in the same test article-treated group.

Trimmed tissues were processed into paraffin blocks, sectioned at 4 to 8 microns, mounted on glass microscope slides and stained with hematoxylin and eosin. Microscopic examination was performed by [ ], Assistant Director, Anatomic Pathology, WIL Research Laboratories, LLC. The tissues available for microscopic examination were of satisfactory quality and quantity to adequately evaluate this study. There was no evidence of infectious disease in any of the organs or tissues examined that would have affected the validity of the study.

Statistical tests were performed using appropriate computing devices or programs. Analyses were conducted using two-tailed tests for minimum significance levels of 1% and 5%, comparing each test article-treated group to the control group. Each mean was presented with the standard deviation (S.D.) and the number of animals (N) used to calculate the mean. Mean body weights, body weight changes, days of acquisition of

vaginal patency, estrous cycle length, age at the first occurrence of estrus, serum hormone levels, luminal fluid weights and absolute and relative organ weights were subjected to a parametric one-way analysis of variance (ANOVA; Snedecor and Cochran, 1980) to determine intergroup differences. If the ANOVA revealed statistically significant ($p<0.05$) intergroup variance, Dunnett's test (Dunnett, 1964) was used to compare the test article-treated groups to the control group.

1.3. KEY STUDY DATES

Date(s)	Event(s)
November 2, 2004	Experimental starting date (animal receipt)
November 16, 2004	Experimental start date (first day of dose administration)
November 16 - December 7, 2004	Test article administration
December 8, 2004	Last day of euthanasia
January 28, 2005	Experimental termination/completion date (last microscopic evaluation)

1.4. DATA RETENTION

The sponsor has title to all documentation records, raw data, specimens or other work product generated during the performance of the study. All work product generated by WIL Research Laboratories, LLC, including raw paper data and specimens, are retained in the Archives at WIL Research Laboratories, LLC, as specified in the study protocol. Data generated by the sponsor will be archived by the sponsor or the sponsor's designee.

Reserve samples of the test articles, pertinent electronic storage media and the original final report are retained in the Archives at WIL Research Laboratories, LLC in compliance with regulatory requirements.

1.5. RESULTS – [ ]

One female in the 250 mg/kg/day [ ] group was found dead at 33 days of age, approximately 45 minutes after being administered the 12th dose. This animal had no clinical findings and no test article-related effects on body weight prior to death. At necropsy, this female had dark red areas on the lungs and the lungs were not fully

collapsed. Because there was no evidence of toxicity in this animal prior to death, the death occurred after dose administration, necropsy findings indicated changes in the lungs and no mortality was observed in animals in the 1000 mg/kg/day [ ] group, the death in the 250 mg/kg/day [ ] group was attributed to possible intubation error and not to the test article. One animal in the control group was found dead at 25 days of age, after three doses. On the day prior to death this animal had an unkempt appearance at the daily observations and labored respiration at the daily observations and 1 hour following dose administration. At necropsy, this animal had a mass in the lung, involving the pericardium and heart, with of two lobes of the lung adhered to the diaphragm and pericardium. This death was also attributed to possible intubation error. All other animals in the control and [ ]-treated groups survived to the scheduled euthanasia.

Wiping the mouth on the cage walls and/or floor, salivation, salivation prior to dose administration and clear material around the mouth were observed at the time of dose administration and/or 1 hour following dose administration in the 250 and 1000 mg/kg/day [ ] groups. The increased incidences of these findings occurred in a dose-related manner; the findings were attributed to the test article but were not considered adverse.

No test article-related effects on body weights or body weight gains were observed in the 60, 250 and 1000 mg/kg/day [ ] groups. The only statistically significant ($p<0.05$ or $p<0.01$) differences from the control group were increased mean body weight gain during PND 24-25 and decreased mean body weight gain during PND 27-28 in the 1000 mg/kg/day [ ] group. No test article-related trends were evident.

Vaginal patency was achieved at an earlier age in the 60, 250 and 1000 mg/kg/day [ ] groups than in the control group; the differences were statistically significant ($p<0.01$). Mean days of acquisition were 33.2, 29.6, 26.5 and 27.9 in the control, 60, 250 and 1000 mg/kg/day [ ] groups, respectively. The values in all [ ]-treated groups

were below the minimum mean value in the WIL historical control data (31.7 days). Since the females were younger on the day that vaginal patency was observed, mean body weights on the day of acquisition in these groups were also lower than the control group value; the differences in these groups were statistically significant ($p<0.01$). The changes in these parameters were consistent with an interpretation of estrogenic effects resulting from the test article.

Mean estrous cycle length in the 1000 mg/kg/day [ ] group (3.2 days) was statistically significantly ($p<0.01$) reduced compared to the control group value (4.9 days). The mean ages at the first occurrence of estrus (32.7, 27.4 and 28.1 days of age) in the 60, 250 and 1000 mg/kg/day [ ] groups, respectively, were earlier than in the control group (34.4 days of age). The differences were statistically significant ($p<0.01$) in the 250 and 1000 mg/kg/day [ ] groups. While vaginal patency and the onset of estrus occurred earlier in all [ ]-treated groups, notable disruption of the estrous cycle (extended estrus) was evident only in the 250 and 1000 mg/kg/day groups. In the 250 mg/kg/day [ ] group, 10 females were in persistent estrus for at least one cycle (3 or more consecutive days of estrus). In the 1000 mg/kg/day [ ] group, 13 females were in persistent estrus for at least one cycle. The differences in all [ ]-treated groups were observed in a dose-related manner and were consistent with estrogenic activity induced by the test article.

A statistically significant ($p<0.05$) increase in the mean T_4 level was observed in the 1000 mg/kg/day [ ] group. No other statistically significant differences in T_4 or TSH levels were observed. Mean TSH level was slightly increased in the 1000 mg/kg/day [ ] group. However, the value was equal to that in the 60 mg/kg/day [ ] group; no dose-related trend was evident.

Test article-related reductions in mean absolute and relative (to final body weight) ovary weights were observed in the 1000 mg/kg/day [ ] group; the differences from the control group were statistically significant ($p<0.01$). Mean absolute and relative uterus

weights (wet and blotted) in the 250 and 1000 mg/kg/day [ ] groups were lower than the control group values; the differences in the 1000 mg/kg/day [ ] group were statistically significant ($p<0.05$ or $p<0.01$). Luminal fluid data were highly variable; however, mean luminal fluid weights in the 250 and 1000 mg/kg/day [ ] groups were lower (not statistically significant) than in the control group. Mean absolute and relative liver, thyroid gland and adrenal gland weights in the 1000 mg/kg/day [ ] group were increased. The differences were statistically significant ($p<0.05$ or $p<0.01$) compared to the control group values. Mean absolute and relative adrenal gland weights were also increased in the 250 mg/kg/day [ ] group; the difference in relative weight was statistically significant ($p<0.05$) compared to the control group value. These increases were considered test article-related. No other [ ]-related or statistically significant differences in organ weights were observed in the test article-treated groups.

In the control, 60, 250 and 1000 mg/kg/day groups, decreased numbers of corpora lutea and/or absent corpora lutea were observed microscopically in 2/15 (including the female that died on PND 25), 3/15, 12/15 (including the female that died on PND 33) and 15/15 females, respectively. The findings in the 1000 mg/kg/day [ ] group correlated to reduced mean ovary weights.

Uterine hypoplasia was observed in 2/15, 1/15, 9/15 (including the female that died on PND 33) and 13/15 females in the control, 60, 250 and 1000 mg/kg/day [ ] groups, respectively. This finding was characterized by poor delineation between the endometrium and the myometrium of the uterine horns. The uterine horns tended to be small, with a uniformly eosinophilic and homogeneous appearance of the endometrium and myometrium without a clear demarcation between the endometrial stroma and the inner circular layer of the myometrium. There was little or no differentiation of the endometrial stromal cells, and the endometrial mucosa had fewer diverticula and glands. Hypoplastic uterus in the 250 and 1000 mg/kg/day [ ] groups correlated with reduced mean uterus weights.

Thyroid gland follicular cell hypertrophy was noted in 1/15, 1/15, 7/15 (including the female that died on PND 33) and 15/15 females in the control, 60, 250 and 1000 mg/kg/day [ ] groups, respectively. This finding was characterized by the presence of enlarged follicular epithelial cells, with an increased amount of finely vacuolated, often slightly basophilic cytoplasm. Cell nuclei in affected thyroid glands tended to be rounder than in unaffected glands (which were generally oval in shape) and had a more open chromatin pattern, compared to a uniformly distributed chromatin pattern in unaffected glands. There was no clear effect on the quantity of colloid in affected thyroid glands, but the colloid in affected glands tended to be paler-staining, and often had a vacuolated or foamy appearance. There was no appreciable subjective difference in the degree of hypertrophy in affected thyroid glands, and all were graded as minimal in severity. Thyroid gland follicular cell hypertrophy correlated to increased mean thyroid gland weights and mean T_4 level in the 1000 mg/kg/day [ ] group.

1.6. CONCLUSIONS - [ ]

Based on the results of this study, the test article, [ ], administered orally to juvenile female rats resulted in estrogenic effects in the 60, 250 and 1000 mg/kg/day groups, as evidenced by early attainment of vaginal patency and occurrence of the first estrus (all [ ] groups). Other indications of estrogenic activity were observed in the 250 and 1000 mg/kg/day [ ] groups following vaginal opening. These observations consisted of persistent estrus and uterine (hypoplasia) and ovarian (decreased/absent corpora lutea) microscopic lesions (250 and 1000 mg/kg/day [ ] groups) and by decreased estrous cycle length and decreased mean ovary weights (1000 mg/kg/day [ ] group). These changes were accompanied by decreased mean uterus weights and thyroid gland follicular cell hyperplasia (250 and 1000 mg/kg/day [ ] groups) and increased T_4 level (1000 mg/kg/day [ ] group).

1.7. RESULTS – [ ]

All animals survived to the scheduled euthanasia. Wiping the mouth on the cage walls and/or floor was observed in all [ ]-treated groups at the time of dose administration. Salivation, salivation prior to dosing and clear material around the mouth were observed at the time of dose administration in the 60 mg/kg/day [ ] group. These findings were attributed to the test article. A single occurrence of salivation was also observed in the 5 mg/kg/day [ ] group at the time of dose administration. None of the findings persisted to 1 hour following dose administration; therefore, these findings were not considered adverse.

No test article-related changes in mean body weights or body weight gains were observed in the 5, 20 and 60 mg/kg/day [ ] groups. Differences from the control group were slight and not statistically significant.

Vaginal patency was achieved earlier in the 60 mg/kg/day [ ] group than in the control group. The difference was statistically significant ($p<0.01$). Mean days of acquisition were 33.2, 33.3, 32.7 and 29.1 in the control, 5, 20 and 60 mg/kg/day [ ] groups, respectively. The value in the 60 mg/kg/day [ ] group was below the minimum mean value in the WIL historical control data (31.7 days). Since the females were younger on the day that vaginal patency was observed, mean body weight on the day of acquisition in the 60 mg/kg/day [ ] group was also statistically significantly ($p<0.01$) lower than the control group value. These differences were consistent with an interpretation of estrogenic effects resulting from the test article.

No differences in mean estrous cycle length were observed when comparing the [ ]-treated groups to the control group. Estrous cycle lengths in females of this age are highly variable, and combined with the limited number of animals and days of data collection, evaluation for a test article-related effect was inconclusive. There was no persistent estrus in any [ ]-treated group. The mean age at first occurrence of estrus in the 60 mg/kg/day [ ] group was earlier than in the control group; the

difference was not statistically significant. This change was consistent with an interpretation of estrogenic effects resulting from the test article.

Mean T_4 and TSH levels in the 5, 20 and 60 mg/kg/day [ ] groups were similar to those in the control group; no statistically significant differences were noted.

No test article-related changes in mean absolute or relative organ weights were observed in the 5, 20 and 60 mg/kg/day [ ] groups.

Decreased corpora lutea were observed microscopically in 3/15 and 4/15 females in the 20 and 60 mg/kg/day [ ] groups, respectively. This finding was potentially test article-related; however, there were no organ weight correlates to this finding. Uterine hypoplasia, as previously described, was noted in 7/15 females in the 60 mg/kg/day [ ] group compared to 2/15 in the control group.

Thyroid gland follicular cell hypertrophy, as previously described, was observed in 1/15, 1/15, 3/15 and 10/15 females in the control, 5, 20 and 60 mg/kg/day [ ] groups, respectively. The increase in the 60 mg/kg/day [ ] group was considered test article-related. There were no changes in mean thyroid gland weights or T_4 and TSH levels correlating to follicular cell hypertrophy. No other test article-related microscopic findings were observed in the [ ]-treated groups.

1.8. CONCLUSIONS – [ ]

Based on the results of this study, the test article, [ ], administered orally to juvenile female rats exhibited slight estrogenic effects in the 60 mg/kg/day group, as evidenced by early achievement of vaginal patency and occurrence of the first estrus. Microscopic findings of uterine hypoplasia and decreased corpora lutea in the 60 mg/kg/day [ ] group also indicated estrogenic activity following vaginal opening. In addition, thyroid follicular cell hypertrophy was also observed at this dose level.

2. KEY STUDY PERSONNEL AND REPORT SUBMISSION

2/8-9/05	Draft Report	2/9/05	03/25/05.	[ ]

This study was inspected in accordance with the U.S. EPA Good Laboratory Practice Standards (40 CFR Parts 160 and 792), the OECD Principles of Good Laboratory Practice, the standard operating procedures of WIL Research Laboratories, LLC and the sponsor's protocol and protocol amendments with the following exceptions. The data located in Appendices A (Certificates of Analysis) and B (Analytical Chemistry Report) were the responsibility of the sponsor. Quality Assurance findings, derived from the inspections during the conduct of the study and from the inspections of the raw data and draft report, are documented and have been reported to the study director. A status report is submitted to management monthly.

This report accurately reflects the data generated during the study. The methods and procedures used in the study were those specified in the protocol, its amendments and the standard operating procedures of WIL Research Laboratories, LLC.

The raw data, the retention sample(s), if applicable, and the final report will be stored in the Archives at WIL Research Laboratories, LLC or another location specified by the sponsor.

3.2. APPROVAL

This study was inspected according to the criteria discussed in Section 3.1.

5. DEVIATIONS FROM THE PROTOCOL

This study was conducted in accordance with the protocol and protocol amendments, except for the following.

- **Protocol Section 4.1.5 (as revised, Amendment II)** states that the test article was to be stored at ambient conditions under nitrogen. On November 15, 2004, the test article was not purged with nitrogen after use.
- **Protocol Section 5.3** states that animals were to be supplied by Charles River Laboratories, Inc., Portage, Michigan. However, animals were received from the Raleigh, North Carolina facility of Charles River Laboratories.
- **Protocol Section 5.4** states that the immature female pups were to be 8-10 days old upon receipt. However, the pups were 6-8 days old at the time of receipt.
- **Protocol Section 5.5** states that at randomization, the female body weight range would be 30 g to 50 g and all animals assigned to the study would be approximately ±5 g of the mean. However, the body weight range used for randomization was 41 g to 58 g, and actual weights were -8 g to +9 g of the mean.
- **Protocol Section 7.5.3** states that samples of the dosing mixtures were to be collected on the first and last day of each weekly preparation, intending that the sample from the first day would be collected prior to the bulk formulation being divided into aliquots for daily dispensation and the sample from the last day would be collected from the aliquot used for the last day of dosing. However, both samples were collected from aliquots on the appropriate days. Therefore, no samples were collected from the bulk formulation (prior to dividing into aliquots) on the day of preparation.
- **Protocol Section 7.5.4** states that [ ]was to be notified prior to shipping the formulations samples, and that the notification was to include test article and study identification, carrier and estimated time/date of arrival. However, on November 16, 23 and 30 and December 7, 2004, [ ]was notified by e-mail prior to shipping samples, and the notification did not include the test article identifications.
- **Protocol Section 7.5.4** states that each vial plus the sample weight was to be recorded with an accuracy of ± 0.0005 g. However, samples that were collected on October 25 and November 16, 22 and 23, 2004 only reflected the net weight of the sample, not the weight of the vial.

- **Protocol Section 8.1** states that blood was to be collected from all animals following euthanasia. However, blood was not collected from animal nos. 69165-03 (250 mg/kg/day [ ] group) and 69166-08 (5 mg/kg/day [ ] group).
- **Protocol Section 9.2.1** states that the harvesting of uteri was to be performed in the same sequence as the animals were dosed. Due to the normal diurnal fluctuation in circulating concentrations of thyroid hormone levels, the necropsy order was randomized to minimize the potential effect, across all groups, that the time of day of sample collection may have had on thyroid hormone levels.
- **Protocol Section 11** does not require statistical analyses of serum hormone levels. However, statistical analyses were conducted on these data to aid in interpretation.

These deviations did not negatively impact the quality or integrity of the data nor the outcome of the study.

INDIVIDUAL MACROSCOPIC AND MICROSCOPIC FINDINGS
SPONSOR NO.:04-023

ANIMAL NO.69169-01 GROUP 1: CORN OIL FEMALE FOUND DEAD 11/20/04 DATE OF DEATH: 11/20/04

			GRADE
	LUNGS	GROSS: MASS 15 X 15 X 10 MM, TAN, INVOLVES RIGHT APICAL, RIGHT INTERMEDIATE AND RIGHT DIAPHRAGMATIC LOBES, PERICARDIUM AND HEART, SOFT, MASS #1	P
	LUNGS	GROSS: ADHESIONS RIGHT DIAPHRAGMATIC AND LEFT LOBES ATTACHED TO DIAPHRAGM; LEFT LOBE ATTACHED TO PERICARDIUM	P
	OVARIES	MICRO: CORPORA LUTEA ABSENT BILATERAL	P
		JUVENILE OVARY BILATERAL	P
	THYROID GLANDS	MICRO: DECREASED COLLOID BILATERAL	4
	UTERUS	MICRO: JUVENILE UTERUS BILATERAL	P
	CERVIX	MICRO: JUVENILE CERVIX	P
	CAUSE OF DEATH	MICRO: UNDETERMINED PARTIAL TISSUES EXAMINED, NO ATTEMPT MADE TO DETERMINE CAUSE OF DEATH	P

NO SIGNIFICANT CHANGES OBSERVED GROSS:

ADRENAL GLANDS	BRAIN	ESOPHAGUS	EYES
HEART	INTESTINE	KIDNEYS	LIVER
LYMPH NODE, MES	MAMMARY GLAND	OVIDUCTS	OVARIES
PANCREAS	PITUITARY	SPINAL CORD	SAL. GLAND MAND
SKIN	SPLEEN	STOMACH	THYMUS
THYROID GLANDS	TRACHEA	URINARY BLADDER	UTERUS

ANIMAL NO.69169-01 GROUP 1: CORN OIL FEMALE FOUND DEAD 11/20/04 DATE OF DEATH: 11/20/04

	GRADE
CERVIX	
VAGINA	

GROSS GRADE CODE: 1-SLIGHT, 2-MODERATE, 3-MARKED, P-PRESENT

MICRO GRADE CODE: 1-MINIMAL, 2-MILD, 3-MODERATE, 4-SEVERE, P-PRESENT

ANIMAL NO.69169-07 GROUP 3: [redacted] 250 FEMALE FOUND DEAD 11/28/04 DATE OF DEATH: 11/28/04

			GRADE
LUNGS	GROSS:	AREA(S), DARK RED MULTIPLE, IRREGULARLY SHAPED, ALL LOBES	P
LUNGS	GROSS:	NOT FULLY COLLAPSED ALL LOBES	P
OVARIES	MICRO:	DECREASED CORPORA LUTEA BILATERAL	P
THYROID GLANDS	MICRO:	HYPERTROPHY, FOLLICULAR CELL BILATERAL	1
UTERUS	MICRO:	HYPOPLASIA BILATERAL	1
CAUSE OF DEATH	MICRO:	UNDETERMINED PARTIAL TISSUES EXAMINED, NO ATTEMPT MADE TO DETERMINE CAUSE OF DEATH	P

NO SIGNIFICANT CHANGES OBSERVED

GROSS: ADRENAL GLANDS, BRAIN, ESOPHAGUS, EYES, HEART, INTESTINE, KIDNEYS, LIVER, LYMPH NODE, MES, MAMMARY GLAND, OVIDUCTS, OVARIES, PANCREAS, PITUITARY, SPINAL CORD, SAL. GLAND MAND, SKIN, SPLEEN, STOMACH, THYMUS, THYROID GLANDS, TRACHEA, URINARY BLADDER, UTERUS, CERVIX, VAGINA

MICRO: CERVIX

ABSTRACT

Samples of suspensions ([redacted] corn oil) used in a female pubertal assay in rats, WIL Research Study #WIL-187041 [redacted] 04-023), were analyzed at [redacted] verify their homogeneity, stability, and nominal concentrations. A direct dilution procedure was employed to prepare the samples for elemental analysis by Inductively Coupled Plasma-Atomic Emission Spectroscopy (ICP-AES). Homogeneity and stability of [redacted] corn oil were established. The nominal concentrations of all dosing suspensions were verified by the analytical data.

TEST SUBSTANCES

The test substances used in the preparation of the dosing suspensions are identified as [redacted] and [redacted]. The CAS numbers are confidential; contact [redacted] for further information. The test substances were characterized and their stabilities were established prior to the initiation of the study.

INTRODUCTION

The purpose of this analytical study was the determination and verification of test substance homogeneity, stability, and concentration in corn oil. The concentration study samples were aliquots taken from mixtures prepared as dosing suspensions for a female pubertal assay in rats as outlined in the protocol for WIL Research Study #WIL-187041.

The analytical portion of the study was performed by the High Volume Services team located in the [redacted]. The analytical start and end dates were 2 November and 30 December 2004 respectively.

EXPERIMENTAL

SAMPLES
Samples were shipped from WIL Research to ILT's Principal Investigator. Samples were stored at room temperature and in the dark prior to analysis.

The first batch of samples was transferred to the laboratory on 2 November 2004. The analysis of the last set of samples was completed on 14 December 2004. Densities for [redacted] and corn oil were determined on 30 December 2004. The density of [redacted] was determined during a previous study.

STANDARDS
Calibration standards for the ICP-AES were made from certified commercially prepared elemental concentrates (Conostan Division of Conoco, Inc.). Standard preparation data is archived by ILT.

[redacted]

[redacted]

[redacted]

[redacted]

ANALYTICAL METHOD

Samples were prepared as stated in ILT's Test Code 30176, SOP ME-125 "Elemental Analysis of Additives or Additive Mixtures by Direct Dilution and ICP Analysis." The procedures outlined in SOP EQ-130, "IRIS Intrepid XDL II Radial Inductively Coupled Plasma Spectrometer," were followed during the instrumental analysis of the samples.

The approach employed in this method was to verify concentration based on the known elemental composition of [redacted] Aliquots of the dosing suspensions were diluted in an o-xylene diluent and the elemental composition was determined by ICP-AES. The calcium concentration of the samples was then used to ascertain the concentration of the test substance in the dosing suspensions.

DISCUSSION

METHOD VALIDATION

Method validation was performed following the recommendations outlined in the International Conference on Harmonisation's Q2B document: Guideline on the Validation of Analytical Procedures: Methodology. The limit of detection (LOD) and limit of quantitation (LOQ) were calculated to be 0.063 and 0.192 wt ppm calcium respectively. A reporting limit of 2 wt ppm calcium was determined to be appropriate for vehicle results.

SAMPLE ANALYSIS

The analytical results for the suspensions of [redacted] n corn oil are summarized in the tables located on pages 8 through 14. Seven calibration standards were analyzed to generate a linear calibration curve with inverse concentration weighting. All instrument control checks and quality control samples were within acceptable limits. Known amounts of calcium were spiked into 26 samples throughout the duration of the study and gave acceptable percent recoveries of 93 to 107%.

The dosing suspensions were analyzed for calcium, an element present in known concentrations in the test substances. Dosing suspension estimates of weight percent calcium were derived by the following formula:

$$Wt\%\ Ca = \left[\frac{x}{x + \left(D_2 - \frac{xD_2}{D_1}\right)}\right] \%\ Ca\ in\ [redacted]\ or\ [redacted]$$

where x is the solute test substance concentration in mg/µL; D_1 is the test substance density (0.9325 g/mL for [redacted]3 and 0.9810 g/mL for [redacted]); and D_2 is the vehicle or solvent density (corn oil, 0.9192 g/mL). The concentration of calcium in [redacted]3 is 3.530 wt% and 5.152 wt% in [redacted]3. The measured results of calcium were obtained by ICP-AES and compared against the estimated values. For [redacted]3 suspensions, results were converted to wt% from ppm by multiplying by 10^{-4}.

Homogeneity was confirmed if the percent differences between the overall dose level mean and individual strata means were 10% or less. Stability and concentration data were evaluated using percent difference. The acceptable tolerance was 15%. Duplicate analyses were compared using the Contract Laboratories Program (CLP) Guidelines for Inorganic Analyses relative percent difference limit of 20%

[redacted]

[redacted]

RESULTS AND CONCLUSIONS

The confirmation of dosing suspension homogeneity is supported by the data presented on pages 8 and 9. The percent difference of all strata means with their respective overall mean is well below the 10% tolerance.

The stabilities of [redacted] corn oil over a 10-day period are established on pages 10 and 11. The percent difference between the estimated and measured concentrations is less than 15% for all dosing levels.

The analytical result summaries for the concentration studies are found on pages 12 and 13. The nominal concentrations of all dosing suspensions were verified by the analytical data. The percent difference between the estimated and measured concentrations is less than 15% for all dosing levels.

The table on page 14 presents the duplicate precision data. The agreement between the duplicates is excellent and well under the CLP relative percent difference guideline of 20%.

ARCHIVES

SAMPLES
The unused portion of all samples shall be stored in room [redacted] for a minimum of one year after the final analytical report is issued.

RAW DATA
Calibration data; and instrument, chemical, and standard logbook documentation shall be archived by [redacted]. All other raw data shall be archived in the Analytical Study File [redacted] Analytical Study Archives.

FINAL REPORT
A copy of the final report shall be archived with the Analytical Study File in [redacted]

PROTOCOL AND SOP DEVIATIONS

There were no protocol deviations.

SOP ME-125 states a duplicate sample shall be prepared for every batch of 20 samples. No duplicates were prepared for samples analyzed on 26 November, 30 November, or 10 December. All QCs and instrument control samples were within acceptable limits on these dates. This did not affect the outcome of the analytical results.

APPENDIX D

Clinical Pathology Methods, Procedures And References

CLINICAL PATHOLOGY METHODS, PROCEDURES AND REFERENCES

Immunoassay- DPC Immulite®

Total T4 - Solid-phase, chemiluminescent enzyme immunoassay for the quantitative measurement of total circulating thyroxide. Default unit: µg/dL.

References:

Immulite®. Diagnostics Products Corporation. Package Insert.

APPENDIX E

WIL Reproductive Historical Control Data [Crl:CD®(SD) Rats]

WIL Reproductive Historical Control Data

APPENDIX F

Study Protocol

[redacted]

Study Number: WIL-187041

PROTOCOL AMENDMENT III

Sponsor: [redacted]

Sponsor Study No.: 04-023

A. Title of Study:

A Female Pubertal Assay of [redacted] and [redacted] Administered Orally in Juvenile Female Rats

B. Protocol Modifications:

1) **9.1** **Macroscopic Examination:**

Change cervix and uterine body (two sections) to cervix and uterine body (one longitudinal section).

2) **9.3** **Microscopic Examination:**

Change cervix and uterine body (two sections) to cervix and uterine body (one longitudinal section).

C. Reasons for Protocol Modifications:

1 & 2) The procedure for sectioning the cervix and uterine body has been revised.

Approved By:

[redacted]

[redacted] 30 January 2005
Sponsor Representative Date

Prepared By:
WIL Research Laboratories, LLC

PROTOCOL AMENDMENT II

Sponsor: [redacted]

Sponsor Study No.: 04-023

A. Title of Study:

A Female Pubertal Assay of [redacted] and [redacted] Administered Orally in Juvenile Female Rats

B. Protocol Modifications:

1) On the cover page, in the study title, chang[redacted] to [redacted]

2) **4.1 Identification:**

[redacted]

4.1.1 Lot Number:

[redacted]

4.1.5 Storage Conditions:

Store at ambient conditions under nitrogen.

3) **7.4.1 Organization of Test Groups:**

Group Number	Test Article	Dosage Level (mg/kg/day)	Dose Concentration (mg/ml)	Dose Volume (ml/kg)	Number of Females
1	Corn Oil	0	0	5	15
2	[redacted]	60	12	5	15
3		250	50	5	15
4		1000	200	5	15
5		5	1	5	15
6		20	4	5	15
7		60	12	5	15

C. Reasons for Protocol Modifications:

1) The Sponsor has elected to replace one of the test articles in this assay.

2) Due to the change in test article, the identification, lot number and storage conditions are corrected.

3) The test article has been changed in the table which presents the study group arrangement.

PROTOCOL

A FEMALE PUBERTAL ASSAY OF [redacted] AND [redacted] ADMINISTERED ORALLY IN JUVENILE FEMALE RATS

Sponsor Study Number: 04-023

Submitted To:

[redacted]

WIL Research Laboratories, Inc.
1407 George Road
Ashland, OH 44805-9281

1 OBJECTIVE:

The objective of this study is to evaluate the ability of the test articles to induce effects on pubertal development in the intact juvenile female rat.

2 PERSONNEL INVOLVED IN THE STUDY:

2.1 Sponsor Representative:

[redacted]

2.2 WIL Study Director:

[redacted]

2.3 WIL Deputy Director:

[redacted]

2.4 WIL Departmental Responsibilities:

[redacted]

3 STUDY SCHEDULE:

Proposed Animal Receipt Date: (Experimental Starting Date)	To be determined.
Proposed Experimental Start Date:	To be determined.
Proposed Experimental Termination/Completion Date:	To be determined.
Proposed Audited Report Date:	To be determined.

4 TEST ARTICLE DATA:

4.1 Identification:

[redacted]

4.1.1 Lot Number:

[redacted]

4.1.2 Purity:

100%

4.1.3 Stability:

The test article is considered to be stable under the storage conditions provided by the Sponsor.

4.1.4 Physical Description:

Dark brown, very viscous liquid.

4.1.5 Storage Conditions:

Store at ambient conditions.

4.1.6 Reserve Samples:

Reserve samples of the test article will be taken in accordance with WIL Standard Operating Procedures and stored in the Archives at WIL Research Laboratories, Inc. indefinitely unless otherwise specified.

4.1.7 Personnel Safety Data:

To be provided by the Sponsor. It is the responsibility of the Sponsor to notify the testing facility of any special handling requirements for the test article. A material safety data sheet (MSDS) should accompany the test article upon arrival at the laboratory.

4.2 Identification:

[redacted]

4.2.1 Lot Number:

[redacted]

4.2.2 Purity:

100%

4.2.3 Stability:

The test article is considered to be stable under the storage conditions provided by the Sponsor.

4.2.4 Physical Description:

Dark brown, opaque, very viscous liquid.

4.2.5 Storage Conditions:

Store at ambient conditions.

4.2.6 Reserve Samples:

Reserve samples of the test article will be taken in accordance with WIL Standard Operating Procedures and stored in the Archives at WIL Research Laboratories, Inc. indefinitely unless otherwise specified.

4.2.7 Personnel Safety Data:

To be provided by the Sponsor. It is the responsibility of the Sponsor to notify the testing facility of any special handling requirements for the test article. A material safety data sheet (MSDS) should accompany the test article upon arrival at the laboratory.

5 TEST SYSTEM:

5.1 Species:

Rat

5.2 Strain:

Sprague-Dawley Crl:CD®(SD)IGS BR

5.3 Source:

Charles River Laboratories
Portage, Michigan

5.4 Number on Study:

105 Females (maximum of 130 immature females and 13 dams purchased). Immature females will be supplied in litters of 10 animals with their own or another (fostering) dam. The immature females will be 8-10 days old upon receipt. Animals not assigned to the study will be transferred to the stock animal colony or will be euthanized by carbon dioxide inhalation and the carcasses discarded. Following weaning, the dams will be euthanized by carbon dioxide inhalation and discarded.

5.5 Body Weight Range:

At randomization: 30-50 g. All animals assigned to study will be approximately ± 5 g of the mean.

5.6 Age:

At start of dosing animals will be 22 days of age.

5.7 Identification System:

The maternal animals will be uniquely identified by a Monel® metal eartag displaying the animal number. The pups will be identified by tail tattoo. Individual cage cards will be affixed to each cage and will display the animal number, group number, study number, dosage level and sex of the animal.

5.8 Justification for Selection:

This species and strain of animal is recognized as appropriate for reproduction studies. WIL Research Laboratories, Inc. has reproductive historical control data in this species and strain of rat. This animal model has been proven to be susceptible to the effects of reproductive toxicants. This number of animals is considered the minimum number required for meaningful interpretation of the data and fulfillment of agency requirements.

6 SPECIFIC MAINTENANCE SCHEDULE:

6.1 Animal Housing:

All animals will be initially housed by litter with their own or another (fostering) dam in plastic maternity cages containing ground corncob nesting material (Bed-O'Cobs®). Following randomization, the juvenile female animals will be weaned and housed three animals per cage in plastic maternity (shoebox) cages. The cage bedding will be changed at least three times each week. The cages will be subjected to routine cleaning at a frequency consistent with maintaining good animal health and WIL Standard Operating Procedures. The facilities at WIL Research Laboratories, Inc. are fully accredited by the Association for Assessment and Accreditation of Laboratory Animal Care International (AAALAC International).

6.2 Environmental Conditions:

Controls will be set to maintain an average daily temperature of 71 ± 5°F (22 ± 3°C) and an average daily relative humidity of 50 ± 20%. Temperature and relative humidity will be monitored continuously. Data for these two parameters will be scheduled for automatic collection on an hourly basis. Fluorescent lighting controlled by light timers will provide illumination for a 12-hour light/dark photoperiod. Temporary adjustments to the light/dark cycles may be made to accommodate protocol-specified activities. The ventilation rate will be set at a minimum of 10 room air changes per hour, 100% fresh air.

6.3 Drinking Water:

Reverse osmosis-purified water will be available *ad libitum*. Filters servicing the automatic watering system are changed regularly according to WIL Standard Operating Procedures. The municipal water supplying the laboratory is analyzed according to WIL Standard Operating Procedures on a routine basis to assure that contaminants are not present in concentrations that would be expected to affect the outcome of the study.

6.4 Basal Diet:

PMI Nutrition International, LLC Certified Rodent LabDiet® 5002 will be offered *ad libitum* during the study. Periodic analyses of the certified feed are performed by the manufacturer to ensure that heavy metals and pesticides are not present at concentrations that would be expected to affect the outcome of the study. Results of the analyses are provided to WIL Research Laboratories, Inc. by the manufacturer and will be placed in the study records. Feeders will be changed and sanitized once per week.

7 EXPERIMENTAL DESIGN:

7.1 Animal Receipt and Quarantine:

Each animal will be inspected by a qualified technician upon receipt. Rats judged to be in good health and suitable as test animals will be immediately placed in quarantine for a minimum of nine days. All rats will be initially sexed and weighed. Maternal animals will be permanently identified with a metal ear tag, and juvenile animals will be identified by tail tattoo. During the quarantine period, each rat will be observed twice daily for changes in general appearance and behavior. Prior to the start of the in-life phase, those animals judged to be suitable test subjects will be identified and receive a detailed physical examination at the time of animal selection for randomization.

7.2 Randomization:

At the conclusion of the quarantine period (animals 21 days of age), animals judged to be suitable test subjects and meeting acceptable body weight requirements, will be assigned at random using a computer program. At that time, the animal numbers and corresponding body weights will be entered into the WIL Toxicology Data Management System (WTDMS™). A printout containing the animal numbers and individual group assignments will be generated based on body weight stratification into a block design. Animals will then be weaned and arranged into the groups according to the printout. Each of 7 groups will consist of fifteen females. If after randomization statistically significant differences between groups exist, new randomizations will be generated until group mean body weights are homogeneous.

7.3 Route and Rationale of Test Article Administration:

The route of administration will be oral (gavage). Historically, this route has been used extensively for studies of this nature. Appropriate-sized flexible, disposable plastic dosing cannulae will be used for the oral administration by gavage. Any losses or incomplete dosing will be recorded.

7.4 Organization of Test Groups, Dosage Levels and Treatment Regimen:

7.4.1 Organization of Test Groups:

The dosage levels were determined from the results of previous studies and were provided by the Sponsor Representative after consultation with the WIL Study Director. The following table presents the study group arrangement.

Group Number	Test Article	Dosage Level (mg/kg/day)	Dose Concentration (mg/ml)	Dose Volume (ml/kg)	Number of Females
1	Corn Oil	0	0	5	15
2	[redacted]	60	12	5	15
3	[redacted]	250	50	5	15
4	[redacted]	1000	200	5	15
5	[redacted]	5	1	5	15
6	[redacted]	20	4	5	15
7	[redacted]	60	12	5	15

7.4.2 Vehicle Control Article:

Corn oil

7.4.3 Treatment Regimen:

The test and control articles will be administered as single daily doses beginning on day 22 of age and continuing through 41 days of age. All animals will be dosed at approximately the same time each day, and the time of dosing will be recorded for each animal.

7.4.4 Adjustment of Dosages:

Individual doses will be calculated based on each daily body weight to provide the proper dosage. Individual animal body weights and individual animal dosages will be recorded.

7.5 Preparation and Analysis of Test Article Formulations:

7.5.1 Method and Frequency of Preparation:

Based on the physical characteristics of the test article, appropriate methods will be used to ensure the best possible formulations of the test article in the vehicle. Dosing formulations of the test article will be prepared weekly. The study director or the deputy director or designee will visually inspect the formulations prior to initiation of dosing. This visual inspection will be performed to assure that the formulations are visibly homogeneous and acceptable for dosing. Any special procedures required for formulation will be documented according to Good Laboratory Practices and presented in the final report of this study.

7.5.2 Homogeneity and Stability of Test Article Formulation:

Dosing mixture homogeneity will be collected prior to the initiation of test article administration. While undergoing stirring in the beaker, the following sample aliquots (5 mL) will be drawn for analysis: control,

three aliquots (from the middle); all treatment groups, nine aliquots (3 each from the top, middle and bottom). Two of the three samples will be sent to [redacted], for analysis of homogeneity and stability over a ten-day period. The samples will be shipped under ambient conditions. The remaining sample from each dose level and strata will be stored under normal laboratory conditions for possible future analysis.

7.5.3 Concentration Analysis:

Samples of the dosing mixtures will be collected on the first and last day of each weekly preparation. At each time point, two 5-mL aliquots will be taken from each dose level (middle stratum), including the control group. The dosing mixture will be thoroughly mixed before taking each sample. One sample from each dose level will be analyzed; the remaining sample will be retained by the Testing Laboratory for possible future analysis.

Dosing mixture samples for homogeneity, stability and concentration of the test article at all dose levels, including the control, will be analyzed by the Sponsor. The methods employed will be one or more of the following:

[redacted] SOP #ME-125

Concentration and stability data will be evaluated using percent difference. The acceptable tolerance between the theoretical and measured values is 15%.

Mixtures will be considered homogeneous if the difference between the overall group mean and the strata mean is 10% or less.

7.5.4 Sample Handling and Shipment:

Each 5-mL sample will be placed in a glass vial with a Teflon-lined lid. The vial plus sample weight will be recorded with an accuracy of $\pm$ 0.0005 g. Each sample will be stored at ambient temperature. Each sample container will be labeled with the following information:

Accession Number
Sponsor's Reference Number
Testing Laboratory Study Number
Test Article Name
Dose Level (mg/kg)
Dosing Mixture Concentration (mg/mL)
Preparation Date
Sampling Date
Weight of Sample

The sample shall be packed in a suitable container to maintain the temperature conditions specified in Section 4 during transit plus an adequate margin of safety for any transit delays. The sample shall be sent by express courier to:

[redacted]

[redacted] shall be notified in advance of shipping by telefax at [redacted] phone at [redacted] or by email [redacted]). This notification shall include test article and study identification, carrier, and estimated time/date of arrival. Sample shipments shall be accompanied by an inventory sheet describing the samples contained in the shipment with the information described above.

7.6 General Observations During the Experimental Period:

7.6.1 Clinical Signs:

The rats will be observed twice daily for appearance, behavior, moribundity and mortality. A detailed physical examination will be conducted at the time of randomization. Clinical observations regarding general appearance and behavior will be recorded daily prior to dosing. During the treatment period, the rats will be observed also approximately one hour following dosing and the observations will be recorded. Additional post-dosing observation periods may be necessary and will be documented in the study records. Observations shall include, but are not limited to, evaluations for changes in appearance of the skin and fur, eyes and mucous membranes, respiratory, circulatory,

autonomic and central nervous system functions, somatomotor activity and behavior patterns. Observations will be recorded.

7.6.2 Body Weights:

Daily body weights will be recorded individually (to the nearest 0.1 gram PND 22-42, with the exception of the weight collected the day prior to dosing and the final body weight) beginning one day prior to the start of dosing. Final body weights will be collected prior to euthanasia.

7.6.3 Vaginal Perforation:

Each female pup (15/group) will be observed daily for vaginal perforation beginning on PND 25 (Adams, 1985). Examination of the females will continue daily until vaginal perforation is present. The body weight of each female will be recorded on the day of acquisition of vaginal perforation.

7.6.4 Determination of Estrous Cycles:

Daily vaginal lavages will be performed to determine the stage of estrus beginning on the day vaginal perforation is observed. Lavages will continue through the day of necropsy. The mean age of first estrous will be determined.

7.7 Euthanasia:

On PND 42, the animals will be euthanized by carbon dioxide inhalation, and the time of euthanasia will be recorded for each animal. Any animals not expected to survive until the following dosing period or until the scheduled euthanasia will be euthanized as described above.

8 HOROMONE ANALYSIS:

8.1 Thyroid Hormones:

Following euthanasia, blood will be collected from the vena cava of all animals. Following collection, all blood samples will be allowed to clot and then be placed in an ice bath and processed to generate serum. The following hormone concentrations will be determined from all serum samples:

Thyroid Stimulating Hormone (TSH) Thyroxine (T_4)

9 ANATOMIC PATHOLOGY:

9.1 Macroscopic Examination:

A complete necropsy examination will be conducted on all animals dying spontaneously or euthanized *in extremis*. This will include examination of the external surface, all orifices, the external surface of the brain and spinal cord and the thoracic, abdominal and pelvic cavities including viscera. A complete necropsy will not be conducted on animals surviving to study termination. The following tissues will be collected and placed in 10% neutral-buffered formalin:

Cervix and Uterine Body (two sections)	Thyroid
Ovaries	Uterine horns (four sections per horn)
Pituitary	Vagina
	All gross (internal) lesions

9.2 Organ Weights:

9.2.1 Uterine Weights:

Wet and blotted uterine weights will be measured for all animals surviving to the scheduled necropsy. Uterine weights will not be collected for any animals found dead or euthanized *in extremis*.

The uterus will be harvested from all animals using the following procedure. The harvesting of uteri will be performed in the same sequence as which dosing occurred. The pubic symphysis will be opened and each ovary and uterine horn will be detached from the dorsal abdominal wall. The ovaries are separated from the uterine horns at the oviduct/uterus junction. The urinary bladder and ureters will be removed from the ventral and lateral side of the uterus and vagina. The fibrous adhesion between the rectum and vagina is then detached until the junction of the vaginal orifice and perineal skin is identified. The uterus and vagina are detached from the body by incising the vaginal wall just above the junction between the perineal skin. The excess fat and adnexa will be trimmed away. The vagina is then removed from the uterus, leaving the cervix intact and attached to the uterus for uterus weight measurement. Care is to be taken during uterus harvesting such that the luminal contents are retained. A record will be made if any luminal contents are lost. The uterus will be transferred to a uniquely marked and tared plastic Petri dish with care to avoid desiccation before weighing. The Petri dish should be lined with saline-moistened filter paper (or equivalent) and covered to minimize desiccation.

The uterus harvesting and weighing procedure will be done in the order described below.

1. Animal is euthanized and uterus harvested.
2. Uterus (with luminal fluid) is immediately transferred to a Petri dish (lined with saline-moistened filter paper or equivalent) that was tared immediately prior to the transfer.
3. The uterus' wet weight is recorded to the nearest 0.1 mg.
4. The uterus is opened and blotted (see below).
5. The uterus is placed in a Petri dish (lined with saline-moistened filter paper or equivalent) that was tared immediately prior to the transfer.
6. The uterus' blotted weight is recorded to the nearest 0.1 mg.

Immediately following collection of the wet weight, the uterus will be individually processed by opening the uterine wall and carefully blotting the excess fluid. Both uterine horns will be pierced and cut longitudinally with small surgical scissors, placed on filter paper (ex. Whatman No. 3) and gently pressed with another piece of dry filter paper to absorb the luminal fluid. The procedure will not be so severe as to render the tissue unacceptable for histopathologic analysis, as this additional investigation may be performed at the discretion of the Sponsor (by protocol amendment).

9.2.2 Ovary, Liver, Kidney, Pituitary, Thyroid and Adrenal Weights:

The following organs from all females euthanized at scheduled termination will be weighed (to the nearest 0.1 mg):

Adrenal glands	Ovaries and oviducts
Kidneys	Pituitary gland
Liver	Thyroid

Paired organs will be weighed together.

To minimize systematic bias in the weighing procedures, organ harvesting and weighing procedures will be divided as equally as possible among the prosecting and weighing technicians, such that all animals from a group are not processed by a single individual.

9.3 Microscopic Examination:

Following collection of wet uterine weight, blotting of the uterus and collection of blotted uterine weight, each uterus will be placed in a uniquely identified jar of 10% neutral-buffered formalin and preserved for microscopic examination.

The vagina, ovaries, and thyroid from each animal will be similarly preserved with the uterus.

Microscopic examination of hematoxylin-eosin stained paraffin sections will be performed on the following tissues from all animals.

Ovaries	Thyroid
Cervix and Uterine Body (two sections)	Uterine Horns (four sections per horn)

10 DURATION OF STUDY:

The conduct of this study will require approximately five weeks for acclimation, dosing and necropsy.

11 STATISTICAL METHODS:

Body weights, body weight gains, organ weights, uterine weights (wet and blotted), luminal fluid weights, mean days of acquisition of vaginal perforation, mean age of first estrous and estrous cycle length will be analyzed by a parametric one-way analysis of variance (ANOVA) (Snedecor, 1980) to determine intergroup difference. If the results of the ANOVA are significant ($p<0.05$), Dunnett's test (Dunnett, 1964) will be applied to the data to compare the treated groups to the control group.

12 QUALITY ASSURANCE:

The study will be audited by the WIL Quality Assurance Unit while in progress to assure compliance with the study protocol and protocol amendments, WIL Standard Operating Procedures and the appropriate provisions of EPA/TSCA and FIFRA Good Laboratory Practice Standards published in the Federal Register (40 CFR Part 792 and 40 CFR Part 160) and the OECD Good Laboratory Practice Regulations [C (97) 186/Final]. The raw data and draft report will be audited by the WIL Quality Assurance Unit prior to submission to the Sponsor Representative to assure that the final report accurately describes the conduct and the findings of the study.

This study will be included on the WIL master list of regulated studies.

13 RECORDS TO BE MAINTAINED:

All original raw data records, as defined by WIL SOPs and the applicable GLPs, will be stored as described in Section 14 in the Archives at WIL Research Laboratories, Inc.

14 WORK PRODUCT:

The Sponsor will have title to all documentation records, raw data, slides, specimens and other work product generated during the performance of the study. All work product, including raw paper data, pertinent electronic storage media and specimens will be returned to the Sponsor after a period of six months or following issuance of the final report. All work product will be stored in compliance with regulatory requirements.

Any work product, including documents, specimens, and samples, that are required by this protocol, its amendments, or other written instructions of the Sponsor, to be shipped by WIL Research Laboratories, Inc. to another location will be appropriately packaged and labeled as defined by WIL's SOPs and delivered to a common carrier for shipment. WIL Research Laboratories, Inc. will not be responsible for shipment following delivery to the common carrier.

15 REPORTS:

The final report will consist of an abbreviated summary report, including data tables and an interpretation and discussion of the study results.

WIL Research Laboratories will submit one copy of an audited draft report in a timely manner upon completion of data collection prior to issuance of the final report. One revision will be permitted as part of the cost of the study, from which the Sponsor's reasonable revisions and suggestions will be incorporated into the final report, as appropriate. Additional changes or revisions may be made, at extra cost. It is expected that the Sponsor will review the draft report and provide comments to WIL within a two-month time frame following submission. WIL will submit the final report within one month following receipt of comments. If the Sponsor's comments and/or authorization to finalize the report have not been received at WIL within one year following submission of the draft report, WIL may elect to finalize the report following appropriate written notification to the Sponsor. Two electronic copies (PDF) of the final report on CD-R will be provided. Requests for additional paper copies of the final report may result in additional charges.

16 ANIMAL WELFARE ACT COMPLIANCE:

This study will comply with all applicable sections of the Final Rules of the Animal Welfare Act regulations (9 CFR Parts 1, 2 and 3). The Sponsor should make particular note of the following:

- The Sponsor Representative's signature on this protocol documents for the Study Director the Sponsor's assurance that the study described in this protocol does not unnecessarily duplicate previous experiments.

- Whenever possible, procedures used in this study have been designed to avoid or minimize discomfort, distress or pain to animals. All methods are described in this study protocol or in written laboratory Standard Operating Procedures.

- Animals that experience severe or chronic pain or distress that cannot be relieved will be painlessly euthanized as deemed appropriate by the veterinary staff and Study Director. The Sponsor will be advised by the Study Director of all circumstances which could lead to this action in as timely a manner as possible.

- Methods of euthanasia used during this study are in conformance with the above-referenced regulation.

- The Sponsor/Study Director has considered alternatives to procedures that may cause more than momentary or slight pain or distress to the animals and has provided a written narrative description (AWA covered species) of the methods and sources used to determine that alternatives are not available.

17 PROTOCOL MODIFICATION:

Modification of the protocol may be accomplished during the course of this investigation. However, no changes will be made in the study design without the written permission of the Sponsor. In the event that the Sponsor requests or approves a change in the protocol, such changes will be made by appropriate documentation in the form of protocol amendment. All alterations of the protocol and reasons for the modification(s) will be signed by the Study Director and the Sponsor Representative.

F. Study Protocol 288

1. SUMMARY

1.1. OBJECTIVE

The objective of the study was to evaluate the ability of the test articles to induce effects on pubertal development in the intact juvenile female rat.

1.2. STUDY DESIGN

[ ] or [ ], in the vehicle, Mazola® corn oil, was administered orally by gavage once daily for 20 consecutive days to three groups each of 15 Crl:CD®(SD)[1] immature female rats. Dosage levels for each test article were 60, 250 and 1000 mg/kg/day, and the dosage volume was 5 mL/kg. A concurrent control group received the vehicle on a comparable regimen. These dosage levels were determined from the results of previous studies and were provided by the sponsor representative after consultation with the WIL study director.

Dosing procedures were performed from November 26 through December 17, 2004, when the animals were 22 to 41 days of age; the study start was staggered, based on age. At the initiation of dose administration, body weights ranged from 43.9 g to 70.2 g. The following table presents the study group assignment:

Group Number	Test Article	Dosage Level (mg/kg/day)	Dose Concentration (mg/mL)	Dose Volume (mL/kg)	Number of Females
1	Corn Oil	0	0	5	15
2	[ ]	60	12	5	15
3	[ ]	250	50	5	15
4	[ ]	1000	200	5	15
5	[ ]	60	12	5	15
6	[ ]	250	50	5	15
7	[ ]	1000	200	5	15

Due to spacing constraints, the dose group names are presented on the tables and figures as corn oil, [ ]/60, [ ]/250, [ ]/1000, [ ]/60, [ ]/250 and [

[1] Prior to January 1, 2005, this strain of rat was designated the Crl:CD®(SD)IGS BR rat.

]/1000 for the vehicle control, 60, 250 and 1000 mg/kg/day [ ] and 60, 250 and 1000 mg/kg/day [ ] groups, respectively.

Preparation, storage and sampling of the control and test article formulations were conducted as follows. For the control group, the appropriate amount of the vehicle (100% pure corn oil, exp. dates 2/17/06, 3/19/06 and 4/6/06) was dispensed into a storage container and stirred throughout use. The [ ] and [ ] dosing formulations were prepared by weighing an appropriate amount of test article for each group into a tared, calibrated storage container. A stir bar and approximately 80% of the vehicle were added to the storage container, and the mixture was stirred until uniform. The appropriate volume of vehicle was added to bring each formulation to the calibration mark, and the preparations were stirred until uniform and throughout use. The [ ] and [ ] dosing formulations were prepared approximately weekly, divided into aliquots for daily dispensation and stored at room temperature. Three samples from the control group and three sets of samples from the test article formulations were collected prior to the initiation of dose administration. Two sets of samples for concentration verification were collected on each day of preparation and two sets were collected on the last day of use of each preparation. Two sets of homogeneity/stability samples and six sets of concentration samples were shipped under ambient conditions to the sponsor for homogeneity, stability and concentration analyses; the remaining samples were stored under normal laboratory conditions at WIL Research Laboratories, LLC, for possible future analysis.

Thirteen dams with 10 female pups each (130 pups total) were received from Charles River Laboratories, Inc., Raleigh, North Carolina, on November 9, 2004. The pups were 3 to 5 days old upon receipt. Pups were initially identified by tail tattoo, housed in plastic maternity cages (by litter with their own or a fostering dam) during the acclimation period (17 to 19 days) until randomization of the pups on postnatal day (PND) 21. Following randomization, the female pups were weaned, identified by metal eartag and housed three per cage in plastic maternity cages. Environmental controls were set to

maintain an average daily temperature of 71±5°F and an average daily relative humidity of 50±20%. Actual mean daily temperatures ranged from 70.4°F to 70.8°F (21.3°C to 21.6°C) and mean daily relative humidity ranged from 36.0% to 46.6%. Light timers were calibrated to provide a 12-hour light (6 a.m. to 6 p.m.)/12-hour dark photoperiod. Air handling units were set to provide approximately 10 fresh air changes per hour. PMI Nutrition International, LLC, Certified Rodent LabDiet® 5002 and reverse-osmosis-purified water were offered *ad libitum*.

All animals were observed twice daily for appearance, behavior, mortality and moribundity. A detailed physical examination was performed at the time of randomization. The rats were also observed daily (prior to dosing). Clinical findings at the time of dose administration and approximately 1 hour following dose administration were recorded when observed. Individual body weights were recorded daily. Each female pup was observed daily for vaginal patency beginning on PND 25 (Adams, *et al.*, 1985). Examination continued daily until vaginal patency was observed. Body weights were recorded on the day that vaginal patency was noted. Beginning on the day that vaginal patency was observed, vaginal lavages were performed daily, through the day of euthanasia, and the slides were examined to determine the stage of estrus. The mean estrous cycle length was calculated and reported for complete estrous cycles (*i.e.*, the total number of returns to metestrus [M] or diestrus [D] from estrus [E] or proestrus [P] until the day of euthanasia), beginning on the day vaginal patency was observed. Estrous cycle length was determined by counting the number of days from the first M or D in a cycle to the first M or D in a subsequent cycle. In addition, the mean age at the onset of the first estrous cycle was calculated using the first day each animal was observed to be in estrus. A gross necropsy was performed only on animals that were found dead or euthanized *in extremis*. All surviving animals were euthanized on PND 42 by carbon dioxide inhalation; blood was collected via the vena cava for evaluation of serum thyroxine (T_4) and thyroid stimulating hormone (TSH) levels. The uterus (wet and blotted), kidneys, liver, ovaries and oviducts, adrenal glands, pituitary gland and thyroid

glands were weighed. Luminal fluid weight was calculated by subtracting the blotted uterus weight from the wet uterus weight. The ovaries, uterus (horns and body), cervix, vagina, pituitary gland, thyroid glands and gross lesions were retained from all females, including those found dead.

Statistical tests were performed using appropriate computing devices or programs. Analyses were conducted using two-tailed tests for minimum significance levels of 1% and 5%, comparing each test article-treated group to the control group. Each mean was presented with the standard deviation (S.D.) and the number of animals (N) used to calculate the mean. Mean body weights, body weight changes, days of acquisition of vaginal patency, estrous cycle lengths, ages at the first occurrence of estrus, luminal fluid weights and absolute and relative organ weights were subjected to a parametric one-way analysis of variance (ANOVA; Snedecor and Cochran, 1980) to determine intergroup differences. If the ANOVA revealed statistically significant ($p<0.05$) intergroup variance, Dunnett's test (Dunnett, 1964) was used to compare the test article-treated groups to the control group.

1.3. KEY STUDY DATES

Date(s)	Event(s)
November 9, 2004	Experimental starting date (animal receipt)
November 26, 2004	Experimental start date (first day of dose administration)
November 26 - December 17, 2004	Test article administration
December 30, 2004	Experimental termination/completion date (last analytical analyses)

1.4. DATA RETENTION

The sponsor has title to all documentation records, raw data, specimens or other work product generated during the performance of the study. All work product generated by WIL Research Laboratories, LLC, including raw paper data and specimens, are retained in the Archives at WIL Research Laboratories, LLC, as specified in the study protocol. Data generated by the sponsor will be archived by the sponsor or the sponsor's designee.

Reserve samples of the test articles, pertinent electronic storage media and the original final report are retained in the Archives at WIL Research Laboratories, LLC in compliance with regulatory requirements.

1.5. RESULTS - [ ]

Female no. 69638-07 in the 1000 mg/kg/day [ ] group was euthanized *in extremis* near the end of the dose administration period at 40 days of age; no internal findings were noted at necropsy. This female had labored respiration, red material around the eyes, nose and/or mouth and was gasping at the daily examinations on PND 38, 39 and/or 40. At the time of dose administration and/or 1 hour following administration, this female had salivation and/or clear material around the mouth and was wiping its mouth on the walls and/or floor occasionally throughout the study. This female lost 21 g of body weight at 37-40 days of age. At necropsy, this female was internally normal. The moribund condition of this animal was attributed to the test article. All other animals in the [ ]-treated groups survived to the scheduled euthanasia. Test article-related salivation and/or clear material around the mouth and wiping the mouth on the cage floor and/or walls were observed at the time of and 1 hour following dose administration in the 250 and 1000 mg/kg/day [ ] groups. These findings did not persist to the daily observations and were not considered adverse. One female in the 1000 mg/kg/day [ ] group had hypoactivity and hypothermia (body cool to the touch) and was pale at 33, 34 and/or 35 days of age. These findings were considered test article-related because this female also lost weight during this period. However, they were not considered adverse because the female was clinically normal and gained weight during the remainder of the study. Salivation prior to dose administration occurred once or twice in up to four animals in the 60 mg/kg/day [ ] group. This finding was considered test article-related but not adverse. No other [ ]-related findings were observed.

Mean body weight gains in the 1000 mg/kg/day [ ] group were reduced compared to the control group values following the first 2 days of dose administration. The differences were statistically significant ($p<0.05$ or $p<0.01$) on PND 22-23 and 23-24.

Throughout the remainder of the dosing period, mean body weight gains in this group were generally similar to those in the control group. However, occasional decreases in mean body weight gains were observed; the difference during PND 31-32 was statistically significant ($p<0.01$) compared to that in the control group. When the entire treatment period (PND 22-42) was evaluated, mean body weight gain in the 1000 mg/kg/day [ ] group was statistically significantly ($p<0.05$) reduced compared to the control group value. Mean body weights in this group were 4.6% to 10.6% lower than the control group values from PND 24-42. The differences were statistically significant ($p<0.05$) on PND 38 and 39. Mean body weights and body weight gains in the 60 and 250 mg/kg/day [ ] groups were similar to those in the control group throughout the study; none of the differences were statistically significant.

Vaginal patency in the 250 and 1000 mg/kg/day [ ] groups was achieved at an earlier age than in the control group; the differences were significant ($p<0.01$). Mean ages of acquisition were 31.8, 31.1, 27.0 and 26.1 days in the control, 60, 250 and 1000 mg/kg/day [ ] groups, respectively. The values in the 60, 250 and 1000 mg/kg/day [ ] groups were below the minimum mean value in the WIL historical control data (31.7 days); however, the 60 mg/kg/day [ ] value was considered similar to the concurrent control group value. Because the females were younger on the day that vaginal patency was observed, mean body weights at the age of acquisition in the 250 and 1000 mg/kg/day [ ] groups were also lower (statistically significant, $p<0.01$) than the control group value. These differences were consistent with an interpretation of estrogenic effects resulting from the test article.

No differences in mean estrous cycle length were observed when the [ ]-treated groups were compared to the control group. Estrous cycle lengths in females of this age are highly variable. In the 1000 mg/kg/day [ ] group, estrous cycle length could only be determined for six females due to an increase in the number of females in persistent diestrus following vaginal opening; persistent diestrus in these females was attributed to the test article. The age of the first occurrence of estrus in the 60, 250 and

1000 mg/kg/day [ ] groups was earlier (32.9, 32.9 and 32.4 days of age, respectively) than in the control group (34.1 days of age); the differences were not statistically significant. While vaginal patency was observed approximately 4.5 days earlier (observed in all females by 28 days of age) in the 1000 mg/kg/day [ ] group, the age at the first occurrence of estrus in this group was PND 38 or later for four females; four other females in this group had no occurrence of estrus prior to euthanasia.

Mean total T_4 and TSH levels in the 60, 250 and 1000 mg/kg/day [ ] groups were similar to those in the control group.

Test article-related reductions in mean absolute and relative (to final body weight) ovary/oviduct and uterus (wet and blotted) weights were observed in the 1000 mg/kg/day [ ] group; the differences from the control group were statistically significant ($p<0.05$ or $p<0.01$). These decreases in uterus and ovary/oviduct weights corresponded to the increased number of females in persistent diestrus. Luminal fluid data were highly variable; no attempt was made to euthanize the females at the same stage of estrous. However, mean luminal fluid weight in the 1000 mg/kg/day [ ] group was reduced (not statistically significant) compared to the control group value. Mean absolute and relative liver weights in the 1000 mg/kg/day [ ] group were increased compared to the control group values; the differences were statistically significant ($p<0.01$). Mean absolute pituitary gland weight in the 1000 mg/kg/day [ ] group was reduced compared to the control group value (statistically significant, $p<0.01$). Although the relative pituitary weight was similar to that in the control group, the lower mean pituitary weight was attributed to the test article. No test article-related or statistically significant differences in organ weights were observed in the 60 and 250 mg/kg/day [ ] groups.

1.6. CONCLUSIONS - [ ]

Based on the results of this study, the test article, [ ], administered orally to juvenile female rats resulted in estrogenic effects in the 250 and 1000 mg/kg/day groups, as evidenced by early attainment of vaginal patency. The decreased mean ovary and uterus

(wet and blotted) weights, fewer number of animals cycling normally (persistent diestrus) and decreased pituitary weight at 1000 mg/kg/day [ ] were attributed to test article.

1.7. RESULTS - [ ]

Female no. 69629-03 in the 1000 mg/kg/day [ ] group was found dead at 30 days of age, following nine doses. This animal was prostrate immediately following dose administration on the day of death. The only other clinical finding for this female was clear material around the mouth noted at the time of dose administration at 25 days of age. No test article-related decreases in body weight gain were observed for this female prior to death. At necropsy, this female had dark red discoloration of one lobe of the lung. The relationship of this mortality to [ ] administration is unclear. All other animals survived to the scheduled euthanasia. Salivation and/or clear material around the mouth and wiping the mouth on the cage walls and/or floor were observed at the time of dose administration and/or 1 hour following dose administration in the majority of the animals in the 1000 mg/kg/day [ ] group. These findings were attributed to the test article but not considered adverse. Clear material around the mouth and/or salivation prior to dose administration were observed in one or two animals in the 60 and 250 mg/kg/day [ ] groups at the time of dose administration and/or 1 hour following dose administration.

A slight decrease in mean body weight gain was observed in the 1000 mg/kg/day [ ] group following the first day of test article administration (PND 22-23). The difference from the control group value was statistically significant ($p<0.05$). Mean body weight gains in this group were similar to those in the control group throughout the remainder of the study. The reduction in mean body weight gain on PND 22-23 was not of sufficient magnitude to result in any statistically significant decreases in mean body weights in this group throughout the study. Therefore, this transient reduction was not considered adverse. No [ ]-related effects on mean body weights or body weight gains were observed in the 60 and 250 mg/kg/day groups. The only statistically significant ($p<0.05$) difference from the control group was an increase in mean body weight gain in the 250 mg/kg/day [ ] group during PND 30-31.

There were no test article-related effects on the mean age of acquisition of vaginal patency. Vaginal patency was achieved slightly later in the 60, 250 and 1000 mg/kg/day [ ] groups than in the control group. Mean days of acquisition were 31.8, 33.6, 32.8 and 33.4 days in the control, 60, 250 and 1000 mg/kg/day [ ] groups, respectively. However, the differences were not statistically significant, and the values in all [ ]-treated groups were similar to the mean value in the WIL historical control data (33.4 days), and no dose-related trends were evident. Since the females were slightly older on the day that vaginal patency was observed, mean body weights on the day of acquisition in the 60, 250 and 1000 mg/kg/day [ ] groups were also higher than the control group value. The differences were statistically significant ($p<0.05$) in the 60 and 1000 mg/kg/day [ ] groups. None of these differences were attributed to the test article.

No test article-related differences in mean estrous cycle length were observed when comparing the [ ]-treated groups to the control group. The age of the first occurrence of estrus in the 60, 250 and 1000 mg/kg/day [ ] groups was slightly later (36.5, 35.6 and 35.3 days of age, respectively) than in the control group (34.1 days of age). The differences were not statistically significant, but were related to the slightly later age at which vaginal patency was observed compared to the control group.

Mean T_4 and TSH levels in the 60, 250 and 1000 mg/kg/day [ ] groups were similar to the control group values. No statistically significant differences or dose-related trends were evident.

No test article-related or statistically significant differences in organ weights were observed in the [ ]-treated groups. Slight reductions (not statistically significant) in absolute and relative uterus (wet and blotted) weights were observed in 1000 mg/kg/day [ ] group. These reductions were attributed to biological variation. Luminal fluid data were highly variable; no statistically significant differences in mean luminal fluid weights were observed in the [ ]-treated groups, and no dose-related trends were evident.

1.8. CONCLUSIONS - [ ]

Based on the results of this study, the test article, [ ], administered orally to juvenile female rats resulted in no estrogenic effects in the 60, 250 and 1000 mg/kg/day groups.

This study was inspected in accordance with the U.S. EPA Good Laboratory Practice Standards (40 CFR Parts 160 and 792), the OECD Principles of Good Laboratory Practice, the standard operating procedures of WIL Research Laboratories, LLC and the sponsor's protocol and protocol amendments with the following exceptions. The data located in Appendices A (Certificates of Analysis) and B (Analytical Chemistry Report) were the responsibility of the sponsor. Quality Assurance findings, derived from the inspections during the conduct of the study and from the inspections of the raw data and draft report, are documented and have been reported to the study director. A status report is submitted to management monthly.

This report accurately reflects the data generated during the study. The methods and procedures used in the study were those specified in the protocol, its amendments and the standard operating procedures of WIL Research Laboratories, LLC.

The raw data, the retention sample(s), and the final report will be stored in the Archives at WIL Research Laboratories, LLC or another location specified by the sponsor.

3.2. APPROVAL

This study was inspected according to the criteria discussed in Section 3.1.

5. DEVIATIONS FROM THE PROTOCOL

This study was conducted in accordance with the protocol and protocol amendments, except for the following.

- **Protocol Section 5.3** states that animals were to be supplied by Charles River Laboratories, Inc., Portage, Michigan. However, animals were received from the Raleigh, North Carolina facility of Charles River Laboratories.
- **Protocol Section 5.4** states that the immature female pups were to be 4-6 days old upon receipt. However, the pups were 3-5 days old at the time of receipt.
- **Protocol Section 5.5** states that the body weight range at randomization was to be 30 g to 50 g and animals assigned to study would weigh ± 5 g of the mean. However, the actual body weights of animals assigned to study were 42 g to 63 g, and individual body weights ranged from -13 g to +8 g of the mean.
- **Protocol Section 7.5.4** states that [ ]was to be notified prior to shipping dosing formulation samples; the notification was to include test article and study identifications. However, the e-mail notifications sent to [ ]on November 8 and 23, 2004, did not include test article identification.
- **Protocol Sections 9.1 and 9.2.2** state that the thyroid glands were to be retained and weighed. However, the thyroid glands from female no. 69636-09 (control group) and 69626-08 (60 mg/kg/day [ ] group, left thyroid gland only) were lost at necropsy, and therefore were not retained or weighed.
- **Protocol Section 9.2.1** states that the harvesting of uteri was to be performed in the same sequence as the animals were dosed. Due to the normal diurnal fluctuation in circulating concentrations of thyroid hormone levels, the necropsy order was randomized to minimize the potential effect, across all groups, that the time of day of sample collection may have had on thyroid hormone levels.

These deviations did not negatively impact the quality or integrity of the data nor the outcome of the study.

ABSTRACT

Samples of suspensions ([redacted]4 and [redacted]5 in corn oil) used in a female pubertal assay in rats, WIL Research Study #WIL-187042 ([redacted]; Reference #04-027), were analyzed at [redacted]n [redacted]y to verify their homogeneity, stability, and nominal concentrations. A direct dilution procedure was employed to prepare the samples for elemental analysis by Inductively Coupled Plasma-Atomic Emission Spectroscopy (ICP-AES). Homogeneity and stability of [redacted]4 and [redacted]5 in corn oil were established. The nominal concentrations of all dosing suspensions were verified by the analytical data.

TEST SUBSTANCES

The test substances used in the preparation of the dosing suspensions are identified as [redacted] and [redacted]. The CAS numbers are confidential; contac[redacted]for further information. The test substances were characterized and their stabilities were established prior to the initiation of the study.

INTRODUCTION

The purpose of this analytical study was the determination and verification of test substance homogeneity, stability, and concentration in corn oil. The concentration study samples were aliquots taken from mixtures prepared as dosing suspensions for a female pubertal assay in rats as outlined in the protocol for WIL Research Study #WIL-187042.

The analytical portion of the study was performed by the High Volume Services team located in the [redacted]es [redacted]group at [redacted]y [redacted]. The analytical start and end dates were 11 November 2004 and 30 December 2004 respectively.

EXPERIMENTAL

SAMPLES
Samples were shipped from WIL Research to [redacted]; Principal Investigator. Samples were stored at room temperature and in the dark prior to analysis.

The first batch of samples was transferred to the laboratory and analyzed on 11 November 2004. The analysis of the last set of samples was completed on 21 December 2004. Test substance and corn oil densities were determined on 30 December 2004.

STANDARDS
Calibration standards for the ICP-AES were made from certified commercially prepared elemental concentrates (Conostan Division of Conoco, Inc.). Standard preparation data is archived by [redacted]

[redacted]

[redacted]

ANALYTICAL METHOD
Samples were prepared as stated in [redacted] Test Code 30176, SOP ME-125 "Elemental Analysis of Additives or Additive Mixtures by Direct Dilution and ICP Analysis." The procedures outlined in SOP EQ-130, "IRIS Intrepid XDL II Radial Inductively Coupled Plasma Spectrometer," were followed during the instrumental analysis of the samples.

The approach employed in this method was to verify concentration based on the known elemental composition of [redacted]. Aliquots of the dosing suspensions were diluted in an o-xylene diluent and the elemental composition was determined by ICP-AES. The calcium concentration of the samples was then used to ascertain the concentration of the test substance in the dosing suspensions.

DISCUSSION

METHOD VALIDATION
Method validation was performed following the recommendations outlined in the International Conference on Harmonisation's Q2B document: Guideline on the Validation of Analytical Procedures: Methodology. The limit of detection (LOD) and limit of quantitation (LOQ) were calculated to be 0.063 and 0.192 wt ppm calcium respectively. A reporting limit of 2 wt ppm calcium was determined to be appropriate for vehicle results.

SAMPLE ANALYSIS
The analytical results for the suspensions of [redacted] in corn oil are summarized in the tables located on pages 8 through 13. Seven calibration standards were analyzed to generate a linear calibration curve with inverse concentration weighting. All instrument control checks and quality control samples were within acceptable limits. Known amounts of calcium were spiked into 31 samples throughout the duration of the study and gave acceptable percent recoveries of 96 to 106%.

The dosing suspensions were analyzed for calcium, an element present in known concentrations in the test substances. Dosing suspension estimates of weight percent calcium were derived by the following formula:

$$Wt\%\ Ca = \left[\frac{x}{x + \left(D_2 - \frac{xD_2}{D_1}\right)}\right] \%\ Ca\ in\ [redacted]$$

where x is the solute test substance concentration in mg/µL; D_1 is the test substance density (0.9397 g/mL for [redacted] and 0.9103 g/mL for [redacted]); and D_2 is the vehicle or solvent density (corn oil, 0.9193 g/mL). The concentration of calcium in [redacted] is 4.004 wt% and 2.585 wt% in [redacted]. The measured results of calcium were obtained by ICP-AES, converted to wt% from ppm by multiplying by 10^{-4}, and then compared against the estimated values.

Homogeneity was confirmed if the percent differences between the overall dose level mean and individual strata means were 10% or less. Stability and concentration data were evaluated using percent difference. The acceptable tolerance was 15%.

[redacted]

[redacted]

RESULTS AND CONCLUSIONS

The confirmation of dosing suspension homogeneity is supported by the data presented on pages 8 and 9. The percent difference of all strata means with their respective overall mean is well below the 10% tolerance

The stabilities of [redacted] in corn oil over a 12-day period are established on pages 10 and 11. The percent difference between the estimated and measured concentrations is less than 15% for all dosing levels.

The analytical result summaries for the concentration studies are found on pages 12 and 13. The nominal concentrations of all dosing suspensions were verified by the analytical data. The percent difference between the estimated and measured concentrations is less than 15% for all dosing levels.

ARCHIVES

SAMPLES
The unused portion of all samples shall be stored in room [redacted] for a minimum of one year after the final analytical report is issued.

RAW DATA
Calibration data; and instrument, chemical, and standard logbook documentation shall be archived by [redacted] as facility records [redacted]. All other raw data shall be archived in the Analytical Study File in [redacted]; Analytical Study Archives.

FINAL REPORT
A copy of the final report shall be archived with the Analytical Study File in [redacted]

PROTOCOL AND SOP DEVIATIONS

Due to laboratory scheduling conflicts, the stability of the test substances in corn oil was evaluated over a 12-day period instead of 10 days as specified in the protocol. This did not affect the outcome of the analytical study.

SOP ME-125 states a duplicate sample shall be prepared for every batch of 20 samples. Only one duplicate was prepared over the course of the study instead of the expected 12. All QCs and instrument control samples were within acceptable limits. This did not affect the outcome of the analytical results.

APPENDIX D

Clinical Pathology Methods, Procedures And References

CLINICAL PATHOLOGY METHODS, PROCEDURES AND REFERENCES

Immunoassay- DPC Immulite®

Total T4 - Solid-phase, chemiluminescent enzyme immunoassay for the quantitative measurement of total circulating thyroxide. Default unit: µg/dL.

Immunoassay-GAMMA-C12 Gamma Counter

Rat Thyroid Stimulating Hormone (rTSH) - ^{125}I assay system with magnetic separation for the quantitative measurement of (rTSH). DPC GAMMA C-12 gamma counter. Biotrak™ rat thyroid stimulating hormone ^{125}I assay system. Amersham Pharmacia Biotech. Package insert.

References:

Immulite®. Diagnostics Products Corporation. Package Insert.

APPENDIX F

Study Protocol

[redacted]

Study Number: WIL-187042

PROTOCOL AMENDMENT II

Sponsor: [redacted]

Sponsor Study No.: 04-027

A. Title of Study:

A Female Pubertal Assay of [redacted] and [redacted] Administered Orally in Juvenile Female Rats

B. Protocol Additions:

1) **9.1** **Macroscopic Examination:**

Change cervix and uterine body (two sections) to cervix and uterine body (one longitudinal section)

2) **9.3** **Microscopic Examination:**

Change cervix and uterine body (two sections) to cervix and uterine body (one longitudinal section)

C. Reasons for Protocol Modifications:

1 & 2) The procedure for sectioning the cervix and uterine body has been revised.

Approved By:

[redacted]

Sponsor Representative — 3 January 2005 Date

Prepared By:

WIL Research Laboratories, LLC

[redacted]

Study Director — 12/21/2004 Date

[redacted]

Director, Developmental and Reproductive Toxicology — 12-21-04 Date

Study Number: WIL-187042

PROTOCOL AMENDMENT I

Sponsor: [redacted]

Sponsor Study No.: 04-027

A. Title of Study:

A Female Pubertal Assay of [redacted] and [redacted] Administered Orally in Juvenile Female Rats

B. Protocol Addition:

1) **3. STUDY SCHEDULE:**

Proposed Experimental Start Date:	November 26, 2004
Proposed Experimental Termination/Completion Date:	December 18, 2004
Proposed Audited Report Date:	February 25, 2005

2) **5.4 Number on Study:**

The second sentence is replaced as follows:

The immature females were 3-5 days old upon receipt.

C. Reasons for Protocol Modifications:

1) The Proposed Experimental Start Date and Proposed Experimental Termination/Completion Date have been revised and the Proposed Audited Report Date has been added.

2) The age of the immature females upon receipt has been corrected.

PROTOCOL

A FEMALE PUBERTAL ASSAY OF [redacted] AND [redacted] ADMINISTERED ORALLY IN JUVENILE FEMALE RATS

Sponsor Study Number: 04-027

Submitted To:

[redacted]

WIL Research Laboratories, LLC
1407 George Road
Ashland, OH 44805-9281

1 OBJECTIVE:

The objective of this study is to evaluate the ability of the test articles to induce effects on pubertal development in the intact juvenile female rat.

2 PERSONNEL INVOLVED IN THE STUDY:

2.1 Sponsor Representative:

[redacted]

2.2 WIL Study Director:

[redacted]

2.3 WIL Deputy Director:

[redacted]

2.4 WIL Departmental Responsibilities:

[redacted]
President, Director

Director, Informational Systems

[redacted]
Director, Regulatory Affairs and Services

[redacted]
Manager, Gross Pathology and
Developmental Toxicology Laboratory

[redacted]
Manager, Quality Assurance

[redacted]
Director, Metabolism and Analytical Chemistry

[redacted]
Clinical Veterinarian

[redacted]
Assistant Director, Anatomic Pathology

3 STUDY SCHEDULE:

Proposed Animal Receipt Date: (Experimental Starting Date)	November 9, 2004
Proposed Experimental Start Date:	November 25, 2004
Proposed Experimental Termination/Completion Date:	December 17, 2004
Proposed Audited Report Date:	To be determined.

4 TEST ARTICLE DATA:

4.1 Identification:

[redacted]

4.1.1 Lot Number:

[redacted]

4.1.2 Purity:

100%

4.1.3 Stability:

The test article is considered to be stable under the storage conditions provided by the Sponsor.

4.1.4 Physical Description:

Brown, viscous liquid.

4.1.5 Storage Conditions:

Store at ambient conditions under nitrogen.

4.1.6 Reserve Samples:

Reserve samples of the test article will be taken in accordance with WIL Standard Operating Procedures and stored in the Archives at WIL Research Laboratories, LLC indefinitely unless otherwise specified.

4.1.7 Personnel Safety Data:

To be provided by the Sponsor. It is the responsibility of the Sponsor to notify the testing facility of any special handling requirements for the test article. A material safety data sheet (MSDS) should accompany the test article upon arrival at the laboratory.

4.2 Identification:

[redacted]

4.2.1 Lot Number:

[redacted]

4.2.2 Purity:

100%

4.2.3 Stability:

The test article is considered to be stable under the storage conditions provided by the Sponsor.

4.2.4 Physical Description:

Black, viscous liquid.

4.2.5 Storage Conditions:

Store at ambient conditions under nitrogen.

4.2.6 Reserve Samples:

Reserve samples of the test article will be taken in accordance with WIL Standard Operating Procedures and stored in the Archives at WIL Research Laboratories, LLC indefinitely unless otherwise specified.

4.2.7 Personnel Safety Data:

To be provided by the Sponsor. It is the responsibility of the Sponsor to notify the testing facility of any special handling requirements for the test article. A material safety data sheet (MSDS) should accompany the test article upon arrival at the laboratory.

5 TEST SYSTEM:

5.1 Species:

Rat

5.2 Strain:

Sprague-Dawley Crl:CD®(SD)IGS BR

5.3 Source:

Charles River Laboratories
Portage, Michigan

5.4 Number on Study:

105 Females (maximum of 130 immature females and 13 dams purchased). Immature females will be supplied in litters of 10 animals with their own or another (fostering) dam. The immature females will be 4-6 days old upon

receipt. Animals not assigned to the study will be transferred to the stock animal colony or will be euthanized by carbon dioxide inhalation and the carcasses discarded. Following weaning, the dams will be euthanized by carbon dioxide inhalation and discarded.

5.5 Body Weight Range:

At randomization: 30-50 g. All animals assigned to study will be approximately ± 5 g of the mean.

5.6 Age:

At start of dosing animals will be 22 days of age.

5.7 Identification System:

The maternal animals will be uniquely identified by a Monel® metal eartag displaying the animal number. The pups will be identified by tail tattoo. Individual cage cards will be affixed to each cage and will display the animal number, group number, study number, dosage level and sex of the animal.

5.8 Justification for Selection:

This species and strain of animal is recognized as appropriate for reproduction studies. WIL Research Laboratories, LLC has reproductive historical control data in this species and strain of rat. This animal model has been proven to be susceptible to the effects of reproductive toxicants. This number of animals is considered the minimum number required for meaningful interpretation of the data and fulfillment of agency requirements.

6 SPECIFIC MAINTENANCE SCHEDULE:

6.1 Animal Housing:

All animals will be initially housed by litter with their own or another (fostering) dam in plastic maternity cages containing ground corncob nesting material (Bed-O'Cobs®). Following randomization, the juvenile female animals will be weaned and housed three animals per cage in plastic maternity (shoebox) cages. The cage bedding will be changed at least three times each week. The cages will be subjected to routine cleaning at a frequency consistent with maintaining good animal health and WIL Standard Operating Procedures. The facilities at WIL Research Laboratories, LLC are fully accredited by the Association for Assessment and Accreditation of Laboratory Animal Care International (AAALAC International).

6.2 Environmental Conditions:

Controls will be set to maintain an average daily temperature of 71 ± 5°F (22 ± 3°C) and an average daily relative humidity of 50 ± 20%. Temperature and relative humidity will be monitored continuously. Data for these two parameters will be scheduled for automatic collection on an hourly basis. Fluorescent lighting controlled by light timers will provide illumination for a 12-hour light/dark photoperiod. Temporary adjustments to the light/dark cycles may be made to accommodate protocol-specified activities. The ventilation rate will be set at a minimum of 10 room air changes per hour, 100% fresh air.

6.3 Drinking Water:

Reverse osmosis-purified water will be available *ad libitum*. Filters servicing the automatic watering system are changed regularly according to WIL Standard Operating Procedures. The municipal water supplying the laboratory is analyzed according to WIL Standard Operating Procedures on a routine basis to assure that contaminants are not present in concentrations that would be expected to affect the outcome of the study.

6.4 Basal Diet:

PMI Nutrition International, LLC Certified Rodent LabDiet® 5002 will be offered *ad libitum* during the study. Periodic analyses of the certified feed are performed by the manufacturer to ensure that heavy metals and pesticides are not present at concentrations that would be expected to affect the outcome of the study. Results of the analyses are provided to WIL Research Laboratories, LLC by the manufacturer and will be placed in the study records. Feeders will be changed and sanitized once per week.

7 EXPERIMENTAL DESIGN:

7.1 Animal Receipt and Quarantine:

Each animal will be inspected by a qualified technician upon receipt. Rats judged to be in good health and suitable as test animals will be immediately placed in quarantine for a minimum of nine days. All rats will be initially sexed and weighed. Maternal animals will be permanently identified with a metal ear tag, and juvenile animals will be identified by tail tattoo. During the quarantine period, each rat will be observed twice daily for changes in general appearance and behavior. Prior to the start of the in-life phase, those animals judged to be suitable test subjects will be identified and receive a detailed physical examination at the time of animal selection for randomization.

7.2 Randomization:

At the conclusion of the quarantine period (animals approximately 21 days of age), animals judged to be suitable test subjects and meeting acceptable body weight requirements, will be assigned at random using a computer program. At that time, the animal numbers and corresponding body weights will be entered into the WIL Toxicology Data Management System (WTDMS™). A printout containing the animal numbers and individual group assignments will be generated based on body weight stratification into a block design. Animals will then be weaned and arranged into the groups according to the printout. Each of 7 groups will consist of fifteen females. If after randomization statistically significant differences between groups exist, new randomizations will be generated until group mean body weights are homogeneous.

7.3 Route and Rationale of Test Article Administration:

The route of administration will be oral (gavage). Historically, this route has been used extensively for studies of this nature. Appropriate-sized flexible, disposable plastic dosing cannulae will be used for the oral administration by gavage. Any losses or incomplete dosing will be recorded.

7.4 Organization of Test Groups, Dosage Levels and Treatment Regimen:

7.4.1 Organization of Test Groups:

The dosage levels were determined from the results of previous studies and were provided by the Sponsor Representative after consultation with the WIL Study Director. The following table presents the study group arrangement.

Group Number	Test Article	Dosage Level (mg/kg/day)	Dose Concentration (mg/mL)	Dose Volume (mL/kg)	Number of Females
1	Corn Oil	0	0	5	15
2	[redacted]	60	12	5	15
3	[redacted]	250	50	5	15
4	[redacted]	1000	200	5	15
5	[redacted]	60	12	5	15
6	[redacted]	250	50	5	15
7	[redacted]	1000	200	5	15

7.4.2 Vehicle Control Article:

Corn oil

7.4.3 Treatment Regimen:

The test and control articles will be administered as single daily doses beginning on day 22 of age and continuing through 41 days of age. All animals will be dosed at approximately the same time each day, and the time of dosing will be recorded for each animal.

7.4.4 Adjustment of Dosages:

Individual doses will be calculated based on each daily body weight to provide the proper dosage. Individual animal body weights and individual animal dosages will be recorded.

7.5 Preparation and Analysis of Test Article Formulations:

7.5.1 Method and Frequency of Preparation:

Based on the physical characteristics of the test article, appropriate methods will be used to ensure the best possible formulations of the test article in the vehicle. Dosing formulations of the test article will be prepared weekly. The study director or the deputy director or designee will visually inspect the formulations prior to initiation of dosing. This visual inspection will be performed to assure that the formulations are visibly homogeneous and acceptable for dosing. Any special procedures required for formulation will be documented according to Good Laboratory Practices and presented in the final report of this study.

7.5.2 Homogeneity and Stability of Test Article Formulation:

Dosing mixture homogeneity will be collected prior to the initiation of test article administration. While undergoing stirring in the beaker, the following sample aliquots (5 mL) will be drawn for analysis: control, three aliquots (from the middle); all treatment groups, nine aliquots (3 each from the top, middle and bottom). Two of the three samples will be sent to [redacted] c/o [redacted] for analysis of homogeneity and stability over a ten-day period. The samples will be shipped under ambient conditions. The remaining sample from each dose level and strata will be stored under normal laboratory conditions for possible future analysis.

7.5.3 Concentration Analysis:

Samples of the dosing mixtures will be collected on the first and last day of each weekly preparation. At each time point, two 5-mL aliquots will be taken from each dose level (middle stratum), including the control

group. The dosing mixture will be thoroughly mixed before taking each sample. One sample from each dose level will be analyzed; the remaining sample will be retained by the Testing Laboratory for possible future analysis.

Dosing mixture samples for homogeneity, stability and concentration of the test article at all dose levels, including the control, will be analyzed by the Sponsor. The methods employed will be one or more of the following:

[redacted] SOP #ME-125

Concentration and stability data will be evaluated using percent difference. The acceptable tolerance between the theoretical and measured values is 15%.

Mixtures will be considered homogeneous if the difference between the overall group mean and the strata mean is 10% or less.

7.5.4 Sample Handling and Shipment:

Each 5-mL sample will be placed in a glass vial with a Teflon-lined lid. The vial plus sample weight will be recorded with an accuracy of ± 0.0005 g. Each sample will be stored at ambient temperature. Each sample container will be labeled with the following information:

Accession Number
Sponsor's Reference Number
Testing Laboratory Study Number
Test Article Name
Dose Level (mg/kg)
Dosing Mixture Concentration (mg/mL)
Preparation Date
Sampling Date
Weight of Sample

The sample shall be packed in a suitable container to maintain the temperature conditions specified in Section 4 during transit plus an adequate margin of safety for any transit delays. The sample shall be sent by express courier to:

[redacted] shall be notified in advance of shipping by telefax at [redacted] phone at [redacted] or by email [redacted]. This notification shall include test article and study identification, carrier, and estimated time/date of arrival. Sample shipments shall be accompanied by an inventory sheet describing the samples contained in the shipment with the information described above.

7.6 General Observations During the Experimental Period:

7.6.1 Clinical Signs:

The rats will be observed twice daily for appearance, behavior, moribundity and mortality. A detailed physical examination will be conducted at the time of randomization. Clinical observations regarding general appearance and behavior will be recorded daily prior to dosing. During the treatment period, the rats will be observed also approximately one hour following dosing and the observations will be recorded. Additional post-dosing observation periods may be necessary and will be documented in the study records. Observations shall include, but are not limited to, evaluations for changes in appearance of the skin and fur, eyes and mucous membranes, respiratory, circulatory, autonomic and central nervous system functions, somatomotor activity and behavior patterns. Observations will be recorded.

7.6.2 Body Weights:

Daily body weights will be recorded individually (to the nearest 0.1 gram PND 22-42, with the exception of the weight collected the day prior to dosing and the final body weight) beginning one day prior to the start of dosing. Final body weights will be collected prior to euthanasia.

7.6.3 Vaginal Perforation:

Each female pup (15/group) will be observed daily for vaginal perforation beginning on PND 25 (Adams, 1985). Examination of the females will continue daily until vaginal perforation is present. The body weight of each female will be recorded on the day of acquisition of vaginal perforation.

7.6.4 Determination of Estrous Cycles:

Daily vaginal lavages will be performed to determine the stage of estrus beginning on the day vaginal perforation is observed. Lavages will continue through the day of necropsy. The mean age of first estrous will be determined.

7.7 Euthanasia:

On PND 42, the animals will be euthanized by carbon dioxide inhalation, and the time of euthanasia will be recorded for each animal. Any animals not expected to survive until the following dosing period or until the scheduled euthanasia will be euthanized as described above.

8 HOROMONE ANALYSIS:

8.1 Thyroid Hormones:

Following euthanasia, blood will be collected from the vena cava of all animals. Following collection, all blood samples will be allowed to clot and then be placed in an ice bath and processed to generate serum. The following hormone concentrations will be determined from all serum samples:

Thyroid Stimulating Hormone (TSH) Thyroxine (T_4)

9 ANATOMIC PATHOLOGY:

9.1 Macroscopic Examination:

A complete necropsy examination will be conducted on all animals dying spontaneously or euthanized *in extremis*. This will include examination of the external surface, all orifices, the external surface of the brain and spinal cord and the thoracic, abdominal and pelvic cavities including viscera. A complete necropsy will not be conducted on animals surviving to study termination. The following tissues will be collected and placed in 10% neutral-buffered formalin:

Cervix and Uterine Body (two sections)	Thyroid
Ovaries	Uterine horns (four sections per horn)
Pituitary	Vagina
	All gross (internal) lesions

9.2 Organ Weights:

9.2.1 Uterine Weights:

Wet and blotted uterine weights will be measured for all animals surviving to the scheduled necropsy. Uterine weights will not be collected for any animals found dead or euthanized *in extremis*.

The uterus will be harvested from all animals using the following procedure. The harvesting of uteri will be performed in the same sequence as which dosing occurred. The pubic symphysis will be opened and each ovary and uterine horn will be detached from the dorsal abdominal wall. The ovaries are separated from the uterine horns at the oviduct/uterus junction. The urinary bladder and ureters will be removed from the ventral and lateral side of the uterus and vagina. The fibrous adhesion between the rectum and vagina is then detached until the junction of the vaginal orifice and perineal skin is identified. The uterus and vagina are detached from the body by incising the vaginal wall just above the junction between the perineal skin. The excess fat and adnexa will be trimmed away. The vagina is then removed from the uterus, leaving the cervix intact and attached to the uterus for uterus weight measurement. Care is to be taken during uterus harvesting such that the luminal contents are retained. A record will be made if any luminal contents are lost. The uterus will be transferred to a uniquely marked and tared plastic Petri dish with care to avoid desiccation before weighing. The Petri dish should be lined with saline-moistened filter paper (or equivalent) and covered to minimize desiccation.

The uterus harvesting and weighing procedure will be done in the order described below.

1. Animal is euthanized and uterus harvested.
2. Uterus (with luminal fluid) is immediately transferred to a Petri dish (lined with saline-moistened filter paper or equivalent) that was tared immediately prior to the transfer.
3. The uterus' wet weight is recorded to the nearest 0.1 mg.
4. The uterus is opened and blotted (see below).
5. The uterus is placed in a Petri dish (lined with saline-moistened filter paper or equivalent) that was tared immediately prior to the transfer.
6. The uterus' blotted weight is recorded to the nearest 0.1 mg.

Immediately following collection of the wet weight, the uterus will be individually processed by opening the uterine wall and carefully blotting the excess fluid. Both uterine horns will be pierced and cut longitudinally with small surgical scissors, placed on filter paper

(ex. Whatman No. 3) and gently pressed with another piece of dry filter paper to absorb the luminal fluid. The procedure will not be so severe as to render the tissue unacceptable for histopathologic analysis, as this additional investigation may be performed at the discretion of the Sponsor (by protocol amendment).

9.2.2 Ovary, Liver, Kidney, Pituitary, Thyroid and Adrenal Weights:

The following organs from all females euthanized at scheduled termination will be weighed (to the nearest 0.1 mg):

Adrenal glands	Ovaries and oviducts
Kidneys	Pituitary gland
Liver	Thyroid

Paired organs will be weighed together.

To minimize systematic bias in the weighing procedures, organ harvesting and weighing procedures will be divided as equally as possible among the prosecting and weighing technicians, such that all animals from a group are not processed by a single individual.

9.3 Microscopic Examination:

Following collection of wet uterine weight, blotting of the uterus and collection of blotted uterine weight, each uterus will be placed in a uniquely identified jar of 10% neutral-buffered formalin and preserved for microscopic examination. The vagina, ovaries, and thyroid from each animal will be similarly preserved with the uterus.

Microscopic examination of hematoxylin-eosin stained paraffin sections may be performed on the following tissues from all animals at the discretion of the Sponsor (additional cost).

Ovaries	Thyroid
Cervix and Uterine Body (two sections)	Uterine Horns (four sections per horn)

10 DURATION OF STUDY:

The conduct of this study will require approximately five weeks for acclimation, dosing and necropsy.

11 STATISTICAL METHODS:

Body weights, body weight gains, organ weights, uterine weights (wet and blotted), luminal fluid weights, mean days of acquisition of vaginal perforation, mean age of first estrous and estrous cycle length will be analyzed by a parametric one-way analysis of variance (ANOVA) (Snedecor, 1980) to determine intergroup difference. If the results of the ANOVA are significant ($p<0.05$), Dunnett's test (Dunnett, 1964) will be applied to the data to compare the treated groups to the control group.

12 QUALITY ASSURANCE:

The study will be audited by the WIL Quality Assurance Unit while in progress to assure compliance with the study protocol and protocol amendments, WIL Standard Operating Procedures and the appropriate provisions of EPA/TSCA and FIFRA Good Laboratory Practice Standards published in the Federal Register (40 CFR Part 792 and 40 CFR Part 160) and the OECD Good Laboratory Practice Regulations [C (97) 186/Final]. The raw data and draft report will be audited by the WIL Quality Assurance Unit prior to submission to the Sponsor Representative to assure that the final report accurately describes the conduct and the findings of the study.

Dosing formulation and test article concentration analyses will be conducted following the Standard Operating Procedures of the performing laboratory and in accordance with GLPs. Quality Assurance monitoring of these analyses for SOP and GLP compliance is the responsibility of the performing laboratory. Inspection reports will be supplied to the Study Director. Upon completion of the prescribed activities and submission of the results to the Sponsor and Study Director, the performing laboratory will provide a signed Quality Assurance Statement to the Sponsor (copy to the Study Director). The results will be included in the report.

This study will be included on the WIL master list of regulated studies.

13 RECORDS TO BE MAINTAINED:

All original raw data records, as defined by WIL SOPs and the applicable GLPs, will be stored as described in Section 14 in the Archives at WIL Research Laboratories, LLC.

14 WORK PRODUCT:

The Sponsor will have title to all documentation records, raw data, slides, specimens and other work product generated during the performance of the study. All work product, including raw paper data, pertinent electronic storage media and specimens will be returned to the Sponsor after a period of six months or following issuance of the final report. All work product will be stored in compliance with regulatory requirements.

Any work product, including documents, specimens, and samples, that are required by this protocol, its amendments, or other written instructions of the Sponsor, to be shipped by WIL Research Laboratories, LLC to another location will be appropriately packaged and labeled as defined by WIL's SOPs and delivered to a common carrier for shipment. WIL Research Laboratories, LLC will not be responsible for shipment following delivery to the common carrier.

15 REPORTS:

The final report will consist of an abbreviated summary report, including data tables and an interpretation and discussion of the study results.

WIL Research Laboratories will submit one copy of an audited draft report in a timely manner upon completion of data collection prior to issuance of the final report. One revision will be permitted as part of the cost of the study, from which the Sponsor's reasonable revisions and suggestions will be incorporated into the final report, as appropriate. Additional changes or revisions may be made, at extra cost. It is expected that the Sponsor will review the draft report and provide comments to WIL within a two-month time frame following submission. WIL will submit the final report within one month following receipt of comments. If the Sponsor's comments and/or authorization to finalize the report have not been received at WIL within one year following submission of the draft report, WIL may elect to finalize the report following appropriate written notification to the Sponsor. Two electronic copies (PDF) of the final report on CD-R will be provided. Requests for additional paper copies of the final report may result in additional charges.

16 ANIMAL WELFARE ACT COMPLIANCE:

This study will comply with all applicable sections of the Final Rules of the Animal Welfare Act regulations (9 CFR Parts 1, 2 and 3). The Sponsor should make particular note of the following:

- The Sponsor Representative's signature on this protocol documents for the Study Director the Sponsor's assurance that the study described in this protocol does not unnecessarily duplicate previous experiments.

- Whenever possible, procedures used in this study have been designed to avoid or minimize discomfort, distress or pain to animals. All methods are described in this study protocol or in written laboratory Standard Operating Procedures.

- Animals that experience severe or chronic pain or distress that cannot be relieved will be painlessly euthanized as deemed appropriate by the veterinary staff and Study Director. The Sponsor will be advised by the Study Director of all circumstances which could lead to this action in as timely a manner as possible.

- Methods of euthanasia used during this study are in conformance with the above-referenced regulation.

- The Sponsor/Study Director has considered alternatives to procedures that may cause more than momentary or slight pain or distress to the animals and has provided a written narrative description (AWA covered species) of the methods and sources used to determine that alternatives are not available.

17 PROTOCOL MODIFICATION:

Modification of the protocol may be accomplished during the course of this investigation. However, no changes will be made in the study design without the written permission of the Sponsor. In the event that the Sponsor requests or approves a change in the protocol, such changes will be made by appropriate documentation in the form of protocol amendment. All alterations of the protocol and reasons for the modification(s) will be signed by the Study Director and the Sponsor Representative.

COMPLIANCE STATEMENT

This study, designated WIL-187043, was conducted in compliance with the United States Environmental Protection Agency (EPA) Good Laboratory Practice Standards (40 CFR Part 160), 16 October 1989; the United States Environmental Protection Agency (EPA) Good Laboratory Practice Standards (40 CFR Part 792), 18 September 1989; the Organisation for Economic Cooperation and Development (OECD) Principles of Good Laboratory Practice [C(97) 186/Final], 26 November 1997; the standard operating procedures of WIL Research Laboratories, LLC, and the protocol as approved by the sponsor. Stability of the test article in the dosing formulations was not tested. However, in the professional judgment of the sponsor, the formulations were stable under the conditions of this study because the test article is intended for use at high temperatures under oxidative conditions.

E. Study Protocol 265

1. SUMMARY

1.1. OBJECTIVE

The objective of the study was to evaluate the ability of the test articles to induce effects on pubertal development in the intact juvenile female rat.

1.2. STUDY DESIGN

[ ] or [ ], in the vehicle, Mazola® corn oil, was administered orally by gavage once daily for 20 consecutive days to 3 groups each of 15 Crl:CD®(SD) immature female rats. Dosage levels for each test article were 60, 250 and 1000 mg/kg/day, and the dose volume was 5 mL/kg for all groups. A concurrent control group received the vehicle on a comparable regimen. These dosage levels were determined from the results of previous studies and were provided by the sponsor representative after consultation with the WIL study director.

Dosing procedures were performed from 26 May through 16 June 2005, when the animals were 22-41 days of age; the study start was staggered, based on age. At the initiation of dose administration, body weights ranged from 32.1 g to 54.6 g. The following table presents the study group assignment:

Group Number	Test Article	Dosage Level (mg/kg/day)	Dosage Concentration (mg/mL)	Dose Volume (mL/kg)	Number of Females
1	Corn Oil	0	0	5	15
2	[ ]	60	12	5	15
3	[ ]	250	50	5	15
4	[ ]	1000	200	5	15
5	[ ]	60	12	5	15
6	[ ]	250	50	5	15
7	[ ]	1000	200	5	15

Due to spacing constraints, the dose group names for the vehicle control and the 60, 250 and 1000 mg/kg/day [ ] and [ ] groups are presented on the tables and

WIL-187043 [ ] and [ ]
[ ] 05-002

figures as corn oil, [ ]/60, [ ]/250, [ ]/1000, [ ]/60, [ ]/250 and [ ]/1000.

Preparation, storage and sampling of the control and test article formulations were conducted as follows. For the control group, the appropriate amount of the vehicle (100% pure corn oil, exp. date: 6 April 2006) was dispensed into a storage container and stirred throughout use. The [ ] and [ ] dosing formulations were prepared as follows. [ ] was heated to 35°C to 45°C for approximately 15-30 minutes prior to preparation of the dosing formulations. Both test articles were inverted or shaken prior to use. An appropriate amount of test article for each group was weighed into a tared, calibrated glass container. A stir bar and approximately 80% of the vehicle were added to each container, and the mixture was stirred until uniform. The appropriate volume of vehicle was added to bring each formulation to the calibration mark, and the preparations were stirred until uniform and throughout use. The [ ] and [ ] dosing formulations were prepared weekly, divided into aliquots for daily dispensation and stored at room temperature under nitrogen. Three samples from the control group and 3 sets each of samples from the top, middle and bottom strata were collected from representative (bulk) batches of the test article formulations prior to the initiation of dose administration. Two sets of samples for concentration verification were collected from the dosing formulations on each day of preparation and 2 sets were collected on the last day of use of each preparation. Two full sets of homogeneity/stability samples and 6 full sets of concentration samples were shipped under ambient conditions to the sponsor for homogeneity, stability and concentration analyses; the remaining samples were stored under normal laboratory conditions at WIL Research Laboratories, LLC, for possible future analysis. The back-up sample for the 60 mg/kg/day [ ]group pre-initiation formulation was also shipped to the sponsor. The test article formulations were determined to be homogeneous and contained the amount of test article specified in the protocol (as determined by calcium content).

Thirteen dams with 10 female pups each (130 pups total) were received from Charles River Laboratories, Inc., Raleigh, North Carolina, on 10 May 2005. The pups were 4 to 6 days old upon receipt. Pups were initially identified by tail tattoo, housed in plastic maternity cages (by litter with their own or a fostering dam) during the acclimation period (16 to 18 days) until randomization of the pups on postnatal day (PND) 21. Following randomization, the female pups were weaned, identified by metal eartag and housed 3 per cage in plastic maternity cages. Environmental controls were set to maintain an average daily temperature of 71°F ± 5°F (22°C ± 3°C) and an average daily relative humidity of 50% ± 20%. Actual mean daily temperatures ranged from 70.4°F to 70.6°F (21.3°C to 21.4°C) and mean daily relative humidity ranged from 38.0% to 51.1%. Light timers were calibrated to provide a 12-hour light (0600 hours to 1800 hours)/12-hour dark photoperiod. Air handling units were set to provide approximately 10 fresh air changes per hour. PMI Nutrition International, LLC, Certified Rodent LabDiet® 5002 and reverse osmosis-purified water were offered ad libitum.

All animals were observed twice daily for appearance, behavior, mortality and moribundity. A detailed physical examination was performed at the time of randomization. The rats were also observed daily (prior to dosing). Clinical findings at the time of dose administration and approximately 1 hour following dose administration were recorded when observed. Individual body weights were recorded daily. Each female pup was observed daily for vaginal patency beginning on PND 25 (Adams et al., 1985). Examination continued daily until vaginal patency was observed. Body weights were recorded on the day that vaginal patency was noted. Beginning on the day that vaginal patency was observed, vaginal lavages were performed daily, through the day of euthanasia, and the slides were examined to determine the stage of estrus. The mean estrous cycle length was calculated and reported for complete estrous cycles (i.e., the total number of returns to metestrus [M] or diestrus [D] from estrus [E] or proestrus [P] until the day of euthanasia). In addition, the mean age at the onset of the first estrous cycle was calculated using the first day each animal was observed to be in estrus. A

gross necropsy was performed only on animals that were found dead. All surviving animals were euthanized on PND 42 by carbon dioxide inhalation; blood was collected via the vena cava for evaluation of serum thyroxine (T_4) and thyroid stimulating hormone (TSH) levels. The uterus (wet and blotted), kidneys, liver, ovaries and oviducts, adrenal glands, pituitary gland and thyroid glands were weighed. Luminal fluid weight was calculated by subtracting the blotted uterus weight from the wet uterus weight. The ovaries, uterus (horns and body), cervix, vagina, pituitary gland, thyroid glands and gross lesions were retained from all females, including those found dead.

Statistical tests were performed using appropriate computing devices or programs. Analyses were conducted using two-tailed tests for minimum significance levels of 1% and 5%, comparing each test article-treated group to the control group. Each mean was presented with the standard deviation (S.D.) and the number of animals (N) used to calculate the mean. Mean body weights, body weight changes, day of acquisition of vaginal patency, estrous cycle lengths, age at the first occurrence of estrus, serum hormone levels, luminal fluid weight and absolute and relative organ weights were subjected to a parametric one-way analysis of variance (ANOVA; Snedecor and Cochran, 1980) to determine intergroup differences. If the ANOVA revealed statistically significant ($p<0.05$) intergroup variance, Dunnett's test (Dunnett, 1964) was used to compare the test article-treated groups to the control group.

1.3. KEY STUDY DATES

Date(s)	Event(s)
10 May 2005	Experimental starting date (animal receipt)
26 May 2005	Experimental start date (first day of dose administration)
26 May - 16 June 2005	Test article administration
28 June 2005	Experimental termination/completion date (last analysis of thyroid stimulating hormone)

1.4. DATA RETENTION

The sponsor has title to all documentation records, raw data, specimens or other work product generated during the performance of the study. All work product generated by WIL Research Laboratories, LLC, including raw paper data and specimens, are retained in the Archives at WIL Research Laboratories, LLC, as specified in the study protocol. Data generated by the sponsor will be archived by the sponsor or the sponsor's designee.

Reserve samples of the test articles, pertinent electronic storage media and the original final report are retained in the Archives at WIL Research Laboratories, LLC in compliance with regulatory requirements.

1.5. RESULTS - [ ]

All females in the [ ]-treated groups survived to the scheduled euthanasia. There were no test article-related clinical findings at the daily examinations. At the time of dose administration, evidence of salivation (including clear material around the mouth) was noted in 1, 3 and 9 females in the 60, 250 and 1000 mg/kg/day [ ] groups, respectively; the incidence of this finding was greatest in the 1000 mg/kg/day [ ] group. One hour following dose administration, evidence of salivation (including clear material around the nose and/or mouth, ventral neck, ventral abdomen) was observed in the 1000 mg/kg/day [ ] group. These findings were not suggestive of systemic toxicity because none persisted to the daily observations on the following day. Therefore, although these findings were considered test article-related, they were not considered adverse.

No test article-related effects on mean body weights or body weight gains were noted in the 60, 250 and 1000 mg/kg/day [ ] groups. The only statistically significant ($p<0.05$) differences from the control group values were increases in mean body weight gain during PND 26-27 (250 mg/kg/day [ ] group) and PND 35-36 (60 mg/kg/day [ ] group).

Vaginal patency in the 250 and 1000 mg/kg/day [ ] groups was achieved earlier than in the control group; the differences were significant ($p<0.01$). Mean ages of attainment were 33.5, 32.8, 29.9 and 27.2 days in the control, 60, 250 and 1000 mg/kg/day [ ] groups, respectively. The values in the 250 and 1000 mg/kg/day [ ] groups were below the minimum mean value in the WIL historical control data (31.7 days). Because the females were younger on the day vaginal patency was observed, mean body weights at the age of attainment of vaginal patency in the 250 and 1000 mg/kg/day [ ] groups were lower (statistically significant, $p<0.01$) than the control group value. The changes in these parameters were consistent with an interpretation of estrogenic effects resulting from the test article.

No differences in mean estrous cycle length were observed when the [ ]-treated groups were compared to the control group. Estrous cycle length could not be determined for 2, 5, 1 and 3 females in the control, 60, 250 and 1000 mg/kg/day [ ] groups, respectively, due to incomplete estrous cycles; estrous cycle lengths in females of this age are highly variable. The ages of the first occurrence of estrus in the 60, 250 and 1000 mg/kg/day [ ] groups (33.5, 33.1 and 35.8 days of age, respectively) were similar to that in the control group (35.5 days of age); the differences were not statistically significant. While vaginal patency was observed in all females in the 1000 mg/kg/day [ ] group by 29 days of age (the mean age at attainment was 6 days earlier than that observed in the control group), the age at the first occurrence of estrus in this group was PND 38 or later for 6 females (compared to 3 females in the control group). In addition, 2 females in the 1000 mg/kg/day [ ] group had no occurrence of estrus prior to euthanasia (compared to none in the control group), and 1 of these 2 females was in persistent diestrus for 16 days.

Mean total T_4 levels in the 60, 250 and 1000 mg/kg/day [ ] groups were increased by approximately 31%, 29% and 44%, respectively, compared to the control group value. The differences were statistically significant ($p<0.05$ or $p<0.01$). There was no dose-response relationship between the 60 and 250 mg/kg/day groups. The mean TSH

level in the 1000 mg/kg/day [ ] group was also 36% increased ($p<0.05$) compared to the control group value. These increases were considered test article-related; however, no effects on mean absolute and relative (to final body weight) thyroid gland weights were noted in this group. Mean TSH levels in the 60 and 250 mg/kg/day [ ] groups were similar to the control group value.

Test article-related reductions in mean absolute and relative (to final body weight) uterus (wet and blotted) weights and mean absolute ovary/oviduct weight were observed in the 1000 mg/kg/day [ ] group when compared to the control group values. The differences in mean absolute and relative blotted uterus and absolute ovary/oviduct weights were statistically significant ($p<0.05$ or $p<0.01$). The mean absolute weights for the wet and blotted uterus and ovary/oviducts were 26%, 30% and 14%, respectively, lower than the control group values. The mean relative ovary/oviduct weight in the 1000 mg/kg/day [ ] group was similar to that in the control group. Mean relative liver weight in the 1000 mg/kg/day [ ] group was increased compared to the control group value. The difference was statistically significant ($p<0.01$); however, no statistically significant differences or dose-related trends were evident when the absolute liver weights were evaluated. No test article-related or statistically significant differences in organ weights were observed in the 60 and 250 mg/kg/day [ ] groups. Luminal fluid weights in the [ ]-treated groups were highly variable; no statistically significant differences from the control group were observed for these data, and no dose-related trends were evident.

1.6. CONCLUSIONS - [ ]

Based on the results of this study, the test article, [ ], administered orally to juvenile female rats resulted in estrogenic effects in the 250 and 1000 mg/kg/day groups, as evidenced by early attainment of vaginal patency. However, a delay in the first occurrence of estrus was noted in the 1000 mg/kg/day [ ] group. The decreased mean ovary/oviduct and uterus (wet and blotted) weights at 1000 mg/kg/day [ ] were also attributed to test article administration. Mean total T_4 levels were increased in

the 60, 250 and 1000 mg/kg/day [ ] groups, and mean TSH level in the 1000 mg/kg/day [ ] group was increased. However, no effects on thyroid gland weights were noted at any dosage level.

1.7. RESULTS - [ ]

Female nos. 83683-10 (34 days of age) and 83680-06 (26 days of age) in the 1000 mg/kg/day [ ] group were found dead approximately 45 minutes following administration of the 13th and 5th doses, respectively. Clinical findings prior to death, consisting of salivation prior to dose administration and clear material around the mouth 1 hour following dose administration (30-33 days of age), were noted only for female no. 83683-10; these findings were also observed in surviving females in all [ ]-treated groups and were not considered related to the death. These females had no internal findings at necropsy. However, because these deaths occurred at the highest dosage level and survival was unaffected in the control group, the mortality at 1000 mg/kg/day [ ] was attributed to the test article. Female no. 83689-09 in the 60 mg/kg/day [ ] group was found dead at 31 days of age 1 hour and 15 minutes following administration of the 10th dose. This animal had no clinical findings prior to death; at necropsy, dark red discoloration of the lungs was noted. Because no deaths were noted in the 250 mg/kg/day [ ] group, the death at 60 mg/kg/day [ ] was not considered test article-related. All other animals survived to the scheduled euthanasia.

Salivation was observed prior to dose administration in 1, 4 and 11 females in the 60, 250 and 1000 mg/kg/day [ ] groups, respectively. Evidence of salivation (clear material on the ventral neck and/or around the nose and/or mouth) was also observed in the 250 and 1000 mg/kg/day [ ] groups 1 hour following test article administration; the incidence was markedly increased in the 1000 mg/kg/day [ ] group. These findings were not suggestive of systemic toxicity because they generally did not persist to the daily examinations on the following day. Therefore, the salivation-related findings were attributed to the test article but were not considered adverse. At the daily examinations, 3 females in the 1000 mg/kg/day [ ] group were noted with masses on the head, neck and/or thorax, beginning at 32-36 days of age. Because the

affected females survived to the scheduled euthanasia, macroscopic evaluation of the masses was not conducted; the relationship to test article administration is unclear.

No test article-related effects on mean body weights or body weight gains were noted in the 60, 250 and 1000 mg/kg/day [ ] groups. The only statistically significant ($p<0.05$) difference from the control group was an increase in mean body weight gain during PND 26-27 in the 60 mg/kg/day [ ] group.

Vaginal patency was achieved slightly later in the 1000 mg/kg/day [ ] group than in the control group. Female no. 83687-04 in this group did not achieve patency before the scheduled euthanasia at 42 days of age. Mean ages of acquisition were 33.5, 33.6, 34.3 and 35.5 days in the control, 60, 250 and 1000 mg/kg/day [ ] groups, respectively. None of the differences from the control group were statistically significant. Since females in the 1000 mg/kg/day [ ] group were slightly older on the day vaginal patency was observed, mean body weight on the day of attainment of vaginal patency was also higher (statistically significant, $p<0.01$) than the control group value. The delay in attainment of vaginal patency in the 1000 mg/kg/day [ ] group was considered to be test article-related. The mean ages of attainment of vaginal patency in the 60 and 250 mg/kg/day [ ] groups were similar to the control group value.

Because animals were older on the day of attainment of vaginal patency in the 1000 mg/kg/day [ ] group, the first occurrence of estrus in this group was also later (37.2 days of age) than that of the control group (35.5 days of age). The difference was not statistically significant. Mean estrous cycle length in the 1000 mg/kg/day [ ] group (6.3 days) was increased compared to the control group value (4.8 days); the difference was statistically significant ($p<0.01$). However, only 4/15 females in this group had at least 1 complete cycle. One female in this group was in diestrus for 10 consecutive days. The delay in the first occurrence of estrus and the increase in mean estrous cycle length in the 1000 mg/kg/day [ ] group were considered to be test

article-related. Mean estrous cycle length and the age of first occurrence of estrus were unaffected by test article administration in the 60 and 250 mg/kg/day [ ] groups.

Mean T_4 and TSH levels in the 60, 250 and 1000 mg/kg/day [ ] groups were similar to the control group values. No statistically significant differences or dose-related trends were evident.

Mean absolute and relative (to final body weight) liver weights in the 1000 mg/kg/day [ ] group were increased (statistically significant, $p<0.01$) compared to the control group values. These increases were considered test article-related. No other test article-related differences in organ weights (absolute or relative to final body weight) were observed in the [ ]-treated groups. Luminal fluid weights were highly variable; however, no statistically significant differences in mean luminal fluid weights were observed in the [ ]-treated groups, and no dose-related trends were evident.

1.8. CONCLUSIONS - [ ]

Based on the results of this study, the test article, [ ], administered orally to juvenile female rats resulted in mortality and delays in the age of attainment of vaginal patency and the first occurrence of estrus, as well as an increase in mean estrous cycle length at 1000 mg/kg/day. Because of the delay in vaginal patency at 1000 mg/kg/day [ ], only 4/15 females had at least 1 complete estrous cycle prior to the scheduled euthanasia at 42 days of age. Increases in mean absolute and relative liver weights were also observed in this group.

This study was inspected in accordance with the U.S. EPA Good Laboratory Practice Standards (40 CFR Parts 160 and 792), the OECD Principles of Good Laboratory Practice, the standard operating procedures of WIL Research Laboratories, LLC and the sponsor's protocol with the following exceptions. The data located in Appendices A

(Certificates of Analysis) and B (Analytical Chemistry Report) were the responsibility of the sponsor. Quality Assurance findings, derived from the inspections during the conduct of the study and from the inspections of the raw data and draft report, are documented and have been reported to the study director. A status report is submitted to management monthly.

This report accurately reflects the data generated during the study. The methods and procedures used in the study were those specified in the protocol, its amendments and the standard operating procedures of WIL Research Laboratories, LLC.

The raw data, the retention sample(s), and the final report will be stored in the Archives at WIL Research Laboratories, LLC or another location specified by the sponsor.

3.2. APPROVAL

This study was inspected according to the criteria discussed in Section 3.1.

5. DEVIATIONS FROM THE PROTOCOL

This study was conducted in accordance with the protocol and protocol amendments, except for the following.

- **Protocol Section 5.3** states that animals would be supplied by Charles River Laboratories, Portage, Michigan. Animals were supplied by the Raleigh, North Carolina facility of Charles River Laboratories.
- **Protocol Section 5.7** states that the pups would be identified by tail tattoo. At the time of randomization, each pup was identified by a unique Monel® eartag in addition to the tail tattoo that was applied following receipt.
- **Protocol Section 6.1** states that following weaning, the juvenile females would be housed 3 per cage in plastic maternity cages. Documentation of triple-housing was not recorded.
- **Protocol Section 6.4** states that animals would be offered food ad libitum during the study. On the morning of 16 May 2005 (during the acclimation period, when pups were 10-12 days old), all animals, with the exception of 1 female, were without food. It could not be determined how long the animals were without food; all animals were given 2 food jars on 16 May 2005. The dams and pups were examined by a veterinarian, and no abnormalities were noted.
- **Protocol Section 7.5.1** states that any special procedures required for formulation would be documented. The sponsor-supplied instructions required that the dosing aliquots would be purged with nitrogen. No documentation of purging could be located for the aliquots dispensed on 2 and 8 June 2005 (used for dose administration on 2-8 June and 9-16 June 2005, respectively).
- **Protocol Section 7.6.2** states that individual daily body weights would be recorded (to the nearest 0.1 gram, with the exception of the weight collected on the day prior to dose administration and the final body weight) beginning 1 day prior to initiation of test article administration. However, individual body weights were recorded to the nearest 0.1 gram on the day prior to test article administration.
- **Protocol Section 7.6.4** states daily vaginal lavages were to be performed to determine the stage of the estrous cycle, starting on the day vaginal perforation was observed and continuing through the day of euthanasia. Vaginal lavages were not performed on female no. 83689-04 (60 mg/kg/day [ ] group) at 39 days of age and on female nos. 83687-09, 83689-01, 83682-01 and 83685-07 (250 mg/kg/day [ ] group) at 31, 31, 32 and 32 days of age, respectively.

These deviations did not negatively impact the quality or integrity of the data nor the outcome of the study.

ANALYTICAL STUDY GLP COMPLIANCE STATEMENT

All analytical tests performed by Integrated Laboratory Technologies for WIL Research Study #WIL-187043 ([redacted] Reference #05-002) were conducted in compliance with current EPA Good Laboratory Practice (GLP) standards as described by the Toxic Substances Control Act (TSCA) 40 CFR Part 792.

The stability of the test substances in corn oil over a 10-day period was not determined. The test substance is formulated for use in the high temperature and oxidative environment found in internal combustion engines. Based on information provided by the Sponsor, it is not expected to degrade under conditions used in this toxicology study.

Principal Investigator [redacted] Date: 5 June 2007

Draft Final Report

ANALYTICAL STUDY QUALITY ASSURANCE UNIT STATEMENT

The analytical raw data and final report for the [redacted] study have been reviewed by the [redacted] Quality Assurance Team.

The report appears to accurately describe the methods and Standard Operating Procedures (SOPs) used in the study. The reported results accurately reflect the raw data of the study.

Draft Final Report

ABSTRACT

Samples of suspensions ([redacted] and [redacted] in corn oil) used in a female pubertal assay in rats, WIL Research Study #WIL-187043 ([redacted] Reference #05-002), were analyzed at [redacted] to verify their homogeneity, resuspension homogeneity, and nominal concentrations.

A direct dilution procedure was employed to prepare the samples for elemental analysis by Inductively Coupled Plasma-Atomic Emission Spectroscopy (ICP-AES). Homogeneity and resuspension homogeneity of [redacted] and [redacted] in corn oil were established. The nominal concentrations of all dosing suspensions were verified by the analytical data.

INTRODUCTION

The purpose of this analytical study was the determination and verification of test substance *homogeneity, resuspension homogeneity, and concentration in corn oil. The concentration* study samples were aliquots taken from mixtures prepared as dosing suspensions for a female pubertal assay in rats as outlined in the protocol for WIL Research Study #WIL-187043.

The analytical portion of the study was performed by the High Volume Services team located in the [redacted]. The analytical start and end dates were 17 May and 24 June 2005 respectively.

TEST SUBSTANCES

The test substances used in the preparation of the dosing suspensions are identified as [redacted] and [redacted] The CAS numbers are confidential; contac[redacted] for further information. The test substances were characterized and their stabilities were established prior to the initiation of the study.

EXPERIMENTAL

SAMPLES
Samples were shipped from WIL Research to [redacted] Principal Investigator. Samples were stored at room temperature and in the dark prior to analysis.

The first batch of samples was transferred to the laboratory on 16 May 2005 and analyzed on 17 May 2005. The analysis of the last set of samples was completed on 24 June 2005.

STANDARDS
Calibration standards for the ICP-AES were made from certified commercially prepared elemental concentrates (Conostan Division of Conoco, Inc.). Standard preparation data is archived by [redacted]

Draft Final Report

ANALYTICAL METHOD
Samples were prepared as stated in [redacted] Test Code 30176, SOP ME-125 "Elemental Analysis of Additives or Additive Mixtures by Direct Dilution and ICP Analysis." The procedures outlined in SOP EQ-130, "IRIS Intrepid XDL II Radial Inductively Coupled Plasma Spectrometer," were followed during the instrumental analysis of the samples.

The approach employed in this method was to verify concentration based on the known elemental composition of [redacted] and [redacted] Aliquots of the dosing suspensions were diluted in an o-xylene diluent and the elemental composition was determined by ICP-AES. The calcium concentration of the samples was then used to ascertain the concentration of the test substance in the dosing suspensions.

DISCUSSION

METHOD VALIDATION
Method validation was performed following the recommendations outlined in the International Conference on Harmonisation's Q2B document: Guideline on the Validation of Analytical Procedures: Methodology. The limit of detection (LOD) and limit of quantitation (LOQ) were calculated to be 0.063 and 0.192 wt ppm calcium respectively. A reporting limit of 2 wt ppm calcium was determined to be appropriate for vehicle results.

SAMPLE ANALYSIS
The analytical results for the suspensions of [redacted] and [redacted] in corn oil are summarized in the tables located on pages 8 through 14. Seven calibration standards were analyzed to generate a linear calibration curve with inverse concentration weighting. All instrument control checks and quality control samples were within acceptable limits. Known amounts of calcium were spiked into 27 samples throughout the duration of the study and gave acceptable percent recoveries of 96 to 100%.

The dosing suspensions were analyzed for calcium, an element present in known concentrations in the test substances. Dosing suspension estimates of weight percent calcium were derived by the following formula:

$$Wt\%\ Ca = \left[\frac{x}{x + \left(D_2 - \frac{xD_2}{D_1}\right)}\right] \%\ Ca\ in\ [redacted]$$

where x is the solute test substance concentration in mg/μL; D_1 is the test substance density (0.9209 g/mL for [redacted] and 0.9332 g/mL for [redacted] and D_2 is the vehicle or solvent density (corn oil, 0.9195 g/mL). The concentration of calcium in [redacted] is 3.13 wt% and 3.84 wt% in [redacted] The measured results of calcium were obtained by ICP-AES and compared against the estimated values. Results were converted to wt% from ppm by multiplying by 10^{-4}.

Homogeneity was confirmed if the percent differences between the overall dose level mean and individual strata means were 10% or less. Concentration data were evaluated using percent difference between estimated and measured concentrations. The acceptable tolerance was 15%. Duplicate analyses were compared using the Contract Laboratories Program (CLP) Guidelines for Inorganic Analyses relative percent difference limit of 20%

RESULTS AND CONCLUSIONS

The confirmation of dosing suspension homogeneity and resuspension homogeneity is supported by the data presented on pages 8 through 11. The percent difference of all strata means with their respective overall mean is well below the 10% tolerance.

The analytical result summaries for the concentration studies are found on pages 12 and 13. The nominal concentrations of all dosing suspensions were verified by the analytical data. The percent difference between the estimated and measured concentrations is less than 15% for all dosing levels.

The table on page 14 presents the duplicate precision data. The agreement between the duplicates is excellent and well under the CLP relative percent difference guideline of 20%.

ARCHIVES

SAMPLES
The unused portion of all samples shall be stored in room [redacted] for a minimum of one year after the final analytical report is issued.

RAW DATA
Instrument, chemical, and standard logbook documentation shall be archived by [redacted] as facility records [redacted]). All other raw data shall be archived in the Analytical Study File in [redacted]

FINAL REPORT
The original copy of the final report shall be archived with the Analytical Study File in [redacted]

PROTOCOL AND SOP DEVIATIONS

SOP ME-125 states quality control (QC) samples should be analyzed every 10 samples. For samples analyzed on 17 May 2005, QCs were run approximately every 20 samples. This did not appear to affect the outcome of the analytical results.

APPENDIX E

Study Protocol

Draft Final Report

Draft Final Report

PROTOCOL

A FEMALE PUBERTAL ASSAY OF [redacted] AND [redacted] ADMINISTERED ORALLY IN JUVENILE FEMALE RATS

Sponsor Study Number:
05-002

Submitted To:

[redacted]

WIL Research Laboratories, LLC
1407 George Road
Ashland, OH 44805-9281

Draft Final Report

1 OBJECTIVE:

The objective of this study is to evaluate the ability of the test articles to induce effects on pubertal development in the intact juvenile female rat.

2 PERSONNEL INVOLVED IN THE STUDY:

2.1 Sponsor Representative:

[redacted]

2.2 WIL Study Director:

[redacted]

2.3 WIL Deputy Director:

[redacted]

2.4 WIL Departmental Responsibilities:

[redacted]

Draft Final Report

[redacted]

3 STUDY SCHEDULE:

Proposed Animal Receipt Date (Experimental Starting Date):	May 10, 2005
Proposed Experimental Start Date:	May 26, 2205
Proposed Experimental Termination/ Completion Date:	June 17, 2005
Proposed Audited Report Date:	August 26, 2005

4 TEST ARTICLE DATA:

4.1 Identification:

[redacted]

Draft Final Report

4.1.1 Lot Number:

[redacted]

4.1.2 Purity:

100%.

4.1.3 Stability:

The test article is considered to be stable under the storage conditions provided by the Sponsor.

4.1.4 Physical Description:

Viscous liquid.

4.1.5 Storage Conditions:

Store at ambient conditions under nitrogen.

4.1.6 Reserve Samples:

Reserve samples of the test article will be taken in accordance with WIL standard operating procedures and stored in the Archives at WIL Research Laboratories, LLC indefinitely unless otherwise specified.

4.1.7 Personnel Safety Data:

To be provided by the Sponsor. It is the responsibility of the Sponsor to notify the testing facility of any special handling requirements for the test article. A material safety data sheet (MSDS) will accompany the test article upon arrival at the laboratory.

4.2 Identification:

[redacted]

4.2.1 Lot Number:

[redacted]

4.2.2 Purity:

100%.

Draft Final Report

4.2.3 Stability:

The test article is considered to be stable under the storage conditions provided by the Sponsor.

4.2.4 Physical Description:

Viscous liquid.

4.2.5 Storage Conditions:

Store at ambient conditions under nitrogen.

4.2.6 Reserve Samples:

Reserve samples of the test article will be taken in accordance with WIL standard operating procedures and stored in the Archives at WIL Research Laboratories, LLC indefinitely unless otherwise specified.

4.2.7 Personnel Safety Data:

To be provided by the Sponsor. It is the responsibility of the Sponsor to notify the testing facility of any special handling requirements for the test article. A material safety data sheet (MSDS) will accompany the test article upon arrival at the laboratory.

5 TEST SYSTEM:

5.1 Species:

Rat.

5.2 Strain:

Sprague-Dawley Crl:CD®(SD)

5.3 Source:

Charles River Laboratories
Portage, Michigan

5.4 Number on Study:

105 Females (maximum of 130 females and 13 dams purchased). Immature females will be supplied in litters of 10 animals with their own or another (fostering) dam. The immature females will be 4-6 days old upon receipt. Animals not assigned to the study will be transferred to the stock animal colony

or will be euthanized by carbon dioxide inhalation and the carcasses discarded. Following weaning, the dams will be euthanized by carbon dioxide inhalation and discarded.

5.5 Body Weight Range:

At randomization: 30-50 g. All animals assigned to study will be approximately ± 5 g of the mean.

5.6 Age:

At start of dosing animals will be 22 days of age.

5.7 Identification System:

The maternal animals will be uniquely identified by a Monel® metal eartag displaying the animal number. The pups will be identified by tail tattoo. Individual cage cards will be affixed to each cage and will display the animal number, group number, study number, dosage level and sex of the animal.

5.8 Justification for Selection:

This species and strain of animal is recognized as appropriate for reproduction studies. WIL Research Laboratories, LLC has reproductive historical control data in this species and strain of rat. This animal model has been proven to be susceptible to the effects of reproductive toxicants. This number of animals is considered the minimum number required for meaningful interpretation of the data and fulfillment of agency requirements.

6 SPECIFIC MAINTENANCE SCHEDULE:

6.1 Animal Housing:

All animals will be initially housed by litter with their own or another (fostering) dam in plastic maternity cages containing ground corncob nesting material (Bed-O'Cobs®). Following randomization, the juvenile female animals will be weaned and housed three animals per cage in plastic maternity (shoebox) cages. Control animals (Group 1) will be housed on a separate rack from exposed animals. The cage bedding will be changed at least three times each week. The cages will be subjected to routine cleaning at a frequency consistent with maintaining good animal health and WIL standard operating procedures. The facilities at WIL Research Laboratories, LLC are fully accredited by the Association for Assessment and Accreditation of Laboratory Animal Care International (AAALAC International).

Draft Final Report

Draft Final Report

6.2 Environmental Conditions:

Controls will be set to maintain an average daily temperature of 71 ± 5°F (22 ± 3°C) and an average daily relative humidity of 50 ± 20%. Temperature and relative humidity will be monitored continuously. Data for these two parameters will be scheduled for automatic collection on an hourly basis. Fluorescent lighting controlled by light timers will provide illumination for a 12-hour light/dark photoperiod. Temporary adjustments to the light/dark cycles may be made to accommodate protocol-specified activities. The ventilation rate will be set at a minimum of 10 room air changes per hour, 100% fresh air.

6.3 Drinking Water:

Reverse osmosis-purified water will be available ad libitum. Filters servicing the automatic watering system are changed regularly according to WIL standard operating procedures. The municipal water supplying the laboratory is analyzed according to WIL standard operating procedures on a routine basis to assure that contaminants are not present in concentrations that would be expected to affect the outcome of the study.

6.4 Basal Diet:

PMI Nutrition International, LLC Certified Rodent LabDiet® 5002 will be offered ad libitum during the study. Periodic analyses of the certified feed are performed by the manufacturer to ensure that heavy metals and pesticides are not present at concentrations that would be expected to affect the outcome of the study. Results of the analyses are provided to WIL Research Laboratories, LLC by the manufacturer and will be placed in the study records. Feeders will be changed and sanitized once per week.

7 EXPERIMENTAL DESIGN:

7.1 Animal Receipt and Quarantine:

Each animal will be inspected by a qualified technician upon receipt. Rats judged to be in good health and suitable as test animals will be immediately placed in quarantine for a minimum of nine days. All rats will be initially sexed and weighed. Maternal animals will be permanently identified with a metal ear tag, and juvenile animals will be identified by tail tattoo. During the quarantine period, each rat will be observed twice daily for changes in general appearance and behavior. Prior to the start of the in-life phase, those animals judged to be suitable test subjects will be identified and receive a detailed physical examination at the time of animal selection for randomization.

Draft Final Report

7.2 Randomization:

At the conclusion of the quarantine period (animals 21 days of age), animals judged to be suitable test subjects and meeting acceptable body weight requirements, will be assigned at random using a computer program. At that time, the animal numbers and corresponding body weights will be entered into the WIL Toxicology Data Management System (WTDMS™). A printout containing the animal numbers and individual group assignments will be generated based on body weight stratification into a block design. Animals will then be weaned and arranged into the groups according to the printout. Each of 7 groups will consist of fifteen females. If after randomization statistically significant differences between groups exist, new randomizations will be generated until group mean body weights are homogeneous.

7.3 Route and Rationale of Test Article Administration:

The route of administration will be oral (gavage). Historically, this route has been used extensively for studies of this nature. Appropriate-sized flexible, Teflon®-shafted, stainless steel ball-tipped dosing cannulae will be used for the oral administration by gavage. Any losses or incomplete dosing will be recorded.

7.4 Organization of Test Groups, Dosage Levels and Treatment Regimen:

7.4.1 Organization of Test Groups:

The dosage levels were determined from the results of previous studies and were provided by the Sponsor Representative after consultation with the WIL Study Director. The following table presents the study group arrangement.

Group Number	Test Article	Dosage Level (mg/kg/day)	Dose Concentration (mg/mL)	Dose Volume (mL/kg)	Number of Females
1	Corn Oil	0	0	5	15
2	[redacted]	60	12	5	15
3	[redacted]	250	50	5	15
4	[redacted]	1000	200	5	15
5	[redacted]	60	12	5	15
6	[redacted]	250	50	5	15
7	[redacted]	1000	200	5	15

7.4.2 Vehicle Control Article:

Corn oil

Draft Final Report

7.4.3 Treatment Regimen:

The test and control articles will be administered as single daily doses beginning on day 22 of age and continuing through 41 days of age. All animals will be dosed at approximately the same time each day, and the time of dosing will be recorded for each animal.

7.4.4 Adjustment of Dosages:

Individual doses will be calculated based on each daily body weight to provide the proper dosage. Individual animal body weights and individual animal dosages will be recorded.

7.5 Preparation and Analysis of Test Article Formulations:

7.5.1 Method and Frequency of Preparation:

Based on the physical characteristics of the test article, appropriate methods will be used to ensure the best possible formulations of the test article in the vehicle. Dosing formulations of the test article will be prepared weekly. The study director or the deputy director or designee will visually inspect the formulations prior to initiation of dosing. This visual inspection will be performed to assure that the formulations are visibly homogeneous and acceptable for dosing. Any special procedures required for formulation will be documented according to Good Laboratory Practices and presented in the final report of this study.

7.5.2 Homogeneity and Stability of Test Article Formulation:

Dosing mixture homogeneity in bulk preparations will be collected prior to the initiation of test article administration. While undergoing stirring in the beaker, the following sample aliquots (5 mL) will be drawn for analysis: control, three aliquots (from the middle); all treatment groups, nine aliquots (3 each from the top, middle and bottom). Test article formulations will be divided into aliquots for daily dispensation. Resuspension homogeneity of aliquots will be determined over the longest period of aliquot storage. Three samples (5 mL) from the top and bottom of each group will be collected to assess the homogeneity after storage and resuspension. Two of the three samples will be sent to [redacted] analysis of homogeneity and stability over a ten-day period. The samples will be shipped under ambient conditions under nitrogen. The remaining sample from each dose level and strata will be stored under normal laboratory conditions for possible future analysis.

Draft Final Report

7.5.3 Concentration Analysis:

Samples of the dosing mixtures will be collected on the first and last day of each weekly preparation. At each time point, two 5-mL aliquots will be taken from each dose level (middle stratum), including the control group. The dosing mixture will be thoroughly mixed before taking each sample. One sample from each dose level will be analyzed; the remaining sample will be retained by the Testing Laboratory for possible future analysis.

Dosing mixture samples for homogeneity, stability and concentration of the test article at all dose levels, including the control, will be analyzed by the Sponsor. Quality assurance (QA) auditing of the conduct, results and reporting of the analyses, as well as archiving of the data will be the responsibility of the Sponsor. Critical phase inspection reports and report audits will be submitted to the Study Director and management at WIL Research Laboratories, LLC. A QA statement will be issued for inclusion in the overall final report. The methods and results of the analysis will be provided by the Sponsor and included as an appendix to the WIL final report. The methods employed will be one or more of the following:

[redacted] SOP #ME-125

Concentration and stability data will be evaluated using percent difference. The acceptable tolerance between the theoretical and measured values is 15%.

Mixtures will be considered homogeneous if the difference between the overall group mean and the strata mean is 10% or less.

7.5.4 Sample Handling and Shipment:

Each 5-mL sample will be placed in a glass vial with a Teflon-lined lid. The vial plus sample weight will be recorded with an accuracy of $\pm$ 0.0005 g. Each sample will be stored at ambient temperature under nitrogen. Each sample container will be labeled with the following information:

Accession Number
Sponsor's Reference Number
Testing Laboratory Study Number
Test Article Name
Dose Level (mg/kg)
Dosing Mixture Concentration (mg/mL)
Preparation Date
Sampling Date
Weight of Sample

The sample shall be packed in a suitable container to maintain the temperature conditions specified in Section 4 during transit plus an adequate margin of safety for any transit delays. The sample shall be sent by express courier to:

[redacted]

[redacted] shall be notified in advance of shipping by telefax at [redacted] This notification shall include test article and study identification, carrier, and estimated time/date of arrival. Sample shipments shall be accompanied by an inventory sheet describing the samples contained in the shipment with the information described above.

7.6 General Observations During the Experimental Period:

7.6.1 Clinical Signs:

The rats will be observed twice daily for appearance, behavior, moribundity and mortality. A detailed physical examination will be conducted at the time of randomization. Clinical observations regarding general appearance and behavior will be recorded daily prior to dosing. During the treatment period, the rats will be observed also approximately one hour following dosing and the observations will be recorded. Additional post-dosing observation periods may be necessary and will be documented in the study records. Observations shall include, but are not limited to, evaluations for changes in appearance of the skin and fur, eyes and mucous membranes, respiratory, circulatory, autonomic and central nervous system functions, somatomotor activity and behavior patterns. Observations will be recorded.

Draft Final Report

Draft Final Report

7.6.2 Body Weights:

Daily body weights will be recorded individually (to the nearest 0.1 gram PND 22-42, with the exception of the weight collected the day prior to dosing and the final body weight) beginning one day prior to the start of dosing. Final body weights will be collected prior to euthanasia.

7.6.3 Vaginal Perforation:

Each female pup (15/group) will be observed daily for vaginal perforation beginning on PND 25 (Adams, 1985). Examination of the females will continue daily until vaginal perforation is present. The body weight of each female will be recorded on the day of acquisition of vaginal perforation.

7.6.4 Determination of Estrous Cycles:

Daily vaginal lavages will be performed to determine the stage of estrus beginning on the day vaginal perforation is observed. Lavages will continue through the day of necropsy. The mean age of first estrous will be determined.

7.7 Euthanasia:

On PND 42, the animals will be euthanized by carbon dioxide inhalation, and the time of euthanasia will be recorded for each animal. Any animals not expected to survive until the following dosing period or until the scheduled euthanasia will be euthanized by carbon dioxide inhalation and necropsied as described in section 9.

8 HOROMONE ANALYSIS:

8.1 Thyroid Hormones:

Following euthanasia, blood will be collected from the vena cava of all animals. Following collection, all blood samples will be allowed to clot and then be placed in an ice bath and processed to generate serum. The following hormone concentrations will be determined from all serum samples:

Thyroid Stimulating Hormone (TSH) Thyroxine (T4)

Draft Final Report

9 ANATOMIC PATHOLOGY:

9.1 Macroscopic Examination:

A complete necropsy examination will be conducted on all animals dying spontaneously or euthanized in extremis. This will include examination of the external surface, all orifices, the external surface of the brain and spinal cord and the thoracic, abdominal and pelvic cavities including viscera. A complete necropsy will not be conducted on animals surviving to study termination. The following tissues will be collected and placed in 10% neutral-buffered formalin at study termination:

Cervix and Uterine Body (one longitudinal section)	Thyroid
Ovaries	Uterine horns (four sections per horn)
Pituitary	Vagina
	All gross (internal) lesions

9.2 Organ Weights:

9.2.1 Uterine Weights:

Wet and blotted uterine weights will be measured for all animals surviving to the scheduled necropsy. Uterine weights will not be collected for any animals found dead or euthanized in extremis.

The uterus will be harvested from all animals using the following procedure. The harvesting of uteri will be performed in the same sequence as which dosing occurred. The pubic symphysis will be opened and each ovary and uterine horn will be detached from the dorsal abdominal wall. The ovaries are separated from the uterine horns at the oviduct/uterus junction. The urinary bladder and ureters will be removed from the ventral and lateral side of the uterus and vagina. The fibrous adhesion between the rectum and vagina is then detached until the junction of the vaginal orifice and perineal skin is identified. The uterus and vagina are detached from the body by incising the vaginal wall just above the junction between the perineal skin. The excess fat and adnexa will be trimmed away. The vagina is then removed from the uterus, leaving the cervix intact and attached to the uterus for uterus weight measurement. Care is to be taken during uterus harvesting such that the luminal contents are retained. A record will be made if any luminal contents are lost. The uterus will be transferred to a uniquely marked and tared plastic Petri dish with care to avoid desiccation before weighing. The Petri dish should be lined with saline-moistened filter paper (or equivalent) and covered to minimize desiccation.

Draft Final Report

The uterus harvesting and weighing procedure will be done in the order described below.

1. Animal is euthanized and uterus harvested.
2. Uterus (with luminal fluid) is immediately transferred to a Petri dish (lined with saline-moistened filter paper or equivalent) that was tared immediately prior to the transfer.
3. The uterus' wet weight is recorded to the nearest 0.1 mg.
4. The uterus is opened and blotted (see below).
5. The uterus is placed in a Petri dish (lined with saline-moistened filter paper or equivalent) that was tared immediately prior to the transfer.
6. The uterus' blotted weight is recorded to the nearest 0.1 mg.

Immediately following collection of the wet weight, the uterus will be individually processed by opening the uterine wall and carefully blotting the excess fluid. Both uterine horns will be pierced and cut longitudinally with small surgical scissors, placed on filter paper (ex. Whatman No. 3) and gently pressed with another piece of dry filter paper to absorb the luminal fluid. The procedure will not be so severe as to render the tissue unacceptable for histopathologic analysis, as this additional investigation may be performed at the discretion of the Sponsor (by protocol amendment).

9.2.2 Ovary, Liver, Kidney, Pituitary, Thyroid and Adrenal Weights:

The following organs from all females euthanized at scheduled termination will be weighed (to the nearest 0.1 mg):

Adrenal glands	Ovaries and oviducts
Liver	Pituitary gland
Kidneys	Thyroid (following fixation)

Paired organs will be weighed together.

To minimize systematic bias in the weighing procedures, organ harvesting and weighing procedures will be divided as equally as possible among the prosecting and weighing technicians, such that all animals from a group are not processed by a single individual.

9.3 Microscopic Examination:

Following collection of wet uterine weight, blotting of the uterus and collection of blotted uterine weight, each uterus will be placed in a uniquely identified jar of 10% neutral-buffered formalin and preserved for microscopic examination.

The vagina, ovaries, and thyroid from each animal will be similarly preserved with the uterus.

Microscopic examination of hematoxylin-eosin stained paraffin sections may be performed on the following tissues from all animals at the discretion of the Sponsor (additional cost).

Ovaries	Thyroid
Cervix and Uterine Body (one longitudinal section)	Uterine Horns (four sections per horn)

Draft Final Report

10 DURATION OF STUDY:

The conduct of this study will require approximately five weeks for acclimation, dosing and necropsy.

11 STATISTICAL METHODS:

Body weights, body weight gains, organ weights, uterine weights (wet and blotted), luminal fluid weights, mean days of acquisition of vaginal perforation, mean age of first estrous and estrous cycle length will be analyzed by a parametric one-way analysis of variance (ANOVA) (Snedecor, 1980) to determine intergroup difference. If the results of the ANOVA are significant ($p<0.05$), Dunnett's test (Dunnett, 1964) will be applied to the data to compare the treated groups to the control group.

12 QUALITY ASSURANCE:

The study will be audited by the WIL Quality Assurance Unit while in progress to assure compliance with the study protocol and protocol amendments, WIL standard operating procedures and the appropriate provisions of EPA/TSCA and FIFRA Good Laboratory Practice Standards published in the Federal Register (40 CFR Part 792 and 40 CFR Part 160) and the OECD Good Laboratory Practice Regulations [C (97) 186/Final]. The raw data and draft report will be audited by the WIL Quality Assurance Unit prior to submission to the Sponsor Representative to assure that the final report accurately describes the conduct and the findings of the study.

This study will be included on the WIL master list of regulated studies.

13 RECORDS TO BE MAINTAINED:

All original raw data records, as defined by WIL SOPs and the applicable GLPs, will be stored as described in Section 14 in the Archives at WIL Research Laboratories, LLC.

14 WORK PRODUCT:

The Sponsor will have title to all documentation records, raw data, slides, specimens and other work product generated during the performance of the study. All work product, including raw paper data, pertinent electronic storage media and specimens will be returned to the Sponsor after a period of six months or following issuance of the final report. All work product will be stored in compliance with regulatory requirements.

Any work product, including documents, specimens, and samples, that are required by this protocol, its amendments, or other written instructions of the Sponsor, to be shipped by WIL Research Laboratories, LLC to another location will be appropriately packaged and labeled as defined by WIL's SOPs and delivered to a common carrier for shipment. WIL Research Laboratories, LLC will not be responsible for shipment following delivery to the common carrier.

Draft Final Report

15 REPORTS:

The final report will consist of an abbreviated summary report, including data tables and an interpretation and discussion of the study results.

WIL Research Laboratories will submit one copy of an audited draft report in a timely manner upon completion of data collection prior to issuance of the final report. One revision will be permitted as part of the cost of the study, from which the Sponsor's reasonable revisions and suggestions will be incorporated into the final report, as appropriate. Additional changes or revisions may be made, at extra cost. It is expected that the Sponsor will review the draft report and provide comments to WIL within a two-month time frame following submission. WIL will submit the final report within one month following receipt of comments. If the Sponsor's comments and/or authorization to finalize the report have not been received at WIL within one year following submission of the draft report, WIL may elect to finalize the report following appropriate written notification to the Sponsor. Two electronic copies (PDF) of the final report on CD-R will be provided. Requests for additional paper copies of the final report may result in additional charges.

16 ANIMAL WELFARE ACT COMPLIANCE:

This study will comply with all applicable sections of the Final Rules of the Animal Welfare Act regulations (9 CFR Parts 1, 2 and 3). The Sponsor should make particular note of the following:

- The Sponsor Representative's signature on this protocol documents for the Study Director the Sponsor's assurance that the study described in this protocol does not unnecessarily duplicate previous experiments.

- Whenever possible, procedures used in this study have been designed to avoid or minimize discomfort, distress or pain to animals. All methods are described in this study protocol or in written laboratory standard operating procedures.

- Animals that experience severe or chronic pain or distress that cannot be relieved will be painlessly euthanized as deemed appropriate by the veterinary staff and Study Director. The Sponsor will be advised by the Study Director of all circumstances which could lead to this action in as timely a manner as possible.

- Methods of euthanasia used during this study are in conformance with the above-referenced regulation.

- The Sponsor/Study Director has considered alternatives to procedures that may cause more than momentary or slight pain or distress to the animals and has provided a written narrative description (AWA covered species) of the methods and sources used to determine that alternatives are not available.

17 PROTOCOL MODIFICATION:

Modification of the protocol may be accomplished during the course of this investigation. However, no changes will be made in the study design without the written permission of the Sponsor. In the event that the Sponsor requests or approves a change in the protocol, such changes will be made by appropriate documentation in the form of protocol amendment. All alterations of the protocol and reasons for the modification(s) will be signed by the Study Director and the Sponsor Representative.

1. SUMMARY

1.1. OBJECTIVE

The objective of the study was to evaluate the ability of the test articles to induce effects on pubertal development in the intact juvenile female rat.

1.2. STUDY DESIGN

[ ] or [ ], in the vehicle, Mazola® corn oil, was administered orally by gavage once daily for 20 consecutive days to 3 groups each of 15 Crl:CD®(SD) immature female rats. Dosage levels for each test article were 60, 250 and 1000 mg/kg/day, and the dosage volume was 5 mL/kg. A concurrent control group received the vehicle on a comparable regimen. These dosage levels were determined from the results of previous studies and were provided by the sponsor representative after consultation with the WIL study director. Due to mortality, dosing procedures were performed after 1200 hours (approximately 1 hour later than on previous days) beginning on 11 June 2005, when the animals were 31-33 days of age.

Dosing procedures were performed from 31 May 2005 through 21 June 2005, when the animals were 22 to 41 days of age; the start of dose administration was staggered, based on age. At the initiation of dose administration, body weights ranged from 41.1 g to 62.8 g. The following table presents the study group assignment:

Group Number	Test Article	Dosage Level (mg/kg/day)	Dose Concentration (mg/mL)	Dose Volume (mL/kg)	Number of Females
1	Corn Oil	0	0	5	15
2	[ ]	60	12	5	15
3	[ ]	250	50	5	15
4	[ ]	1000	200	5	15
5	[ ]	60	12	5	15
6	[ ]	250	50	5	15
7	[ ]	1000	200	5	15

Due to spacing constraints, the dosage group names are presented on the tables and figures as corn oil, [ ]/60, [ ]/250 and [ ]/1000 for the vehicle control, 60, 250 and 1000 mg/kg/day [ ] groups, respectively and [ ]/60, [ ]/250 and [ ]/1000 for the 60, 250 and 1000 mg/kg/day [ ] groups, respectively.

Preparation, storage and sampling of the control and test article formulations were conducted as follows. For the control group, the appropriate amount of the vehicle (100% pure corn oil, exp. date: 6 April 2006) was dispensed into a storage container and stirred throughout use. The [ ] and [ ] dosing formulations were prepared as follows. [ ] and [ ] were heated to approximately 40°C to 50°C, then inverted or shaken prior to use. The appropriate amount of test article for each group was weighed into a tared, calibrated glass container. A stir bar and approximately 80% of the vehicle were added to each container, and the mixtures were stirred until uniform. The appropriate volume of vehicle was added to bring each formulation to the calibration mark, and the preparations were stirred until uniform and throughout use. The [ ] and [ ] dosing formulations were prepared approximately weekly, divided into aliquots for daily dispensation and stored at room temperature under nitrogen. Three samples from the control group formulation and 3 sets of samples from the top, middle and bottom strata of the test article formulations were collected prior to the initiation of dose administration. Additional samples (3 sets) were collected for resuspension homogeneity from the same formulations following 10 days of room temperature storage. Two sets of samples for concentration verification were collected on each day of preparation and 2 sets were collected on the last day of use of each preparation. Two sets of homogeneity/stability samples and 6 sets of concentration samples were shipped under ambient conditions to the sponsor for homogeneity, stability and concentration analyses; the remaining samples were stored under normal laboratory conditions at WIL Research Laboratories, LLC, for possible future analysis.

Thirteen dams with 10 female pups each (130 pups total) were received from Charles River Laboratories, Inc., Raleigh, North Carolina, on 17 May 2005. The pups were 6 to

8 days old upon receipt. Pups were initially identified by tail tattoo, housed in plastic maternity cages (by litter with their own or a fostering dam for 14 to 16 days) during the acclimation period until randomization of the pups on postnatal day (PND) 21. Following randomization, the female pups were weaned, identified by metal eartag and housed 3 per cage in plastic maternity cages. Environmental controls were set to maintain an average daily temperature of 71°F ± 5°F and an average daily relative humidity of 50%±20%. Actual mean daily temperatures ranged from 70.1°F to 70.6°F (21.2°C to 21.4°C) and mean daily relative humidity ranged from 38.0% to 50.9%. Light timers were calibrated to provide a 12-hour light (0600 hours to 1800 hours)/12-hour dark photoperiod. Air handling units were set to provide approximately 10 fresh air changes per hour. PMI Nutrition International, LLC, Certified Rodent LabDiet® 5002 and reverse osmosis-purified water were offered ad libitum.

All animals were observed twice daily for appearance, behavior, mortality and moribundity. A detailed physical examination was performed at the time of randomization. The rats were also observed daily (prior to dosing). Clinical findings at the time of dose administration and approximately 1 hour following dose administration were recorded when observed. Individual body weights were recorded daily. Each female pup was observed daily for vaginal patency beginning on PND 25 (Adams et al., 1985). Examination continued daily until vaginal patency was observed. Body weights were recorded on the day that vaginal patency was noted. Beginning on the day that vaginal patency was observed, vaginal lavages were performed daily, through the day of euthanasia, and the slides were examined to determine the stage of estrus. The mean estrous cycle length was calculated and reported for complete estrous cycles (i.e., the total number of returns to metestrus [M] or diestrus [D] from estrus [E] or proestrus [P] until the day of euthanasia). Estrous cycle length was determined by counting the number of days from the first M or D in a cycle to the first M or D in a subsequent cycle. In addition, the mean age at the onset of the first estrous cycle was calculated using the first day each animal was observed to be in estrus. A gross necropsy was performed only

on animals that were found dead or euthanized in extremis. Beginning on 8 June 2005, blood was collected from all animals euthanized in extremis or found dead following dose administration for hematology and serum chemistry evaluation (see Appendix E); the lungs, heart, liver, kidneys, esophagus and gastrointestinal tract from these animals, as well as from all animals found dead, were also retained in 10% neutral-buffered formalin. All surviving animals were euthanized on PND 42 by carbon dioxide inhalation; blood was collected via the vena cava for evaluation of serum thyroxine (T_4) and thyroid stimulating hormone (TSH) levels. Additional serum samples (taken from the samples used for TSH and T_4 analysis) were collected and stored frozen for possible future serological analysis. The uterus (wet and blotted), kidneys, liver, ovaries and oviducts, adrenal glands, pituitary gland and thyroid glands were weighed. Luminal fluid weight was calculated by subtracting the blotted uterus weight from the wet uterus weight. The ovaries, uterus (horns and body), cervix, vagina, pituitary gland, thyroid glands and gross lesions were retained from all females, including those found dead.

Statistical tests were performed using appropriate computing devices or programs. Analyses were conducted using two-tailed tests for minimum significance levels of 1% and 5%, comparing each test article-treated group to the control group. Each mean was presented with the standard deviation (S.D.) and the number of animals (N) used to calculate the mean. Mean body weights, body weight changes, days of acquisition of vaginal patency, estrous cycle lengths, ages at the first occurrence of estrus, serum hormone levels, luminal fluid weights and absolute and relative organ weights were subjected to a parametric one-way analysis of variance (ANOVA; Snedecor and Cochran, 1980) to determine intergroup differences. If the ANOVA revealed statistically significant ($p<0.05$) intergroup variance, Dunnett's test (Dunnett, 1964) was used to compare the test article-treated groups to the control group.

1.3. KEY STUDY DATES

Date(s)	Event(s)
17 May 2005	Experimental starting date (animal receipt)
31 May 2005	Experimental start date (first day of dose administration)
31 May - 21 June 2005	Test article administration
22 June 2005	Experimental termination/completion date (last euthanasia)

1.4. DATA RETENTION

The sponsor has title to all documentation records, raw data, specimens or other work product generated during the performance of the study. All work product generated by WIL Research Laboratories, LLC, including raw paper data and specimens, are retained in the Archives at WIL Research Laboratories, LLC, as specified in the study protocol. Data generated by the sponsor will be archived by the sponsor or the sponsor's designee.

Reserve samples of the test articles, pertinent electronic storage media and the original final report are retained in the Archives at WIL Research Laboratories, LLC in compliance with regulatory requirements.

1.5. RESULTS - [ ]

Clear material on various body surfaces (primarily around the mouth) was noted in females, primarily in the 1000 mg/kg/day [ ] group, with infrequent occurrences in the 250 mg/kg/day group 1 hour following dose administration. These findings were attributed to the test article, but were not considered adverse.

One, 3, 7 and 7 females in the control, 60, 250 and 1000 mg/kg/day [ ] groups, respectively, were found dead at 23-32 days of age as a result of test article administration. Three females in the 1000 mg/kg/day [ ] group were found dead at 23 days of age following 1 dose on the previous day. The remaining 3, 6 and 4 females in the 60, 250 and 1000 mg/kg/day [ ] groups, respectively, died within approximately 1.5 hours of dose administration at 28 to 32 days of age. There were no deaths after PND 30 in the 250 and 1000 mg/kg/day [ ] groups, and no females were

found dead after the administration time was changed. One female in the 1000 mg/kg/day [ ] group was hypoactive with shallow respiration 1 hour following dose administration on PND 22. No other remarkable clinical findings exclusive to animals that were found dead were noted in the 1000 mg/kg/day [ ] group. Necropsy findings in the 1000 mg/kg/day [ ] group consisted of dark red discoloration of the lungs (2 females), lungs not fully collapsed (2 females) and clear tracheal contents (1 female). Prior to death (at 28, 29 or 30 days of age), 1 female each in the 250 mg/kg/day [ ] group had labored respiration or hypoactivity noted on the day of death. Necropsy findings in the 250 mg/kg/day [ ] group consisted of 1 female with cystic kidneys, lungs that were not fully collapsed and dark red discoloration of the skeletal muscle dorsal to the thyroid glands. Another female in this group had lungs that were not fully collapsed and dark red discoloration of the skeletal muscle at the approximate level of thoracic vertebrae nos. 1-3, and a third female in this group had dark red discoloration of the lungs. In the 60 mg/kg/day group, 1 female (found dead at 30 days of age) was hypoactive and prostrate with shallow respiration at the time of dose administration on the day of death. In this same group, 1 female had no clinical findings and another female was hypoactive and had tan material around the mouth 1 hour following dose administration on the day of death; both of these females were 32 days of age at death. At necropsy, 2 females in the 60 mg/kg/day [ ] group had lungs that were not fully collapsed; another female had dark red discoloration of the lungs. The control group female died on PND 31 and had no clinical findings prior to death and no internal findings at necropsy. All other animals survived to the scheduled euthanasia.

Mean body weight gains in the 1000 mg/kg/day [ ] group were lower than the control group values following the first 3 days of dose administration. The differences were statistically significant ($p<0.01$) from PND 22-23 to PND 23-24. Throughout the remainder of the dosing period and when the entire treatment period (PND 22-42) was evaluated, mean body weight gains in this group were generally similar to those in the control group. Mean body weights in this group were 5.4% to 11.6% lower than the

control group values from PND 23-35. The differences were statistically significant ($p<0.05$ or $p<0.01$) from PND 24-29. By PND 42, mean body weight in the surviving females in the 1000 mg/kg/day [ ] group was similar to the control group. Mean body weights and body weight gains in the 60 and 250 mg/kg/day [ ] groups were generally similar to those in the control group throughout the study; none of the differences were statistically significant.

A test article-related delay in the mean age of attainment of vaginal patency was noted in the 1000 mg/kg/day [ ] group. Mean ages of attainment were 33.7, 33.7, 34.6 and 35.5 days in the control, 60, 250 and 1000 mg/kg/day [ ] groups, respectively. Mean body weights at the age of attainment in these groups were similar to the control group value. No statistically significant differences in either parameter were noted; however, only 8 females each in the 250 and 1000 mg/kg/day [ ] groups were available for evaluation compared to 14 females in the control group.

The ages of the first occurrence of estrus in the 60, 250 and 1000 mg/kg/day [ ] groups (35.2, 36.9 and 37.5 days, respectively) were similar to that in the control group (37.1 days of age); the differences were not statistically significant. No differences in mean estrous cycle length were observed when the 60 (n=7) and 250 (n=3) mg/kg/day [ ] groups were compared to the control group (n=7); only 1 of 8 surviving females in the 1000 mg/kg/day group had a complete cycle prior to necropsy. Estrous cycle lengths in females of this age are highly variable. Estrous cycle length could only be determined for 7/14, 7/12, 3/8 and 1/8 surviving females in the control, 60, 250 and 1000 mg/kg/day [ ] groups, respectively, due to an increase in the number of females with incomplete cycles. The delay in completing 1 estrous cycle in the 250 and 1000 mg/kg/day [ ] groups was potentially test article-related. However, the small group size (N=8) in these groups confounds the interpretation of these results.

Test article-related changes in thyroid hormone levels were observed in the 1000 mg/kg/day [ ] group. The mean total T_4 level in this group was lower than the

control group value; the difference was statistically significant ($p<0.05$). The mean TSH level in the 1000 mg/kg/day [ ] group was higher than that in the control group. The difference was not statistically significant. There were no effects on thyroid gland weight in this group. Mean total T_4 and TSH levels in the 60 and 250 mg/kg/day [ ] groups were generally similar to those in the control group; there was no dose-response relationship in these groups.

Mean absolute and/or relative (to final body weight) liver weights in the 1000 mg/kg/day [ ] group were increased compared to the control group values; the difference in mean relative liver weight was statistically significant ($p<0.01$). These increases were attributed to the test article. No other test article-related changes in organ weights were observed. Mean wet (absolute and relative) uterus weight and mean absolute luminal fluid weight in the 60 mg/kg/day [ ] group were increased compared to the control group values. The differences were not statistically significant, and no dose-response relationship was observed. In addition, luminal fluid weights were highly variable, and no attempt was made to euthanize the females at the same stage of estrous. Therefore, the increases in wet uterus and luminal fluid weights in the 60 mg/kg/day [ ] group were not considered test article-related.

1.6. CONCLUSIONS - [ ]

Based on the results of this study, the test article, [ ], administered orally to juvenile female rats resulted in no apparent estrogenic effects for surviving females at 60, 250 and 1000 mg/kg/day. However, the number of animals available for evaluation in the 250 and 1000 mg/kg/day groups may not be sufficient to determine such effects due to the high mortality rate in these groups. Attainment of vaginal patency was delayed in the 1000 mg/kg/day [ ] group with no difference in body weight at the age of attainment. Following the attainment of vaginal patency, the number of females completing 1 estrous cycle was reduced in the 250 and 1000 mg/kg/day [ ] groups. The mean T_4 level was decreased and the mean TSH level was increased in the 1000 mg/kg/day [ ] group; no changes in thyroid weights were noted.

1.7. RESULTS - [ ]

Low incidences of clear material around the mouth and/or nose were observed 1 hour following dose administration in the 250 and 1000 mg/kg/day [ ] group females, including 1 occurrence in each of the females found dead. These findings were attributed to the test article, but were not considered adverse.

Three, 2 and 1 females in the 60, 250 and 1000 mg/kg/day [ ] groups, respectively, were found dead at 22 to 31 days of age. Because no dose-related trend was evident, 1 control group animal was found dead and there was no evidence of systemic toxicity at any [ ] dosage level, these deaths were not attributed to test article administration. In the 1000 mg/kg/day [ ] group, female no. 84028-02 was found dead at 29 days of age 12 minutes following dose administration. The only internal finding at necropsy for this female was lungs that were not fully collapsed. In the 250 mg/kg/day [ ] group, female no. 84034-08 was found dead at 22 days of age approximately 1 hour following administration of the first dose; this female had no clinical findings prior to death and no internal findings at necropsy. Female no. 84023-03 in the same group was found dead at 25 days of age following 3 days of dose administration. This female was cannibalized and could not be examined macroscopically. Female nos. 84030-08, 84029-08 and 84031-07 in the 60 mg/kg/day group were found dead at 27, 30 and 31 days of age, respectively; no clinical findings were noted for these females prior to death. At necropsy, female nos. 84029-08 and 84031-07 had dark red discoloration of the lungs; female no. 84029-08 also had lungs that were not fully collapsed; no internal findings were noted for female no. 84030-08. All other females survived to the scheduled euthanasia.

Mean body weights and body weight gains in the 60, 250 and 1000 mg/kg/day [ ] groups were generally similar to those in the control group throughout the study. No statistically significant differences were noted.

There were no test article-related effects on the mean age of attainment of vaginal patency or body weight at the age of attainment of patency. Mean days of attainment were 33.7, 33.3, 33.7 and 34.2 days in the control, 60, 250 and 1000 mg/kg/day [ ] groups, respectively. No statistically significant differences were noted.

The ages of the first occurrence of estrus in the 60, 250 and 1000 mg/kg/day [ ] groups (35.1, 36.3 and 36.6 days of age, respectively) were similar to that in the control group (37.1 days of age). The differences were not statistically significant. Two females in the 1000 mg/kg/day [ ] group had no occurrences for estrus; 1 of these females was in extended diestrus (11 days). No test article-related differences in mean estrous cycle length were observed when the [ ]-treated groups were compared to the control group. However, estrous cycle lengths could only be determined for 7/14, 6/12, 7/13 and 7/14 females in the control, 60, 250 and 1000 mg/kg/day [ ] groups, respectively, due to incomplete cycles.

Mean T_4 and TSH levels in the 60, 250 and 1000 mg/kg/day [ ] groups were similar to the control group values. No statistically significant differences or dose-related trends were evident.

No test article-related changes in organ weights were observed in the [ ]-treated groups. Differences from the control group were not statistically significant. Mean wet (absolute and relative) uterus weight and mean absolute luminal fluid weight in the 250 and 1000 mg/kg/day [ ] groups were increased (not statistically significant) compared to the control group values. However, no attempt was made to euthanize the females at the same stage of estrous. In addition, luminal fluid weights were highly variable. Therefore, the increases in wet uterus and luminal fluid weights in the 250 and 1000 mg/kg/day [ ] groups were not considered test article-related.

1.8. CONCLUSIONS - [ ]

Based on the results of this study, the test article, [ ], administered orally to juvenile female rats resulted in no apparent estrogenic effects in the 60, 250 and 1000 mg/kg/day groups.

This study was inspected in accordance with the U.S. EPA Good Laboratory Practice Standards (40 CFR Parts 160 and 792), the OECD Principles of Good Laboratory Practice, the standard operating procedures of WIL Research Laboratories, LLC and the sponsor's protocol and protocol amendment with the following exceptions. The data located in Appendices A (Certificates of Analysis) and B (Analytical Chemistry Report) were the responsibility of the sponsor. Quality Assurance findings, derived from the inspections during the conduct of the study and from the inspections of the raw data and draft report, are documented and have been reported to the study director. A status report is submitted to management monthly.

This report accurately reflects the data generated during the study. The methods and procedures used in the study were those specified in the protocol, its amendments and the standard operating procedures of WIL Research Laboratories, LLC.

The raw data, the retention sample(s), and the final report will be stored in the Archives at WIL Research Laboratories, LLC or another location specified by the sponsor.

3.2. APPROVAL

This study was inspected according to the criteria discussed in Section 3.1.

5. DEVIATIONS FROM THE PROTOCOL

This study was conducted in accordance with the protocol and protocol amendments, except for the following.

- **Protocol Sections 4.1.5, 4.2.5 and 7.5.4** state that the test articles and the dosing formulation samples would be stored at ambient conditions under nitrogen. There is no documentation that dosing formulation samples and the bulk test article were stored under nitrogen on 6 June 2005.
- **Protocol Section 5.3** states that the animals would be supplied by Charles River Laboratories, Inc., Portage, Michigan. Animals were supplied by the Raleigh, North Carolina facility of Charles River Laboratories, Inc.
- **Protocol Section 7.5.4** states that the vial plus the sample weight would be recorded with an accuracy of ±0.0005. The vial plus the sample weight from all formulations were weighed to 5 decimal places instead of 4 decimal places.
- **Protocol Section 7.6.1** states that the rats would be observed twice daily for appearance, behavior, moribundity and mortality. Documentation of the afternoon observation was not recorded on 21 May 2005 (pretest period).
- **Protocol Section 7.6.1** states that the animals would be observed approximately 1 hour following dose administration. The following deviations from the target time of approximately 1 hour were noted:

Date (2005)	Group	Number Of Animals	Time After Dose Administration
31 May	Control	1	1 hour, 16 minutes
2 June	250 mg/kg/day [ ]	9	1 hour, 16 minutes to 1 hour, 21 minutes
5 June	1000 mg/kg/day [ ]	5	42 to 44 minutes
6 June	Control	1	1 hour, 16 minutes
6 June	1000 mg/kg/day [ ]	10	1 hour, 16 minutes to 1 hour, 20 minutes
9 June	Control	2	1 hour, 16 minutes
12 June	Control	5	1 hour, 16 minutes to 1 hour, 17 minutes

- **Protocol Section 7.6.2** states that body weights would be recorded to the nearest 0.1 g, except on the day prior to dosing and the final body weight. However, body weights were recorded to the nearest 0.1 g on the day prior to dosing.

- **Protocol Section 9.1** states that blood would be collected from animals that were found dead or euthanized in extremis. Due to the amount of time that had elapsed between dosing and death, animal nos. 84030-09 (control group), 84027-01 (60 mg/kg/day [ ] group) and 84032-05 (250 mg/kg/day [ ] group) did not have blood collected.

These deviations did not negatively impact the quality or integrity of the data nor the outcome of the study.

APPENDIX D

Clinical Pathology Methods, Procedures And References

Revised Audited Draft

CLINICAL PATHOLOGY METHODS, PROCEDURES AND REFERENCES

Serum Chemistry - Hitachi 912

Albumin - Bromcresol Green (BCG) Method, Modification of the Doumas reaction. Default unit: g/dL. Hitachi 912 Application Code 413. Roche Reagent, catalog number 11970569.

A/G Ratio - Calculated from Albumin and Globulin Results. Default unit: %.

Alkaline Phosphatase - based on the International Federation of Clinical Chemistry (IFCC) Method (Tietz *et al.* J Clin Chem Clin Biochem 1983; 21:731-748). Default unit: U/L. Hitachi 912 Application Code 158. Roche Reagent, catalog number 2172933.

Alanine Aminotransferase - Modification of the International Federation of Clinical Chemistry (IFCC) recommended method. Default unit: U/L. Hitachi 912 Application Code 706. Roche Reagent, catalog number 450065.

Aspartate Aminotransferase - Kinetic method based on the International Federation of Clinical Chemistry (IFCC) recommendations. Default unit: U/L. Hitachi 912 Application Code 715. Roche Reagent, catalog number 450064.

Bilirubin (Total) – Total bilirubin is coupled with a diazonium ion in a strongly acidic medium resulting in production of azobilirubin. Intensity of color of azobilirubin is proportional to the total bilirubin concentration and is measured photometrically. Method developed by Wahlefeld *et al.* Scan J Clin Lab Invest. 1972; 29: Supplement 126. Default unit: mg/dL. Hitachi 912 Application Code 18. Roche Reagent, catalog number 1822730.

Blood Urea Nitrogen (BUN) - A urease-triggered methodology based upon the method of Talke and Schubert Klin Wschr, 1965; 43:174. Default unit: mg/dL. Hitachi 912 Application Code 427. Roche Reagent, catalog number 1489321.

Calcium - Modified method using a gamma-amino-butyric acid (GABA) buffer. Default unit: mg/dL. Hitachi 912 Application Code 180. Roche Reagent, catalog number 1125621.

Chloride - An ion-selective electrode that measures the electrical potential of the ions present in solution. Default unit: mEq/L. Hitachi 912 Application. Roche Reagent, catalog numbers 820638, 836246 and 820639.

Cholesterol - Enzymatic reaction as described by Trinder. Ann Clin Biochem 1974; 12:266. Default unit: mg/dL. Hitachi 912 Application Code 722. Roche Reagent, catalog number 450061.

Revised Audited Draft

Revised Audited Draft

Creatinine - Modified Jaffe reaction based on the work of Poper *et al.* Biochem Z 1937; 291:354, and Seelig and Wuest. Aerztl Labor 1969; 15:34. Default unit: mg/dL. Hitachi 912 Application Code 727. Roche Reagent, catalog number 450019.

Gamma-Glutamyltransferase (GGT) - Method based on the studies of Persijn and Van der Slik, J Clin Chem Clin Biochem, 1976; 14:421-427. Default unit: U/L. Hitachi 912 Application Code 479. Roche Reagent, catalog number 2016885.

Globulin - Calculation obtained by subtracting Albumin from Total Protein. Default unit: g/dL.

Glucose - Glucose hexokinase method based on the work of Schmidt, Peterson and Young. Klin Wschr 1961; 39:1244. Methods of Enzymatic Analysis, 2nd Eng ed. New York, Academic Press, 1974; 1196. Anal Biochemistry 1958; 23:301. Default unit: mg/dL. Hitachi 912 Application Code 767. Roche Reagent, catalog number 450058.

Phosphorus - Method involves the formation of ammonium phosphomolybdate. Default unit: mg/dL. Hitachi 912 Application Code 714. Roche Reagent, catalog number 1040898.

Potassium - An ion-selective electrode that measures the electrical potential of the ions present in solution. Default unit: mEq/L. Hitachi 912 Application. Roche Reagent, catalog numbers 820638, 836246 and 820639.

Sodium - An ion-selective electrode that measures the electrical potential of the ions present in solution. Default unit: mEq/L. Hitachi 912 Application. Roche Reagent, catalog number 820638, 836246 and 820639.

Total Protein - Endpoint biuret method that utilizes a sample blank. Default unit: g/dL. Hitachi 912 Application Code 756. Roche Reagent, catalog number 1040901.

Hematology - Manual Methods

White Cell Differential - Manual method of counting 100 white cells stained with Wright Giemsa and entered on-line into the data files.

Reticulocyte Count - Manual method of counting the reticulocytes present in 1000 red blood cells stained with New Methylene Blue and entered on-line into the data files.

Red Blood Cell Morphology - Manual method of evaluating red blood cells on a Wright Giemsa-stained slide and entered on-line into the data files.

Platelet Estimate- Manual method of evaluating platelets on a Wright Giemsa-stained slide. Platelet estimation is evaluated and entered on-line into the data files as decreased, adequate or increased. Platelet clumps present on the slide will be reported as part of the RBC morphology.

Immunoassay- DPC Immulite®

Total T4 - Solid-phase, chemiluminescent enzyme immunoassay for the quantitative measurement of total circulating thyroxide. Default unit: µg/dL.

Rat Thyroid Stimulating Hormone (rTSH) - ^{125}I assay system with magnetic separation for the quantitative measurement of (rTSH). DPC GAMMA C-12 gamma counter. Biotrak™ rat thyroid stimulating hormone ^{125}I assay system. Amersham Pharmacia Biotech. Package insert.

Hematology-Bayer Advia® 120

WBC Count - The whole blood sample is mixed with ADVIA® 120 BASO reagent that contains acid and surfactant. The red cells are hemolyzed, and the white blood cells are then analyzed using two angle laser light scatter signals. Default unit: x 10^3 cells/µL

RBC / Platelet Count - Both red blood cells and platelets are analyzed by a single optical cytometer after appropriate dilution of the blood sample with ADVIA® 120 RBC/PLT reagent. The red blood cells are isovolumetrically sphered and lightly fixed with glutaraldehyde to preserve the spherical shape. Red cells and platelets are counted from the signals from a common detector with 2 different gain settings. Default unit RBC: x 10^6cells/µL. Default unit PLT: x 10^3 cells/µL

Hgb - Hemoglobin: The hemoglobin method is a modification of the manual cyanmethemoglobin method developed by the International Committee for standardization in Hematology (ICSH). Default unit: g/dL.

Hematocrit - The percentage of blood volume that is occupied by red blood cells. Also referred to as the packed red cell volume. On the ADVIA® 120 Hematology System this parameter is derived from the measured red cell volume (MCV) and the red cell count (RBC). Default unit: %.

MCH - Mean Corpuscular Hemoglobin: the average weight of hemoglobin in the red blood cells, calculated from the RBC and Hgb measurements. Default unit: pg.

MCHC - Mean Corpuscular Hemoglobin Concentration: the average concentration of

Revised Audited Draft

hemoglobin in the red blood cells. This parameter is computed from the measured hemoglobin and the computed hematocrit. Default unit: g/dL.

MCV - Mean Corpuscular Volume: the average volume of the red blood cells. Default unit: fL

White blood cell differential - The ADVIA® 120 Hematology System White Blood Cell Differential (WBC DIFF) methods, consists of both the Peroxidase method and the Basophil/Lobularity method. The ADVIA® 120 Hematology System performs a six-part differential that consists of basophils, eosinophils, large unstained cells, lymphocytes, monocytes, and neutrophils. The white blood cell differential count is reported in percent and the actual number of each type of cell per microliter of blood.

Reticulocyte - This method uses a nucleic acid dye (oxazine 750) to stain cellular RNA. The ADVIA® 120 autoRETIC reagent isovolumetrically spheres the erythroid cells and stains cellular RNA. Low-angle laser light scatter, high-angle laser light scatter, and absorption characteristics of all cells are counted and measured. The absorption data are used to classify each cell as a reticulocyte or mature red blood cell based on its RNA content. The reticulocyte is reported in percent and actual number x 10 cells/Liter.

APPENDIX G

Study Protocol

Revised Audited Draft

Revised Audited Draft

Study Number: WIL-187044

PROTOCOL AMENDMENT I

Sponsor: [redacted]

Sponsor Study Number: 05-003

A. Title of Study:

A Female Pubertal Assay of [redacted] and [redacted] Administered Orally in Juvenile Female Rats

B. Protocol Modification:

1) **8.1** **Thyroid Hormones:**

In accordance with the Study Director Notification dated June 18, 2005, the Sponsor elected to collect additional serum for possible future serological evaluation. This serum was taken from the samples collected for TSH and T4 analysis from all animals following euthanasia. These samples are being stored frozen.

9.1 **Macroscopic Examination:**

2) In accordance with the Study Director Notification dated June 8, 2005, the following tissues were saved in 10% neutral-buffered formalin from animals found dead or euthanized *in extremis* beginning on June 8, 2005.

Lungs	Kidneys
Heart	Esophagus
Liver	GI Tract

3) In accordance with the Study Director Notification dated June 8, 2005, the animals euthanized *in extremis* and the animals which died following dosing had blood collected from the vena cava for evaluation of the following blood chemistry and complete blood count (with differential) parameters. These procedures were in effect beginning on June 8, 2005.

Revised Audited Draft

Hematology:

Differential leukocyte count	MCHC
Erythrocyte count	MCV
Hematocrit	Platelet count
Hemoglobin	Reticulocyte count
MCH	Total leukocyte count

Serum Chemistry:

A/G ratio	Glucose
Alanine aminotransferase	Glutamyltransferase
Albumin	Phosphorus
Alkaline phosphatase	Potassium
Aspartate aminotransferase	Sodium
Calcium	Total bilirubin
Chloride	Total cholesterol
Creatinine	Total protein
Globulin	Urea nitrogen

C. Reason for Protocol Modification:

1) The Sponsor requested collection and processing of serum samples for possible serological evaluation.

2) Addition of tissues collected as per the request of the Sponsor.

[redacted]

[redacted]

3) Addition of hematology and serum chemistry parameters at the request of the Sponsor.

PROTOCOL

A FEMALE PUBERTAL ASSAY OF [redacted] AND [redacted] ADMINISTERED ORALLY IN JUVENILE FEMALE RATS

Sponsor Study Number: 05-003

Submitted To:

[redacted]

WIL Research Laboratories, LLC
1407 George Road
Ashland, OH 44805-9281

Revised Audited Draft

1 OBJECTIVE:

The objective of this study is to evaluate the ability of the test articles to induce effects on pubertal development in the intact juvenile female rat.

2 PERSONNEL INVOLVED IN THE STUDY:

2.1 Sponsor Representative:

[redacted]

2.2 WIL Study Director:

[redacted]

2.3 WIL Deputy Director:

[redacted]

2.4 WIL Departmental Responsibilities:

[redacted]

Revised Audited Draft

[redacted]

3 STUDY SCHEDULE:

Proposed Animal Receipt Date:	May 17, 2005
Proposed Experimental Start Date (Experimental Starting Date):	May 31, 2005
Proposed Experimental Termination/ Completion Date:	June 22, 2005
Proposed Audited Report Date:	August 31, 2005

4 TEST ARTICLE DATA:

4.1 Identification:

[redacted]

Revised Audited Draft

4.1.1 Lot Number:

[redacted]

4.1.2 Purity:

100%.

4.1.3 Stability:

The test article is considered to be stable under the storage conditions provided by the Sponsor.

4.1.4 Physical Description:

Viscous liquid.

4.1.5 Storage Conditions:

Store at ambient conditions under nitrogen.

4.1.6 Reserve Samples:

Reserve samples of the test article will be taken in accordance with WIL standard operating procedures and stored in the Archives at WIL Research Laboratories, LLC indefinitely unless otherwise specified.

4.1.7 Personnel Safety Data:

To be provided by the Sponsor. It is the responsibility of the Sponsor to notify the testing facility of any special handling requirements for the test article. A material safety data sheet (MSDS) will accompany the test article upon arrival at the laboratory.

4.2 Identification:

[redacted]

4.2.1 Lot Number:

[redacted]

4.2.2 Purity:

100%.

Revised Audited Draft

4.2.3 Stability:

The test article is considered to be stable under the storage conditions provided by the Sponsor.

4.2.4 Physical Description:

Viscous liquid.

4.2.5 Storage Conditions:

Store at ambient conditions under nitrogen.

4.2.6 Reserve Samples:

Reserve samples of the test article will be taken in accordance with WIL standard operating procedures and stored in the Archives at WIL Research Laboratories, LLC indefinitely unless otherwise specified.

4.2.7 Personnel Safety Data:

To be provided by the Sponsor. It is the responsibility of the Sponsor to notify the testing facility of any special handling requirements for the test article. A material safety data sheet (MSDS) will accompany the test article upon arrival at the laboratory.

5 TEST SYSTEM:

5.1 Species:

Rat.

5.2 Strain:

Sprague-Dawley Crl:CD®(SD)

5.3 Source:

Charles River Laboratories
Portage, Michigan

5.4 Number on Study:

105 Females (maximum of 130 females and 13 dams purchased). Immature females will be supplied in litters of 10 animals with their own or another (fostering) dam. The immature females will be 6-8 days old upon receipt. Animals not assigned to the study will be transferred to the stock animal colony

Revised Audited Draft

or will be euthanized by carbon dioxide inhalation and the carcasses discarded. Following weaning, the dams will be euthanized by carbon dioxide inhalation and discarded.

5.5 Body Weight Range:

At randomization: 30-50 g. All animals assigned to study will be approximately ± 5 g of the mean.

5.6 Age:

At start of dosing animals will be 22 days of age.

5.7 Identification System:

The maternal animals will be uniquely identified by a Monel® metal eartag displaying the animal number. The pups will be identified by tail tattoo. Individual cage cards will be affixed to each cage and will display the animal number, group number, study number, dosage level and sex of the animal.

5.8 Justification for Selection:

This species and strain of animal is recognized as appropriate for reproduction studies. WIL Research Laboratories, LLC has reproductive historical control data in this species and strain of rat. This animal model has been proven to be susceptible to the effects of reproductive toxicants. This number of animals is considered the minimum number required for meaningful interpretation of the data and fulfillment of agency requirements.

6 SPECIFIC MAINTENANCE SCHEDULE:

6.1 Animal Housing:

All animals will be initially housed by litter with their own or another (fostering) dam in plastic maternity cages containing ground corncob nesting material (Bed-O'Cobs®). Following randomization, the juvenile female animals will be weaned and housed three animals per cage in plastic maternity (shoebox) cages. Control animals (Group 1) will be housed on a separate rack from exposed animals. The cage bedding will be changed at least three times each week. The cages will be subjected to routine cleaning at a frequency consistent with maintaining good animal health and WIL standard operating procedures. The facilities at WIL Research Laboratories, LLC are fully accredited by the Association for Assessment and Accreditation of Laboratory Animal Care International (AAALAC International).

Revised Audited Draft

6.2 Environmental Conditions:

Controls will be set to maintain an average daily temperature of 71 ± 5°F (22 ± 3°C) and an average daily relative humidity of 50 ± 20%. Temperature and relative humidity will be monitored continuously. Data for these two parameters will be scheduled for automatic collection on an hourly basis. Fluorescent lighting controlled by light timers will provide illumination for a 12-hour light/dark photoperiod. Temporary adjustments to the light/dark cycles may be made to accommodate protocol-specified activities. The ventilation rate will be set at a minimum of 10 room air changes per hour, 100% fresh air.

6.3 Drinking Water:

Reverse osmosis-purified water will be available ad libitum. Filters servicing the automatic watering system are changed regularly according to WIL standard operating procedures. The municipal water supplying the laboratory is analyzed according to WIL standard operating procedures on a routine basis to assure that contaminants are not present in concentrations that would be expected to affect the outcome of the study.

6.4 Basal Diet:

PMI Nutrition International, LLC Certified Rodent LabDiet® 5002 will be offered ad libitum during the study. Periodic analyses of the certified feed are performed by the manufacturer to ensure that heavy metals and pesticides are not present at concentrations that would be expected to affect the outcome of the study. Results of the analyses are provided to WIL Research Laboratories, LLC by the manufacturer and will be placed in the study records. Feeders will be changed and sanitized once per week.

7 EXPERIMENTAL DESIGN:

7.1 Animal Receipt and Quarantine:

Each animal will be inspected by a qualified technician upon receipt. Rats judged to be in good health and suitable as test animals will be immediately placed in quarantine for a minimum of nine days. All rats will be initially sexed and weighed. Maternal animals will be permanently identified with a metal ear tag, and juvenile animals will be identified by tail tattoo. During the quarantine period, each rat will be observed twice daily for changes in general appearance and behavior. Prior to the start of the in-life phase, those animals judged to be suitable test subjects will be identified and receive a detailed physical examination at the time of animal selection for randomization.

Revised Audited Draft

7.2 Randomization:

At the conclusion of the quarantine period (animals 21 days of age), animals judged to be suitable test subjects and meeting acceptable body weight requirements, will be assigned at random using a computer program. At that time, the animal numbers and corresponding body weights will be entered into the WIL Toxicology Data Management System (WTDMS™). A printout containing the animal numbers and individual group assignments will be generated based on body weight stratification into a block design. Animals will then be weaned and arranged into the groups according to the printout. Each of 7 groups will consist of fifteen females. If after randomization statistically significant differences between groups exist, new randomizations will be generated until group mean body weights are homogeneous.

7.3 Route and Rationale of Test Article Administration:

The route of administration will be oral (gavage). Historically, this route has been used extensively for studies of this nature. Appropriate-sized flexible, Teflon®-shafted, stainless steel ball-tipped dosing cannulae will be used for the oral administration by gavage. Any losses or incomplete dosing will be recorded.

7.4 Organization of Test Groups, Dosage Levels and Treatment Regimen:

7.4.1 Organization of Test Groups:

The dosage levels were determined from the results of previous studies and were provided by the Sponsor Representative after consultation with the WIL Study Director. The following table presents the study group arrangement.

Group Number	Test Article	Dosage Level (mg/kg/day)	Dose Concentration (mg/mL)	Dose Volume (mL/kg)	Number of Females
1	Corn Oil	0	0	5	15
2	[redacted]	60	12	5	15
3		250	50	5	15
4		1000	200	5	15
5		60	12	5	15
6		250	50	5	15
7		1000	200	5	15

7.4.2 Vehicle Control Article:

Corn oil

Revised Audited Draft

7.4.3 Treatment Regimen:

The test and control articles will be administered as single daily doses beginning on day 22 of age and continuing through 41 days of age. All animals will be dosed at approximately the same time each day, and the time of dosing will be recorded for each animal.

7.4.4 Adjustment of Dosages:

Individual doses will be calculated based on each daily body weight to provide the proper dosage. Individual animal body weights and individual animal dosages will be recorded.

7.5 Preparation and Analysis of Test Article Formulations:

7.5.1 Method and Frequency of Preparation:

Based on the physical characteristics of the test article, appropriate methods will be used to ensure the best possible formulations of the test article in the vehicle. Dosing formulations of the test article will be prepared weekly. The study director or the deputy director or designee will visually inspect the formulations prior to initiation of dosing. This visual inspection will be performed to assure that the formulations are visibly homogeneous and acceptable for dosing. Any special procedures required for formulation will be documented according to Good Laboratory Practices and presented in the final report of this study.

7.5.2 Homogeneity and Stability of Test Article Formulation:

Dosing mixture homogeneity in bulk preparations will be collected prior to the initiation of test article administration. While undergoing stirring in the beaker, the following sample aliquots (5 mL) will be drawn for analysis: control, three aliquots (from the middle); all treatment groups, nine aliquots (3 each from the top, middle and bottom). Test article formulations will be divided into aliquots for daily dispensation. Resuspension homogeneity of aliquots will be determined over the longest period of aliquot storage. Three samples (5mL) from the top and bottom of each group will be collected to assess the homogeneity after storage and resuspension. Two of the three samples will be sent to [redacted] for analysis of homogeneity and stability over a ten-day period. The samples will be shipped under ambient conditions under nitrogen. The remaining sample from each dose level and strata will be stored under normal laboratory conditions for possible future analysis.

Revised Audited Draft

7.5.3 Concentration Analysis:

Samples of the dosing mixtures will be collected on the first and last day of each weekly preparation. At each time point, two 5-mL aliquots will be taken from each dose level (middle stratum), including the control group. The dosing mixture will be thoroughly mixed before taking each sample. One sample from each dose level will be analyzed; the remaining sample will be retained by the Testing Laboratory for possible future analysis.

Dosing mixture samples for homogeneity, stability and concentration of the test article at all dose levels, including the control, will be analyzed by the Sponsor. Quality assurance (QA) auditing of the conduct, results and reporting of the analyses, as well as archiving of these data will be the responsibility of the Sponsor. Critical phase inspection reports and report audits will be submitted to the Study Director and management at WIL Research Laboratories, LLC. A QA statement will be issued for inclusion in the overall final report. The methods and results of the analysis will be provided by the Sponsor and included as an appendix to the WIL final report. The methods employed will be one or more of the following:

[redacted] SOP #ME-125

Concentration and stability data will be evaluated using percent difference. The acceptable tolerance between the theoretical and measured values is 15%.

Mixtures will be considered homogeneous if the difference between the overall group mean and the strata mean is 10% or less.

7.5.4 Sample Handling and Shipment:

Each 5-mL sample will be placed in a glass vial with a Teflon-lined lid. The vial plus sample weight will be recorded with an accuracy of ± 0.0005 g. Each sample will be stored at ambient temperature under nitrogen. Each sample container will be labeled with the following information:

Accession Number
Sponsor's Reference Number
Testing Laboratory Study Number
Test Article Name
Dose Level (mg/kg)
Dosing Mixture Concentration (mg/mL)
Preparation Date
Sampling Date
Weight of Sample

The sample shall be packed in a suitable container to maintain the temperature conditions specified in Section 4 during transit plus an adequate margin of safety for any transit delays. The sample shall be sent by express courier to:

[redacted]

[redacted] shall be notified in advance of shipping by telefax at [redacted]. This notification shall include test article and study identification, carrier, and estimated time/date of arrival. Sample shipments shall be accompanied by an inventory sheet describing the samples contained in the shipment with the information described above.

7.6 General Observations During the Experimental Period:

7.6.1 Clinical Signs:

The rats will be observed twice daily for appearance, behavior, moribundity and mortality. A detailed physical examination will be conducted at the time of randomization. Clinical observations regarding general appearance and behavior will be recorded daily prior to dosing. During the treatment period, the rats will be observed also approximately one hour following dosing and the observations will be recorded. Additional post-dosing observation periods may be necessary and will be documented in the study records. Observations shall include, but are not limited to, evaluations for changes in appearance of the skin and fur, eyes and mucous membranes, respiratory, circulatory, autonomic and central nervous system functions, somatomotor activity and behavior patterns. Observations will be recorded.

Revised Audited Draft

Revised Audited Draft

7.6.2 Body Weights:

Daily body weights will be recorded individually (to the nearest 0.1 gram PND 22-42, with the exception of the weight collected the day prior to dosing and the final body weight) beginning one day prior to the start of dosing. Final body weights will be collected prior to euthanasia.

7.6.3 Vaginal Perforation:

Each female pup (15/group) will be observed daily for vaginal perforation beginning on PND 25 (Adams, 1985). Examination of the females will continue daily until vaginal perforation is present. The body weight of each female will be recorded on the day of acquisition of vaginal perforation.

7.6.4 Determination of Estrous Cycles:

Daily vaginal lavages will be performed to determine the stage of estrus beginning on the day vaginal perforation is observed. Lavages will continue through the day of necropsy. The mean age of first estrous will be determined.

7.7 Euthanasia:

On PND 42, the animals will be euthanized by carbon dioxide inhalation, and the time of euthanasia will be recorded for each animal. Any animals not expected to survive until the following dosing period or until the scheduled euthanasia will be euthanized by carbon dioxide inhalation and necropsied as described in section 9.

8 HOROMONE ANALYSIS:

8.1 Thyroid Hormones:

Following euthanasia, blood will be collected from the vena cava of all animals. Following collection, all blood samples will be allowed to clot and then be placed in an ice bath and processed to generate serum. The following hormone concentrations will be determined from all serum samples:

Thyroid Stimulating Hormone (TSH) Thyroxine (T4)

Revised Audited Draft

9 ANATOMIC PATHOLOGY:

9.1 Macroscopic Examination:

A complete necropsy examination will be conducted on all animals dying spontaneously or euthanized in extremis. This will include examination of the external surface, all orifices, the external surface of the brain and spinal cord and the thoracic, abdominal and pelvic cavities including viscera. A complete necropsy will not be conducted on animals surviving to study termination. The following tissues will be collected and placed in 10% neutral-buffered formalin at study termination:

Cervix and Uterine Body (one longitudinal section)	Thyroid
Ovaries	Uterine horns (four sections per horn)
Pituitary	Vagina
	All gross (internal) lesions

9.2 Organ Weights:

9.2.1 Uterine Weights:

Wet and blotted uterine weights will be measured for all animals surviving to the scheduled necropsy. Uterine weights will not be collected for any animals found dead or euthanized in extremis.

The uterus will be harvested from all animals using the following procedure. The harvesting of uteri will be performed in the same sequence as which dosing occurred. The pubic symphysis will be opened and each ovary and uterine horn will be detached from the dorsal abdominal wall. The ovaries are separated from the uterine horns at the oviduct/uterus junction. The urinary bladder and ureters will be removed from the ventral and lateral side of the uterus and vagina. The fibrous adhesion between the rectum and vagina is then detached until the junction of the vaginal orifice and perineal skin is identified. The uterus and vagina are detached from the body by incising the vaginal wall just above the junction between the perineal skin. The excess fat and adnexa will be trimmed away. The vagina is then removed from the uterus, leaving the cervix intact and attached to the uterus for uterus weight measurement. Care is to be taken during uterus harvesting such that the luminal contents are retained. A record will be made if any luminal contents are lost. The uterus will be transferred to a uniquely marked and tared plastic Petri dish with care to avoid desiccation before weighing. The Petri dish should be lined with saline-moistened filter paper (or equivalent) and covered to minimize desiccation.

Revised Audited Draft

The uterus harvesting and weighing procedure will be done in the order described below.

1. Animal is euthanized and uterus harvested.
2. Uterus (with luminal fluid) is immediately transferred to a Petri dish (lined with saline-moistened filter paper or equivalent) that was tared immediately prior to the transfer.
3. The uterus' wet weight is recorded to the nearest 0.1 mg.
4. The uterus is opened and blotted (see below).
5. The uterus is placed in a Petri dish (lined with saline-moistened filter paper or equivalent) that was tared immediately prior to the transfer.
6. The uterus' blotted weight is recorded to the nearest 0.1 mg.

Immediately following collection of the wet weight, the uterus will be individually processed by opening the uterine wall and carefully blotting the excess fluid. Both uterine horns will be pierced and cut longitudinally with small surgical scissors, placed on filter paper (ex. Whatman No. 3) and gently pressed with another piece of dry filter paper to absorb the luminal fluid. The procedure will not be so severe as to render the tissue unacceptable for histopathologic analysis, as this additional investigation may be performed at the discretion of the Sponsor (by protocol amendment).

9.2.2 Ovary, Liver, Kidney, Pituitary, Thyroid and Adrenal Weights:

The following organs from all females euthanized at scheduled termination will be weighed (to the nearest 0.1 mg):

Adrenal glands	Ovaries and oviducts
Liver	Pituitary gland
Kidneys	Thyroid (following fixation)

Paired organs will be weighed together.

To minimize systematic bias in the weighing procedures, organ harvesting and weighing procedures will be divided as equally as possible among the prosecting and weighing technicians, such that all animals from a group are not processed by a single individual.

9.3 Microscopic Examination:

Following collection of wet uterine weight, blotting of the uterus and collection of blotted uterine weight, each uterus will be placed in a uniquely identified jar of 10% neutral-buffered formalin and preserved for microscopic examination.

The vagina, ovaries, and thyroid from each animal will be similarly preserved with the uterus.

Microscopic examination of hematoxylin-eosin stained paraffin sections may be performed on the following tissues from all animals at the discretion of the Sponsor (additional cost).

Ovaries	Thyroid
Cervix and Uterine Body (one longitudinal section)	Uterine Horns (four sections per horn)

Revised Audited Draft

10 DURATION OF STUDY:

The conduct of this study will require approximately five weeks for acclimation, dosing and necropsy.

11 STATISTICAL METHODS:

Body weights, body weight gains, organ weights, uterine weights (wet and blotted), luminal fluid weights, mean days of acquisition of vaginal perforation, mean age of first estrous and estrous cycle length will be analyzed by a parametric one-way analysis of variance (ANOVA) (Snedecor, 1980) to determine intergroup difference. If the results of the ANOVA are significant ($p<0.05$), Dunnett's test (Dunnett, 1964) will be applied to the data to compare the treated groups to the control group.

12 QUALITY ASSURANCE:

The study will be audited by the WIL Quality Assurance Unit while in progress to assure compliance with the study protocol and protocol amendments, WIL standard operating procedures and the appropriate provisions of EPA/TSCA and FIFRA Good Laboratory Practice Standards published in the Federal Register (40 CFR Part 792 and 40 CFR Part 160) and the OECD Good Laboratory Practice Regulations [C (97) 186/Final]. The raw data and draft report will be audited by the WIL Quality Assurance Unit prior to submission to the Sponsor Representative to assure that the final report accurately describes the conduct and the findings of the study.

This study will be included on the WIL master list of regulated studies.

13 RECORDS TO BE MAINTAINED:

All original raw data records, as defined by WIL SOPs and the applicable GLPs, will be stored as described in Section 14 in the Archives at WIL Research Laboratories, LLC.

Revised Audited Draft

14 WORK PRODUCT:

The Sponsor will have title to all documentation records, raw data, slides, specimens and other work product generated during the performance of the study. All work product, including raw paper data, pertinent electronic storage media and specimens will be returned to the Sponsor after a period of six months or following issuance of the final report. All work product will be stored in compliance with regulatory requirements.

Any work product, including documents, specimens, and samples, that are required by this protocol, its amendments, or other written instructions of the Sponsor, to be shipped by WIL Research Laboratories, LLC to another location will be appropriately packaged and labeled as defined by WIL's SOPs and delivered to a common carrier for shipment. WIL Research Laboratories, LLC will not be responsible for shipment following delivery to the common carrier.

15 REPORTS:

The final report will consist of an abbreviated summary report, including data tables and an interpretation and discussion of the study results.

WIL Research Laboratories will submit one copy of an audited draft report in a timely manner upon completion of data collection prior to issuance of the final report. One revision will be permitted as part of the cost of the study, from which the Sponsor's reasonable revisions and suggestions will be incorporated into the final report, as appropriate. Additional changes or revisions may be made, at extra cost. It is expected that the Sponsor will review the draft report and provide comments to WIL within a two-month time frame following submission. WIL will submit the final report within one month following receipt of comments. If the Sponsor's comments and/or authorization to finalize the report have not been received at WIL within one year following submission of the draft report, WIL may elect to finalize the report following appropriate written notification to the Sponsor. Two electronic copies (PDF) of the final report on CD-R will be provided. Requests for additional paper copies of the final report may result in additional charges.

16 ANIMAL WELFARE ACT COMPLIANCE:

This study will comply with all applicable sections of the Final Rules of the Animal Welfare Act regulations (9 CFR Parts 1, 2 and 3). The Sponsor should make particular note of the following:

- The Sponsor Representative's signature on this protocol documents for the Study Director the Sponsor's assurance that the study described in this protocol does not unnecessarily duplicate previous experiments.

- Whenever possible, procedures used in this study have been designed to avoid or minimize discomfort, distress or pain to animals. All methods are described in this study protocol or in written laboratory standard operating procedures.

- Animals that experience severe or chronic pain or distress that cannot be relieved will be painlessly euthanized as deemed appropriate by the veterinary staff and Study Director. The Sponsor will be advised by the Study Director of all circumstances which could lead to this action in as timely a manner as possible.

- Methods of euthanasia used during this study are in conformance with the above-referenced regulation.

- The Sponsor/Study Director has considered alternatives to procedures that may cause more than momentary or slight pain or distress to the animals and has provided a written narrative description (AWA covered species) of the methods and sources used to determine that alternatives are not available.

Revised Audited Draft

17 PROTOCOL MODIFICATION:

Modification of the protocol may be accomplished during the course of this investigation. However, no changes will be made in the study design without the written permission of the Sponsor. In the event that the Sponsor requests or approves a change in the protocol, such changes will be made by appropriate documentation in the form of protocol amendment. All alterations of the protocol and reasons for the modification(s) will be signed by the Study Director and the Sponsor Representative.

COMPLIANCE STATEMENT

This study, designated WIL-187051, was conducted in compliance with the OECD (Organisation for Economic Cooperation and Development) Principles of Good Laboratory Practice [C (97) 186/Final], 26 November 1997; the standard operating procedures of WIL Research Laboratories, LLC, and the protocol as approved by the sponsor with the following exception. Stability of the test article in the dosing formulations was not tested. However, in the professional judgment of the sponsor, the formulations were stable under the conditions of this study because the test article is intended for use at high temperatures and under oxidative conditions.

The protocol was designed to be in general accordance with the OECD Guidelines for Testing of Chemicals, Health Effects Test Guidelines, Section 407, July 27, 1995.

1. SUMMARY

1.1. OBJECTIVE

The objective of the study was to evaluate the possible toxic effects of [redacted] when administered orally by gavage to rats for 28 days and to assess recovery from such effects. This study included evaluation of potential neurotoxicity by functional observational battery (FOB) and motor activity (MA) assessment.

1.2. STUDY DESIGN

[redacted] in the vehicle, corn oil, was administered orally by gavage once daily for a minimum of 28 consecutive days to 3 groups (Groups 2-4) of Crl:CD(SD) rats. Dosage levels were 160, 400 and 1000 mg/kg/day. A concurrent control group (Group 1) received the vehicle on a comparable regimen. The dosage volume was 5 mL/kg for all groups. Groups 1 and 4 each consisted of 10 animals/sex, and Groups 2 and 3 each consisted of 5 animals/sex. Following 28 days of dose administration, 5 rats/sex/group were euthanized; the remaining 5 rats/sex in the control and high dose groups were euthanized following a 14-day nondosing (recovery) period.

For toxicology assessment, all animals were observed twice daily for mortality and moribundity. Clinical examinations were performed daily, and detailed physical examinations were performed weekly. Individual body weights and food consumption were recorded weekly. Functional observational battery and locomotor activity data were recorded for 5 animals/sex/group during study week 3. Clinical pathology evaluations (hematology and serum chemistry) were performed on all rats at the primary (study day 28) and recovery (study day 42) necropsies. Complete necropsies were conducted on all animals, and selected organs were weighed at the scheduled necropsies. Selected tissues were examined microscopically from all animals in the control (Group 1) and high dose (Group 4) groups at the primary necropsy. Gross lesions were examined from animals in the 160 and 400 mg/kg/day groups at the primary necropsy.

1.3. RESULTS

All animals survived to the scheduled necropsies. There were no test article-related effects on food consumption. Functional observational battery evaluations, including home cage, handling, open field, sensory, neuromuscular and physical observations and monitored locomotor activity patterns (total and ambulatory activity counts), during study week 3 were unaffected by test article administration. There were no test article-related macroscopic or microscopic changes observed. There were no test article-related effects in organ weights at the primary or recovery necropsy.

Test article-related clinical findings were generally limited to the 1000 mg/kg/day group males and females and consisted of high incidences of evidence of salivation, including clear material around the mouth, and also low incidences of red material around the mouth. These findings were most frequently observed at 1 hour post-dosing, usually not until the second or third week of dosing. These test article-related clinical findings were also noted in the 400 mg/kg/day group at a lower incidence, most frequently seen at 1 hour post-dosing during study weeks 1 to 3. None of these test article-related clinical findings were observed during the recovery period.

Test article-related decreased weekly and cumulative body weight gains, as well as slightly lower body weights, were observed in the 1000 mg/kg/day group males. This resulted in body weights and cumulative body weight gains that were 4.5% and 13% lower, respectively, than the control group males at the end of the dosing period.

At the end of the dosing period (study day 28), increases in mean prothrombin time in the 1000 mg/kg/day group males and females and mean activated partial thromboplastin time in the 1000 mg/kg/day group males compared to the control group were considered test article-related. These coagulation parameters were similar to the control group at the recovery evaluation.

Alanine aminotransferase in the 400 and 1000 mg/kg/day group males and females and aspartate aminotransferase in the 1000 mg/kg/day group males and females at study

day 28 were higher than the control group; these findings were dose-related and statistically significant. Also at study day 28, globulin and total protein were significantly lower in the 1000 mg/kg/day group males compared to the control group. Globulin and total protein were also numerically lower than the control group in the 1000 mg/kg/day group females, but the differences were not statistically significant. These differences were considered test article-related but not adverse as correlating macroscopic or microscopic changes in the liver were not observed, there was no effect on mean liver weight and a site of potential protein loss (kidney, gastrointestinal tract) was not identified.

1.4. CONCLUSIONS

Based on the results of this study, the no-observed-effect level (NOEL) for oral (gavage) administration of [redacted] to Crl:CD(SD) rats for 28 consecutive days was 160 mg/kg/day based on clinical observations and serum chemistry effects at 400 and 1000 mg/kg/day and body weight and coagulation parameter effects at 1000 mg/kg/day. The clinical observations and the effects upon serum chemistry were not considered to be adverse based on the absence of microscopic changes in the 400 and 1000 mg/kg/day groups. Effects at 1000 mg/kg/day were fully resolved after a 14-day recovery period. Based upon body weight and coagulation changes, the no-observed-adverse-effect level (NOAEL) for oral (gavage) administration of [redacted] to Crl:CD(SD) rats for 28 consecutive days was 400 mg/kg/day.

2. INTRODUCTION

2.1. GENERAL STUDY INFORMATION

This report presents the data from "A 28-Day Repeated Dose Oral (Gavage) Toxicity Study of [redacted] in Rats (with Functional Observational Battery and Motor Activity Determinations)". Due to software spacing constraints, the study title appears as "A 28-Day Repeated Dose Toxicity Study of [redacted] in Rats" on the report tables.

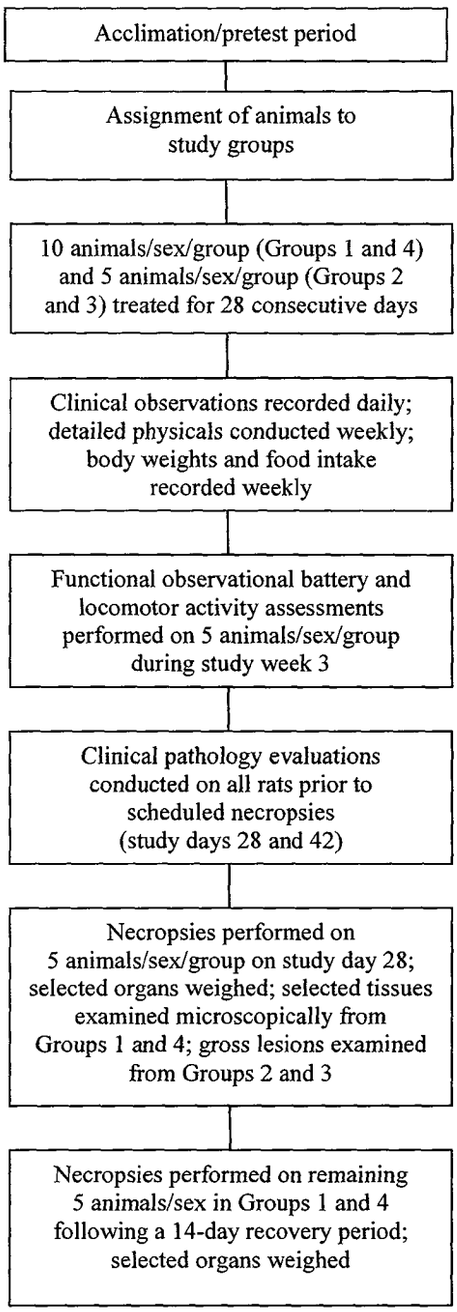
The following computer protocols were used for data collection during the study:

Computer Protocol	Type of Data Collected
WIL-187051	Main study data
WIL-187051P	Pretest data
WIL-187051U	Unscheduled clinical observations

2.2. KEY STUDY DATES

Date(s)	Event(s)
11 October 2005	Experimental starting date (animal receipt)
25 October 2005	Assignment to study groups
26 October 2005	Experimental start date (initiation of dose administration; study week 0)
23 November 2005	Primary necropsy (study week 4)
7 December 2005	Recovery necropsy (study week 6)
12 January 2006	Experimental termination (completion) date (last histopathological examination)

3. STUDY DESIGN



4. EXPERIMENTAL PROCEDURES - MATERIALS AND METHODS

4.1. TEST ARTICLE AND VEHICLE

4.1.1. TEST ARTICLE IDENTIFICATION

The test article, [redacted] was received from [redacted], on 27 July 2005, as follows:

Identification	Quantity Received	Physical Description
[redacted] Lot no [redacted] Exp. date: 1 August 2006 [WIL log no. 6578A]	1 can Gross weight: 3395.4 g	Dark brown viscous liquid

Data documenting the purity and stability of the test article are on file with the sponsor. A Certificate of Analysis for the test article was provided by the sponsor and is presented in Appendix A. The purity of the test article was 100%. The test article was stored at room temperature and was considered stable under this condition. A reserve sample of the test article (approximately 1 g) was collected on 28 July 2005 and stored in the Archives of WIL Research Laboratories, LLC.

4.1.2. VEHICLE IDENTIFICATION

The vehicle used in preparation of the test article formulations and for administration to the control group was 100% pure Mazola® corn oil (exp. date: 2 January 2007) distributed by ACH Food Companies, Inc., Memphis, Tennessee and purchased locally.

4.1.3. PREPARATION

For the control group (Group 1), a sufficient amount of corn oil was transferred to a glass container approximately weekly. The corn oil was stirred continuously using a magnetic stirrer throughout sampling and dosing. Aliquots of the vehicle were prepared for daily dispensation and stored at room temperature.

Dosing formulations were prepared at the concentrations indicated in the following table:

Group Number	Test Article[a]	Dosage Level (mg/kg/day)	Dosage Concentration (mg/mL)
2	[redacted]	160	32
3		400	80
4		1000	200

[a] = The dosing formulations were not adjusted for purity.

The appropriate amount of the test article for each group was weighed into a tared, calibrated glass container. Vehicle was added to each container to bring the formulations nearly to the calibration mark. The formulations were mixed until uniform using a magnetic stirrer. Vehicle was then added to each container to bring the formulations to the calibration mark.

The test article formulations were prepared approximately weekly as single formulations for each dosage level, divided into aliquots for daily dispensation and stored at room temperature. The test article formulations were stirred continuously throughout the preparation, sampling and dose administration procedures. The test article formulations were visually inspected by the study director on 3 October 2005, and were found to be visibly homogeneous and acceptable for dose administration.

4.1.4. SAMPLING AND ANALYSES

Prior to the initiation of dose administration, triplicate samples (5 mL each) for homogeneity determination were collected on 3 October 2005 from the middle stratum of the vehicle and from the top, middle and bottom strata of the 32, 80 and 200 mg/mL formulations. In addition, triplicate samples (5 mL each) for stability and resuspension homogeneity determinations were collected from the top and bottom strata of the vehicle and from the top and bottom strata of these same suspensions on 13 October 2005 following 10 days of storage at room temperature. Duplicate samples (5 mL each) for concentration analyses were collected on the first and last day of each weekly preparation from the middle stratum of each dosing formulation (including the vehicle for the control

group). Two of the 3 sets of samples for resuspension homogeneity and stability and 1 set of samples for concentration analysis were shipped at ambient temperature to [redacted]. All remaining samples were retained at WIL Research Laboratories, LLC under normal laboratory conditions for possible future analysis. The methodology and results of these analyses are presented in Appendix B and are summarized in Section 6.1.

4.2. TEST SYSTEM

Crl:CD(SD) rats from Charles River Laboratories, Inc., Raleigh, North Carolina were used as the test system on this study. This species and strain of animal is recognized as appropriate for subchronic toxicity studies. The Sprague-Dawley rat was used because it is a widely used strain for which significant historical control data are available.

4.3. ORGANIZATION OF TEST GROUPS, DOSAGE LEVELS AND TREATMENT REGIMEN

The vehicle and test article formulations were administered orally by gastric intubation via appropriately sized flexible Teflon®-shafted, stainless steel ball-tipped dosing cannula (Natume, Japan) once daily for 28 consecutive days, through the day prior to the scheduled primary necropsy or recovery period. The dosage volume for all groups was 5 mL/kg. Individual doses were based on the most recently recorded body weights to provide the correct mg/kg/day dosage. Adjusted doses became effective the day of collection of the weekly body weights.

The following table presents the study group assignment:

Group Number	Test Article	Dosage Level (mg/kg/day)	Dosage Volume (mL/kg)	Number of Animals[a] Males	Females
1	Vehicle	0	5	10	10
2	[redacted]	160	5	5	5
3		400	5	5	5
4		1000	5	10	10

[a] = 5 animals/sex/group were euthanized following a minimum of 28 days of dose administration; the remaining 5 animals/sex/group in Groups 1 and 4 were euthanized following a 14-day nondosing (recovery) period.

Dosage levels were selected based on results from a prior dose range-finding study (WIL-187047; [redacted] 2006) and were provided by the sponsor representative after consultation with the study director.

The selected route of administration for this study was oral (gavage) because this is an acceptable and standard method for administering test material per OECD Guideline 407. The number of animals selected for this study was the minimum required to yield statistically and scientifically meaningful data and was consistent with regulatory agency expectations.

4.4. ANIMAL RECEIPT AND ACCLIMATION/PRETEST PERIOD

Thirty-five male and 35 female Crl:CD(SD) rats were received in good health on 11 October 2005, from Charles River Laboratories, Inc., Raleigh, North Carolina. The animals were approximately 36 days old at receipt. Each animal was examined by a qualified technician on the day of receipt and weighed on the following day. Each animal was uniquely identified by a metal eartag displaying the permanent identification number. All animals were housed for a 15-day acclimation/pretest period. During this period, each animal was observed twice daily for mortality and changes in general appearance or behavior.

Pretest data collection began on 19 October 2005. Individual body weights were recorded, and detailed physical examinations were performed periodically during the

pretest period. Food consumption data were also recorded for pretest animals prior to the initiation of dose administration. Pretest clinical observations are presented in Appendix C.

4.5. ANIMAL HOUSING

Upon arrival, all animals were housed 2 or 3 per cage by sex for approximately 6 days. Thereafter, all animals were housed individually in clean, stainless steel, wire-mesh cages suspended above cage-board. Animals were maintained in accordance with the *Guide for the Care and Use of Laboratory Animals* (National Research Council, 1996). The animal facilities at WIL Research Laboratories, LLC are accredited by the Association for Assessment and Accreditation of Laboratory Animal Care International (AAALAC International).

4.6. DIET, DRINKING WATER AND MAINTENANCE

The basal diet used in this study, PMI Nutrition International, LLC, Certified Rodent LabDiet® 5002 (meal), is a certified feed with appropriate analyses performed by the manufacturer and provided to WIL Research Laboratories, LLC. Reverse osmosis-treated (on-site) drinking water, delivered by an automatic watering system, and the basal diet were provided ad libitum throughout the study, except during the period of fasting prior to blood collection when food, but not water, was withheld. Municipal water supplying the facility was sampled for contaminants according to the standard operating procedures. The results of the diet and water analyses are maintained at WIL Research Laboratories, LLC. No contaminants were present in animal feed or water at concentrations sufficient to interfere with the objectives of this study.

4.7. ENVIRONMENTAL CONDITIONS

All animals were housed throughout the acclimation period and during the study in an environmentally controlled room. The room temperature and humidity controls were set to maintain daily averages of $71 \pm 5°F$ ($22 \pm 3°C$) and $50 \pm 20\%$ relative humidity. Room temperature and relative humidity were controlled and monitored using the

Metasys® DDC Electronic Environmental control system. These data were recorded approximately hourly and are summarized in Appendix D. Actual mean daily temperature ranged from 70.2°F to 71.0°F (21.2°C to 21.7°C) and mean daily relative humidity ranged from 36.1% to 57.0% during the study. Light timers were set to provide a 12-hour light (0600 hours to 1800 hours)/12-hour dark photoperiod. Air handling units were set to provide a minimum of 10 fresh air changes per hour. The 12-hour light/12-hour dark photoperiod was interrupted as necessary to allow for the performance of protocol-specified activities.

4.8. ASSIGNMENT OF ANIMALS TO TREATMENT GROUPS

On 25 October 2005 (the day prior to the initiation of dose administration), all available rats were weighed and examined in detail for physical abnormalities. These data were collected using the WIL Toxicology Data Management System (WTDMS™) and reviewed by the study director. The animals judged suitable for assignment to the study were selected for use in a computerized randomization procedure. A printout containing the animal numbers, corresponding body weights and individual group assignments was generated based on body weight stratification in a block design. The animals were then arranged into groups according to the printout. Individual body weights at randomization were within ± 20% of the mean for each sex. The control and 1000 mg/kg/day groups (Groups 1 and 4, respectively) each consisted of 10 males and 10 females, and the 160 and 400 mg/kg/day groups (Groups 2 and 3, respectively) each consisted of 5 males and 5 females. These animals were then randomized into 2 study replicates to allow for the reasonable conduct of the functional observational battery and locomotor activity assessments. Each dose group and sex were approximately equally represented within each study replicate. The selected animals were approximately 7 weeks old at the initiation of dose administration; individual body weights ranged from 233 g to 272 g for males and from 146 g to 183 g for females.

5. PARAMETERS EVALUATED

5.1. CLINICAL OBSERVATIONS AND SURVIVAL

All animals were observed twice daily, once in the morning and once in the afternoon, for mortality and moribundity.

Clinical examinations were performed twice daily, at the time of dose administration and approximately 1 to 2 hours following dose administration (designated as 1 hour post-dosing for report presentation purposes). During the recovery period, the animals were observed once daily. All significant findings were recorded. Detailed physical examinations were conducted on all animals weekly, beginning 1 week prior to test article administration and prior to the scheduled necropsies. A separate computer protocol was used to record any observations noted outside of the above-specified intervals. These unscheduled clinical observations are presented in Appendix E.

5.2. BODY WEIGHTS

Individual body weights were recorded at least weekly, beginning 1 week prior to test article administration (study week -1). Mean body weights and mean body weight changes were calculated for the corresponding intervals. Final body weights (fasted) were recorded prior to the scheduled necropsies.

5.3. FOOD CONSUMPTION

Individual food consumption was recorded weekly, beginning 1 week prior to test article administration (study week -1). Food intake was calculated as g/animal/day for the corresponding body weight intervals. When food consumption could not be measured for a given interval (due to spillage, weighing error, obvious erroneous value, etc.), the appropriate interval was footnoted as "NA" (Not Applicable) on the individual tables.

5.4. FUNCTIONAL OBSERVATIONAL BATTERY [FOB]

Functional observational battery (FOB) assessments were recorded for 5 animals/sex/group during study week 3 (prior to dosing). Testing was performed by the same technicians,

whenever possible, without knowledge of the animals' group assignments. The FOB was performed in a sound-attenuated room equipped with a white-noise generator set to operate at 70 ± 10 dB. The FOB used at WIL Research Laboratories, LLC is based on previously developed protocols (Moser et al., 1991; Irwin, 1968; Gad, 1982; Moser et al., 1988; Haggerty, 1989; O'Donoghue, 1989). Refer to Appendix F for additional details on the functional observational battery methodology and validation.

All animals were observed for the following parameters as described below (refer to Appendix G for a detailed description of the scoring criteria used for each observation):

5.4.1. HOME CAGE OBSERVATIONS

Posture
Convulsions/tremors
Feces consistency
Biting
Palpebral (eyelid) closure

5.4.2. HANDLING OBSERVATIONS

Ease of removal from cage
Lacrimation/chromodacryorrhea
Piloerection
Palpebral closure
Eye prominence
Red/crusty deposits
Ease of handling animal in hand
Salivation
Fur appearance
Respiratory rate/character
Mucous membranes/eye/skin color
Muscle tone

5.4.3. OPEN FIELD OBSERVATIONS (EVALUATED OVER A 2-MINUTE OBSERVATION PERIOD)

Mobility
Rearing
Convulsions/tremors
Grooming
Bizarre/stereotypic behavior
Time to first step (seconds)
Gait
Arousal
Urination/defecation
Gait score
Backing

5.4.4. SENSORY OBSERVATIONS

Approach response	Touch response
Startle response	Tail pinch response
Pupil response	Eyeblink response
Forelimb extension	Hindlimb extension
Air righting reflex	Olfactory orientation

5.4.5. NEUROMUSCULAR OBSERVATIONS

Hindlimb extensor strength	Grip strength-hind and forelimb
Hindlimb foot splay	Rotarod performance

5.4.6. PHYSIOLOGICAL OBSERVATIONS

Catalepsy	Body weight
Body temperature	

5.5. LOCOMOTOR ACTIVITY

Locomotor activity was assessed for 5 animals/sex/group during study week 3. Locomotor activity, recorded after the completion of the FOB, was measured automatically using the SDI Photobeam Activity System (San Diego Instruments, Inc., San Diego, California). This personal computer-controlled system utilized a series of infrared photobeams surrounding a clear plastic, rectangular cage to quantify the motor activity of each animal. Four-sided black plastic enclosures were used to surround the clear plastic boxes and decrease the potential for distraction from extraneous environmental stimuli or activity by technicians or adjacent animals. The black enclosures rested on top of the photobeam frame and did not interfere with the path of the beams. The locomotor activity assessment was performed in a sound-attenuated room equipped with a white noise generator set to operate at 70±10 dB. The testing of treatment groups was conducted according to replicate sequence. Each animal was tested separately. Data were collected in 5-minute epochs and the test session duration was 60 minutes. These data were compiled as four 15-minute subsessions for tabulation.

Data for ambulatory and total motor activity were tabulated. Total motor activity was defined as a combination of fine motor skills (i.e., grooming, interruption of

1 photobeam) and ambulatory motor activity (interruption of 2 or more consecutive photobeams). Refer to Appendix F for additional details on the motor activity methodology and validation.

5.6. CLINICAL PATHOLOGY

Blood samples for clinical pathology evaluations (hematology and serum chemistry) were collected from all animals just prior to the scheduled necropsies (study weeks 4 and 6). The animals were fasted overnight prior to blood collection. Blood for hematology and serum chemistry evaluations was collected from the retro-orbital sinus of isoflurane-anesthetized animals prior to necropsy. Blood for coagulation parameters was collected from the vena cava at the time of necropsy. Blood was collected into tubes containing EDTA (hematology), sodium citrate (clotting determinations) or no anticoagulant (serum chemistry). Clinical pathology methods, procedures and references are presented in Appendix H. The following parameters were evaluated:

5.6.1. HEMATOLOGY

Total leukocyte count (White Cells)
Erythrocyte count (Red Cells)
Hemoglobin
Hematocrit
Mean corpuscular volume (MCV)
Mean corpuscular hemoglobin (MCH)
Mean corpuscular hemoglobin concentration (MCHC)
Platelet count (Platelet)
Prothrombin time (ProTime)
Activated partial thromboplastin time (APTT)
Reticulocyte count
  Percent (Reticulocyte)
  Absolute (Retic Absolute)

Differential leukocyte count -
  Percent and absolute
  -Neutrophil
  -Lymphocyte
  -Monocyte
  -Eosinophil
  -Basophil
  -Large unstained cell
Platelet estimate[a]
Red cell morphology (RBC Morphology)[a]

[a] - Presented on individual tables if the automated differential data were verified by manual review of slides
( ) - Designates tabular abbreviation

5.6.2. SERUM CHEMISTRY

Albumin
Total protein
Globulin [by calculation]
Albumin/globulin ratio (A/G Ratio) [by calculation]
Total bilirubin (Total Bili)
Urea nitrogen
Creatinine
Alkaline phosphatase (AlkalinePhos'tse)
Alanine aminotransferase (Alanine Transfer)
Aspartate aminotransferase (AspartatTransfer)
Glucose
Total cholesterol (Cholesterol)
Calcium
Chloride
Phosphorus
Potassium
Sodium
Triglycerides (Triglyceride)

( ) - Designates tabular abbreviation

5.7. ANATOMIC PATHOLOGY

5.7.1. MACROSCOPIC EXAMINATION

A complete necropsy was conducted on all animals. Animals were euthanized by carbon dioxide followed by exsanguination. The necropsies included, but were not limited to, examination of the external surface, all orifices, and the cranial, thoracic, abdominal and pelvic cavities, including viscera. Clinical findings that were confirmed macroscopically were designated CEO (correlates with externally observed) on the individual macroscopic data tables. The following tissues and organs were collected and placed in 10% neutral-buffered formalin (except as noted):

Adrenal glands (2)
Bone with marrow
  Femur
  Sternum
Bone marrow smear
  (from femur)[a]
Brain
  Cerebrum level 1
  Cerebrum level 2
  Cerebellum with medulla/pons
Epididymides (2)[b]
Gastrointestinal tract
  Stomach
  Duodenum
  Jejunum
  Ileum
  Cecum
  Colon
  Rectum
Heart
Kidneys (2)
Liver (sections of 2 lobes)
Lungs (including bronchi, fixed by
  inflation with fixative)
Lymph nodes
  Mandibular (2)
  Mesenteric
Mammary gland (females only)
Ovaries with oviducts (2)
Peripheral nerve (sciatic)
Prostate
Seminal vesicles (2)
Spinal cord (cervical, midthoracic,
  lumbar)
Spleen
Testes (2)[b]
Thymus
Thyroid [with parathyroids, if
  present (2)][c]
Trachea
Urinary bladder
Uterus
Cervix
Vagina
Gross lesions (when possible)

[a] - Bone marrow smears were obtained at necropsy but not placed in formalin; slides were examined only if scientifically warranted.
[b] - Fixed in Bouin's solution
[c] - Parathyroids were examined microscopically if in the plane of section, or if gross lesions were present.

5.7.2. ORGAN WEIGHTS

The following organs were weighed from all animals at the scheduled necropsies:

Adrenal glands	Prostate
Brain	Seminal vesicle/coagulating gland
Epididymides	Spleen
Heart	Testes
Kidneys	Thymus
Liver	Uterus
Ovaries with oviducts	

Paired organs were weighed together. Organ to final body weight and organ to brain weight ratios were calculated.

5.7.3. SLIDE PREPARATION AND MICROSCOPIC EXAMINATION

After fixation, protocol-specified tissues were trimmed according to standard operating procedures and the protocol. Trimmed tissues were processed into paraffin blocks, sectioned at 4 to 8 microns, mounted on glass microscope slides and stained with hematoxylin and eosin.

Microscopic examination was performed on all tissues listed in Section 5.7.1. from all animals in the control and 1000 mg/kg/day groups at the primary necropsy. Gross lesions were examined from animals in the 160 and 400 mg/kg/day groups. Microscopic examination was performed by [redacted], Consulting Pathologist, Regan Pathology/Toxicology Services.

5.8. STATISTICAL METHODS

All statistical tests were performed using appropriate computing devices or programs. Analyses were conducted using two-tailed tests (except as noted otherwise) for minimum significance levels of 1% and 5%, comparing each test article-treated group to the control group by sex. Each mean was presented with the standard deviation (S.D.) and the number of animals (N) used to calculate the mean. In addition, percent change from control is presented for body weights, clinical pathology parameters and organ weights.

Statistical analyses were not conducted if the number of animals was 2 or less. Due to the use of significant figures and the different rounding conventions inherent in the types of software used, the means and standard deviations on the summary and individual tables may differ slightly.

Body weight, body weight change, food consumption, continuous functional observational battery (FOB), clinical pathology and organ weight data were subjected to a parametric 1-way analysis of variance (ANOVA) (Snedecor and Cochran, 1980) to determine intergroup differences. If the ANOVA revealed statistically significant ($p<0.05$) intergroup variance, Dunnett's test (Dunnett, 1964) was used to compare the test article-treated groups to the control group. Functional observational battery parameters that yielded scalar or descriptive data were analyzed using Fisher's Exact Test (Steel and Torrie, 1980).

All RANOVA statistical analyses for total and ambulatory locomotor activity counts were conducted by BioSTAT Consultants, Inc. using SAS version 8.2 software (SAS Institute, Inc., 1999-2001). Each analysis endpoint was analyzed, by sex and session, with a repeated measure analysis of variance (RANOVA). Factors in the model included treatment group (TRT), time interval (TIME), and the interaction of time interval and treatment group (TRT*TIME). The SAS® procedure PROC MIXED was used for analysis with the random effect of animal included as the repeated measurement. The covariance structure across time was selected by comparing Akaike's Information Criterion (AIC) for first-order autoregressive homogeneous [AR(1)] and compound symmetric (CS) structures. The monotonic dose response relationship was evaluated using sequential linear trend tests based on ordinal spacing of dose levels. The linear dose by time interaction (LinTrt*Time) was evaluated and, if significant at the 0.05 level, trend tests on treatment means were performed at the 0.05 level for each time interval. If the linear dose by time interaction was not significant, the trend test was conducted across the pooled time intervals of the entire session only. Nonmonotonic dose responses were evaluated whenever no significant linear trends were detected but TRT and/or

TRT*TIME interaction was significant at the 0.01 level. Within the framework of the RANOVA, pairwise comparisons were made for each individual treated group with the control group through linear contrasts. If TRT*TIME was significant, the comparisons were conducted for each time interval. If only the TRT effect was significant, the comparisons were conducted across the pooled time intervals of the entire session. These nonmonotonic dose response comparisons were conducted at the 0.01 significance level. The results of these analyses are presented in Appendix J.

5.9. DATA RETENTION

The sponsor has title to all documentation records, raw data, specimens or other work product generated during the performance of the study. All work product generated by WIL Research Laboratories, LLC, including raw paper data and specimens, are retained in the Archives at WIL Research Laboratories, LLC as specified in the study protocol. Data generated by the sponsor will be archived by the sponsor or the sponsor's designee.

A reserve sample of the test article, pertinent electronic storage media and the original final report are retained in the Archives at WIL Research Laboratories, LLC in compliance with regulatory requirements.

6. RESULTS AND DISCUSSION

6.1. ANALYTICAL CHEMISTRY

Analytical Chemistry Report: Appendix B

The nominal concentrations for all dosing formulations analyzed were confirmed to be within ±15% of the target concentration. Initial bulk formulation and resuspension homogeneity after 10-day storage at room temperature were confirmed. Although the analytical method used for the 10-day resuspension analysis was not stability indicating, the test substance is formulated for use in the high temperature and oxidative environment found in internal combustion engines. Based on information provided by the sponsor, it is not expected to degrade under conditions used in this toxicology study.

6.2. CLINICAL OBSERVATIONS AND SURVIVAL

Summary Data: Tables 1, 2, 3, 4, 5, 6

Individual Data: Table 29; Appendices E, I

All animals survived to the scheduled necropsies. Test article-related clinical findings were generally limited to the 1000 mg/kg/day group males and females and consisted of high incidences of evidence of salivation, including clear material around the mouth, and much lower incidences of red material around the mouth. These findings were most frequently seen at 1 hour post-dosing, usually not until the second or third week of dosing. Evidence of salivation was noted for 8 males and 9 females in the 1000 mg/kg/day group. Red material around the mouth was noted for 5 males and 4 females in this group.

These test article-related clinical findings were also noted in the 400 mg/kg/day group at lower incidences, most frequently seen at 1 hour post-dosing during study weeks 1 to 3. Evidence of salivation was noted for 3 males and 4 females in the 400 mg/kg/day group. Red material around the mouth was noted for 2 males and 3 females in the 400 mg/kg/day group.

The aforementioned clinical findings were not noted during the recovery period. All other clinical findings in the test article-treated groups were noted with similar incidence in the control group, were limited to single animals, were not noted in a dose-related manner and/or were common findings for laboratory rats of this age and strain.

6.3. BODY WEIGHTS

Summary Data: Tables 7, 8, 9

Individual Data: Tables 30, 31, 32

Test article-related slightly lower body weights and weekly and cumulative body weight gains were observed in the 1000 mg/kg/day males compared to the control group. Although not statistically significant, these body weight parameters were consistently lower in the 1000 mg/kg/day group males than the control group throughout the study, resulting in mean body weights and cumulative mean body weight gains that were 4.5% and 13% lower, respectively, than the control group males at the end of the dosing period. Similar effects were not observed in the 1000 mg/kg/day group females.

Mean cumulative body weight gains for the test article-treated group males during treatment from study week 0 to 4 were lower, not statistically significant, than the control group males. Throughout test article administration, body weights for the 160 and 400 mg/kg/day group males and females were similar to the control group.

Mean body weight gains were slightly lower, not statistically significant, from study week 4 to 5 and study week 5 to 6 for 1000 mg/kg/day group males when compared to the control group. Statistically significantly ($p<0.05$) lower mean body weights were noted at study week 5 and 6 in the 1000 mg/kg/day males when compared to the control group males. These lower mean body weights were not considered test article-related as the animals assigned to the recovery control group by computer randomization were heavier than those animals assigned to the recovery 1000 mg/kg/day group. At study week 4, these control group males retained for recovery had a mean body weight of 396 g (versus 377g for the entire control group), and the 1000 mg/kg/day group males assigned

to recovery had a mean body weight of 360 g. There were no other statistically significant differences when the control and test article-treated groups were compared.

6.4. FOOD CONSUMPTION

Summary Data: Table 10

Individual Data: Table 33

There were no test article-related effects on food consumption. Mean food consumption in the 1000 mg/kg/day group males from study week 0 to 1 and study week 5 to 6 was statistically significantly ($p<0.05$) lower compared to the control group. For the 160 and 1000 mg/kg/day group females from study week 1 to 2, mean food consumption was statistically significantly ($p<0.05$) higher compared to the control group. However, these differences were not observed similarly in the opposite sex and/or in a time or dose-related manner, and therefore were not considered test article-related.

6.5. FUNCTIONAL OBSERVATIONAL BATTERY [FOB]

6.5.1. HOME CAGE OBSERVATIONS

Summary Data: Table 11

Individual Data: Table 34

Historical Control Data: Appendix K

Home cage observations were unaffected by test article administration. There were no statistically significant differences when the test article-treated males and females were compared to the control group at the study week 3 evaluation.

6.5.2. HANDLING OBSERVATIONS

Summary Data: Table 12

Individual Data: Table 35

Historical Control Data: Appendix K

Handling observations were unaffected by test article administration. There were no statistically significant differences when the test article-treated males and females were compared to the control group at the study week 3 evaluation.

6.5.3. OPEN FIELD OBSERVATIONS

Summary Data: Table 13

Individual Data: Table 36

Historical Control Data: Appendix K

Open field observations were unaffected by test article administration. There were no statistically significant differences when the test article-treated males and females were compared to the control group at the study week 3 evaluation.

6.5.4. SENSORY OBSERVATIONS

Summary Data: Table 14

Individual Data: Table 37

Historical Control Data: Appendix K

Sensory observations were unaffected by test article administration. There were no statistically significant differences when the test article-treated males and females were compared to the control group at the study week 3 evaluation.

6.5.5. NEUROMUSCULAR OBSERVATIONS

Summary Data: Table 15

Individual Data: Table 38

Historical Control Data: Appendix K

Neuromuscular observations were unaffected by test article administration. There were no statistically significant differences when the test article-treated males and females were compared to the control group at the study week 3 evaluation.

6.5.6. PHYSIOLOGICAL OBSERVATIONS

Summary Data: Table 16

Individual Data: Table 39

Historical Control Data: Appendix K

Physiological observations were unaffected by test article administration. There were no statistically significant differences when the test article-treated males and females were compared to the control group at the study week 3 evaluation.

6.6. LOCOMOTOR ACTIVITY

Summary Data: Table 17; Figures 1, 2, 3, 4

Individual Data: Table 40

Historical Control Data: Appendix L

Locomotor activity patterns (total and ambulatory activity counts) were unaffected by test article administration. There were no statistically significant changes for the test article-treated males and females when compared to the control group using a repeated measures analysis of variance at the study week 3 evaluation. Values obtained from the 4 epochs evaluated (0-15 minutes, 16-30 minutes, 31-45 minutes and 46-60 minutes) and the overall 60-minute test session were comparable to the concurrent control values. No remarkable shifts in the pattern of habituation occurred in any of the test article-treated groups when the animals were evaluated on study week 3.

6.7. CLINICAL PATHOLOGY

6.7.1. HEMATOLOGY

Summary Data: Table 18

Individual Data: Tables 41, 42

Historical Control Data: Appendix M

Hematology parameters affected by test article administration at 1000 mg/kg/day included activated partial thromboplastin times (APTT) and prothrombin times. At study day 28, statistically significant ($p<0.01$) increases in mean prothrombin time in the 1000 mg/kg/day group males and females and APTT in the 1000 mg/kg/day group males were observed compared to the control group. Increases in both prothrombin time and APTT suggest a deficiency in the common pathway of the coagulation cascade or multiple defects involving the intrinsic, extrinsic and common pathways. Mean values for prothrombin time and APTT in the 1000 mg/kg/day group males and females were similar to the control group after the 14-day recovery period.

Other statistically significant ($p<0.01$ or $p<0.05$) differences in hematology parameters were observed but were not considered test article-related. These differences included slightly lower mean hemoglobin and hematocrit in the 160 and/or 1000 mg/kg/day group males at study day 28, and lower mean hemoglobin, hematocrit and red blood cell count and higher mean corpuscular hemoglobin concentration (MCHC) in the 1000 mg/kg/day group females and higher mean corpuscular hemoglobin (MCH) in the 1000 mg/kg/day group males at study day 42. Also higher mean red blood cell count in the 160 mg/kg/day group females and higher mean percent monocytes in the 400 mg/kg/day group females were observed when compared to the control group at study day 28. All of these changes were considered spontaneous, incidental and unrelated to the administration of the test article as these hematology parameters were within WIL historical control data (version 2.1) ranges. There were no other statistically significant differences when the control and test article-treated groups were compared.

6.7.2. SERUM CHEMISTRY

Summary Data: Table 19

Individual Data: Tables 43, 44

Historical Control Data: Appendix M

Serum chemistry parameters affected by test article administration included alanine aminotransferase, aspartate aminotransferase, globulin and total protein in the 400 or 1000 mg/kg/day groups. However, these findings were not considered adverse as there were no correlating clinical signs, macroscopic or microscopic findings or weight changes, and the changes reversed quickly after a 2-week recovery period, and globulin and total protein levels were within WIL historical control data (version 2.1) ranges. Test article-related higher mean alanine aminotransferase in the 400 and 1000 mg/kg/day group males and females and mean aspartate aminotransferase in the 1000 mg/kg/day group males and females were observed at study day 28 when compared to the control group; these increases were dose-related and statistically significant ($p<0.05$ or $p<0.01$). There were no correlating macroscopic or microscopic changes in the liver. Also at study day 28, mean globulin and total protein were statistically significantly ($p<0.05$ and $p<0.01$, respectively) lower in the 1000 mg/kg/day group males when compared to the control group. Mean globulin and total protein were also numerically lower in the 1000 mg/kg/day group females, but the differences were not statistically significant. These differences were considered test article-related, although correlating microscopic changes in the liver were not observed, and a site of potential protein loss (kidney, gastrointestinal tract) was not identified microscopically. All other changes in serum chemistry parameters were considered spontaneous, incidental and unrelated to the administration of the test article. After the 14-day recovery period, changes observed at the primary necropsy were no longer apparent, suggesting recovery from these effects.

6.8. ANATOMIC PATHOLOGY

6.8.1. MACROSCOPIC EXAMINATION

Summary Data: Tables 20, 21

Individual Data: Tables 45, 46

There were no test article-related macroscopic changes observed.

6.8.2. ORGAN WEIGHTS

Summary Data: Tables 22, 23, 24, 25, 26, 27

Individual Data: Tables 47, 48, 49, 50, 51, 52

Historical Control Data: Appendix N

There were no test article-related changes in organ weights at the primary or recovery necropsy. At the study day 28 primary necropsy, mean absolute brain weight was statistically significantly ($p<0.01$ or $p<0.05$) lower in the 400 and 1000 mg/kg/day group males, and mean absolute testes weight was statistically significantly ($p<0.05$) lower in the 1000 mg/kg/day group males. These lower organ weights were not dose-related (brain) and were within WIL historical control data (version 2.1) ranges, and there were no correlating microscopic changes. Also at study day 28, mean relative (to brain weight) kidney weights in the 400 mg/kg/day group males were statistically significantly ($p<0.05$) higher compared to the control group. These organ weight differences were considered spontaneous and unrelated to the administration of the test article.

Mean absolute and relative (to final body and brain weight) heart, ovary (with oviducts) and adrenal gland weights for the 1000 mg/kg/day group females were higher than the control group at the study day 42 recovery necropsy. These increases were generally statistically significant ($p<0.05$). The relationship of these increases to test article administration is unclear. At the study day 28 necropsy, changes in mean heart, ovary and adrenal gland weights in females were not observed, and there were no microscopic test article-related changes in these organs. Mean relative (to final body weight) heart and adrenal gland weights were statistically significantly ($p<0.01$ or $p<0.05$) higher in the

1000 mg/kg/day group males; these increases resulted from a significantly ($p<0.05$) lower mean final body weight in the 1000 mg/kg/day group males at the recovery necropsy, and were not considered test article-related, because mean absolute and mean relative to brain weights were not changed.

No other statistically significant differences in organ weights were observed.

6.8.3. MICROSCOPIC EXAMINATION

Summary Data: Table 28

Individual Data: Table 45

There were no test article-related microscopic changes noted. Although lymph node hemorrhage was observed in the mandibular node for 4 males in the 1000 mg/kg/day group and 1 control group male, the hemorrhage was fresh in all animals, meaning the hemorrhage occurred around the time of death. Because of the mandibular node location on the ventral side of the neck, this node is easily squeezed at the time of necropsy, resulting in the hemorrhage that was noted microscopically. An effect on the immune system would more likely affect the lymphoid elements. The thymic epithelial hyperplasia noted in 2 females for the 1000 mg/kg/day group is a common change in the rodent thymus as the animal ages and the thymus starts to atrophy. This change appears in females first as was the case in this study. The thickness of the cortex and medulla were not noticeably changed indicating that there was no effect on the immune system. All microscopic observations were considered spontaneous, incidental and unrelated to the administration of the test article.

7. DISCUSSION

The objective of the study was to evaluate the possible toxic effects of [redacted] when administered orally by gavage to rats for 28 days and to assess recovery from such effects. This study included evaluation of potential neurotoxicity by functional observational battery (FOB) and motor activity (MA) assessment. Dosage levels of [redacted] were 160, 400 and 1000 mg/kg/day.

All animals survived to the scheduled necropsies. There were no test article-related effects on food consumption. Functional observational battery evaluations, including home cage, handling, open field, sensory, neuromuscular and physical observations and monitored locomotor activity patterns (total and ambulatory activity counts), during study week 3 were unaffected by test article administration. There were no test article-related macroscopic or microscopic changes observed. There were no test article-related effects in organ weights at the primary or recovery necropsy.

Test article-related clinical findings were generally limited to the 1000 mg/kg/day group males and females and consisted of high incidences of evidence of salivation, including clear material around the mouth, and also low incidences of red material around the mouth. These findings were most frequently observed at 1 hour post-dosing, usually not until the second or third week of dosing. These test article-related clinical findings were also noted in the 400 mg/kg/day group at a lower incidence, most frequently seen at 1 hour post-dosing during study weeks 1 to 3. None of these test article-related clinical findings were observed during the recovery period.

Test article-related slightly lower body weights and weekly and cumulative body weight gains were observed in the 1000 mg/kg/day group males than in the control group throughout the dosing period, resulting in body weights and cumulative body weight gains that were 4.5% and 13% lower, respectively, than the control group males at the end of the dosing period.

At the end of the dosing period (study day 28), increases in mean prothrombin time in the 1000 mg/kg/day group males and females and mean activated partial thromboplastin time in the 1000 mg/kg/day group males compared to the control group were considered test article-related. These coagulation parameters were similar to the control group at the recovery evaluation.

Alanine aminotransferase in the 400 and 1000 mg/kg/day group males and females and aspartate aminotransferase in the 1000 mg/kg/day group males and females at study day 28 were higher than the control group; these findings were dose-related and statistically significant. Also at study day 28, globulin and total protein were statistically significantly lower in the 1000 mg/kg/day group males compared to the control group. Globulin and total protein were also numerically lower than the control group in the 1000 mg/kg/day group females, but the differences were not statistically significant. These differences were considered test article-related but not adverse as correlating macroscopic or microscopic changes in the liver were not observed, there was no effect on liver weights and a site of potential protein loss (kidney, gastrointestinal tract) was not identified.

8. CONCLUSIONS

Based on the results of this study, the no-observed-effect level (NOEL) for oral (gavage) administration of [redacted] to Crl:CD(SD) rats for 28 consecutive days was 160 mg/kg/day based on clinical observations and serum chemistry effects at 400 and 1000 mg/kg/day and body weight and coagulation parameter effects at 1000 mg/kg/day. The clinical observations and the effects upon serum chemistry were not considered to be adverse based on the absence of microscopic changes in the 400 and 1000 mg/kg/day groups. Effects at 1000 mg/kg/day were fully resolved after a 14-day recovery period. Based upon body weight and coagulation changes, the no-observed-adverse-effect level (NOAEL) for oral (gavage) administration of [redacted] to Crl:CD(SD) rats for 28 consecutive days was 400 mg/kg/day.

This study was inspected in accordance with the OECD Principles of Good Laboratory Practice, the standard operating procedures of WIL Research Laboratories, LLC and the sponsor's protocol and protocol amendments, with the following exceptions. The data located in Appendix B (Analyses of Formulations and Vehicle) were the responsibility of the sponsor. Quality Assurance findings, derived from the inspections during the conduct of the study and from the inspections of the raw data and draft report, are documented

and have been reported to the study director. A status report is submitted to management monthly.

This report accurately reflects the data generated during the study. The methods and procedures used in the study were those specified in the protocol, its amendments and the standard operating procedures of WIL Research Laboratories, LLC.

The raw data, the retention sample(s), and the final report will be stored in the Archives at WIL Research Laboratories, LLC or another location specified by the sponsor.

10.2. APPROVAL

This study was inspected according to the criteria discussed in Section 10.1.

12. DEVIATIONS FROM THE PROTOCOL

This study was conducted in accordance with the protocol and protocol amendments, except for the following.

- **Protocol Section 5.5** states that the males will weigh approximately 160 to 260 g and the females approximately 110 to 180 g at initiation of dosing. On study day 0 the male weights ranged from 233 to 272 g with a mean weight of 251 g and the female weights from 146 to 183 g with a mean weight of 165 g. Therefore, several animals that were not within the specified weight range requirements were placed on study.
- **Protocol Section 7.5.2** states that 3 samples from the top and bottom of each formulation will be collected to assess the homogeneity after storage and resuspension. Two of the three samples will be sent to [redacted] for analysis of homogeneity and stability over a ten-day period. Stability of the dosing formulations was not addressed in the analytical method used.
- **Protocol Section 8.6** states that functional observational battery (FOB) evaluations may also be performed on the 5 recovery animals/sex from Groups 1 and 4 near the end of the 14 day recovery period (if added by protocol amendment). The same animals will be used for the appropriate time points. **Protocol Section 8.7** states that those animals not selected for recovery will be fasted overnight before taking blood samples just prior to necropsy. On 23 November 2005 (study day 28) prior to blood collection, it was noted that the animals in Groups 1 and 4 scheduled for blood collection and necropsy had not been fasted overnight. Instead the 5 animals/sex in Groups 1 and 4 selected for recovery FOB evaluations had been fasted overnight. The study director made a decision to draw the blood samples and perform necropsy on the animals that had been fasted overnight.

These deviations did not negatively impact the quality or integrity of the data nor the outcome of the study.

FINAL REPORT

Volume 2 of 3
(Tables 44-52 and Appendices A-M)

STUDY TITLE

A 28-DAY REPEATED DOSE ORAL (GAVAGE)
TOXICITY STUDY OF [redacted] IN RATS (WITH FUNCTIONAL
OBSERVATIONAL BATTERY AND MOTOR ACTIVITY DETERMINATIONS)

STUDY NUMBER

WIL-187051

STUDY DIRECTOR

[redacted]

STUDY INITIATION DATE

21 September 2005

STUDY COMPLETION DATE

28 June 2006

PERFORMING LABORATORY

WIL Research Laboratories, LLC
1407 George Road
Ashland, OH 44805-9281

SPONSOR STUDY NUMBER

05-087

SPONSOR
