ANALYTICAL STUDY GLP COMPLIANCE STATEMENT

All analytical tests performed by [redacted] for WIL Research Study #WIL-187051 ([redacted] Reference #05-087) were conducted in compliance with current EPA Good Laboratory Practice (GLP) standards as described by the Toxic Substances Control Act (TSCA) 40 CFR Part 792.

Principal Investigator: [redacted] Date: 30 June 2006

ANALYTICAL STUDY QUALITY ASSURANCE UNIT STATEMENT

The analytical raw data and final report for the [redacted] study have been reviewed by the [redacted] Quality Assurance Team.

The report appears to accurately describe the methods and Standard Operating Procedures (SOPs) used in the study The reported results accurately reflect the raw data of the study

ABSTRACT

Samples of [redacted] in corn oil used in a 28-day repeated dose oral (gavage) toxicity study in rats, WIL Research Study #WIL-187051 ([redacted] Reference #05-087), were analyzed at [redacted] to verify their homogeneity, 10-day resuspension homogeneity, and nominal concentrations. A direct dilution procedure was employed to prepare the samples for elemental analysis by Inductively Coupled Plasma-Atomic Emission Spectroscopy (ICP-AES). Homogeneity and 10-day resuspension homogeneity of [redacted] in corn oil were established. The nominal concentrations of all dosing suspensions were verified by the analytical data.

TEST SUBSTANCE

The test substance used in the preparation of the dosing suspensions was identified as [redacted] Lot # [redacted] The CAS number is confidential, contact [redacted] for further information. The test substance was characterized according to the TSCA GLPs and its stability was established prior to the initiation of the study.

INTRODUCTION

The purpose of this analytical study was the determination and verification of test substance homogeneity, 10-day resuspension homogeneity, and concentration in corn oil. The concentration study samples were aliquots taken from mixtures prepared as dosing suspensions for a 28-day repeated dose oral (gavage) toxicity study in rats as outlined in the protocol for WIL Research Study #WIL-187051.

The analytical portion of the study was performed by the High Volume Services team located in the [redacted] group at [redacted] The analytical start and end dates were 14 October and 2 December 2005 respectively.

EXPERIMENTAL

SAMPLES
Samples were shipped from WIL Research to [redacted] Principal Investigator. Samples were stored at room temperature and in the dark prior to analysis. Sample RX-187051L-0112 leaked during transit from WIL Research to [redacted] and an insufficient amount of sample remained for analysis.

The first batch of samples was transferred to the laboratory and analyzed on 14 October 2005. The analysis of the last set of samples was completed on 2 December 2005.

STANDARDS
Calibration standards for the ICP-AES were made from certified commercially prepared elemental concentrates (Conostan Division of Conoco, Inc). Standard preparation data is archived by [redacted]

ANALYTICAL METHOD
Samples were prepared as stated in [redacted] Test Code 30176, SOP ME-125 "Elemental Analysis of Additives or Additive Mixtures by Direct Dilution and ICP Analysis." The procedures outlined in SOP EQ-130, "IRIS Intrepid XDL II Radial Inductively Coupled Plasma Spectrometer," were followed during the instrumental analysis of the samples

The approach employed in this method was to verify concentration based on the known elemental composition of [redacted] Aliquots of the dosing suspensions were diluted in an o-xylene diluent and the elemental composition was determined by ICP-AES. The calcium concentration of the samples was then used to ascertain the concentration of the test substance in the dosing suspensions.

DISCUSSION

METHOD VALIDATION
Method validation was performed following the recommendations outlined in the International Conference on Harmonisation's Q2B document: Guideline on the Validation of Analytical Procedures Methodology. The limit of detection (LOD) and limit of quantitation (LOQ) were calculated to be 0.063 and 0.192 wt ppm calcium respectively. A reporting limit of 2 wt ppm calcium was determined to be appropriate for vehicle results.

SAMPLE ANALYSIS
The analytical results for the suspensions of [redacted] in corn oil are summarized in the tables located on pages 8 through 11. Seven calibration standards were analyzed to generate a linear calibration curve with inverse concentration weighting. All instrument control checks and quality control samples were within acceptable limits Known amounts of calcium were spiked into 11 samples throughout the duration of the study and gave acceptable percent recoveries of 95 to 98%.

The dosing suspensions were analyzed for calcium, an element present in known concentrations in the test substance. Dosing suspension estimates of weight percent calcium were derived by the following formula:

$$Wt\%\ Ca = \left[\frac{x}{x + \left(D_2 - \frac{xD_2}{D_1} \right)} \right] \%\ Ca\ in\ [redacted]$$

where x is the solute test substance concentration in mg/µL; D_1 is the test substance density (0.9905 g/mL) and D_2 is the vehicle or solvent density (corn oil, 0.9193 g/mL). The concentration of calcium in [redacted] is 5.789 wt%. The measured results of calcium were obtained by ICP-AES and compared against the estimated values Results were converted to wt% from ppm by multiplying by 10^{-4}.

Homogeneity and 10-day resuspension homogeneity were confirmed if the percent differences between the overall dose level mean and individual strata means were 10% or less. Concentration data were evaluated using percent difference The acceptable tolerance was 15% Duplicate analyses were compared using the Contract Laboratories Program (CLP) Guidelines for Inorganic Analyses relative percent difference limit of 20%.

RESULTS AND CONCLUSIONS

The confirmation of dosing suspension homogeneity is supported by the data presented on page 8 The percent difference of all strata means with their respective overall mean is well below the 10% tolerance.

The data shown on page 9 confirms the 10-day resuspension homogeneity of [redacted] in corn oil. The percent difference of all strata means with their respective overall mean is well below the 10% tolerance

The analytical result summary for the concentration study is found on page 10 The nominal concentrations of all dosing suspensions were verified by the analytical data. The percent difference between the estimated and measured concentrations is less than 15% for all dosing levels.

The table on page 11 presents the duplicate precision data The agreement between the duplicates is excellent and well under the CLP relative percent difference guideline of 20%

ARCHIVES

SAMPLES
The unused portion of all samples shall be stored in room [redacted] for a minimum of one year after the final analytical report is issued.

RAW DATA
Instrument, chemical, and standard logbook documentation shall be archived by [redacted] as facility records [redacted] All other raw data shall be archived in the Analytical Study File in [redacted] Analytical Study Archives.

FINAL REPORT
The original copy of the final report shall be archived with the Analytical Study File in [redacted]

PROTOCOL AND SOP DEVIATIONS

Analyses to confirm the stability of [redacted] in corn oil over a 10-day period were not performed as stated in the protocol. The test substance is formulated for use in the high temperature and oxidative environment found in internal combustion engines. Based on information provided by the Sponsor, it is not expected to degrade under conditions used in this toxicology study.

SOP ME-125 states a laboratory control sample (LCS) and matrix spike (MS) shall be prepared for every batch of 20 samples Only one LCS was prepared instead of the expected two during analyses on 14 and 28 October 2006. This did not affect the outcome of the analytical results.

Determination of Test Session Duration and Test Interval for the
San Diego Photobeam Activation System Using Untreated Rats

Study Objective:

Regulatory guidelines require that the length of the locomotor activity monitoring session be long enough to allow untreated rats to approach normal activity levels by the last 20% of the session following their placement into a novel environment habituation). The primary objective of this study was to determine the appropriate test session duration for the locomotor activity measuring apparatus (San Diego Instruments - Photobeam Activity System [SDI-PAS]). A secondary objective was to collect data that could be used to determine an appropriate interval length (epoch) within the test session for the capturing and reporting of locomotor activity data.

Test System:

Juvenile (approximately six-week old) Sprague-Dawley Crl:CD®(SD)IGS BR rats weighing approximately 225 ± 75 grams (males) and 135 ± 25 grams (females) were used on the study. The rats were arbitrarily selected from available stock.

Environmental Conditions:

The rats were acclimated to laboratory conditions for five days prior to monitoring locomotor activity. Animals were housed and maintained under conditions consistent with maintaining good health and as per WIL Standard Operating Procedures. Temperature and humidity were maintained at 72 ± 4° F and 50 ± 20%, respectively, in a room with a 12 hours light/12 hours dark (0600-1800 hrs) photoperiod. The facilities at WIL Research Laboratories, Inc. are fully accredited by the Association for Assessment and Accreditation of Laboratory Animal Care International.

Locomotor Activity Monitoring Methods:

Locomotor activity of 24 untreated rats (12 per sex) was monitored to determine the acceptable test session duration and test interval to be used on subsequent studies. (The test interval is the frequency at which activity counts are captured.) For this testing, the duration of the test session was 120 minutes. The test interval was one minute. That is, total activity (photobeam interruptions) was recorded at one-minute intervals for 120 minutes. Monitoring commenced one minute after placement of the rats into the monitoring units.

Locomotor activity monitoring was performed using the SDI Photobeam Activity System (San Diego Instruments, Inc., San Diego, CA), which includes Photobeam Activity System (PAS) software, analyzer and 24 activity monitors. A local personal computer linked to the laboratory's mainframe computer controls the SDI PAS.

Each locomotor activity monitoring unit consists of seven photobeam emitting/detecting units attached to a mounting frame. A clear acrylic shoe box -style cage (18.5"L x 9.5"W x 8"H) fits into the mounting frame to contain a single animal during the test session. Activity is measured as interruptions of the photobeams.

Photobeam diagnostic checks were performed prior to and following completion of the test session. Confirmation that the software-driven procedure was operating correctly was obtained by manually blocking the photobeams with pre-cut pieces of cardboard.

Monitoring was performed in a sound-attenuated room equipped with a white-noise generator set to operate at approximately 70 db.

Results:

Mean total locomotor activity data are presented graphically as both one-minute and five-minute test intervals (epochs) for the entire 120-minute test session in Figures 1 and 2, respectively. Corresponding numerical data are presented in Tables 1 and 2.

Mean total activity counts per minute were calculated using all 24 animals at each time point. Five-minute epochal data represent grand mean activity counts for each five-minute interval.

Discussion:

Following their placement into the monitoring units, untreated rats returned to normal locomotor activity levels after 36 minutes. Therefore, although a 45-minute test session would be adequate to allow rats to fully habituate to a novel environment, a 60-minute test session was selected for future studies. A test session of 60 minutes duration would comfortably meet the criterion for approaching normal locomotor activity levels by the last 20% of the test session, while providing a slightly extended session that may allow for detection of delayed effects.

No differences in locomotor activity levels were apparent when the data were examined in one-minute versus five-minute test intervals (epochs). Therefore, collection and reporting of locomotor activity with the SDI-PAS using a five-minute test interval was judged to be adequate to detect alterations in locomotor activity.

Alternative locomotor activity monitoring paradigms can be employed as appropriate, necessary or requested, but the above conditions (60-minute test session with five-minute epochs) are considered to be acceptable standards for this laboratory and equipment.

Demonstration of the Sensitivity of the SDI-PAS
to Detect Alterations in Locomotor Activity in Rats

Study Objective:

Regulatory guidelines require that the testing laboratory demonstrate that the devices and systems used for measuring locomotor activity be able to detect chemically-induced increases and decreases in locomotor activity. The objective of this study was to demonstrate that the locomotor activity measuring apparatus (San Diego Instruments - Photobeam Activity System [SDI-PAS]) and the testing paradigm used by WIL Research Laboratories, Inc., met this criterion.

Test And Control Articles:

Two test articles were employed, one to elicit increases in motor activity (d-amphetamine sulfate, Research Biochemicals International, Natick, MA, Lot. No. BS-111-100) and one to elicit decreases in motor activity (chlorpromazine hydrochloride, Sigma Chemical Company, St. Louis, MO, Lot No. 48 H 1403). Physiological saline was used as the vehicle and for treatment of the concurrent negative control group.

Test System:

Juvenile (approximately six-week old) Sprague-Dawley Crl:CD®(SD)IGS BR rats weighing 175 ± 27 grams (males) and 146 ± 20 grams (females) at the time of randomization were used on the study. The rats were randomly assigned to treatment groups by body weight stratification in a block design, and subsequently allocated to group- and sex-uniform replicates for the locomotor activity evaluations. Dosing and locomotor activity evaluations occurred on the day after randomization (Day 0).

Environmental Conditions:

The rats were acclimated to laboratory conditions for 13 days prior to dosing. Animals were housed and maintained under conditions consistent with maintaining good health and as per WIL Standard Operating Procedures. Temperature and humidity were maintained at 72 ± 4° F and 50 ± 20%, respectively, in a room with a 12 hours light/12 hours dark (0600-1800 hrs) photoperiod. The facilities at WIL Research Laboratories, Inc. are fully accredited by the Association for Assessment and Accreditation of Laboratory Animal Care International.

Treatment Regimen:

Animals were assigned to treatment groups as follows:

Group Number	Test Article	Dosage Level (mg/kg)	Dosage Concentration (mg/ml)	Dosage Volume (mg/kg)	Number of Animals	
					Male	Female
1	PS	0	0	1.0	12	12
2	AMP	2	2	1.0	12	12
3	AMP	4	4	1.0	12	12
4	CPZ	5	5	1.0	12	12
5	CPZ	10	10	1.0	12	12

PS = Physiological Saline AMP = d-Amphetamine Sulfate CPZ = Chlorpromazine Hydrochloride

The test and control articles were administered as a single intraperitoneal injection (Day 0). Individual doses were calculated based on the animals' body weights recorded on the day of dose administration.

Locomotor Activity Monitoring Methods:

Locomotor activity was monitored once 4-5 days prior to dose administration (pretest) and on the day of dose administration. The duration of each test session was 60 minutes. The test interval was five minutes. Monitoring following dosing commenced 15 minutes after test or control article administration. The duration of the test session and length of the test interval were selected based on results of a previous study (WIL-99140).

Locomotor activity monitoring was performed using the SDI Photobeam Activity System (San Diego Instruments, Inc., San Diego, CA), which includes Photobeam Activity System (PAS) software, analyzer and 24 activity monitors. A local personal computer linked to the laboratory's mainframe computer controls the SDI-PAS.

Each locomotor activity monitoring unit consists of seven photobeam emitting/detecting units attached to a mounting frame. A clear acrylic shoe box -style cage (18.5"L x 9.5"W x 8"H) fits into the mounting frame to contain a single animal during the test session. Activity is measured as interruptions of the photobeams.

Photobeam diagnostic checks were performed prior to and following completion of the test session. Confirmation that the software-driven procedure was operating correctly was obtained by manually blocking the photobeams with pre-cut pieces of cardboard or other appropriate devices. After completion of the test session, motor

activity and photobeam files are transferred electronically to the mainframe computer for subsequent manipulation and presentation of the collected information, i.e., generation of tables, including statistical analysis.

Activity counts are presented as Total Activity Counts (ambulatory plus stereotypic counts) and Ambulatory Activity Counts. Sequential interruption of 2 or more photobeams, i.e., gross motor movement, is recorded as one ambulatory activity count. Repeated beam breaks of the same photobeam, i.e., fine motor movement, is recorded as one stereotypic count.

Monitoring was performed in a sound-attenuated room equipped with a white-noise generator set to operate at approximately 70 db.

Statisical Analysis:

Locomotor activity data were analyzed by analysis of variance. A one-way ANOVA followed by Dunnett's test was conducted to determine significant treatment differences from the control group at significance levels of $p < 0.05$ and $p < 0.01$.

Quality Assurance:

The raw data and draft report were audited by the WIL Quality Assurance Unit to assure that the final report accurately describes the conduct and findings of the study.

Results:

Group mean locomotor activity counts are presented in Table 1. The data are presented graphically by sex, interval and activity type in Figures 1-8.

Discussion:

There were no differences in either total or ambulatory activity counts for either sex during the pretest evaluations.

Dose-dependent increases in both total and ambulatory activity counts were observed for both males and females following administration of d-amphetamine sulfate (AMP). For males, over the entire 60-minute test session, total (ambulatory) counts were increased 103 (135)% at 2 mg/kg AMP and 166 (193)% at 4 mg/kg AMP. For females, over the entire 60-minute test session, total (ambulatory) activity counts were increased 37 (46)% at 2 mg/kg AMP and 146 (184)% at 4 mg/kg AMP. With the exception of the 2 mg/kg AMP females, all differences from the vehicle control group were statistically significant ($p < 0.01$).

Dose-dependent decreases in both total and ambulatory activity counts were observed for both males and females following administration of chlorpromazine hydrochloride (CPZ). For males, over the entire 60-minute test session, total (ambulatory) counts were decreased 77 (85)% at 5 mg/kg CPZ and 96 (98)% at 10 mg/kg CPZ. For females, over the entire 60-minute test session, total (ambulatory) activity counts were decreased 88 (92)% at 5 mg/kg CPZ and 97 (99)% at 10 mg/kg CPZ. All differences from the vehicle control group were statistically significant ($p < 0.01$).

Based on the results obtained, the SDI-PAS is sufficiently sensitive to detect dose-related increases and decreases in locomotor activity under the testing paradigm that was used.

WIL-99263

AN INTER-OBSERVER RELIABILITY STUDY OF TECHNICIANS ASSIGNED TO PERFORM FUNCTIONAL OBSERVATIONAL BATTERY ASSESSMENTS IN RATS

Study Date Range: December 14, 2001 - October 9, 2002

STUDY OBJECTIVE:

The objective of this study was to train personnel to conduct the Functional Observational Battery (FOB) and to assess inter-observer reliability of the same technicians. FOB. inter-observer reliability studies serve as training for new employees, as well as on-going training for current employees.

CONTROL ARTICLES:

Deionized water was used as the negative control article. Two positive control articles, 3,3′-Iminodipropionitrile (IDPN) and Parathion, were used to elicit behavioral changes in the animals. IDPN was administered orally at 2000 mg/kg, and Parathion was administered orally at 4 mg/kg. All control articles were administered as a single dose.

TEST SYSTEM:

All animals used on the study were female Sprague-Dawley Crl:CD® (SD)IGS BR rats obtained from the WIL Research Laboratories, Inc. stock colony. Animals were randomly assigned to treatment groups using a computer program. The study was conducted according the protocol and WIL standard operating procedures.

ENVIRONMENTAL CONDITIONS:

The animals were housed and maintained under conditions consistent with maintaining good health. Temperature and relative humidity were set to maintain at 71 ± 5° C and 30-70%, respectively, in a room with a 12 hour light (6 a.m. to 6 p.m.)/dark photoperiod. Temperature and relative humidity were recorded once daily. The facilities at WIL Research Laboratories, Inc. are fully accredited by the Association for Assessment and Accreditation of Laboratory Animal Care International (AAALAC International).

VIABILITY OBSERVATIONS:

The rats were observed for mortality/moribundity and general condition twice daily, in the morning and in the afternoon.

BODY WEIGHTS:

Body weights were recorded on days of dosing for calculation of doses only.

FUNCTIONAL OBSERVATIONAL BATTERY ASSESSMENTS:

The Functional Observational Battery used at WIL Research Laboratories, Inc. is based on previously developed protocols (Moser et al., 1999; Irwin, 1968; Gad, 1982; Moser et al., 1988; Haggerty, 1989; O'Donoghue, 1989). Testing for Phase III (described below) was performed by trained technicians who did not know the animal's group assignment. The time of testing was determined by the Study Director based on the appearance of the expected behavioral signs following dosing. Animals were observed for the following parameters as described below (see WIL standard operating procedure No. T1-112, as revised, for a description of scoring criteria):

HOME CAGE OBSERVATIONS:

Posture
Convulsions/Tremors
Feces consistency
Biting
Palpebral (eyelid) closure

HANDLING OBSERVATIONS:

Ease of removal from cage
Lacrimation/chromodacryorrhea
Piloerection
Palpebral closure
Red/crusty deposits
Eye prominence
Ease of handling animal in hand
Salivation
Fur appearance
Respiratory rate/character
Mucous membranes/eye/skin color
Muscle tone

OPEN FIELD OBSERVATIONS: (evaluated over a 2-minute observation period)

Mobility
Rearing
Convulsions/tremors
Grooming
Bizarre/stereotypic behavior
Time to first step (seconds)
Gait
Arousal
Urination/defecation
Gait score
Backing

SENSORY OBSERVATIONS:

Approach response
Startle response
Pupil response
Forelimb extension
Air righting reflex
Touch response
Tail pinch
Eyeblink response
Hindlimb extension
Olfactory orientation

The study design consisted of three distinct phases to ensure the most adequate training and reliability among the technicians. Phases were designed as a progression to allow for

training and discussion prior to the final phase, which evaluated the inter-observer reliability. The phases of testing are described as follows:

PHASE I:

Phase I testing consisted of FOB assessments on naive stock animals. Each technician observed up to 60 rats through the entire FOB assessment. The purpose of Phase I testing was to ensure consistent and accurate use of all equipment and to gain a strong knowledge of the stereotypic behavior of naive animals. All rats used in Phase I testing were returned to stock following FOB assessments.

PHASE II:

Phase II testing consisted of an open discussion of each animal's observations conducted in a group setting. Two animals per group were dosed with Parathion, IDPN or deionized water and evaluated by the observers once the effects were apparent. Phase II allowed for open discussion of observations and interpretation of the findings. All animals used in Phase II testing were euthanized by carbon dioxide inhalation and carcasses discarded following testing.

PHASE III:

Phase III testing consisted of three animals per group dosed with a single dose of Parathion, IDPN or deionized water and observed at a time determined by the Study Director. Each technician individually recorded observations for each animal to evaluate the inter-observer reliability. All animals used in Phase III testing were euthanized by carbon dioxide inhalation and carcasses discarded following testing.

CRITERIA FOR EVALUATION OF TECHNICIANS:

The following criteria were used to evaluate the ability of technicians to reliably distinguish signs of neurotoxicity.

1. No omission of findings within the categories of Home Cage Observations, Handling Observations, Open Field Observations and Sensory Observations.

2. A difference of no more than two grades (severity) for a given finding in each category.

RESULTS:

VIABILITY:

All animals survived until scheduled euthanasia.

FUNCTIONAL OBSERVATIONAL BATTERY ASSESSMENTS:

Technicians were consistent in the findings reported when deionized water, IDPN or Parathion was administered (Table 1). There were no obvious or gross inconsistencies among the calls.

It was determined that the previously established criteria for evaluation were fulfilled to a degree deemed acceptable by the Study Director. It should be noted that there were a few apparent omissions of findings (Table 2) which upon further review were found to be of no practical significance.

CONCLUSIONS:

It was determined that the technicians fulfilled the criteria for reliably observing FOB parameters to assess behavioral changes in rats in a manner consistent with good science and WIL Research Laboratories, Inc. standard operating procedures.

AN INTER-OBSERVER RELIABILITY STUDY OF INDIVIDUALS ASSIGNED TO PERFORM FUNCTIONAL OBSERVATIONAL BATTERY OBSERVATIONS FOR NEUROTOXICITY STUDIES

Study Date Range:

STUDY OBJECTIVE:

The objective of this study was to train personnel to conduct the Functional Observational Battery (FOB) and to assess inter-observer reliability of the same individuals. The inter-observer reliability also included one individual that had been previously trained to further demonstrate inter-observer reliability of the newly trained individuals with those currently approved to conduct neurotoxicity studies. FOB inter-observer reliability studies serve as training for new employees, as well as on-going training for current employees.

CONTROL ARTICLES:

Mazola® corn oil was used as the negative control article. Three positive control articles, 3,3′-Iminodipropionitrile (IDPN), Parathion and d-Amphetamine, were used to elicit behavioral changes in the animals. IDPN was administered orally (gavage) at 2000 mg/kg, Parathion was administered orally (gavage) at 4 mg/kg, and d-Amphetamine was administered by intraperitoneal injection at 2 mg/kg. All positive and negative control articles were administered as a single dose.

TEST SYSTEM:

All animals used on the study were female Sprague-Dawley Crl:CD® (SD)IGS BR rats obtained from the WIL Research Laboratories, Inc. stock colony. Animals were randomly assigned to treatment groups using a computer program. The study was conducted according the protocol and WIL standard operating procedures.

ENVIRONMENTAL CONDITIONS:

The animals were housed and maintained under conditions consistent with maintaining good health. Temperature and relative humidity were set to maintain at 71 ± 5° C and 30-70%, respectively, in a room with a 12 hour light (6 a.m. to 6 p.m.)/dark photoperiod. Temperature and relative humidity were recorded once daily. The ventilation rate was set at a minimum of 10 room air changes per hour using 100% fresh air. The facilities at WIL Research Laboratories, Inc. are fully accredited by the Association for Assessment and Accreditation of Laboratory Animal Care International (AAALAC International).

VIABILITY OBSERVATIONS:

The rats were observed for mortality/moribundity and general condition twice daily, in the morning and in the afternoon.

BODY WEIGHTS:

Body weights were recorded on days of dose administration for calculation of doses only.

FUNCTIONAL OBSERVATIONAL BATTERY ASSESSMENTS:

The Functional Observational Battery used at WIL Research Laboratories, Inc. is based on previously developed protocols (Moser et al., 1999; Irwin, 1968; Gad, 1982; Moser et al., 1988; Haggerty, 1989; O'Donoghue, 1989). Testing for the Inter-observer Reliability testing (described below) was performed by trained technicians who did not know the animal's group assignment. The time of testing was determined by the Study Director based on the appearance of the expected behavioral signs following dosing. Animals were observed for the following parameters as described below (see WIL standard operating procedure No. T1-112, as revised, for a description of scoring criteria):

HOME CAGE OBSERVATIONS:

Posture
Convulsions/Tremors
Feces consistency
Biting
Palpebral (eyelid) closure

HANDLING OBSERVATIONS:

Ease of removal from cage
Lacrimation/chromodacryorrhea
Piloerection
Palpebral closure
Red/crusty deposits
Eye prominence
Ease of handling animal in hand
Salivation
Fur appearance
Respiratory rate/character
Mucous membranes/eye/skin color
Muscle tone

OPEN FIELD OBSERVATIONS: (evaluated over a 2-minute observation period)

Mobility
Rearing
Convulsions/tremors
Grooming
Bizarre/stereotypic behavior
Time to first step (seconds)
Gait
Arousal
Urination/defecation
Gait score
Backing

SENSORY OBSERVATIONS:

Approach response	Touch response
Startle response	Tail pinch
Pupil response	Eyeblink response
Forelimb extension	Hindlimb extension
Air righting reflex	Olfactory orientation

The study design consisted of three distinct phases to ensure the most adequate training and reliability among the technicians. Phases were designed as a progression to allow for training and discussion prior to the final phase, which evaluated the inter-observer reliability. The phases of testing are described as follows:

PHASE I:

Phase I testing consisted of FOB assessments on naive stock animals. Each technician observed up to 60 rats through the entire FOB assessment. The purpose of Phase I testing was to ensure consistent and accurate use of all equipment and to gain a strong knowledge of the stereotypic behavior of naive animals. All rats used in Phase I testing were returned to stock following FOB assessments.

PHASE II:

Phase II testing consisted of an open discussion of each animal's observations conducted in a group setting. Two animals per group were dosed with IDPN, Parathion, d-Amphetamine or corn oil and evaluated by the observers once the effects were apparent. Phase II allowed for open discussion of observations and interpretation of the findings. All animals used in Phase II testing were euthanized by carbon dioxide inhalation and carcasses discarded following testing.

PHASE III:

Inter-observer Reliability testing consisted of three animals per group dosed with a single dose of Parathion, IDPN, d-Amphetamine or corn oil and observed at a time determined by the Study Director or designee. Each observer individually recorded observations for each animal to evaluate the inter-observer reliability. All animals used in Inter-observer Reliability testing were euthanized by carbon dioxide inhalation and carcasses discarded following testing.

CRITERIA FOR EVALUATION OF TECHNICIANS:

The following criteria were used to evaluate the ability of technicians to reliably distinguish signs of neurotoxicity.

1. No omission of findings within the categories of Home Cage Observations, Handling Observations, Open Field Observations and Sensory Observations.

2. A difference of no more than two grades (severity) for a given finding in each category.

RESULTS:

VIABILITY:

All animals survived until scheduled euthanasia.

FUNCTIONAL OBSERVATIONAL BATTERY ASSESSMENTS:

Observers B, C, D and E were consistent in the findings reported when corn oil, IDPN, Parathion or d-Amphetamine was administered (Table 1). There were no obvious or gross inconsistencies among the calls with the exception of observer E who differed consistently when evaluating pupillary response. Therefore, these four observers were considered to have met acceptable for performing the functional observational battery on neurotoxicity studies. However, prior to working independently on studies, observer E will undergo additional training and demonstrate proficiency in the evaluation of pupillary response.

Observer A differed significantly from the common response of the other observers in several categories. Therefore, observer A was not considered to have met acceptable criteria for performing functional observational battery testing on neurotoxicity studies.

It should be noted there were six apparent omissions of observations (Table 2) which upon further review were found to be of no consequence.

Scoring Criteria For The Functional Observational Battery

Scoring Criteria for the Functional Observational Battery

Definition:

The Functional Observational Battery (FOB) is a procedure used to detect gross functional deficits in test animals.

Description:

The FOB consists of a series of tests. The tests are categorized into home-cage, handling, open-field, sensory, neuromuscular and physiological observations and are as follows:

1. Home-Cage Observations

    a. Posture
    b. Convulsions
    c. Tremors
    d. Biting
    e. Palpebral (eyelid) closure
    f. Feces Consistency

2. Handling Observations

    a. Ease of removal from cage
    b. Ease of handling animal in hand
    c. Lacrimation
    d. Chromodacryorrhea
    e. Salivation
    f. Piloerection
    g. Fur appearance
    h. Palpebral closure
    i. Respiratory rate
    j. Respiratory character
    k. Red deposits
    l. Crusty deposits
    m. Mucous membranes/eye/skin color
    n. Eye prominence
    o. Muscle tone

3. Open-Field Observations

   a. Time to first step (seconds)
   b. Rearing
   c. Mobility
   d. Backing
   e. Grooming
   f. Gait
   g. Convulsions
   h. Tremors
   i. Gait Score
   j. Arousal
   k. Bizarre/Stereotypic behavior
   l. Urination
   m. Defecation

4. Sensory Observations

   a. Approach response
   b. Touch response
   c. Startle response
   d. Tail pinch
   e. Olfactory orientation
   f. Pupil response
   g. Eyeblink response
   h. Forelimb extension
   i. Hindlimb extension
   j. Air righting reflex

5. Neuromuscular Observations

   a. Hindlimb extensor strength
   b. Grip strength-hind and forelimb
   c. Rotarod performance
   d. Hindlimb foot splay

6. Physiological Observations

   a. Catalepsy
   b. Body Temperature
   c. Body Weight

Procedure

The FOB was performed on those study days specified in the study protocol. Test animals were removed from their cages one at a time on the designated day of testing, and, unless specified in the study protocol, were taken through the FOB in the following order: FOB1 (inclusive of categories 1a-1f and 2a), FOB2 (inclusive of categories 2b-2o, 3a-3m and 4a-4j) and FOB3 (inclusive of categories 5a-5d and 6a-6c).

Testing was performed by trained technicians, who did not know the group assignment of the animals. A description of the scoring criteria for each test is provided below:

1. HOME-CAGE OBSERVATIONS

Observations of the animal in its home cage and while opening the cage were performed and scored as follows:

a. Posture

Sitting or standing normally	1
Asleep, lying on side or curled up	2
Alert, oriented toward observer	3
Sitting, head held low	4
Flattened, limbs may be extended	5
Lying on side, limbs in air	6
Immobile	7
Rearing	8

b. Convulsions

I. Clonic

Absent	1
Repetitive movement of mouth and jaws	2
Clonic tremors of the limbs (contraction followed by relaxation)	3
Whole body tremors	4
Clonic convulsions	5
Wet Dog Shakes	6

II. Tonic

Absent	1
Tonic: contraction of extensors such that limbs are rigid and extended	2
Opisthotonus: head, body and limbs rigidly arched backwards	3
Emprosthotonus: head, body and limbs extended forward	4
'Popcorn seizure': animal repeatedly jumps or bounces in air	5
Asphyxial: bouts of severe clonic-tonic convulsions	6

c. Tremors

None	1
Slight (1.5 mm)	2
Moderately coarse (3 mm), slight impairment of locomotion	3
Markedly coarse (4.5 mm), moderate/marked impairment of locomotion	4
Extremely coarse (6 mm), locomotion impossible	5

d. Biting

None	1
Biting of cage	2
Biting of self	3

e. Palpebral (eyelid) closure

Eyelids wide open	1
Eyelids slightly drooping	2
Drooping eyelids (half closed)	3
Eyelids completely shut	4

f. Feces Consistency

Pellets	1
Pellets, partially formed	2
Unformed, diarrhea	3
Pellets absent	4

2. HANDLING OBSERVATIONS

Animals were removed singly from their cages and observed and scored as follows:

a. Ease of removal from cage

Very easy: animal sits quietly, allows investigator to pick it up	1
Easy: with or without vocalization, without resistance or slight resistance to being picked up	2
Moderately difficult: animal rears, often following Investigator's hand	3
Freezes: with or without vocalization	4
Difficult: runs around cage, is hard to grab, with or without vocalization	5
Very difficult: tail and throat rattles with or without vocalization, may attack hand	6

b. Ease of handling animal in hand

Low: no resistance, animal is easy to handle	1
Moderately low: slight resistance to being handled, with or without vocalization	2
Moderately high: rat may freeze, or be tense or rigid in hand, with or without vocalization	3
High: squirming, twisting, attempting to bite with or without vocalization	4

c. Lacrimation

None	1
Slight	2
Severe	3

d. Chromodacryorrhea

Absent	1
Present	2

e. Salivation

None	1
Slight	2
Severe	3

f. Piloerection

None	1
Slight	2
Severe	3

g. Fur Appearance

Normal: clean and groomed	1
Slightly soiled	2
Very soiled, crusty	3

h. Palpebral closure

Eyelids wide open	1
Eyelids slightly drooping	2
Drooping eyelids (half closed)	3
Eyelids completely shut	4

i. Respiratory Rate

Normal: by observation (80-110/min.)	1
Decreased: below 80/min.	2
Increased: above 110/min.	3

j. Respiratory Character

Normal	1
Rales: abnormal sound accompanying breathing	2
Retching	3
Dyspneic: short of breath	4
Gasping	5

k. Red Deposits - eyes, nose, mouth

Present	1
Absent	2

l. Crusty Deposits - eyes, nose, mouth

Present	1
Absent	2

m. Mucous membranes/eye/skin color

Pink	1
Pale	2
Darkened	3
Darkened, brown	4
Bright, deep red flush	5

n. Eye Prominence

Normal	1
Exophthalmus	2
Enophthalmus	3

o. Muscle Tone

The musculature of the limbs was palpated between the thumb and forefinger.

Muscle is firm but not hard (normal)	1
Muscle is soft and flabby	2
Muscle is tense and hard	3

3. OPEN-FIELD OBSERVATIONS

Animals were placed singly in the open-field arena (24" x 24" x 6"; constructed from Plexiglas® and painted black) and evaluated over a 2-minute observation period as follows:

a. Time to first step (seconds)

The time taken for the animal to take its first step in the open-field arena was recorded in seconds.

b. Rearing

The number of times the animal reared back onto its hind legs and stood up with both front paws raised off the surface was recorded over a 2-minute observation period in the open-field arena.

c. Mobility (scored within 30 seconds of placing animal in the open-field arena)

Normal	1
Slightly Impaired	2
Moderately Impaired	3
Totally Impaired, Locomotion impossible	4

d. Backing

The number of times the animal took three or more backward steps over a 2-minute observation period in the open-field arena was recorded.

e. Grooming

The number of times the animal groomed itself over a 2-minute observation period in the open-field arena was recorded. Grooming includes washing the face and head with the forepaws, scratching the head or body with a hind paw, and biting the fur.

f. Gait

Normal, head horizontal, abdomen just above surface, slight up and down movement with each step	1
Walks on tiptoes	2
Body drags, abdomen makes contact with surface, body sway	3

f. Gait (Continued)

Hindlimbs splayed or dragging, unable to support weight	4
Hunched body, bottom up, nose held down, arched back	5
Ataxia, excessive sway, rocks or lurches as animal proceeds forward	6

g. Convulsions

I. Clonic

Absent	1
Repetitive movement of mouth and jaws	2
Clonic tremors of the limbs (contraction followed by relaxation)	3
Whole body tremors	4
Clonic convulsions	5
Wet Dog Shakes	6

II. Tonic

Absent	1
Tonic: contraction of extensors such that limbs are rigid and extended	2
Opisthotonus: head, body and limbs rigidly arched backwards	3
Emprosthotonus: head, body and limbs arched forward	4
'Popcorn seizure': animal repeatedly jumps or bounces in air	5
Asphyxial: bouts of severe clonic-tonic convulsions	6

h. Tremors

None	1
Slight (1.5mm)	2
Moderately coarse (3 mm), slight impairment of locomotion	3
Markedly coarse (4.5 mm), moderate/marked impairment of locomotion	4
Extremely coarse (6 mm), locomotion impossible	5

i. Gait Score: Ability to locomote despite abnormalities in gait

Normal	1
Slight impairment, but definite	2
Considerable impairment, without falling	3
Marked impairment, falls every 4 to 6 steps	4
Severe impairment, cannot walk without falling	5

j. Arousal

Very low: Stupor, coma, little or no responsiveness	1
Low: Somewhat stuporous	2
Normal: Alert, exploratory movements	3
Somewhat high: Slight excitement, tense, excited sudden darting or freezing	4
Very high: Hyperalert, excited, sudden bouts of running or body movements	5

k. Bizarre/Stereotypic Behavior

None	1
Head Flick: head shaking or backward flip of head	2
Head Search: stereotyped, repetitive turning of head from side to side as though searching the environment	3
Hallucinatory: animal appears to be responding to objects not present	4
Compulsive licking or biting	5
Prancing: restless shifting from one forelimb to other, with slight turning of the body from side to side	6
Upright walking: on hindlimbs only	7
Aimless wandering: progressive, slow, plodding movements about environment, with no apparent purpose	8
Circling: tendency to move in circles around and along objects, or in an open environment	9
Waltzing: rapid turning in circles	10
Retropulsion: where animal walks backwards	11
Spatial disorientation: walking or stumbling into objects	12
Side to side rocking	13
Straub tail: increased tail elevation	14
Vertical Jumping	15
Pacing without purpose	16
Head bobbing	17

k. Bizarre/Stereotypic Behavior (continued)

Writhing: lying down, wavelike movement of abdomen, alternating limb movements	18

l. Urination

The number of pools of urine in the open-field arena was counted.

m. Defecation

The number of fecal boli in the open-field arena was counted.

4. SENSORY OBSERVATIONS

Sensory tests were performed in the open-field arena as follows:

a. Approach Response

The animal was approached head-on with a blunt object held approximately 3 cm from its face for a 4-second period.

No reaction	1
Slow approach, sniffing or turning away	2
More energetic than (2) may include vocalization	3
Freezes, actual muscle contraction	4
Bizarre reaction: jumps, bites or attacks	5

b. Touch Response

The rump of the animal was approached from the side and touched with a blunt object.

No reaction	1
Animal may slowly turn, walk away	2
More energetic response than (2), may include vocalization	3
Freezes, actual muscle contraction	4
Bizarre reaction: jumps, bites or attacks	5

c. Startle Response

A clicker held approximately 5 cm above the head of the animal was used to make a sudden sound.

No reaction	1
Slight reaction, ear flick or some evidence that snap was heard	2
More energetic response than (2), may include vocalization	3
Freezes, actual muscle contraction	4
Bizarre reactions: jumps, attacks, bites	5

d. Tail Pinch

Metal tweezers were used to squeeze tail approximately 2-3 cm from tip.

No reaction	1
Animal may turn or walk away	2
More energetic than (2), may include vocalization	3
Freezes, actual muscle contraction	4
Bizarre reaction: jumps, attacks or bites	5

e. Olfactory Orientation

Approaching the animal from behind, a cotton swab that had been dipped into a jar of commercially available homogenized baby food was brought to within approximately 4-5 cm of the side of the animal's head.

No reaction present	1
Reaction present, animal approaches swab making sniffing movements with nose, may lick swab	2

f. Pupil Response

The beam from a pen light was brought to within approximately 5 mm of the surface of the eye. Changes in pupil size were recorded.

No pupil response	1
Pupil response present	2

g. Eyeblink Response

The corner of the eye was touched gently with a blunt object.

No eyeblink response	1
Eyeblink response present	2

h. Forelimb Extension

The animal was held by the tail and lowered towards a table top. The presence or absence of normal forelimb extension was recorded.

No forelimb extension	1
Forelimb extension present	2

i. Hindlimb Extension

The animal was placed on a table top and lifted by the tail. The presence of normal hindlimb extension was recorded.

No hindlimb extension	1
Hindlimb extension present	2

j. Air Righting Reflex

The animal was held in a supine position and dropped from a height of approximately 30 cm. The ease of landing was scored as follows:

Normal	1
Slightly uncoordinated	2
Lands on side	3
Lands on back	4

5. NEUROMUSCULAR OBSERVATIONS

a. Hindlimb Extensor Strength

The animal was picked up and slight pressure was applied to its hindlimbs. The normal response is for the animal to extend its hindlimbs against the pressure.

a. Hindlimb Extensor Strength (continued)

Hindlimb resistance absent	1
Reduced hindlimb resistance, animal shows some weakness	2
Hindlimb resistance present	3

b. Grip Strength - hind and forelimb

Forelimb and hindlimb grip strength were measured using a device similar to the one described by Meyer *et al* (Neurobehav. Toxicol. 1:233-239, 1979). The animal was allowed to grip a T-shaped grip bar with its forepaws and was pulled back gently along a platform until its grip was broken. As the backward locomotion continued, the animal's hindpaws reached a T-shaped rearlimb grip bar, which it was allowed to grasp and then forced to release by continued pulling. Chatillon push-pull strain gauges (J.A. King, Greensboro, North Carolina) were used to record the maximum strain required to break forelimb and hindlimb grip. The average of three valid measurements was taken as the animal's score for each grip strength measure.

c. Rotarod Performance

During the pretest period, the animals were trained to walk on a rotarod (a 7.0-cm-diameter rod rotating at 12 rpm; AccuScan Instruments, Inc., Columbus, Ohio) for a period of two minutes. The duration of time each animal remained on the rotarod (up to a maximum time of 120 seconds) during testing was recorded.

d. Hindlimb Foot Splay

The heel pads of the hindfeet of the animal were painted with a non-toxic water-based paint. Animals are dropped from a horizontal position approximately 30 cm above a table onto the Hindlimb Foot Splay Test sheet. The distance (to the nearest millimeter) between the inner edge of the ink blots made by each foot was measured. The test was repeated two more times; and the average score (to the nearest millimeter) of the latter two trials was calculated.

6. PHYSIOLOGICAL OBSERVATIONS

a. Catalepsy

The animal was placed on four Plexiglas® platforms (35 mm high and 40 mm in diameter) that were a distance of 100 mm from each other between the fore and hind feet and 60 mm between right and left feet (when measured from the center of the platforms). The time each animal remained on the four platforms was recorded. The duration of immobility was measured (up to a maximum time of 60 seconds).

b. Body Temperature

A thermometer was inserted into the rectum of the animal, and the body temperature was recorded after an equilibration period of approximately 30 seconds.

c. Body Weight

The weight of the animal was recorded.

The Functional Observational Battery is normally recorded on-line via the "IFOB" program in NT-module. In the event that the Data Management System is unavailable for on-line data collection, data are hand-recorded on the Functional Observational Battery Individual Data Sheets (T1-228, as revised). When appropriate, the hand-recorded data are late entered into the Data Management System.

APPENDIX H

Clinical Pathology Methods, Procedures And References

CLINICAL PATHOLOGY METHODS, PROCEDURES AND REFERENCES

Serum Chemistry - Hitachi 912

Albumin - Bromcresol Green (BCG) Method, Modification of the Doumas reaction. Default unit: g/dL. Hitachi 912 Application Code 413. Roche Reagent, catalog number 11970569.

A/G Ratio - Calculated from Albumin and Globulin Results. Default unit: %.

Alkaline Phosphatase - based on the International Federation of Clinical Chemistry (IFCC) Method (Tietz *et al.* J Clin Chem Clin Biochem 1983; 21:731-748). Default unit: U/L. Hitachi 912 Application Code 158. Roche Reagent, catalog number 2172933.

Alanine Aminotransferase - Modification of the International Federation of Clinical Chemistry (IFCC) recommended method. Default unit: U/L. Hitachi 912 Application Code 706. Roche Reagent, catalog number 450065.

Aspartate Aminotransferase - Kinetic method based on the International Federation of Clinical Chemistry (IFCC) recommendations. Default unit: U/L. Hitachi 912 Application Code 715. Roche Reagent, catalog number 450064.

Bilirubin (Total) - Diazo method developed by Wahlefeld *et al.* Scand J Clin Lab Invest 1972; 29: Supplement 126. Default unit: mg/dL. Hitachi 912 Application Code 716. Roche Reagent, catalog number 1039034.

Blood Urea Nitrogen (BUN) - A urease-triggered methodology based upon the method of Talke and Schubert Klin Wschr, 1965; 43:174. Default unit: mg/dL. Hitachi 912 Application Code 427. Roche Reagent, catalog number 1489321.

Calcium - Modified method using a gamma-amino-butyric acid (GABA) buffer. Default unit: mg/dL. Hitachi 912 Application Code 180. Roche Reagent, catalog number 1125621.

Chloride - An ion-selective electrode that measures the electrical potential of the ions present in solution. Default unit: mEq/L. Hitachi 912 Application. Roche Reagent, catalog numbers 820638, 836246 and 820639.

Cholesterol - Enzymatic reaction as described by Trinder. Ann Clin Biochem 1974; 12:266. Default unit: mg/dL. Hitachi 912 Application Code 722. Roche Reagent, catalog number 450061.

Serum Chemistry - Hitachi 912 (continued)

Creatinine - Modified Jaffe reaction based on the work of Poper *et al.* Biochem Z 1937; 291:354, and Seelig and Wuest. Aerztl Labor 1969; 15:34. Default unit: mg/dL. Hitachi 912 Application Code 727. Roche Reagent, catalog number 450019.

Globulin - Calculation obtained by subtracting Albumin from Total Protein. Default unit: g/dL.

Glucose - Glucose hexokinase method based on the work of Schmidt, Peterson and Young. Klin Wschr 1961; 39:1244. Methods of Enzymatic Analysis, 2nd Eng ed. New York, Academic Press, 1974; 1196. Anal Biochemistry 1958; 23:301. Default unit: mg/dL. Hitachi 912 Application Code 767. Roche Reagent, catalog number 450058.

Phosphorus - Method involves the formation of ammonium phosphomolybdate. Default unit: mg/dL. Hitachi 912 Application Code 714. Roche Reagent, catalog number 1040898.

Potassium - An ion-selective electrode that measures the electrical potential of the ions present in solution. Default unit: mEq/L. Hitachi 912 Application. Roche Reagent, catalog numbers 820638, 836246 and 820639.

Sodium - An ion-selective electrode that measures the electrical potential of the ions present in solution. Default unit: mEq/L. Hitachi 912 Application. Roche Reagent, catalog number 820638, 836246 and 820639.

Total Protein - Endpoint biuret method that utilizes a sample blank. Default unit: g/dL. Hitachi 912 Application Code 756. Roche Reagent, catalog number 1040901.

Triglycerides - Method that utilizes lipase from a microorganism to promote rapid and complete hydrolysis of triglycerides to glycerol. Default unit: mg/dL. Hitachi 912 Application Code 781. Roche Reagent, catalog number 1488899.

Hematology - Manual Methods

White Cell Differential - Manual method of counting 100 white cells stained with Wright Giemsa and entered on-line into the data files.

Reticulocyte Count - Manual method of counting the reticulocytes present in 1000 red blood cells stained with New Methylene Blue and entered on-line into the data files.

Red Blood Cell Morphology - Manual method of evaluating red blood cells on a Wright Giemsa-stained slide and entered on-line into the data files.

Hematology - Manual Methods (continued)

Platelet Estimate- Manual method of evaluating platelets on a Wright Giemsa-stained slide. Platelet estimation is evaluated and entered on-line into the data files as decreased, adequate or increased. Platelet clumps present on the slide will be reported as part of the RBC morphology.

AMAX Destiny Amelung Coagulation

Mechanical (Ball Method) Measurement – Mechanical measurement methods depend on the physical formation of fibrin strands that attach to a moving mechanical device that either completes or opens and electrical circuit. The elapsed time from the addition of the starting reagent, up to the beginning of fibrin formation is measured.

Prothrombin Time (Protime-PT)- mechanical clot detection is used to measure and record the time required for plasma specimens to clot by adding an excess of thromboplastin reagent and an optional amount of calcium to citrated plasma. The PT measures from factor VII through fibrin formation (extrinsic and common pathways of coagulation). Default unit: sec.

Activated Partial Thromboplastin Time (APTT)- mechanical clot detection is used to measure and record clotting time in a one-stage procedure which consists of recalcifying plasma in the presence of an excess of platelet-like reagent (cephalin) containing a plasma activator. The APTT measures the clotting time from factor XII through fibrin formation (intrinsic and common pathways of coagulation) Default unit: sec.

Hematology-Bayer Advia® 120

WBC Count - The whole blood sample is mixed with ADVIA® 120 BASO reagent that contains acid and surfactant. The red cells are hemolyzed, and the white blood cells are then analyzed using two angle laser light scatter signals. Default unit: x 10^3 cells/μL

RBC / Platelet Count - Both red blood cells and platelets are analyzed by a single optical cytometer after appropriate dilution of the blood sample with ADVIA® 120 RBC/PLT reagent. The red blood cells are isovolumetrically sphered and lightly fixed with glutaraldehyde to preserve the spherical shape. Red cells and platelets are counted from the signals from a common detector with 2 different gain settings. Default unit RBC: x 10^6cells/μL. Default unit PLT: x 10^3 cells/μL

Hematology-Bayer Advia® 120 (continued)

Hgb - Hemoglobin: The hemoglobin method is a modification of the manual cyanmethemoglobin method developed by the International Committee for standardization in Hematology (ICSH). Default unit: g/dL.

Hematocrit - The percentage of blood volume that is occupied by red blood cells. Also referred to as the packed red cell volume. On the ADVIA® 120 Hematology System this parameter is derived from the measured red cell volume (MCV) and the red cell count (RBC). Default unit: %.

MCH - Mean Corpuscular Hemoglobin: the average weight of hemoglobin in the red blood cells, calculated from the RBC and Hgb measurements. Default unit: pg.

MCHC - Mean Corpuscular Hemoglobin Concentration: the average concentration of hemoglobin in the red blood cells. This parameter is computed from the measured hemoglobin and the computed hematocrit. Default unit: g/dL.

MCV - Mean Corpuscular Volume: the average volume of the red blood cells. Default unit: fL

White blood cell differential - The ADVIA® 120 Hematology System White Blood Cell Differential (WBC DIFF) methods, consists of both the Peroxidase method and the Basophil/Lobularity method. The ADVIA® 120 Hematology System performs a six-part differential that consists of basophils, eosinophils, large unstained cells, lymphocytes, monocytes, and neutrophils. The white blood cell differential count is reported in percent and the actual number of each type of cell per microliter of blood.

Reticulocyte - This method uses a nucleic acid dye (oxazine 750) to stain cellular RNA. The ADVIA® 120 autoRETIC reagent isovolumetrically spheres the erythroid cells and stains cellular RNA. Low-angle laser light scatter, high-angle laser light scatter, and absorption characteristics of all cells are counted and measured. The absorption data are used to classify each cell as a reticulocyte or mature red blood cell based on its RNA content. The reticulocyte is reported in percent and actual number x 10 cells/Liter.

Statement of Quality Control

This report was quality checked in accordance with BioSTAT Procedural Guideline 2.1 (Quality Control Process for Tables and Reports). The statistical methodology and results of inferential statistics were verified by an independent quality control statistician. Based on these documented quality control activities, it is concluded that the statistical results incorporated in this report accurately reflect the statistical analysis of data received by BioSTAT.

1 Statistical Methodology

1.1 Analysis Endpoints

- Motor Activity
  - Total Counts
  - Ambulatory Counts

1.2 Motor Activity Analysis Methodology

Each analysis endpoint (total and ambulatory counts) was analyzed, by sex and session, with a repeated measure analysis of variance (RANOVA). Factors in the model included treatment group (TRT), time interval (TIME), and the interaction of time interval and treatment group (TRT*TIME). The SAS® procedure PROC MIXED was used for analysis with the random effect of animal included as the repeated measurement. The covariance structure across time was selected by comparing Akiake's Information Criterion (AIC) for first-order autoregressive homogeneous [AR(1)] and compound symmetric (CS) structures.

The monotonic dose response relationship was evaluated using sequential linear trend tests based on ordinal spacing of dose levels. The linear dose by time interaction (LinTrt*Time) was evaluated and, if significant at the 0.05 level, trend tests on treatment means were performed at the 0.05 level for each time interval. If the linear dose by time interaction was not significant, the trend test was conducted across the pooled time intervals of the entire session only.

Nonmonotonic dose responses were evaluated whenever no significant linear trends were detected but TRT and/or TRT*TIME interaction was significant at the 0.01 level. Within the framework of the RANOVA, pairwise comparisons were made for each individual treated group with the control group through linear contrasts. If TRT* TIME was significant, the comparisons were conducted for each time interval. If only the TRT effect was significant, the comparisons were conducted across the pooled time intervals of the entire session. These nonmonotonic dose response comparisons were conducted at the 0.01 significance level.

All statistical analyses were conducted using SAS version 8.2 (SAS Institute, Inc., 1999-2001) software.

2 Results

Results of statistical analyses are summarized in Section 3.

Tables Legend

Treatments:

Treatment #	Dosage Level (mg/kg/day)
1	0
2	160
3	400
4	1000

S.D. = standard deviation
N = number of animals
LSMean = least squares mean
Linear Trend p-value = p-value for the treatment linear trend test
Trt F-test p-value = p-value for treatment group effect
INTN = treatment dose by time (MA) or trial (SR) interactions tested
Trt*Time p-value = p-value for the treatment by time interaction
LinTrt*Time p-value = p-value for the linear trend by time interaction
Covariance Structure: AR1=Autoregressive order 1, CS=Compound symmetric

APPENDIX O

Study Protocol

Study Number: WIL-187051

PROTOCOL AMENDMENT I

Sponsor: [redacted]

Sponsor No.: 05-087

A. Title of Study:

A 28-Day Repeated Dose Oral (Gavage) Toxicity Study of [redacted] in Rats (with Functional Observational Battery and Motor Activity Determinations)

B. Protocol Modification:

1) **3** **STUDY SCHEDULE**:

Proposed Experimental Termination (Completion) Date: January 25, 2006

Proposed Audited Draft Report Date: March 1, 2006

2) **5.4** **Number on Study:**

In accordance with the Study Director Notification dated September 28, 2005:

35 animals of each sex were ordered.

3) **8.8.3** **Microscopic Examination:**

The second sentence is corrected as follows:

Gross lesions will be examined from animals in Groups 2 and 3.

4) Please add the following:

Prepared slides will be evaluated by:

[redacted]

C. Reason for Protocol Modification:

1) The study schedule has been determined.

2) To document a change in the number of animals ordered.

3) The groups from which gross lesions will be examined are corrected.

4) To provide information for outsourcing the pathological evaluation.

PROTOCOL

A 28-DAY REPEATED DOSE ORAL (GAVAGE) TOXICITY STUDY OF [redacted] IN RATS (WITH FUNCTIONAL OBSERVATIONAL BATTERY AND MOTOR ACTIVITY DETERMINATIONS)

(OECD Guideline 407)

Sponsor Study Number: 05-087

Submitted To:

[redacted]

WIL Research Laboratories, LLC
1407 George Road
Ashland, OH 44805-9281

1 OBJECTIVE:

The objective of this study is to evaluate the possible toxic effects of the test material when administered orally to rats for 28 days, and to assess recovery from such effects. This will include evaluation of potential neurotoxicity by functional observational battery (FOB) and motor activity (MA) assessment.

This protocol has been designed and the study will be conducted in general accordance with the OECD (Organisation for Economic Cooperation and Development) Guidelines for Testing of Chemicals, Health Effects Test Guidelines, Section 407, July 27, 1995.

The study will be conducted in compliance with the OECD Good Laboratory Practice (GLP) Standards, [C(97) 186/Final]. The study will be performed according to the protocol and WIL standard operating procedures.

2 PERSONNEL INVOLVED IN THE STUDY:

2.1 Sponsor Representative:

[redacted]

2.2 WIL Study Director:

[redacted]

2.3 WIL Deputy Director:

[redacted]
Staff Toxicologist

2.4 WIL Departmental Responsibilities:

[redacted]
President, Director

[redacted]

2.5 **Repeated Measures Statistical Analysis:**

[redacted]
BioSTAT Consultants, Inc.

3 STUDY SCHEDULE:

Proposed Experimental Starting Date (Animal Receipt):	October 11, 2005
Proposed Experimental Start Date:	October 26, 2005
Proposed Necropsy Dates	
Primary:	November 23, 2005
Recovery:	December 7, 2005
Proposed Experimental Termination (Completion) Date:	To be determined.
Proposed Audited Draft Report Date:	To be determined.

4 TEST MATERIAL:

4.1 Identification:

[redacted]

4.2 Lot Number:

[redacted]

4.3 Purity:

100%

4.4 Stability:

The test article is considered stable under the storage conditions provided by the Sponsor.

4.5 Physical Description:

Dark brown viscous liquid.

4.6 Storage Conditions:

Store at ambient conditions.

4.7 Reserve Samples:

Reserve samples of the test article will be taken in accordance with WIL standard operating procedures.

4.8 Personnel Safety:

To be provided by the Sponsor. It is the responsibility of the Sponsor to notify the testing facility of any special handling requirements for the test article. A Material Safety Data Sheet (MSDS) will accompany the test article upon arrival at the laboratory.

4.9 Vehicle:

Corn oil.

5 TEST SYSTEM:

5.1 Species:

Rat

5.2 Strain:

Crl:CD®(SD)

5.3 Source:

Charles River Laboratories
Raleigh, NC

5.4 Number of Study:

Forty (40) animals of each sex will be ordered. Thirty males and 30 females will be placed on study. Animals not utilized on study will be deemed as part of the stock colony or euthanized by CO_2 inhalation and discarded.

5.5 Approximate Age and Weight:

Animals will be 4 to 6 weeks of age when received, and 6 to 8 weeks of age at initiation of dosing. The males will weigh approximately 160-260 g and the females approximately 110-180 g at initiation of dosing.

5.6 Identification System:

Animals will be uniquely identified by a metal eartag displaying the animal number. Individual cage cards will be affixed to each cage and will display the animal number, group number and study number.

5.7 Justification for Selection:

This species and strain of animal is recognized to be appropriate for subchronic toxicity studies. The Sprague-Dawley rat will be used because it is a widely used strain for which significant control data are available. The number of animals is the minimum required to yield scientifically meaningful and statistically significant data.

6 SPECIFIC MAINTENANCE SCHEDULE:

6.1 Animal Housing:

Weanling animals (less than approximately 35 days of age) will be housed three per cage by sex in an environmentally controlled room in clean suspended wire-mesh cages for approximately three days following receipt. If the number of animals received does not allow for all animals to be housed three per cage by sex, than some animals will be pair-housed by sex. Thereafter, the animals will be housed individually. The cages will be elevated above cage-board or other suitable material which will be changed at least three times each week.

The facilities at WIL Research Laboratories, LLC are fully accredited by the Association for Assessment and Accreditation of Laboratory Animal Care International (AAALAC International).

6.2 Environmental Conditions:

Controls will be set to maintain an average daily temperature of 71° ± 5°F (22 ± 3°C) and an average daily relative humidity of approximately 50 ± 20%.

Fluorescent lighting will provide illumination for 12 hours per day. The light/dark period may be interrupted, however, to allow for protocol-specified activities. Temperature and relative humidity will be monitored continually and scheduled for automatic hourly data capturing. Ventilation rate will be set at 10 to 15 room changes per hour, 100% fresh air.

6.3 Drinking Water:

Reverse osmosis-treated tap water will be available *ad libitum*. Filters servicing the automatic watering system will be changed regularly according to standard operating procedures. The municipal water supplying the laboratory will be analyzed for contaminants according to standard operating procedures to ascertain that none are present at concentrations that would be expected to affect the outcome of the study.

6.4 Diet:

PMI Nutrition International, LLC Certified Rodent LabDiet® 5002 (meal) will be offered *ad libitum* during the study except during fasting prior to clinical pathology blood collection. Each lot utilized will be identified and recorded. Standard operating procedures provide specifications for acceptable levels of heavy metals and pesticides that are reasonably expected to be present in the diet without interfering with the purpose or conduct of the study. Each lot of feed has been analyzed to assure specifications are met. Feeders will be changed and sanitized once per week.

7 EXPERIMENTAL DESIGN:

7.1 Animal Receipt and Acclimation:

Each animal will be inspected by a qualified technician upon receipt. Animals judged to be in good health will be placed immediately in acclimation for at least 10 days. All animals will be weighed and assigned a permanent animal number. During the acclimation period, each animal will be observed twice daily for changes in general appearance or behavior. The animals will be allowed a pretreatment week (as part of the acclimation period) during which body weights and food consumption will be recorded and general health will be monitored, but they will not receive the test material. All animals will receive a detailed physical examination approximately one week prior to initiation of dosing and at the time of animal selection for randomization.

7.2 Randomization:

Animals judged to be suitable for testing will be assigned to groups at random based on body weight stratification into a block design using a computer program. A printout containing the animal numbers and individual group

assignments will be generated. Animals will then be arranged into the groups according to the printout. Body weights at randomization will be within ± 20% of the mean for each sex. If, after randomization, significant differences between groups exist, new randomizations will be generated until group mean body weights are not statistically different between groups by sex. For Groups 1 and 4, animals will be assigned to recovery (which will be the same animals used for FOB and MA assessment). Following the group randomization procedure, the study animals will be randomly assigned to replicates for FOB and MA assessment as described in WIL SOP T1-126, as revised. Each dose group and sex will be approximately equally represented in each study replicate to avoid introduction of bias into the recorded observations related to these variables.

7.3 Route and Rationale of Test Material Administration:

The route of administration will be oral by gavage since this is an acceptable and standard method for administering test material per OECD Guideline 407. Appropriate-sized flexible, Teflon®-shafted, stainless steel ball-tipped dosing cannulae will be used for the oral administration by gavage.

7.4 Organization of Test Groups, Dosage Levels and Treatment Regimen:

7.4.1 Organization of Test Groups:

The dosage levels will be determined from the results of a 14-day dose range-finder study (WIL-187047) and will be provided by the Sponsor Representative after consultation with the WIL Study Director. The following diagram presents the study group arrangement.

Group Number	Treatment	Dosage Level (mg/kg/day)	Dosage Concentration (mg/mL)	Dosage Volume (mL/kg)	Number of Animals	
					Males	Females
1	Vehicle	0	0	5	10[a]	10[a]
2	[redacted]	160	32	5	5	5
3	[redacted]	400	80	5	5	5
4	[redacted]	1000	200	5	10[a]	10[a]

a = At the end of the 28 day dosing period, 5 rats/sex will be randomly assigned to the primary necropsy and ≤ 5 rats/sex will be randomly assigned to a 14-day recovery period (which will be the same animals used for FOB and MA assessment).

7.4.2 Vehicle:

Corn oil will be used as the vehicle.

7.4.3 Treatment Regimen:

The test material and vehicle will be administered once daily for a minimum of 28 consecutive days (until the day prior to necropsy). Day 0 is the first day of dosing, and Day 28 is the day of necropsy and the first day of recovery. The first week of dosing is week 0.

7.4.4 Adjustment of Dosages:

Individual doses will be adjusted weekly for the duration of the study, based on the most recent body weights. Adjusted doses will become effective the day of collection of the weekly body weights.

7.5 Preparation and Analysis of Test Material Preparations:

7.5.1 Test Material Preparation:

Based on the physical characteristics of the test article, appropriate methods will be used to ensure the best possible formulations of the test article in the vehicle. Dosing formulations of the test article will be prepared weekly. The study director or the deputy director or designee will visually inspect the formulations prior to initiation of dosing. This visual inspection will be performed to assure that the formulations are visibly homogeneous and acceptable for dosing. Any special procedures required for formulation will be documented according to Good Laboratory Practices and presented in the final report of this study.

7.5.2 Homogeneity and Stability of the Test Material Preparations:

Dosing mixture homogeneity in bulk preparations will be collected prior to the initiation of test article administration, if possible. While undergoing stirring in the beaker, the following sample aliquots (5 mL) will be drawn for analysis: control, three aliquots (from the middle); all treatment groups, nine aliquots (3 each from the top, middle and bottom). Test article formulations will be divided into aliquots for daily dispensation. Resuspension homogeneity of aliquots will be determined over the longest period of aliquot storage. Three samples (5mL) from the top and bottom of each group will be collected to assess the homogeneity after storage and resuspension. Two of the three samples will be sent to [redacted] for analysis of homogeneity and stability over a ten-day period. The samples will be shipped under ambient conditions. The remaining sample from each dose level and strata will be stored under normal laboratory conditions for possible future analysis.

7.5.3 Concentration Analysis:

Samples of the dosing mixtures will be collected on the first and last day of each weekly preparation. At each time point, two 5-mL aliquots will be taken from each dose level (middle stratum), including the control group. The dosing mixture will be thoroughly mixed before taking each sample. One sample from each dose level will be analyzed; the remaining sample will be retained by the Testing Laboratory for possible future analysis.

Dosing mixture samples for homogeneity, stability and concentration of the test article at all dose levels, including the control, will be analyzed by the Sponsor. Quality assurance (QA) auditing of the conduct, results and reporting of the analyses, as well as archiving of these data will be the responsibility of the Sponsor. Critical phase inspection reports and report audits will be submitted to the Study Director and management at WIL Research Laboratories, LLC. A QA statement will be issued for inclusion in the overall final report. The methods and results of the analysis will be provided by the Sponsor and included as an appendix to the WIL final report. The methods employed will be one or more of the following:

[redacted] SOP #ME-125

Concentration and stability data will be evaluated using percent difference. The acceptable tolerance between the theoretical and measured values is 15%.

Mixtures will be considered homogeneous if the difference between the overall group mean and the strata mean is 10% or less.

7.5.4 Sample Handling and Shipment:

Each 5-mL sample will be placed in a glass vial with a Teflon-lined lid. The vial plus sample weight will be recorded with an accuracy of ± 0.0005 g. Each sample will be stored at ambient temperature. Each sample container will be labeled with the following information:

Accession Number
Sponsor's Reference Number
Testing Laboratory Study Number
Test Article Name
Dose Level (mg/kg)
Dosing Mixture Concentration (mg/mL)
Preparation Date
Sampling Date
Weight of Sample

The sample shall be packed in a suitable container to maintain the temperature conditions specified in Section 4 during transit plus an adequate margin of safety for any transit delays. The sample shall be sent by express courier to:

[redacted]

[redacted] shall be notified in advance of shipping by telefax at [redacted] This notification shall include test article and study identification, carrier, and estimated time/date of arrival. Sample shipments shall be accompanied by an inventory sheet describing the samples contained in the shipment with the information described above.

8 PARAMETERS TO BE EVALUATED:

8.1 Viability Observations:

All animals will be observed for mortality/moribundity twice daily, once in the morning and once in the afternoon. Moribund animals will be euthanized to ensure that tissues will not be lost due to autolysis.

8.2 Clinical Observations:

8.2.1 Daily Observations:

A clinical examination will be performed daily for all animals at the time of dosing and approximately 1-2 hours after dosing. During the recovery period, animals will be examined once daily. The clinical observations prior to dosing and during the recovery period need not be

recorded on the days of detailed physical examinations. Observations will include, but are not limited to, changes in the skin, fur, eyes and mucous membranes; respiratory, circulatory, autonomic and central nervous systems functions; somatomotor activity and behavior patterns. Findings noted at the clinical examination will be recorded for individual animals; the condition of animals without signs will be documented in a general comment.

8.2.2 Detailed Physical Examinations:

A detailed physical examination will be conducted at least once during the pretreatment period, once weekly during the treatment and recovery periods and on the day(s) of necropsy. The animals will be removed from their home cages and placed in a standard arena for observations. Observations will be detailed and carefully recorded. Where appropriate, explicitly defined scoring systems will be used if, in the opinion of the Study Director, doing so increases the utility of the data. Signs noted shall include, but are not limited to, changes in skin, fur, eyes, mucous membranes; occurrence of secretions and excretions and autonomic activity (e.g.-lacrimation, piloerection, pupil size, unusual respiratory pattern). Changes in gait, posture and response to handling, as well as the presence of clonic or tonic movements, stereotypies (e.g.-excessive grooming, repetitive circling) or bizarre behavior (e.g. -self-mutilation, walking backwards) will be recorded. Animals without signs will be noted individually.

8.2.3 Unscheduled Observations:

A separate computer protocol will be used to collect any findings outside the above-specified observations. Only the presence of findings will be recorded; the absence of findings will thus not be recorded.

8.3 Individual Body Weights:

Individual body weights will be recorded during acclimation, at pretest initiation, at randomization, at least weekly during treatment and recovery and on the days of necropsy (fasted).

8.4 Individual Food Consumption:

Individual food consumption will be recorded approximately weekly, beginning at least one week prior to test material administration.

8.5 Ophthalmic Examinations:

Ophthalmic examinations will not be performed.

8.6 Functional Observational Battery:

The FOB utilized at WIL Research Laboratories, LLC, is based on previously developed protocols (Moser, 1991, Irwin, 1968, Gad, 1982, Moser 1988, Haggerty, 1989, O'Donoghue, 1989). Observations on 5 animals/sex/group will be made during the 4th week of the test material administration (prior to dosing). FOB evaluations may also be performed on the 5 recovery animals/sex from Groups 1 and 4 near the end of the 14-day recovery period (if added by protocol amendment). The same animals will be used for the appropriate time points. Testing will be performed by the same trained technicians, wherever possible, who will not know the animals' group assignment. Animals will be observed for the following as described below (see WIL standard operating procedures No. T1-112, as revised, for a description of scoring criteria):

8.6.1 Home Cage Observations:

Biting
Convulsions/tremors
Feces consistency
Palpebral (eyelid) closure
Posture

8.6.2 Handling Observations:

Ease of handling animal in hand
Ease of removal from cage
Eye prominence
Fur appearance
Lacrimation/chromodacryorrhea
Mucous membranes/eye/skin color
Muscle tone
Palpebral closure
Piloerection
Red/crusty deposits
Respiratory rate/character
Salivation

8.6.3 Open Field Observations (Evaluated Over a 2-Minute Observation Period):

Arousal
Backing
Bizarre/stereotypic behavior
Convulsions/tremors
Gait
Gait score
Grooming
Mobility
Rearing
Time to first step (seconds)
Urination/defecation

8.6.4 Sensory Observations:

Air righting reflex	Olfactory orientation
Approach response	Pupil response
Eyeblink response	Startle response
Forelimb extension	Tail pinch response
Hindlimb extension	Touch response

8.6.5 Neuromuscular Observations:

Grip strength-hind and forelimb	Hindlimb foot splay
Hindlimb extensor strength	Rotarod performance

8.6.6 Physiological Observations:

Body temperature	Catalepsy
Body weight	

8.6.7 Locomotor Activity:

Locomotor activity will be monitored on 5 animals/sex/group during the 4th week of the test material administration (prior to dosing). Locomotor Activity evaluations may also be performed on the 5 recovery animals/sex from Groups 1 and 4 near the end of the 14-day recovery period (if added by protocol amendment). The same animals will be used for the appropriate time points. Testing of treatment groups will be balanced across the day of testing, and executed by appropriately trained technicians. Locomotor Activity will be measured using SDI Photobeam Activity System (San Diego Instruments, San Diego, CA) as described in WIL Research Laboratories, LLC, SOP No. T1-185, as revised. The test session will be of 60 minutes duration and will consist of twelve 5-minute intervals. Locomotor activity measures evaluated are total and ambulatory activity counts obtained for the 60-minute test session.

All FOB and Locomotor Activity sessions will be performed in a sound-attenuated room equipped with a white noise generation system set to operate at 70 $\pm$10 dB (see WIL Research Laboratories, LLC, SOP No. T1-124, as revised) to minimize environmental variations in the test conditions.

8.7 Clinical Pathology:

The following clinical pathology parameters will be evaluated on all surviving rats just prior to their scheduled necropsy. The animals will be fasted overnight

before taking blood samples. Blood for hematology and serum chemistry evaluations will be collected from the retro-orbital sinus of isoflurane-anesthetized animals prior to necropsy. Blood for coagulation parameters will be collected from the vena cava at the time of necropsy.

Anticoagulants used will be potassium EDTA for the hematology and sodium citrate for the coagulation tests. Samples for serum chemistry will be collected without anticoagulants.

8.7.1 Hematology:

Activated partial thromboplastin time	MCHC
Differential leukocyte count[a]	MCV
Erythrocyte count	Platelet count
Hematocrit	Prothrombin time
Hemoglobin	Reticulocyte count
MCH	Total leukocyte count

a = If performed manually, results will include platelet estimates and RBC morphology.

8.7.2 Serum Chemistry:

A/G ratio	Glucose
Alanine aminotransferase	Phosphorus
Albumin	Potassium
Alkaline phosphatase	Sodium
Aspartate aminotransferase	Total bilirubin
Calcium	Total cholesterol
Chloride	Total protein
Creatinine	Triglycerides
Globulin	Urea nitrogen

8.8 Anatomic Pathology:

8.8.1 Macroscopic Examination:

A complete necropsy will be conducted on all animals dying spontaneously, euthanized *in extremis* or at the scheduled primary or recovery necropsies. Animals euthanized *in extremis* or at the scheduled necropsies will be anesthetized via carbon dioxide and exsanguinated. Necropsy will include examination of the external surface, all orifices and the cranial, thoracic, abdominal and pelvic cavities (including viscera). At the time of necropsy, the following tissues and organs will be collected and placed in 10% neutral-buffered formalin (except as noted):

Adrenals (2)
Bone with marrow
  Sternum
  Femur
Bone marrow smear (from femur[a])
Brain
  Cerebrum Level 1
  Cerebrum Level 2
  Cerebellum with medulla/pons
Epididymides (2)[b]
Gastrointestinal tract
  Stomach
  Duodenum
  Jejunum
  Ileum
  Cecum
  Colon
  Rectum
Heart
Kidneys (2)
Liver (sections of two lobes)
Lungs (including bronchi, fixed by inflation with fixative)
Lymph node
  Mesenteric
  Mandibular
Mammary gland (females only)
Ovaries with oviducts (2)
Peripheral nerve (sciatic)
Prostate
Seminal vesicles (2)
Spinal cord
  Cervical
  Midthoracic
  Lumbar
Spleen
Testes (2)[b]
Thymus
Thyroids [with parathyroids, if present (2)][c]
Trachea
Urinary bladder
Uterus
Cervix
Vagina
All gross lesions (when possible)

a = Not taken from animals found dead, not placed in formalin; to be examined only if scientifically warranted.
b = To be placed in Bouin's solution.
c = Parathyroids will be examined microscopically if in the plane of section, or if gross lesions are present.

8.8.2 Organ Weights:

The following organs will be weighed from all animals at the scheduled necropsies:

Adrenals
Brain
Epididymides
Heart
Kidneys
Liver
Ovaries with oviducts
Prostate
Seminal vesicle/coagulating gland
Spleen
Testes
Thymus
Uterus

Paired organs will be weighed together. Organ-to-body-weight and organ-to-brain-weight ratios will be calculated from animals euthanized at the scheduled necropsies.

8.8.3 Microscopic Examination:

Microscopic examination of hematoxylin-eosin stained paraffin sections will be performed on the tissues listed in Section 8.8.1 from all animals in the control and high dose groups (primary necropsy), and from all animals that die or are euthanized *in extremis*. Gross lesions will be examined from animals in Groups 2, 3 and 4. Microscopic examination may be extended by amendment (additional cost) to include other animals (including recovery necropsy) if a potential target organ is noted based on histopathological examination of tissues from the high dose group or other parameters (organ weights, clinical pathology, etc.). Special stains may be used at the discretion of the pathologist to further characterize lesions and changes. Any special stains used will be documented in the individual animal data and interpretation of results will be included in the final report.

9 STATISTICAL METHODS:

All analyses will be two-tailed for significance levels of 5% and 1%. All means will be presented with standard deviations. All statistical tests will be performed using appropriate computing devices or programs. Body weights, body weight changes, food consumption, Functional Observational Battery, as well as clinical pathology values and absolute and relative organ weights will be analyzed by a one-way analysis of variance (ANOVA). (Snedecor, 1980) If significant differences are indicated by the ANOVA, Dunnett's test (Dunnett, 1964) will be used to compare the control and treated groups. Functional Observational Battery parameters which yield scalar or descriptive data will be analyzed by Fisher's Exact Test (Steel, 1980)

The locomotor activity data will be analyzed by BioSTAT Consultants, Inc. Each analysis endpoint (total and ambulatory counts) will be analyzed, by sex and session, with a repeated measure analysis of variance (RANOVA). Factors in the model will include treatment group (TRT), time interval (TIME), and the interaction of time interval and treatment group (TRT*TIME). The SAS® procedure PROC MIXED will be used for analysis with the random effect of animal included as the repeated measurement. The covariance structure across time will be selected by comparing Akaike's Information Criterion (AIC) for first-order autoregressive homogeneous [AR(1)] and compound symmetric (CS) structures.

The monotonic dose response relationship will be evaluated using sequential linear trend tests based on ordinal spacing of dose levels. The linear dose by time interaction (LinTrt*Time) will be evaluated and, if significant at the 0.05 level, trend

tests on treatment means will be performed at the 0.05 level for each time interval. If the linear dose by time interaction is not significant, the trend test will be conducted across the pooled time intervals of the entire session only.

Nonmonotonic dose responses will be evaluated whenever no significant linear trends are detected but TRT and/or TRT*TIME interaction is significant at the 0.01 level. Within the framework of the RANOVA, pairwise comparisons will be made for each individual treated group with the control group through linear contrasts. If TRT*TIME is significant, the comparisons will be conducted for each time interval. If only the TRT effect is significant, the comparisons will be conducted across the pooled time intervals of the entire session. These nonmonotonic dose response comparisons will be conducted at the 0.01 significance level.

All statistical analyses will be conducted by BioSTAT Consultants, Inc. using SAS version 8.2 (SAS Institute, Inc., 1999-2001)software.

10 QUALITY ASSURANCE:

The study will be audited by the WIL Quality Assurance Unit while in progress to assure compliance with OECD Good Laboratory Practice regulations, adherence to the protocol and to WIL Standard Operating Procedures. The raw data and draft report will be audited by the WIL Quality Assurance Unit to assure that the final report accurately describes the conduct and the findings of the study.

This study is a regulated study and will be included on the WIL master list of regulated studies.

11 RECORDS TO BE MAINTAINED:

All original raw data records, as defined by WIL SOPs and the applicable GLPs, will be stored as described in Section 12 in the Archives at WIL Research Laboratories, LLC.

12 WORK PRODUCT:

Sponsor will have title to all documentation records, raw data, slides, specimens, or other work product generated during the performance of the study. All work product including raw paper data, pertinent electronic storage media and specimens will be retained at no charge for a period of 6 months following issuance of the final report in the Archives at WIL Research Laboratories, LLC. All work product, including raw paper data, pertinent electronic storage media and specimens, will be returned to the Sponsor after a period of six months or following issuance of the final report. Any remaining formulation or clinical pathology samples will be discarded following issuance of the final report. All work product will be stored in compliance with regulatory requirements.

Any work product, including documents, specimens, and samples, that are required by this protocol, its amendments, or other written instructions of the Sponsor, to be shipped by WIL Research Laboratories, LLC to another location will be appropriately packaged and labeled as defined by WIL's SOPs and delivered to a common carrier for shipment. WIL Research Laboratories, LLC will not be responsible for shipment following delivery to the common carrier.

13 REPORTS:

The final report will contain a summary, test material data, methods and procedures, appropriate individual animal and summary data tables, a copy of the protocol and amendments (if any) and an interpretation and discussion of the study results. The report will contain all information necessary to conform with current OECD specifications. The report will be comprehensive and shall attempt to define toxicity and the no-observed-effect level(s) under the conditions of this investigation.

WIL Research Laboratories will submit one copy of an audited draft report in a timely manner upon completion of data collection prior to issuance of the final report. One revision will be permitted as part of the cost of the study, from which the Sponsor's reasonable revisions and suggestions will be incorporated into the final report, as appropriate. Additional changes or revisions may be made, at extra cost. It is expected that the Sponsor will review the draft report and provide comments to WIL within a two-month time frame following submission. WIL will submit the final report within one month following receipt of comments. If the Sponsor's comments and/or authorization to finalize the report have not been received at WIL within one year following submission of the draft report, WIL may elect to finalize the report following appropriate written notification to the Sponsor. Two electronic copies (PDF) of the final report on CD-R will be provided. Requests for additional electronic or paper copies of the final report may result in additional charges.

14 ANIMAL WELFARE ACT COMPLIANCE:

This study will comply with all applicable sections of the Final Rules of the Animal Welfare Act regulations (9 CFR Parts 1, 2 and 3). The Sponsor should make particular note of the following:

- The Sponsor Representative's signature on this protocol documents for the Study Director the Sponsor's assurance that the study described in this protocol does not unnecessarily duplicate previous experiments.

- Whenever possible, procedures used in this study have been designed to avoid or minimize discomfort, distress or pain to animals. All methods are described in this study protocol or in written laboratory standard operating procedures.

- Animals that experience severe or chronic pain or distress that cannot be relieved will be painlessly euthanized as deemed appropriate by the veterinary staff and Study Director. The Sponsor will be advised by the Study Director of all circumstances which could lead to this action in as timely a manner as possible.

- Methods of euthanasia used during this study are in conformance with the above-referenced regulation.

- The Sponsor/Study Director has considered alternatives to procedures that may cause more than momentary or slight pain or distress to the animals and has provided a written narrative description (AWA covered species) of the methods and sources used to determine that alternatives are not available.

15 PROTOCOL MODIFICATION:

Modification of the protocol may be accomplished during the course of this investigation. However, no changes will be made in the study design without the verbal or written permission of the Sponsor. In the event that the Sponsor verbally requests or approves a change in the protocol, such changes will be made by appropriate documentation in the form of a protocol amendment. All alterations of the protocol and reasons for the modification(s) will be signed by the Study Director and the Sponsor Representative.

APPENDIX P

Report of Results of 28-Day Repeated-Dose Toxicity Test in Mammalia

Form 1. Report of Results of 28-day Repeated Dose Toxicity Test in Mammalia

1. General Items

(Remarks) Because physicochemical properties are reference materials, fill in spaces to extent possible.

1. "Stability" – Fill in the stability for water, other solvents, heat, light, etc.
2. "Vapor pressure" – Fill in the vapor pressure of the test substance at 25°C.
3. "Partition coefficient" – Fill in the value, the temperature used and the name of the solvent used for the measurement. Fill in the value at 37°C, if available.
4. "Solubility" – Fill in such information as water soluble, soluble in oil.
5. "Degree of solubility" – Fill in the solubility at 25°C for each solvent.

2. Acute Toxicity Test

Test No.	Kind and period of the test	Animal species	Number of animals per group	Route of administration	Dose levels (mg/kg)	LD_{50} or NOEL[a] (mg/kg)	Testing institution
1 2 3							

[a]NOEL: no-observed-effect level

28-Day Repeated Dose Toxicity Test

Administration period of the test substance	from 26 October 2005					to 22 November 2005					
Animal species and strain: Rat, Sprague-Dawley	Number of animals per group										
Route of administration: Oral (gavage)	Main study: Male:5 Female:5 Recovery (Groups 1 and 4): Male:5 Female:5										
Sex:	Male						Female					
Phase:	Main				Recovery		Main				Recovery	
Group:	1	2	3	4	1	4	1	2	3	4	1	4
Body weight	N	N	N	Y	N	N	N	N	N	N	N	N
Food consumption	N	N	N	N	N	N	N	N	N	N	N	N
General appearance	N	N	Y	Y	N	N	N	N	Y	Y	N	N
Functional Observational Battery	N	N	N	N	--	--	N	N	N	N	--	--
Locomotor Activity	N	N	N	N	--	--	N	N	N	N	--	--
Hematology	N	N	N	Y	N	N	N	N	N	Y	N	N
Serum chemistry	N	N	Y	Y	N	N	N	N	Y	Y	N	N
Organ weight	N	N	N	N	N	N	N	N	N	N	N	N
Macroscopic examination	N	N	N	N	N	N	N	N	N	N	N	N
Histopathology	N	N	N	N	N	N	N	N	N	N	N	N
NOEL (mg/kg/day)	Male: 160 mg/kg/day						Female: 160 mg/kg/day					
Change(s) by which NOEL is estimated	clinical findings, lower body weights, serum chemistry effects and coagulation parameter effects											

Key: Group: 1 = Control - 0 mg/kg/day
2 = Low dose - 160 mg/kg/day
3 = Mid dose - 400 mg/kg/day
4 = High dose - 1000 mg/kg/day
N = no test substance-related adverse effect noted
Y = test substance-related effect
-- = not tested

COMPLIANCE STATEMENT

This study, designated WIL-187054, was conducted in compliance with the United States Environmental Protection Agency (EPA) Good Laboratory Practice Standards (40 CFR Part 792), 18 September 1989; the Organisation for Economic Cooperation and Development (OECD) Principles of Good Laboratory Practice [C (97) 186/Final], 26 November 1997; the Japanese Ministry of Agriculture, Forestry and Fisheries (MAFF) Good Laboratory Practice for Agricultural Chemicals (11 Nousan No. 6283), 1 October 1999; European Union (EU) Directives 2004/9/EC and 2004/10/EC; the standard operating procedures of WIL Research Laboratories, LLC, and the protocol as approved by the sponsor with the following exception. Stability of the test article in the dosing formulations was not tested. However, in the professional judgment of the sponsor, the formulations were stable under the conditions of this study, because the test article is intended for use at high temperatures and under oxidative conditions.

The protocol was designed to be in general accordance with the OECD (Organisation for Economic Cooperation and Development) Guidelines for Testing of Chemicals, Health Effects Test Guidelines, Section 408, September 1998.

1. SUMMARY

1.1. OBJECTIVE

The objective of this study was to evaluate the possible toxic effects of [redacted] when administered orally to rats for at least 90 days.

1.2. STUDY DESIGN

[redacted] in the vehicle, corn oil, was administered orally by gavage once daily for 91 or 92 consecutive days to 3 groups (Groups 2-4) of Crl:CD(SD) rats. Dosage levels were 160, 400 and 1000 mg/kg/day. A concurrent control group (Group 1) received the vehicle on a comparable regimen. The dosage volume was 5 mL/kg for all groups. Each group consisted of 10 animals/sex. Following 13 weeks of dose administration, all animals were euthanized.

All animals were observed twice daily for mortality and moribundity. Clinical examinations were performed daily, and detailed physical examinations were performed weekly. Individual body weights and food consumption were recorded weekly. Ophthalmic examinations were performed during study weeks -1 and 12. Clinical pathology evaluations (hematology and serum chemistry) were performed on all surviving rats just prior to the scheduled necropsy. Complete necropsies were conducted on all animals, and selected organs were weighed at the scheduled necropsy. Selected tissues were examined microscopically from all animals in the control and 1000 mg/kg/day groups and all animals found dead or euthanized in extremeis. Gross lesions were examined from animals in the 160 and 400 mg/kg/day groups.

1.3. RESULTS

There were no test article-related effects on survival. There were no test article-related macroscopic or microscopic findings.

Test article-related clinical findings of evidence of increased salivation (clear material around the mouth, nose, facial area, ventral neck or forelimbs) were noted primarily in

Audited Draft

the 1000 mg/kg/day group males and females at 1 hour after dose administration beginning during study week 1 and continuing throughout the study. Clear material around the mouth was also noted in the 400 mg/kg/day group at a lower incidence, most frequently seen at 1 hour post-dosing beginning during study week 2.

Test article-related effects on body weights were observed in the 1000 mg/kg/day group males. Lower body weight gains in the 1000 mg/kg/day group were observed during study week 1 to 2 through study week 8 to 9; the difference from the control group during study week 3 to 4 was statistically significant. As a result, lower mean cumulative body weight gains and lower mean absolute body weights in the 1000 mg/kg/day group were observed beginning during study week 4 and persisting to the end of the study. As a result, at study week 13 mean body weight for the 1000 mg/kg/day group males was 12.2% lower than the control group. Transiently lower mean food consumption compared to the control group was noted for the 1000 mg/kg/day group males for study week 0 to 1.

Potential test article-related hepatic alteration manifested as higher liver enzyme values (alkaline phosphatase, alanine aminotransferase and aspartate aminotransferase) was noted in males and females for all test article-treated groups. Additionally, lower total protein and globulin and increased coagulation times in the 160, 400 and 1000 mg/kg/day group males as well as lower globulin and cholesterol values in the 160, 400 and 1000 mg/kg/day group females were also likely associated with hepatocyte alteration, although the lack of effect on albumin levels is atypical. These differences were considered to be potentially test article-related but not adverse as no related clinical signs were seen, and correlating macroscopic or microscopic changes in the liver were not observed, and there was no effect on liver weights. Higher adrenal gland (at 400 and 1000 mg/kg/day) and ovaries/oviduct weights (at 1000 mg/kg/day) had no microscopic correlates and were considered not adverse.

Audited Draft

Higher adrenal gland weights and ovaries/oviducts weights were noted in the 400 and/or 1000 mg/kg/day group females and this occurred in a dose-related manner.

1.4. CONCLUSIONS

Based on the results of this study, test article-related findings were observed at dosage levels of 160, 400 and 1000 mg/kg/day as evidenced by clinical findings of increased salivation (400 and 1000 mg/kg/day groups), lower body weights and food consumption (1000 mg/kg/day group males), higher prothrombin times and APTT, higher alkaline phosphatase, alanine aminotransferase and aspartate aminotransferase, lower globulin values and a correspondingly higher A/G ratio as well as lower total protein values (1000 mg/kg/day group males), lower cholesterol levels (1000 mg/kg/day group females) and higher mean adrenal gland and ovaries/oviducts weights (females). No target organ of toxicity was identified by histologic assessment. As the differences at 400 mg/kg/day were considered to be potentially test article-related but not adverse due to small magnitude, the no-observed-adverse-effect level (NOAEL) for oral (gavage) administration of [redacted] to Crl:CD(SD) rats for 91 consecutive days was 400 mg/kg/day.

Audited Draft

2. INTRODUCTION

2.1. GENERAL STUDY INFORMATION

This report presents the data from "A 90-Day Repeated Dose Oral (Gavage) Toxicity Study of [redacted] in Rats". Due to software spacing constraints, the study title appears as "A 90-Day Repeated Dose Oral Study of [redacted] in Rats" on the report tables.

The following computer protocols were used for data collection during the study:

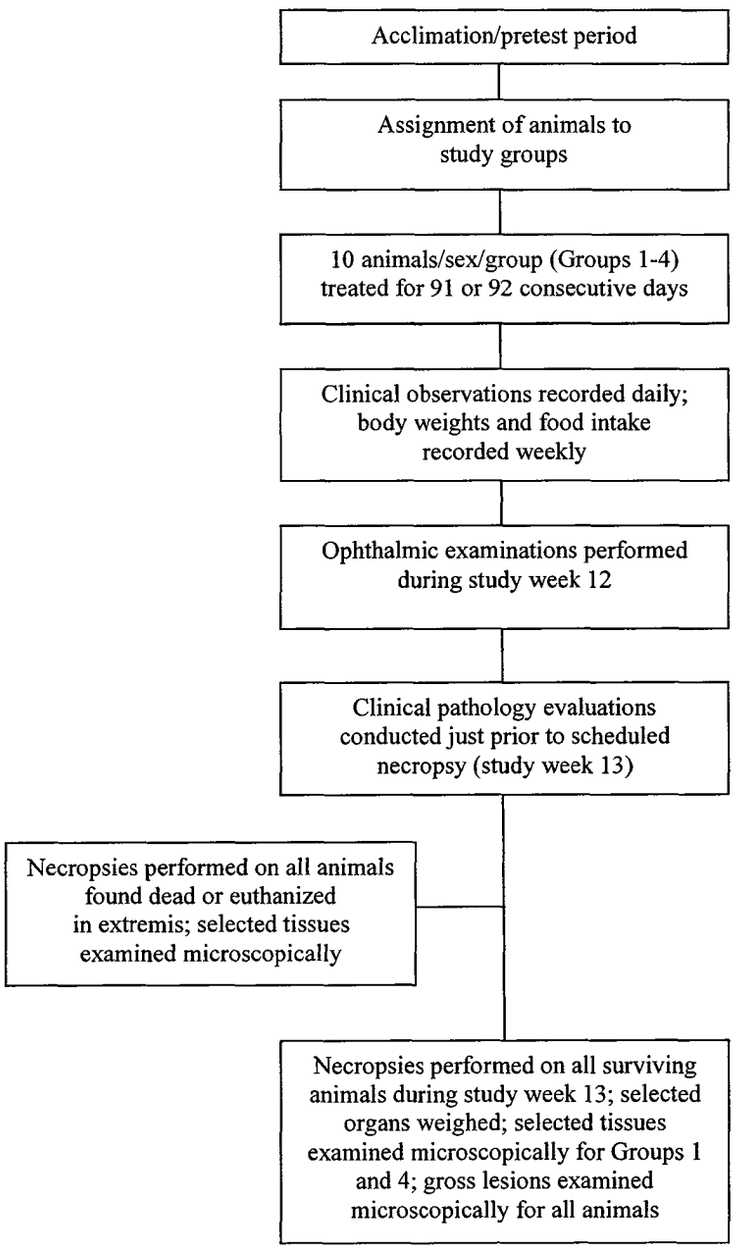
Computer Protocol	Type of Data Collected
WIL-187054	Main study data
WIL-187054P	Pretest data
WIL-187054U	Unscheduled clinical observations

2.2. KEY STUDY DATES

Date(s)	Event(s)
21 February 2006	Experimental starting date (animal receipt)
2 March 2006	Assignment to study groups
6 March 2006	Experimental start date (initiation of dose administration; study week 0)
5 and 6 June 2006	Scheduled necropsy (study week 13)
9 August 2006	Experimental termination (completion) date (last histopathological examination)

Audited Draft

3. STUDY DESIGN



Audited Draft

4. EXPERIMENTAL PROCEDURES - MATERIALS AND METHODS

4.1. TEST ARTICLE AND VEHICLE

4.1.1. TEST ARTICLE IDENTIFICATION

The test article, [redacted] was received from [redacted] as follows:

Identification	Quantity Received	Physical Description	Date of Receipt
[redacted] Lot no. [redacted] Exp. date: 1 August 2006 [WIL log no. 6578A]	1 can Gross weight: 3395.4 g	Dark brown, viscous liquid	27 July 2005
[redacted] Lot no. [redacted] Exp. date: 1 August 2006 [WIL log no. 6950A]	1 can Gross weight: 4277.2 g	Dark brown, viscous liquid	10 May 2006

Data documenting the purity and stability of the test article are on file with the sponsor. A Certificate of Analysis for the test article was provided by the sponsor and is presented in Appendix A. The purity of the test article was 100%. The test article was stored at room temperature and was considered stable under this condition. Reserve samples of the test article (approximately 1 g) were collected on 28 July 2005 and 31 May 2006 from WIL log nos. 6578A and 6950A, respectively, and stored in the Archives of WIL Research Laboratories, LLC.

4.1.2. VEHICLE IDENTIFICATION

The vehicle used in preparation of the test article formulations and for administration to the control group was 100% pure Mazola® corn oil (exp. dates: 2 January 2007, 1 and 23 February 2007 and 7 March 2007) distributed by ACH Food Companies, Inc., Memphis, Tennessee and purchased locally.

Audited Draft

4.1.3. PREPARATION

For the control group (Group 1), a sufficient volume of corn oil was transferred to a glass container approximately weekly. The corn oil was stirred continuously using a magnetic stirrer throughout sampling and dosing. Aliquots of the vehicle were prepared for daily dispensation and stored at room temperature.

Dosing formulations were prepared at the concentrations indicated in the following table:

Group Number	Test Article	Dosage Level (mg/kg/day)	Dosage Concentration (mg/mL)[a]
2	[redacted]	160	32
3		400	80
4		1000	200

[a] = The dosing formulations were not adjusted for purity.

The appropriate amount of the test article for each group was weighed into tared, calibrated glass containers. Vehicle was added to each container to bring the formulations nearly to the calibration mark. The formulations were mixed until uniform using a magnetic stirrer and heated in a water bath at approximately 60°C as necessary. Vehicle was then added to each container to bring the formulations to the calibration mark.

The test article formulations for the toxicology (Groups 2-4) groups were prepared approximately weekly as single formulations for each dosage level, divided into aliquots for daily dispensation and stored at room temperature. The test article formulations were stirred continuously throughout the preparation, sampling and dose administration procedures. On 3 March 2006, the formulations were visually inspected by [redacted] Staff Toxicologist, Developmental, Reproductive Toxicology, WIL Deputy Director.

Audited Draft

Audited Draft

4.1.4. SAMPLING AND ANALYSES

Prior to the initiation of dose administration, triplicate samples (5 mL each) for homogeneity determination were collected on 3 March 2006 from the top, middle and bottom strata of the 32, 80 and 200 mg/mL dosing formulations and the middle stratum of the vehicle. In addition, triplicate samples (5 mL each) for resuspension homogeneity and stability determinations were collected following 10 days storage at room temperature from the top and bottom strata of these same dosing suspensions. After thorough mixing of formulations, duplicate samples (5 mL each) for concentration analyses were collected on the first day formulations were prepared for study weeks 0, 4 8 and 12 from the middle stratum of each dosing formulation (including the vehicle). Two of the 3 sets of samples for homogeneity and stability and 1 set of samples for concentration analysis were shipped at ambient temperature to [redacted] All remaining samples were retained at WIL Research Laboratories, LLC under normal laboratory conditions for possible future analysis. All analyses were conducted by [redacted] **The methodology and results of these analyses will be presented in Appendix B and the results will be summarized in Section 6.1.**

4.2. TEST SYSTEM

Crl:CD(SD) rats from Charles River Laboratories, Inc., Raleigh, North Carolina were used as the test system on this study. This species and strain of animal is recognized as appropriate for subchronic toxicity studies. The Sprague-Dawley rat was used because it is a widely used strain for which significant historical control data are available.

4.3. ORGANIZATION OF TEST GROUPS, DOSAGE LEVELS AND TREATMENT REGIMEN

The vehicle and test article formulations were administered orally by gastric intubation via appropriately sized flexible Teflon®-shafted, stainless steel ball-tipped dosing cannula (Natume, Japan) once daily for 91 or 92 consecutive days, through the day prior to the scheduled primary necropsy. The dosage volume for all groups was 5 mL/kg. Individual

doses were based on the most recently recorded body weights to provide the correct mg/kg/day dosage. Adjusted doses became effective the day of collection of the weekly body weights.

The following table presents the study group assignment:

Group Number	Test Article[a]	Dosage Level (mg/kg/day)	Dosage Volume (mL/kg)	Number of Animals Males	Females
1	Vehicle	0	5	10	10
2	[redacted]	160	5	10	10
3		400	5	10	10
4		1000	5	10	10

[a] = The dosing formulations were not adjusted for purity

Dosage levels were determined from the results of a 28-day study ([redacted], 2006) and were provided by the sponsor representative after consultation with the WIL study director.

The selected route of administration for this study was oral (gavage) because this is an acceptable and standard method for administering test article per OECD Guideline 408. The number of animals selected for this study was the minimum required to yield statistically and scientifically meaningful data and was consistent with regulatory agency expectations.

4.4. ANIMAL RECEIPT AND ACCLIMATION/PRETEST PERIOD

Forty-six male and 46 female Crl:CD(SD) rats were received in good health on 21 February 2006, from Charles River Laboratories, Inc., Raleigh, North Carolina. The animals were approximately 31 days old at receipt. Each animal was examined by a qualified technician on the day of receipt and weighed 3 days later. Each animal was uniquely identified by a Monel® metal eartag displaying the permanent identification number. All animals were housed for a 13-day acclimation/pretest period. During this

Audited Draft

period, each animal was observed twice daily for mortality and changes in general appearance or behavior.

Pretest data collection began on 24 February 2006. Individual body weights were recorded and detailed physical examinations were performed periodically during the pretest period. Food consumption and ophthalmic examination data were also recorded for pretest animals prior to the initiation of dose administration. Pretest clinical observations are presented in Appendix C.

Audited Draft

4.5. ANIMAL HOUSING

Upon arrival, all animals were housed 3 per cage by sex for approximately 3 days. Thereafter, all animals were housed individually in clean, stainless steel, wire-mesh cages suspended above cage-board. Animals were maintained in accordance with the *Guide for the Care and Use of Laboratory Animals* (National Research Council, 1996). The animal facilities at WIL Research Laboratories, LLC are accredited by the Association for Assessment and Accreditation of Laboratory Animal Care International (AAALAC International).

4.6. DIET, DRINKING WATER AND MAINTENANCE

The basal diet used in this study, PMI Nutrition International, LLC, Certified Rodent LabDiet® 5002, is a certified feed with appropriate analyses performed by the manufacturer and provided to WIL Research Laboratories, LLC. Reverse osmosis-treated (on-site) drinking water, delivered by an automatic watering system, and the basal diet were provided ad libitum throughout the study, except during the period of fasting prior to blood collection when food, but not water, was withheld. Municipal water supplying the facility was sampled for contaminants according to the standard operating procedures. The results of the diet and water analyses are maintained at WIL Research Laboratories, LLC. No contaminants were present in animal feed or water at concentrations sufficient to interfere with the objectives of this study.

Audited Draft

4.7. ENVIRONMENTAL CONDITIONS

All animals were housed throughout the acclimation period and during the study in an environmentally controlled room. The room temperature and humidity controls were set to maintain daily averages of 71 ± 5°F (22 ± 3°C) and 50 ± 20% relative humidity. Room temperature and relative humidity were controlled and monitored using the Metasys® DDC Electronic Environmental control system. These data were recorded approximately hourly and are summarized in Appendix D. Actual mean daily temperature ranged from 70.4°F to 71.2°F (21.3°C to 21.8°C) and mean daily relative humidity ranged from 28.1% to 54.6% during the study. Light timers were set to provide a 12-hour light (0600 hours to 1800 hours)/12-hour dark photoperiod. Air handling units were set to provide a minimum of 10 fresh air changes per hour. The 12-hour light/12-hour dark photoperiod was interrupted as necessary to allow for the performance of protocol-specified activities.

4.8. ASSIGNMENT OF ANIMALS TO TREATMENT GROUPS

On 2 March 2006 (4 days prior to the initiation of dose administration), all available rats were weighed and examined in detail for physical abnormalities. These data were collected using the WIL Toxicology Data Management System (WTDMS™) and reviewed by the study director. The animals judged suitable for assignment to the study were selected for use in a computerized randomization procedure. A printout containing the animal numbers, corresponding body weights and individual group assignments was generated based on body weight stratification in a block design. The animals were then arranged into groups according to the printout. Individual body weights at randomization were within ± 20% of the mean for each sex. Each group (Groups 1-4) consisted of 10 males and 10 females. The selected animals were approximately 6 weeks old at the initiation of dose administration; individual body weights ranged from 204 g to 236 g for males and from 151 g to 184 g for females.

5. PARAMETERS EVALUATED

5.1. CLINICAL OBSERVATIONS AND SURVIVAL

All animals were observed twice daily, once in the morning and once in the afternoon, for mortality and moribundity.

Clinical examinations were performed twice daily, at the time of dose administration and approximately 1 to 2 hours following dose administration (designated as 1 hour post-dosing for report presentation purposes). All significant findings were recorded. Detailed physical examinations were conducted on all animals weekly, beginning approximately 2 weeks prior to test article administration and prior to the scheduled necropsy. Observations at the time of dosing were not performed on days when detailed physical examinations were conducted. A separate computer protocol was used to record any observations noted outside of the above-specified intervals. These unscheduled clinical observations are presented in Appendix E.

Audited Draft

5.2. BODY WEIGHTS

Individual body weights were recorded at least weekly during treatment, beginning approximately 2 weeks prior to test article administration (study week -2) and on the day prior to the first day of scheduled necropsy (non-fasted). Mean body weights and mean body weight changes were calculated for the corresponding intervals. Final body weights (fasted) were recorded prior to the scheduled necropsy.

5.3. FOOD CONSUMPTION

Individual food consumption was recorded weekly, beginning approximately 2 weeks prior to test article administration (study week -2 to -1). Food intake was calculated as g/animal/day for the corresponding body weight intervals. When food consumption could not be measured for a given interval (due to spillage, weighing error, obvious erroneous value, etc.), the appropriate interval was footnoted as "NA" (Not Applicable) on the individual tables.

Audited Draft

5.4. CLINICAL PATHOLOGY

Blood samples for clinical pathology evaluations (hematology and serum chemistry) were collected from all animals on the day of the scheduled necropsy (study week 13). The animals were fasted overnight prior to blood collection. Blood for hematology and serum chemistry parameters was collected via the retro-orbital sinus of animals anesthetized by isoflurane inhalation prior to the scheduled necropsy. Blood for coagulation parameters was collected via the vena cava at the time of necropsy. Blood was collected into tubes containing EDTA (hematology), sodium citrate (clotting determinations) or no anticoagulant (serum chemistry). Clinical pathology methods, procedures and references are presented in Appendix F. The following parameters were evaluated:

5.4.1. HEMATOLOGY

Total leukocyte count (White Cells)
Erythrocyte count (Red Cells)
Hemoglobin
Hematocrit
Mean corpuscular volume (MCV)
Mean corpuscular hemoglobin (MCH)
Mean corpuscular hemoglobin concentration (MCHC)
Platelet count (Platelet)
Prothrombin time (ProTime)
Activated partial thromboplastin time (APTT)
Reticulocyte count
  Percent (Reticulocyte)
  Absolute (Retic Absolute)
Differential leukocyte count -
  Percent and absolute
  -Neutrophil
  -Lymphocyte
  -Monocyte
  -Eosinophil
  -Basophil
  -Large unstained cell
Platelet estimate[a]
Red cell morphology (RBC Morphology)[a]

( ) - Designates tabular abbreviation

Globulin [by calculation]
Albumin/globulin ratio (A/G Ratio) [by calculation]
Total bilirubin (Total Bili)
Urea nitrogen
Creatinine
Alkaline phosphatase (AlkalinePhos'tse)
Alanine aminotransferase (Alanine Transfer)
Aspartate aminotransferase (AspartatTransfer)
Glucose
Total cholesterol (Cholesterol)
Calcium
Chloride
Phosphorus
Potassium
Sodium
Triglycerides (Triglyceride)

( ) - Designates tabular abbreviation

5.5. OPHTHALMIC EXAMINATIONS

Ocular examinations were conducted on all animals prior to randomization and the initiation of dose administration (2 March 2006; study week -1) and near the end of the treatment period (1 June 2006; study week 12). All ocular examinations were conducted using an indirect ophthalmoscope and slit lamp biomicroscope preceded by pupillary dilation with an appropriate mydriatic agent. Examinations were performed by [redacted] (Appendix G).

5.6. ANATOMIC PATHOLOGY

5.6.1. MACROSCOPIC EXAMINATION

A complete necropsy was conducted on all animals. Animals were euthanized by carbon dioxide inhalation followed by exsanguination. The necropsies included, but were not limited to, examination of the external surface, all orifices, and the cranial, thoracic, abdominal and pelvic cavities, including viscera. Clinical findings that were confirmed macroscopically were designated CEO (correlates with externally observed) on the individual macroscopic data tables. The following tissues and organs were collected and placed in 10% neutral-buffered formalin (except as noted):

Audited Draft

Adrenal glands (2)
Aorta
Bone with marrow
  Sternum
Bone marrow smear (from femur)[a]
Brain
  Cerebrum level 1
  Cerebrum level 2
  Cerebellum with medulla/pons
Cervix
Epididymides (2)[b]
Eyes with optic nerve (2)[c]
Gastrointestinal tract
  Esophagus
  Stomach
  Duodenum
  Jejunum with Peyer's patches
  Ileum
  Cecum
  Colon
  Rectum
Harderian glands (2)
Heart
Kidneys (2)
Lacrimal glands [exorbital (2)]
Larynx
Liver (sections of 2 lobes)
Lungs (including bronchi, fixed by inflation with fixative)
Lymph nodes
  Mandibular
  Mesenteric
  Popliteal[d]
Mammary gland (females only)
Nasal tissues[e]
Ovaries (2) with oviducts[f]
Pancreas
Peripheral nerve (sciatic)
Pharynx
Pituitary
Prostate
Salivary glands [mandibular (2)]
Seminal vesicles (2)
Skeletal muscle (rectus femoris)
Skin
Spinal cord (cervical, thoracic, lumbar)
Spleen
Testes (2)[b]
Thymus
Thyroid (with parathyroids[f])
Trachea
Urinary bladder
Uterus
Vagina
Gross lesions (when possible)

[a] - Not taken from animals found dead; bone marrow smears were obtained at necropsy, but not placed in formalin; slides were examined only if scientifically warranted.
[b] - Fixed in Bouin's solution
[c] - Fixed in Davidson's solution
[d] - As many per side as found were retained for microscopic evaluation.
[e] - Levels I and III according to the method of Young (Young 1981) were examined.
[f] - Examined microscopically if in the plane of section, or if gross lesions were present.

Audited Draft

5.6.2. ORGAN WEIGHTS

The following organs were weighed from all animals at the scheduled necropsy:

Adrenal glands	Prostate
Brain	Seminal vesicles/coagulating gland
Epididymides	Spleen
Heart	Testes
Kidneys	Thymus
Liver	Thyroid with parathyroids*
Ovaries with oviducts	Uterus
Popliteal lymph nodes	

Paired organs were weighed together with the exception of popliteal lymph nodes. Designated organs (*) were weighed after fixation. Organ to final body weight and organ to brain weight ratios were calculated.

5.6.3. SLIDE PREPARATION AND MICROSCOPIC EXAMINATION

After fixation, protocol-specified tissues were trimmed according to standard operating procedures and the protocol. Trimmed tissues were processed into paraffin blocks, sectioned at 4 to 8 microns, mounted on glass microscope slides and stained with hematoxylin and eosin.

Microscopic examination was performed on all tissues listed in Section 5.6.1. from all animals in the control and 1000 mg/kg/day groups at the scheduled necropsy and from all animals found dead or euthanized in extremis. Gross lesions were examined from all animals. Missing tissues were identified as not found at necropsy, lost at necropsy, lost during processing, not in plane of section or other designations as appropriate. Microscopic examination was performed by [redacted], Staff Pathologist, WIL Research Laboratories, LLC (Appendix H).

5.7. STATISTICAL METHODS

All statistical tests were performed using appropriate computing devices or programs. Analyses were conducted using two-tailed tests (except as noted otherwise) for minimum

significance levels of 1% and 5%, comparing each test article-treated group to the control group by sex. Each mean was presented with the standard deviation (S.D.) and the number of animals (N) used to calculate the mean. In addition, percent change from control is presented for body weights, clinical pathology parameters and organ weights. Due to the different rounding conventions inherent in the types of software used, the means and standard deviations on the summary and individual tables may differ by ±1 in the last significant figure.

Audited Draft

Body weight, body weight change, food consumption, clinical pathology and organ weight data were subjected to a parametric 1-way analysis of variance (ANOVA) (Snedecor and Cochran, 1980) to determine intergroup differences. If the ANOVA revealed statistically significant ($p<0.05$) intergroup variance, Dunnett's test (Dunnett, 1964) was used to compare the test article-treated groups to the control group.

5.8. DATA RETENTION

The sponsor has title to all documentation records, raw data, specimens or other work product generated during the performance of the study. All work product generated by WIL Research Laboratories, LLC, including raw paper data and specimens, are retained in the Archives at WIL Research Laboratories, LLC as specified in the study protocol. Data generated by the sponsor will be archived by the sponsor.

Reserve samples of the test article, pertinent electronic storage media and the original final report are retained in the Archives at WIL Research Laboratories, LLC in compliance with regulatory requirements.

6. RESULTS AND DISCUSSION

6.1. ANALYTICAL CHEMISTRY

Analytical Chemistry Report: Appendix B

To be added upon receipt.

6.2. CLINICAL OBSERVATIONS AND SURVIVAL

Summary Data: Tables 1, 2, 3, 4

Individual Data: Table 18; Appendices E, I

A 400 mg/kg/day group female (no. 19673) was found dead on study day 65 and a control group male (no. 19639) was euthanized in extremis on study day 70. Suppurative rhinitis with intralesional bacteria was noted in male no. 19639 and may have been associated with the death of the animal (i.e., blockage of nasal passages by debris), although an exact cause could not be determined; no significant histologic findings were observed in female no. 19673. Both deaths were considered spontaneous and unrelated to test article exposure. All other animals survived to the scheduled necropsy (study day 91 or 92).

Test article-related clinical findings of evidence of excessive salivation (clear material around the mouth, nose, facial area, ventral neck or forelimbs) were noted primarily in the 1000 mg/kg/day group males and females at 1 hour after dose administration beginning during study week 1 and continuing throughout the study. Clear material around the mouth was also noted in the 400 mg/kg/day group at a lower incidence, most frequently seen at 1 hour post-dosing beginning during study week 2. All other clinical findings in the test article-treated groups were noted with similar incidence in the control group, were limited to single animals, were not noted in a dose-related manner and/or were common findings for laboratory rats of this age and strain.

Audited Draft

Audited Draft

6.3. BODY WEIGHTS

Summary Data: Tables 5, 6, 7

Individual Data: Tables 19, 20, 21

Test article-related effects on body weights were observed in the 1000 mg/kg/day group males. Lower body weight gains in the 1000 mg/kg/day group were observed during study week 1 to 2 through study week 8 to 9; the difference from the control group during study week 3 to 4 was statistically significant. Body weight gains during the remainder of the study were similar to (within 2 grams) or higher than the control group. As a result, lower mean cumulative body weight gains and lower mean absolute body weights in the 1000 mg/kg/day group were observed beginning during study week 4 and persisting to the end of the study. The differences from the control group during study weeks 11, 12 and 13 were statistically significant. As a result, at study week 13 mean body weight for the 1000 mg/kg/day group males was statistically significantly lower (12.2%) than the control group. Mean body weights for the 1000 mg/kg/day group females were similar to the control group throughout the study. There were no other remarkable differences when the control and test article-treated groups were compared.

6.4. FOOD CONSUMPTION

Summary Data: Table 8

Individual Data: Table 22

A transient test article-related effect on food consumption was noted in the 1000 mg/kg/day group males. Statistically significantly lower mean food consumption was noted for the 1000 mg/kg/day group males for study week 0 to 1. Mean food consumption for the 1000 mg/kg/day group females when compared to the control group was statistically significantly higher for study weeks 2 to 3, 7 to 8, 8 to 9, 10 to 11 and 12 to 13. However, there were no corresponding effects on body weight in these females. There were no other statistically significant differences when the control and test article-treated groups were compared.

6.5. CLINICAL PATHOLOGY

6.5.1. HEMATOLOGY

Summary Data: Table 9; Appendix H

Individual Data: Table 23

The following alterations in coagulation parameters were considered to be related to test article administration:

Text Table 1
Toxicologically relevant hematological changes

Parameter	Direction and magnitude of change	Dosage Level(s) (mg/kg/day)	Sex	Interval
Prothrombin time	↑ 7.1%, 13.0%, 53.3%*	160, 400, 1000	M	SN
APTT	↑ 11.2%*, 17.3%*, 44.7%*	160, 400, 1000	M	SN

* = significantly ($p<0.05$ or $p<0.01$) different from the control group using Dunnett's test.

Mean prothrombin time and APTT values were higher in the test article-treated males as compared to the control group. A dose relationship was observed, and all prothrombin values (including the control group values) and the APTT value for the 1000 mg/kg/day group were above WIL historical control data ranges (version 2.1). Increases in both prothrombin time and APTT suggest a deficiency in the common pathway of the coagulation cascade or multiple defects involving the intrinsic, extrinsic and common pathways.

There were no other test article-related effects on hematology data. However, platelet count was statistically significantly higher (32.8%; $p<0.05$ using Dunnett's test) in the 400 mg/kg/day group females as compared to the control group. This group mean difference was not considered to be test article-related because there was no dose response, the value was within WIL historical control data range and a low outlier in the control group contributed to a low mean control group value.

Audited Draft

Audited Draft

6.5.2. SERUM CHEMISTRY

Summary Data: Tables 10; Appendix H

Individual Data: Table 24

The following alterations in serum chemistry parameters were considered to be related to test article administration:

Text Table 2
Test article-related serum chemistry changes

Parameter	Direction and magnitude of change	Dosage Level(s) (mg/kg/day)	Sex	Interval
Alkaline phosphatase	↑ 45.1%*, 82.4%*, 95.6%* ↑ 68.1%*, 72.3%*, 159.6%*	160, 400, 1000	M F	SN
Alanine aminotransferase	↑ 15.8%, 110.5%, 552.6%* ↑ 15.6%, 71.9%, 465.6%*	160, 400, 1000	M F	SN
Aspartate aminotransferase	↑ 1.4%, 12.9%, 74.3%* ↑ 13.2%, 16.2%, 64.7%*	160, 400, 1000	M F	SN
Total Protein	↓ 2.9%, 2.9%, 8.6%*	160, 400, 1000	M	SN
Globulin	↓ 7.7%, 7.7%, 19.2%* ↓ 4.3%, 8.7%, 13.0%*	160, 400, 1000	M F	SN
A/G ratio	↑ 8.9%, 11.2%, 20.1%* ↑ 6.2%, 10.2%, 15.5%	160, 400, 1000	M F	SN
Cholesterol	↓ 1.4%, 17.8%, 21.9%*	160, 400, 1000	F	SN

* = significantly ($p<0.05$ or $p<0.01$) different from the control group using Dunnett's test.

Several mean liver enzyme values (alkaline phosphatase, alanine aminotransferase and aspartate aminotransferase) were higher in the test article-treated animals as compared to the control group, and this was observed in a dose-related manner in both males and females. Although the mean values for alanine aminotransferase and aspartate aminotransferase in the 160 and 400 mg/kg/day groups were not statistically significantly different from the control group, there were generally individual animals with enzyme values outside of the range of the concurrent control animals. In addition, mean alkaline phosphatase and alanine aminotransferase values were above the WIL historical control

data ranges for the 400 and 1000 mg/kg/day group males; these values were also above historical control ranges for the 1000 mg/kg/day group females.

Statistically significantly lower mean total protein and globulin values and higher A/G ratio were noted in the 1000 mg/kg/day group males as compared to the control group values. Lower globulin levels were primarily responsible for the altered A/G ratio, while the difference in total protein was minor. There was no clear dose response. Mean globulin values were also statistically significantly lower in the 1000 mg/kg/day group females as compared to the control group value, and a dose response was observed. The A/G ratios in the test article-treated females were also higher than the control group value, although the differences were not statistically significant for this parameter. In addition, mean cholesterol was statistically significantly lower in the 1000 mg/kg/day group females as compared to the control group value, and this occurred in a dose-related manner. Although there were no statistically significant differences in the low- and mid-dose groups, there were generally individual animals in these groups with values outside of the range of the concurrent control animals.

There were no other test article-related effects on serum chemistry data.

Audited Draft

6.6. OPHTHALMIC EXAMINATIONS

Summary Data: Tables 11, 12; Appendix G

Individual Data: Tables 25, 26

No ophthalmic lesions indicative of toxicity were observed in any of the test article-treated groups. All findings observed were typical in prevalence and appearance for laboratory rats of this age and strain.

Audited Draft

6.7. ANATOMIC PATHOLOGY

6.7.1. MACROSCOPIC EXAMINATION

Summary Data: Tables 13, 14; Appendix H

Individual Data: Tables 27, 28

There were no test article-related macroscopic findings. All macroscopic changes were considered to be spontaneous and/or incidental in nature and unrelated to test article exposure.

6.7.2. ORGAN WEIGHTS

Summary Data: Table 15; Appendix H

Individual Data: Tables 29, 30, 31

Mean final (fasted) body weight was statistically significantly (13.3%) lower in the 1000 mg/kg/day group males as compared to the control group. There were no other statistically significant mean final body weight differences.

The following organ weight changes were considered to be test article-related:

Text Table 3
Toxicologically relevant organ weight changes

Organ	Dosage Level(s) (mg/kg/day)			Sex	Histologic Correlate
	160	400	1000		
Adrenal Glands					
absolute	↑ 8.6%	↑ 21.8%*	↑ 26.3%*	F	None
relative to body weight	↑ 8.3%	↑ 25.0%*	↑ 29.2%*		
relative to brain weight	↑ 6.4%	↑ 17.4%	↑ 25.5%*		
Ovaries/Oviducts					
absolute	↑ 8.3%	↑ 13.5%	↑ 17.6%	F	None
relative to body weight	↑ 6.4%	↑ 17.0%	↑ 21.3%*		
relative to brain weight	↑ 6.6%	↑ 9.5%	↑ 17.0%		

* = significantly ($p<0.05$ or $p<0.01$) different from the control group using Dunnett's test.

Mean adrenal gland weights were statistically significantly higher in the 400 and 1000 mg/kg/day group females as compared to the control group, and these differences occurred in a dose-related manner. A statistically significantly higher mean ovaries/oviducts weight (relative to body weight) was observed in the 1000 mg/kg/day group females. Although remaining group mean differences in ovaries/oviducts weights lacked statistical significance, a dose response was evident.

Brain, testes and kidney weights relative to final body weights were statistically significantly higher (12.4% to 14.2%) in the 1000 mg/kg/day group males when compared to the control group at the scheduled necropsy. However, these changes were considered to be a result of a test article-related effect on final body weight, not a direct effect on the organs.

Audited Draft

There were no other test article-related effects on organ weights. However, statistically significant lower mean absolute heart weight (12.7%; $p<0.05$ using Dunnett's test) in the 1000 mg/kg/day group males, higher mean absolute and relative (to body weight) kidney weights (8.7% and 11.1%, respectively; $p<0.05$ using Dunnett's test) in the 1000 mg/kg/day group females and higher mean liver weight relative to body weight (13.3%; $p<0.01$ using Dunnett's test) in the 1000 mg/kg/day group females were observed as compared to the control group. These group mean differences were not considered to be toxicologically relevant because there was no dose response, the values were generally within WIL historical control data ranges (except for the mean liver weight relative to body weight in the females), and there were no histologic correlates observed.

6.7.3. MICROSCOPIC EXAMINATION

Summary Data: Tables 16, 17; Appendix H

Individual Data: Tables 27, 28

There were no test article-related histologic changes. Histologic changes were considered to be incidental findings, manifestations of spontaneous diseases, or related to

some aspect of experimental manipulation other than exposure to the test article. There was no test article-related alteration in the incidence, severity or histologic character of those incidental and spontaneous tissue alterations.

6.7.4. DISCUSSION OF ANATOMIC PATHOLOGY FINDINGS

Administration of [redacted] to Crl:CD(SD) rats via daily oral gavage for a minimum of 90 consecutive days resulted in hepatic alteration manifested as higher liver enzyme values (alkaline phosphatase, alanine aminotransferase and aspartate aminotransferase) in both males and females. Additionally, lower total protein and globulin and increased coagulation times in the males as well as lower globulin and cholesterol values in the females were also likely associated with hepatocyte alteration, although the lack of effect on albumin levels is atypical. These differences were considered to be potentially test article-related but not adverse as no related clinical signs were seen, correlating macroscopic or microscopic changes in the liver were not observed, and there was no effect on liver weights. Higher adrenal gland and ovaries/oviduct weights had no microscopic correlates and were considered not adverse.

Audited Draft

7. CONCLUSIONS

Based on the results of this study, test article-related findings were observed at dosage levels of 160, 400 and 1000 mg/kg/day as evidenced by clinical findings of increased salivation (400 and 1000 mg/kg/day groups), lower body weights and food consumption (1000 mg/kg/day group males), higher prothrombin times and APTT, higher alkaline phosphatase, alanine aminotransferase and aspartate aminotransferase, lower globulin values and a correspondingly higher A/G ratio as well as lower total protein values (1000 mg/kg/day group males), lower cholesterol levels (1000 mg/kg/day group females) and higher mean adrenal gland and ovaries/oviducts weights (females). No target organ of toxicity was identified by histologic assessment. As the differences at 400 mg/kg/day were considered to be potentially test article-related but not adverse, the no-observed-adverse-effect level (NOAEL) for oral (gavage) administration of [redacted] to Crl:CD(SD) rats for 91 consecutive days was 400 mg/kg/day.

This study was inspected in accordance with the U.S. EPA Good Laboratory Practice Standards (40 CFR 792), the OECD Principles of Good Laboratory Practice [C(97)

186/Final], the Japanese MAFF Good Laboratory Practice Standards, European Union (EU) Directives 2004/9/EC and 2004/10/EC, the standard operating procedures of WIL Research Laboratories, LLC and the sponsor's protocol and protocol amendments, with the following exceptions. The data located in Appendices A (Certificate of Analysis) and B (Analyses of Dosing Formulations) were the responsibility of the sponsor. Quality Assurance findings, derived from the inspections during the conduct of the study and from the inspections of the raw data and draft report, are documented and have been reported to the study director. A status report is submitted to management monthly.

This report accurately reflects the data generated during the study. The methods and procedures used in the study were those specified in the protocol, its amendments and the standard operating procedures of WIL Research Laboratories, LLC.

The raw data, the retention sample(s) and the final report will be stored in the Archives at WIL Research Laboratories, LLC for a period of 6 months following issuance of the final report and thereafter will be returned to the sponsor. Any remaining formulation or clinical pathology samples will be discarded following issuance of the final report.

11. DEVIATIONS FROM THE PROTOCOL

This study was conducted in accordance with the protocol and protocol amendments, except for the following.

- **Protocol Section 6.2** states that controls for the animal room will be set to maintain an average daily relative humidity of approximately 50 ± 20%. On 21 February 06 (study day -13), the average daily humidity was 28.1%, which was outside the allowable range.
- **Protocol Section 8.7.1** states that adrenal glands (2) and thyroids (with parathyroids) will be collected and placed in 10% neutral-buffered formalin, trimmed and weighed. On 6 June 2006 (study day 92), the adrenal glands for male no. 19643 (1000 mg/kg/day group) and the left thyroid/parathyroid for female no. 19695 (1000 mg/kg/day group) were lost at necropsy. Therefore, weights were not obtained for these organs, and the tissues were not examined. Also on 6 June 2006, 1 adrenal gland for female no. 19701 (1000 mg/kg/day group) was lost after weighing at necropsy, and the tissue was not examined.

These deviations did not negatively impact the quality or integrity of the data nor the outcome of the study.

CLINICAL PATHOLOGY METHODS, PROCEDURES AND REFERENCES

Serum Chemistry - Hitachi 912

Albumin - Bromcresol Green (BCG) Method, Modification of the Doumas reaction. Default unit: g/dL. Hitachi 912 Application Code 413. Roche Reagent, catalog number 11970569.

A/G Ratio - Calculated from Albumin and Globulin Results. Default unit: %.

Alkaline Phosphatase - based on the International Federation of Clinical Chemistry (IFCC) Method (Tietz *et al.* J Clin Chem Clin Biochem 1983; 21:731-748). Default unit: U/L. Hitachi 912 Application Code 158. Roche Reagent, catalog number 2172933.

Alanine Aminotransferase - Modification of the International Federation of Clinical Chemistry (IFCC) recommended method. Default unit: U/L. Hitachi 912 Application Code 706. Roche Reagent, catalog number 450065.

Aspartate Aminotransferase - Kinetic method based on the International Federation of Clinical Chemistry (IFCC) recommendations. Default unit: U/L. Hitachi 912 Application Code 715. Roche Reagent, catalog number 450064.

Bilirubin (Total) - Diazo method developed by Wahlefeld *et al.* Scand J Clin Lab Invest 1972; 29: Supplement 126. Default unit: mg/dL. Hitachi 912 Application Code 716. Roche Reagent, catalog number 1039034.

Blood Urea Nitrogen (BUN) - A urease-triggered methodology based upon the method of Talke and Schubert Klin Wschr, 1965; 43:174. Default unit: mg/dL. Hitachi 912 Application Code 427. Roche Reagent, catalog number 1489321.

Calcium - Modified method using a gamma-amino-butyric acid (GABA) buffer. Default unit: mg/dL. Hitachi 912 Application Code 180. Roche Reagent, catalog number 1125621.

Chloride - An ion-selective electrode that measures the electrical potential of the ions present in solution. Default unit: mEq/L. Hitachi 912 Application. Roche Reagent, catalog numbers 820638, 836246 and 820639.

Cholesterol - Enzymatic reaction as described by Trinder. Ann Clin Biochem 1974; 12:266. Default unit: mg/dL. Hitachi 912 Application Code 722. Roche Reagent, catalog number 450061.

Audited Draft

Creatinine - Modified Jaffe reaction based on the work of Poper *et al.* Biochem Z 1937; 291:354, and Seelig and Wuest. Aerztl Labor 1969; 15:34. Default unit: mg/dL. Hitachi 912 Application Code 727. Roche Reagent, catalog number 450019.

Globulin - Calculation obtained by subtracting Albumin from Total Protein. Default unit: g/dL.

Glucose - Glucose hexokinase method based on the work of Schmidt, Peterson and Young. Klin Wschr 1961; 39:1244. Methods of Enzymatic Analysis, 2nd Eng ed. New York, Academic Press, 1974; 1196. Anal Biochemistry 1958; 23:301. Default unit: mg/dL. Hitachi 912 Application Code 767. Roche Reagent, catalog number 450058.

Phosphorus - Method involves the formation of ammonium phosphomolybdate. Default unit: mg/dL. Hitachi 912 Application Code 714. Roche Reagent, catalog number 1040898.

Potassium - An ion-selective electrode that measures the electrical potential of the ions present in solution. Default unit: mEq/L. Hitachi 912 Application. Roche Reagent, catalog numbers 820638, 836246 and 820639.

Sodium - An ion-selective electrode that measures the electrical potential of the ions present in solution. Default unit: mEq/L. Hitachi 912 Application. Roche Reagent, catalog number 820638, 836246 and 820639.

Total Protein - Endpoint biuret method that utilizes a sample blank. Default unit: g/dL. Hitachi 912 Application Code 756. Roche Reagent, catalog number 1040901.

Triglycerides - Method that utilizes lipase from a microorganism to promote rapid and complete hydrolysis of triglycerides to glycerol. Default unit: mg/dL. Hitachi 912 Application Code 781. Roche Reagent, catalog number 1488899.

Hematology - Manual Methods

White Cell Differential - Manual method of counting 100 white cells stained with Wright Giemsa and entered on-line into the data files.

Reticulocyte Count - Manual method of counting the reticulocytes present in 1000 red blood cells stained with New Methylene Blue and entered on-line into the data files.

Red Blood Cell Morphology - Manual method of evaluating red blood cells on a Wright Giemsa-stained slide and entered on-line into the data files.

Audited Draft

Platelet Estimate- Manual method of evaluating platelets on a Wright Giemsa-stained slide. Platelet estimation is evaluated and entered on-line into the data files as decreased, adequate or increased. Platelet clumps present on the slide will be reported as part of the RBC morphology.

AMAX Destiny Amelung Coagulation

Mechanical (Ball Method) Measurement – Mechanical measurement methods depend on the physical formation of fibrin strands that attach to a moving mechanical device that either completes or opens and electrical circuit. The elapsed time from the addition of the starting reagent, up to the beginning of fibrin formation is measured.

Prothrombin Time (Protime-PT)- mechanical clot detection is used to measure and record the time required for plasma specimens to clot by adding an excess of thromboplastin reagent and an optional amount of calcium to citrated plasma. The PT measures from factor VII through fibrin formation (extrinsic and common pathways of coagulation). Default unit: sec.

Activated Partial Thromboplastin Time (APTT)- mechanical clot detection is used to measure and record clotting time in a one-stage procedure which consists of recalcifying plasma in the presence of an excess of platelet-like reagent (cephalin) containing a plasma activator. The APTT measures the clotting time from factor XII through fibrin formation (intrinsic and common pathways of coagulation) Default unit: sec.

Hematology-Bayer Advia® 120

WBC Count - The whole blood sample is mixed with ADVIA® 120 BASO reagent that contains acid and surfactant. The red cells are hemolyzed, and the white blood cells are then analyzed using two angle laser light scatter signals. Default unit: x 10^3 cells/μL

RBC / Platelet Count - Both red blood cells and platelets are analyzed by a single optical cytometer after appropriate dilution of the blood sample with ADVIA® 120 RBC/PLT reagent. The red blood cells are isovolumetrically sphered and lightly fixed with glutaraldehyde to preserve the spherical shape. Red cells and platelets are counted from the signals from a common detector with 2 different gain settings. Default unit RBC: x 10^6cells/μL. Default unit PLT: x 10^3 cells/μL

Hgb - Hemoglobin: The hemoglobin method is a modification of the manual cyanmethemoglobin method developed by the International Committee for standardization in Hematology (ICSH). Default unit: g/dL.

Audited Draft

Hematocrit - The percentage of blood volume that is occupied by red blood cells. Also referred to as the packed red cell volume. On the ADVIA® 120 Hematology System this parameter is derived from the measured red cell volume (MCV) and the red cell count (RBC). Default unit: %.

MCH - Mean Corpuscular Hemoglobin: the average weight of hemoglobin in the red blood cells, calculated from the RBC and Hgb measurements. Default unit: pg.

MCHC - Mean Corpuscular Hemoglobin Concentration: the average concentration of hemoglobin in the red blood cells. This parameter is computed from the measured hemoglobin and the computed hematocrit. Default unit: g/dL.

MCV - Mean Corpuscular Volume: the average volume of the red blood cells. Default unit: fL

White blood cell differential - The ADVIA® 120 Hematology System White Blood Cell Differential (WBC DIFF) methods, consists of both the Peroxidase method and the Basophil/Lobularity method. The ADVIA® 120 Hematology System performs a six-part differential that consists of basophils, eosinophils, large unstained cells, lymphocytes, monocytes, and neutrophils. The white blood cell differential count is reported in percent and the actual number of each type of cell per microliter of blood.

Reticulocyte - This method uses a nucleic acid dye (oxazine 750) to stain cellular RNA. The ADVIA® 120 autoRETIC reagent isovolumetrically spheres the erythroid cells and stains cellular RNA. Low-angle laser light scatter, high-angle laser light scatter, and absorption characteristics of all cells are counted and measured. The absorption data are used to classify each cell as a reticulocyte or mature red blood cell based on its RNA content. The reticulocyte is reported in percent and actual number x 10^9cells/Liter = thous/µl.

Concluding Statement

Pertaining to

Ophthalmic Examinations

Performed During Conduct of

Study WIL-187054

All findings observed during the ophthalmic examinations for the above mentioned study are typical in prevalence and appearance for the species and strain or breed of animals examined. There were no significant differences within or among dose groups or compared to the pretest ophthalmic examinations to suggest a test article-related effect.

1. INTRODUCTION

The objective of this study was to evaluate the possible toxic effects of the test article when administered orally to rats for at least 90 days.

2. STUDY DESIGN

Male and female Crl:CD(SD) rats, approximately 6 weeks of age at initiation of dosing, were administered [redacted] via oral gavage daily for a minimum of 90 consecutive days as indicated in the following table. The dosage volume was 5 mL/kg for all groups.

Group Number	Treatment	Dosage Level (mg/kg/day)	Number of Animals Males	Females
1	Vehicle [a]	0	10	10
2	[redacted]	160	10	10
3		400	10	10
4		1000	10	10

[a] = The vehicle was corn oil.

3. METHODS

3.1. CLINICAL PATHOLOGY

Hematology and serum chemistry parameters were evaluated on all surviving animals just prior to the scheduled necropsy. Animals were fasted overnight prior to blood collection. Blood for hematology and serum chemistry evaluations was collected prior to necropsy via the retro-orbital sinus of animals anesthetized by inhalation of isoflurane. Blood for coagulation parameters was collected from the vena cava at the time of necropsy. Anticoagulants were potassium EDTA for the hematology and sodium citrate for the coagulation tests. Anticoagulants were not used for serum chemistry samples.

The following parameters were evaluated:

Thymus
Thyroids with parathyroids[e]
Trachea
Urinary bladder
Uterus
Cervix
Vagina
Gross lesions (when possible)

[a] - Bone marrow smears were obtained at necropsy but not placed in formalin; smears were not microscopically examined.
[b] - Fixed in Bouin's solution.
[c] - Fixed in Davidson's solution.
[d] - Levels I and III according to the method of Young (Young, 1981) were examined.
[e] - Examined microscopically when in the plane of section and in all cases where a gross lesion was present.
[f] - As many per side as found were retained for microscopic evaluation.

3.2.2. ORGAN WEIGHTS

The following organs were weighed from all animals at the scheduled necropsy:

Adrenal glands	Prostate
Brain	Seminal vesicles / coagulating gland
Epididymides	Spleen
Heart	Testes
Kidneys	Thymus
Liver	Thyroid with parathyroids*
Ovaries (with oviducts)	Uterus
Popliteal lymph nodes	

Designated (*) organs were weighed following fixation in 10% neutral-buffered formalin. Paired organs were weighed together. Organ-to-final-body-weight and organ-to-brain-weight ratios were calculated.

3.2.3. MICROSCOPIC EXAMINATION

Microscopic examination of routinely prepared hematoxylin-eosin stained paraffin sections was performed on all tissues collected at necropsy from all animals that were found dead as well as all animals in the control and 1000 mg/kg/day groups. Additionally, all gross lesions were examined from animals in the 160 and 400 mg/kg/day groups. The stained histologic sections were examined by routine light microscopy and histologic observations were entered in the WIL Toxicology Data Management System (WTDMS™) by the pathologist at the time of examination. At the time of histologic examination, all gross necropsy observations were addressed and a cause-of-death/debility determination was made for all animals that died prior to scheduled study termination. Due to sectioning difficulties or minor laboratory errors, the number of tissues examined from each dosage group does not necessarily correlate with the number of animals included in the group. The number of missing tissues was small and did not interfere with detection of test article-related histologic alterations in the study. The histologic sections were of adequate size and quality for detailed histologic evaluation. The WTDMS™ histopathology tables contain a record of tissues

Audited Draft

examined and histologic findings and serve as the basis for this narrative report. Histopathologic lesions were classified using standard published terminology to the extent possible.

3.3. ABBREVIATIONS

The following abbreviations may apply to this report:

Interval - point in the study at which an animal died or was euthanized
FD - found dead
SN - scheduled necropsy
M - male
F - female

Audited Draft

3.4. DATA INTERPRETATION

In the discussion of clinical pathology parameters, values derived from the control group animals provided a 'normal' range for the present study. In addition, historical control values for this laboratory were consulted to refine data interpretation. Unless otherwise stated in this report, the 'normal' historical control range was considered to be the mean value ± 2 standard deviations. This narrative report addresses all clinical pathology values that were identified as statistically significantly different from control group values on the clinical pathology data tables.

In the discussion of organ weight changes, the indication of higher or lower mean organ weights refers to a statistically significant ($p<0.05$ or 0.01 using Dunnett's test) difference between test article-treated versus control group animals in the present study. In addition, historical control values for this laboratory were consulted to refine data interpretation. This narrative report addresses all organ weight values that were identified as statistically significantly different from control group values on the organ weight data tables.

Audited Draft

4. RESULTS

4.1. SURVIVAL

A single control male (no. 19639) was euthanized in extremis on study day 70, and a single 400 mg/kg/day group female (no. 19673) was found dead on study day 65. Suppurative rhinitis with intralesional bacteria was noted in male no. 19639 and may have been associated with the death of the animal (i.e., blockage of nasal passages by debris), although an exact cause could not be determined; no significant histologic findings were observed in female no 19673. Both deaths were considered spontaneous and unrelated to test article exposure. All other rats survived to the scheduled necropsy (study day 91 or 92).

4.2. CLINICAL PATHOLOGY

4.2.1. HEMATOLOGY

The following alterations in coagulation parameters were considered to be related to test article administration:

Text Table 1
Toxicologically relevant hematological changes

Parameter	Direction and magnitude of change	Dosage Level(s) (mg/kg/day)	Sex	Interval
Prothrombin time	↑ 7.1%, 13.0%, 53.3%*	160, 400, 1000	M	SN
APTT	↑ 11.2%*, 17.3%*, 44.7%*	160, 400, 1000	M	SN

* = significantly ($p<0.05$ or $p<0.01$) different from the control group using Dunnett's test.

Mean prothrombin time and APTT values were higher in the test article-treated males as compared to the control group. A dose relationship was observed, and all prothrombin values (including the control group values) and the APTT value for the 1000 mg/kg/day group were above WIL historical control data ranges. Increases in both prothrombin time and APTT suggest a deficiency in the common pathway of the coagulation cascade or multiple defects involving the intrinsic, extrinsic and common pathways.

Audited Draft

There were no other test article-related effects on hematology data. However, platelet count was statistically significantly higher (32.8%; $p<0.05$ using Dunnett's test) in the 400 mg/kg/day group females as compared to the control group. This group mean difference was not considered to be test article-related because there was no dose response, the value was within WIL historical control data range and a low outlier in the control group contributed to a low mean control group value.

4.2.2. SERUM CHEMISTRY

The following alterations in serum chemistry parameters were considered to be related to test article administration:

Text Table 2
Toxicologically relevant serum chemistry changes

Parameter	Direction and magnitude of change	Dosage Level(s) (mg/kg/day)	Sex	Interval
Alkaline phosphatase	↑ 45.1%*, 82.4%*, 95.6%* ↑ 68.1%*, 72.3%*, 159.6%*	160, 400, 1000	M F	SN
Alanine aminotransferase	↑ 15.8%, 110.5%, 552.6%* ↑ 15.6%, 71.9%, 465.6%*	160, 400, 1000	M F	SN
Aspartate aminotransferase	↑ 1.4%, 12.9%, 74.3%* ↑ 13.2%, 16.2%, 64.7%*	160, 400, 1000	M F	SN
Total Protein	↓ 2.9%, 2.9%, 8.6%*	160, 400, 1000	M	SN
Globulin	↓ 7.7%, 7.7%, 19.2%* ↓ 4.3%, 8.7%, 13.0%*	160, 400, 1000	M F	SN
A/G ratio	↑ 8.9%, 11.2%, 20.1%* ↑ 6.2%, 10.2%, 15.5%	160, 400, 1000	M F	SN
Cholesterol	↓ 1.4%, 17.8%, 21.9%*	160, 400, 1000	F	SN

* = significantly ($p<0.05$ or $p<0.01$) different from the control group using Dunnett's test.

Several mean liver enzyme values (alkaline phosphatase, alanine aminotransferase and aspartate aminotransferase) were higher in the test article-treated animals as compared to the control group, and this was observed in a dose-related manner in both males and

females. In addition, mean alkaline phosphatase and alanine aminotransferase values were above the WIL historical control data ranges for the 400 and 1000 mg/kg/day group males; these values were also above historical control ranges for the 1000 mg/kg/day group females.

Statistically significantly lower mean total protein and globulin values and higher A/G ratio were noted in the 1000 mg/kg/day group males as compared to the control group values. Lower globulin levels were primarily responsible for the altered A/G ratio, while the difference in total protein was minor. There was no clear dose response. Mean globulin values were also statistically significantly lower in the 1000 mg/kg/day group females as compared to the control group value, and a dose response was observed. The A/G ratios in the test article-treated females were also higher than the control group value, although the differences were not statistically significant for this parameter. In addition, mean cholesterol was statistically significantly lower in the 1000 mg/kg/day group females as compared to the control group value, and this occurred in a dose-related manner, although there were no statistically significant differences in the mid-dose groups.

There were no other test article-related effects on serum chemistry data.

Audited Draft

4.3. GROSS OBSERVATIONS

There were no test article-related macroscopic findings. All macroscopic changes were considered to be spontaneous and/or incidental in nature and unrelated to test article exposure.

4.4. ORGAN WEIGHTS

Mean final body weight was statistically significantly (13.3%) lower in the 1000 mg/kg/day group males as compared to the control group. There were no other statistically significant mean final body weight differences.

The following organ weight changes were considered to be test article-related:

Audited Draft

Text Table 3 Toxicologically relevant organ weight changes					
	Dosage Level(s) (mg/kg/day)				Histologic
Organ	**160**	**400**	**1000**	**Sex**	**Correlate**
Adrenal Glands					
absolute	↑ 8.6%	↑ 21.8%*	↑ 26.3%*	F	None
relative to body weight	↑ 8.3%	↑ 25.0%*	↑ 29.2%*		
relative to brain weight	↑ 6.4%	↑ 17.4%	↑ 25.5%*		
Ovaries/Oviducts					
absolute	↑ 8.3%	↑ 13.5%	↑ 17.6%	F	None
relative to body weight	↑ 6.4%	↑ 17.0%	↑ 21.3%*		
relative to brain weight	↑ 6.6%	↑ 9.5%	↑ 17.0%		

* = significantly ($p<0.05$ or $p<0.01$) different from the control group using Dunnett's test.

Mean adrenal gland weights were statistically significantly higher in the 400 and 1000 mg/kg/day group females as compared to the control group, and this occurred in a dose-related manner. A statistically significantly higher mean ovaries/oviducts weight (relative to body weight) was observed in the 1000 mg/kg/day group females. Although remaining group mean differences in ovaries/oviducts weights lacked statistical significance, a dose response was evident.

Brain, testes and kidney weights relative to final body weights were statistically significantly higher (12.4% to 14.2%) in the 1000 mg/kg/day group males when compared to the control group at the scheduled necropsy. However, these changes were considered to be a result of a test article-related effect on final body weight, not a direct effect on the organs.

There were no other test article-related effects on organ weights. However, statistically significant lower mean absolute heart weight (12.7%; $p<0.05$ using Dunnett's test) in the 1000 mg/kg/day group males, higher mean absolute and relative (to body weight) kidney weights (8.7% and 11.1%, respectively; $p<0.05$ using Dunnett's test) in the 1000 mg/kg/day group females and higher mean liver weight relative to body weight (13.3%; $p<0.01$ using Dunnett's test) in the 1000 mg/kg/day group females were observed as compared to the control group. These group mean differences were not considered to be toxicologically relevant because there was no dose response, the values were generally within WIL historical control data ranges (except for the mean liver weight relative to body weight in the females), and there were no histologic correlates observed.

Audited Draft

4.5. HISTOLOGIC CHANGES

There were no test article-related histologic changes. Histologic changes were considered to be incidental findings, manifestations of spontaneous diseases, or related to some aspect of experimental manipulation other than exposure to the test article. There was no test article-related alteration in the incidence, severity or histologic character of those incidental and spontaneous tissue alterations.

5. DISCUSSION

Administration of [redacted] to Crl:CD(SD) rats via daily oral gavage for a minimum of 90 consecutive days resulted in hepatic alteration manifested as higher liver enzyme values (alkaline phosphatase, alanine aminotransferase and aspartate aminotransferase) in both males and females. Additionally, lower total protein, lower globulin and increased coagulation times in the males as well as lower globulin and cholesterol values in the females were also likely associated with hepatocyte alteration, although the lack of effect on albumin levels is atypical. These differences were considered to be test article-related but not adverse as no related clinical signs were seen, correlating macroscopic or microscopic changes in the liver were not observed, and there was no effect on liver

weights. Higher adrenal gland and ovaries/oviduct weights had no microscopic correlates and were not considered adverse.

6. CONCLUSIONS

Administration of [redacted] to male and female Crl:CD(SD) rats via daily oral gavage for a minimum of 90 consecutive days resulted in the following alterations: higher prothrombin times and APTT values in the 160, 400 and 1000 mg/kg/day group males; higher alkaline phosphatase, alanine aminotransferase and aspartate aminotransferase in the 160, 400 and 1000 mg/kg/day group males and females; lower globulin values and a correspondingly higher A/G ratio in test article-treated males and females as well as statistically significantly lower total protein values in the 1000 mg/kg/day males and lower cholesterol levels in the 1000 mg/kg/day females; lower mean final body weight in the 1000 mg/kg/day males; and higher mean adrenal gland and ovaries/oviducts weights in the test article-treated females. There were no test article-related histologic observations.

Study Number: WIL-187054

PROTOCOL AMENDMENT I

Sponsor: [redacted]

A. Title of Study:

A 90-Day Repeated-Dose Oral (Gavage) Toxicity Study of [redacted] in Rats

B. Protocol Modification:

1) **7.5.1 Test Article Preparation:**

In accordance with the study director notification dated March 2, 2006, dosing formulations will be stored at room temperature.

2) **7.5.2 Homogeneity and Stability of the Test Material Preparations:**

In accordance with the study director notification dated March 2, 2006, bulk homogeneity will be determined for all dose levels.

8.7.1 Macroscopic Examination:

3) In accordance with the study director notification dated June 1, 2006, the tissue "Jejunum" is changed to "Jejunum with Peyer's patches."

4) In accordance with the study director notification dated June 1, 2006, the tissue "Popliteal lymph nodes" is added to the list of tissues to be collected at necropsy. The separate identity of the popliteal lymph nodes will be maintained through collection, processing and examination.

5) In accordance with the study director notification dated June 3, 2006, animals will be euthanized by carbon dioxide inhalation and exsanguinated.

6) **8.7.2 Organ Weights:**

In accordance with the study director notification dated June 1, 2006, the tissue "Popliteal lymph nodes" is added to the list of organs to be weighed.

Audited Draft

7) **8.7.3 Microscopic Examination:**

In accordance with the study director notification dated June 1, 2006, the Peyer's patches (collected with the tissue "Jejunum") and Popliteal lymph nodes will be examined microscopically in the protocol-specified groups.

C. Reason for Protocol Modification:

1) Addition of storage conditions for dosing formulations.

2) Clarification of instructions for homogeneity determinations.

3) Modification of tissue to be collected at necropsy.

4) Addition of tissue to be collected at necropsy.

5) Clarification of method of euthanasia.

6) Addition of organ to be weighed.

7) Addition of tissues for microscopic examination.

Audited Draft

1 OBJECTIVE:

The objective of this study is to evaluate the possible toxic effects of the test article when administered orally to rats for at least 90 days.

This protocol has been designed and the study will be conducted in general accordance with the OECD (Organisation for Economic Cooperation and Development) Guidelines for Testing of Chemicals, Health Effects Test Guidelines, Section 408, September 1998.

The study will be conducted in compliance with the U.S. Environmental Protection Agency (EPA), 40 CFR Part 792, the OECD [C(97) 186/Final] and the Ministry of Agricultural, Forestry and Fisheries (MAFF), Law No. 82, 1948, Good Laboratory Practice (GLP) Standards. The study will be performed according to the protocol and WIL Standard Operating Procedures and European Union (EU) Directives 2004/9/EC and 2004/10/EC.

2 PERSONNEL INVOLVED IN THE STUDY:

2.1 Sponsor Representative:

[redacted]
Toxicologist
[redacted]

2.2 WIL Study Director:

[redacted]

2.3 WIL Deputy Director:

[redacted]

2.4 WIL Departmental Responsibilities:

Audited Draft

3 STUDY SCHEDULE:

Proposed Experimental Starting Date (Animal Receipt):	February 21, 2006
Proposed Experimental Start Date:	March 6, 2006
Proposed Necropsy Dates:	June 5-6, 2006
Proposed Experimental Termination (Completion) Date:	To be amended.
Proposed Audited Draft Report Date:	To be determined.

4 TEST ARTICLE:

4.1 Identification:

[redacted]

4.2 Lot Number:

[redacted]

4.3 Purity:

100%

4.4 Stability:

The test article is considered stable under the storage conditions provided by the Sponsor.

4.5 Physical Description:

Dark brown viscous liquid.

4.6 Storage Conditions:

Store at ambient conditions.

4.7 Reserve Samples:

Reserve samples of the test article will be taken in accordance with WIL standard operating procedures.

Audited Draft

Audited Draft

4.8 Personnel Safety:

To be provided by the Sponsor. It is the responsibility of the Sponsor to notify the testing facility of any special handling requirements for the test article. A Material Safety Data Sheet (MSDS) will accompany the test article upon arrival at the laboratory.

4.9 Vehicle:

Corn oil.

5 TEST SYSTEM:

5.1 Species:

Rat

5.2 Strain:

Crl:CD(SD)

5.3 Source:

Charles River Laboratories
Raleigh, NC

5.4 Number of Study:

Forty-six animals of each sex will be ordered. Forty males and 40 females will be placed on study. This study is designed to use the smallest number of animals possible consistent with the objective(s) of the study. Animals not utilized on study will be deemed as part of the stock colony or euthanized by CO_2 inhalation and discarded.

5.5 Approximate Age and Weight:

Animals will be 4 to 6 weeks of age when received, and 6 to 8 weeks of age at initiation of dosing. The males will weigh approximately 160-260 g and the females approximately 110-180 g at initiation of dosing.

5.6 Identification System:

Animals will be uniquely identified by a metal eartag displaying the animal number. Individual cage cards will be affixed to each cage and will display the animal number, group number, study number, dosage level and sex.

5.7 Justification for Selection:

This species and strain of animal is recognized to be appropriate for subchronic toxicity studies. The Sprague-Dawley rat will be used because it is a widely used strain for which significant control data are available. The number of animals is the minimum required to yield scientifically meaningful and statistically significant data.

6 SPECIFIC MAINTENANCE SCHEDULE:

6.1 Animal Housing:

Weanling animals (less than approximately 35 days of age) will be housed three per cage by sex in an environmentally controlled room in clean suspended wire-mesh cages for approximately three days following receipt. If the number of animals received does not allow for all animals to be housed three per cage by sex, than some animals will be pair-housed by sex. Thereafter, the animals will be housed individually. The cages will be elevated above cage-board or other suitable material which will be changed at least three times each week.

The facilities at WIL Research Laboratories, LLC are fully accredited by the Association for Assessment and Accreditation of Laboratory Animal Care International (AAALAC International).

6.2 Environmental Conditions:

Controls will be set to maintain an average daily temperature of 71° ± 5°F (22 ± 3°C) and an average daily relative humidity of approximately 50 ± 20%. Fluorescent lighting will provide illumination for 12 hours per day. The light/dark period may be interrupted, however, to allow for protocol-specified activities. Temperature and relative humidity will be monitored continually and scheduled for automatic hourly data capturing. Ventilation rate will be set at 10 to 15 room changes per hour, 100% fresh air.

6.3 Drinking Water:

Reverse osmosis-treated tap water will be available *ad libitum*. Filters servicing the automatic watering system will be changed regularly according to standard operating procedures. The municipal water supplying the laboratory will be analyzed for contaminants according to standard operating procedures to ascertain that none are present at concentrations that would be expected to affect the outcome of the study.

Audited Draft

Audited Draft

6.4 Diet:

PMI Nutrition International, LLC Certified Rodent LabDiet® 5002 (meal) will be offered *ad libitum* during the study except during fasting prior to clinical pathology blood collection. Each lot utilized will be identified and recorded. Standard operating procedures provide specifications for acceptable levels of heavy metals and pesticides that are reasonably expected to be present in the diet without interfering with the purpose or conduct of the study. Each lot of feed has been analyzed by the manufacturer to assure specifications are met. Feeders will be changed and sanitized once per week.

7 EXPERIMENTAL DESIGN:

7.1 Animal Receipt and Acclimation:

Each animal will be inspected by a qualified technician upon receipt. Animals judged to be in good health will be placed immediately in acclimation for at least 10 days. All animals will be weighed and assigned a permanent animal number. During the acclimation period, each animal will be observed twice daily for changes in general appearance or behavior. The animals will be allowed a pretreatment week (as part of the acclimation period) during which body weights and food consumption will be recorded and general health will be monitored, but they will not receive the test material. All animals will receive a detailed physical examination approximately one week prior to initiation of dosing and at the time of animal selection for randomization.

7.2 Randomization:

Animals judged to be suitable for testing will be assigned to groups at random based on body weight stratification into a block design using a computer program. A printout containing the animal numbers and individual group assignments will be generated. Animals will then be arranged into the groups according to the printout. Body weights at randomization will be within ± 20% of the mean for each sex. If, after randomization, significant differences between groups exist, new randomizations will be generated until group mean body weights are not statistically different between groups by sex.

7.3 Route and Rationale of Test Article Administration:

The route of administration will be oral by gavage since this is an acceptable and standard method for administering test article per OECD Guideline 408. Appropriate-sized flexible, Teflon®-shafted, stainless steel ball-tipped dosing cannulae will be used for the oral administration by gavage.

Audited Draft

7.4 Organization of Test Groups, Dosage Levels and Treatment Regimen:

7.4.1 Organization of Test Groups:

The dosage levels were determined from the results of a 28-day study (WIL-187051) and were provided by the Sponsor Representative after consultation with the WIL Study Director. The following table presents the study group arrangement.

Group Number	Treatment	Dosage Level (mg/kg/day)	Dosage Concentration (mg/mL)	Dosage Volume (mL/kg)	Number of Animals	
					Males	Females
1	Vehicle	0	0	5	10	10
2	[redacted]	160	32	5	10	10
3	[redacted]	400	80	5	10	10
4	[redacted]	1000	200	5	10	10

7.4.2 Vehicle:

Corn oil will be used as the vehicle.

7.4.3 Treatment Regimen:

The test article and vehicle will be administered once daily for a minimum of 90 consecutive days (until the day prior to necropsy). Day 0 is the first day of dosing, and Day 91 is the first day of necropsy. The first week of dosing is week 0.

7.4.4 Adjustment of Dosages:

Individual doses will be adjusted weekly for the duration of the study, based on the most recent body weights.

7.5 Preparation and Analysis of Test Article Preparations:

7.5.1 Test Article Preparation:

Based on the physical characteristics of the test article, appropriate methods will be used to ensure the best possible formulations of the test article in the vehicle. Dosing formulations of the test article will be prepared weekly. The study director or the deputy director or designee will visually inspect the formulations prior to initiation of dosing. This visual inspection will be performed to assure that the formulations are visibly homogeneous and acceptable for dosing. Any special procedures required for formulation will be documented according to Good Laboratory Practices and presented in the final report of this study.

Audited Draft

7.5.2 Homogeneity and Stability of the Test Material Preparations:

Information regarding the stability of the test article in the dosing formulations will be provided by the Sponsor. Dosing mixture homogeneity in bulk preparations will be collected from high and low dose formulations prepared for the first week of dosing. While undergoing stirring in the beaker, the following sample aliquots (5 mL) will be drawn for analysis: control, three aliquots (from the middle); all treatment groups, nine aliquots (3 each from the top, middle and bottom). Test article formulations will be divided into aliquots for daily dispensation. Resuspension homogeneity of aliquots will be determined over the longest period of aliquot storage. Three samples (5mL) from the top and bottom of each group will be collected to assess the homogeneity after storage and resuspension. Two of the three samples will be sent to [redacted], for analysis of homogeneity over a ten-day period. The samples will be shipped under ambient conditions. The remaining sample from each dose level and stratum will be stored under normal laboratory conditions for possible future analysis.

7.5.3 Concentration Analysis:

Samples of the dosing mixtures will be collected on the first day of formulations prepared for study weeks 0, 4, 8 and 12. At each time point, two 5-mL aliquots will be taken from each dose level (middle stratum), including the control group. The dosing mixture will be thoroughly mixed before taking each sample. One sample from each dose level will be analyzed; the remaining sample will be retained by the Testing Laboratory for possible future analysis.

Dosing mixture samples for homogeneity, stability and concentration of the test article at all dose levels, including the control, will be analyzed by the Sponsor. Quality assurance (QA) auditing of the conduct, results and reporting of the analyses, as well as archiving of these data will be the responsibility of the Sponsor. Critical phase inspection reports and report audits will be submitted to the Study Director and management at WIL Research Laboratories, LLC. A QA statement will be issued for inclusion in the overall final report. The methods and results of the analysis will be provided by the Sponsor and included as an appendix to the WIL final report. The methods employed will be one or more of the following:

[redacted] SOP #ME-125

Audited Draft

Concentration and stability data will be evaluated using percent difference. The acceptable tolerance between the theoretical and measured values is 15%.

Mixtures will be considered homogeneous if the difference between the overall group mean and the strata mean is 10% or less.

7.5.4 Sample Handling and Shipment:

Each 5-mL sample will be placed in a glass vial with a Teflon-lined lid. The vial plus sample weight will be recorded with an accuracy of ± 0.0005 g. Each sample will be stored at ambient temperature. Each sample container will be labeled with the following information:

Accession Number
Sponsor's Reference Number
Testing Laboratory Study Number
Test Article Name
Dose Level (mg/kg)
Dosing Mixture Concentration (mg/mL)
Preparation Date
Sampling Date
Weight of Sample

The sample shall be packed in a suitable container to maintain the temperature conditions specified in Section 4 during transit plus an adequate margin of safety for any transit delays. The sample shall be sent by express courier to:

[redacted]

[redacted] shall be notified in advance of shipping by telefax at [redacted] This notification shall include test article and study identification, carrier, and estimated time/date of arrival. Sample shipments shall be accompanied by an inventory sheet describing the samples contained in the shipment with the information described above.

8 PARAMETERS TO BE EVALUATED:

8.1 Viability Observations:

All animals will be observed for mortality/moribundity twice daily, once in the morning and once in the afternoon. Moribund animals will be euthanized to ensure that tissues will not be lost due to autolysis.

8.2 Clinical Observations:

8.2.1 Daily Observations:

A clinical examination will be performed daily for all animals at the time of dosing and approximately 1-2 hours after dosing. The clinical observations prior to dosing need not be recorded on the days of detailed physical examinations, provided the detailed physicals are performed prior to dosing. Observations will include, but are not limited to, changes in the skin, fur, eyes and mucous membranes; respiratory, circulatory, autonomic and central nervous systems functions; somatomotor activity and behavior patterns. Findings noted at the clinical examination will be recorded for individual animals; the condition of animals without signs will be documented in a general comment.

8.2.2 Detailed Physical Examinations:

A detailed physical examination will be conducted at least once during the pretreatment period, once weekly during the treatment period and on the day(s) of necropsy. The animals will be removed from their home cages and placed in a standard arena for observations. Observations will be detailed and carefully recorded. Where appropriate, explicitly defined scoring systems will be used if, in the opinion of the Study Director, doing so increases the utility of the data. Signs noted shall include, but are not limited to, changes in skin, fur, eyes, mucous membranes; occurrence of secretions and excretions and autonomic activity (e.g. lacrimation, piloerection, pupil size, unusual respiratory pattern). Changes in gait, posture and response to handling, as well as the presence of clonic or tonic movements, stereotypies (e.g. excessive grooming, repetitive circling) or bizarre behavior (e.g. self-mutilation, walking backwards) will be recorded. Animals without signs will be noted individually.

8.2.3 Unscheduled Observations:

A separate computer protocol will be used to collect any findings outside the above-specified observations. Only the presence of findings

Audited Draft

will be recorded; the absence of findings will thus not be recorded. Unscheduled observations will be included in the final report as individual animal data only.

8.3 Individual Body Weights:

Individual body weights will be recorded approximately weekly, beginning at least one week prior to test article administration, at least weekly during treatment, the day prior to the first day of scheduled necropsy (non-fasted) and on the days of necropsy (fasted).

8.4 Individual Food Consumption:

Individual food consumption will be recorded approximately weekly, beginning at least one week prior to test material administration.

8.5 Ophthalmic Examinations:

Ophthalmic examinations will be conducted by a board-certified veterinary ophthalmologist using an indirect ophthalmoscope and slit lamp biomicroscope. Prior to examination, animals will be treated with 0.5% mydriacyl. All animals will be examined prior to randomization and near the end of the dosing period.

8.6 Clinical Pathology:

The following clinical pathology parameters will be evaluated on all surviving rats just prior to their scheduled necropsy. The animals will be fasted overnight before taking blood samples. Blood for hematology and serum chemistry evaluations will be collected prior to necropsy from the retro-orbital sinus of animals anesthetized by inhalation of isoflurane. Blood for coagulation parameters will be collected from the vena cava at the time of necropsy.

Anticoagulants used will be potassium EDTA for the hematology and sodium citrate for the coagulation tests. Samples for serum chemistry will be collected without anticoagulants.

Audited Draft

Audited Draft

8.6.1 Hematology:

Activated partial thromboplastin time	MCHC
Differential leukocyte count[a]	MCV
Erythrocyte count	Platelet count
Hematocrit	Prothrombin time
Hemoglobin	Reticulocyte count
MCH	Total leukocyte count

a = If performed manually, results will include platelet estimates and RBC morphology.

8.6.2 Serum Chemistry:

A/G ratio	Glucose
Alanine aminotransferase	Phosphorus
Albumin	Potassium
Alkaline phosphatase	Sodium
Aspartate aminotransferase	Total bilirubin
Calcium	Total cholesterol
Chloride	Total protein
Creatinine	Triglycerides
Globulin	Urea nitrogen

8.7 Anatomic Pathology:

8.7.1 Macroscopic Examination:

A complete necropsy will be conducted on all animals dying spontaneously, euthanized *in extremis* or at the scheduled necropsy. Animals euthanized *in extremis* or at the scheduled necropsy will be anesthetized via carbon dioxide and exsanguinated. Necropsy will include examination of the external surface, all orifices and the cranial, thoracic, abdominal and pelvic cavities (including viscera). At the time of necropsy, the following tissues and organs will be collected and placed in 10% neutral-buffered formalin (except as noted):

Audited Draft

Adrenals (2)
Aorta
Bone with marrow
  Sternum
Bone marrow smear (from femur[a])
Brain
  Cerebrum Level 1
  Cerebrum Level 2
  Cerebellum with medulla/pons
Epididymides (2)[c]
Exorbital lacrimal glands (2)
Eyes with optic nerve (2)[b]
Gastrointestinal tract
  Esophagus
  Stomach
  Duodenum
  Jejunum
  Ileum
  Cecum
  Colon
  Rectum
Harderian glands (2)
Heart
Kidneys (2)
Larynx
Liver (sections of two lobes)
Lungs (including bronchi, fixed by inflation with fixative)
Lymph node
  Mesenteric
  Mandibular
Mammary gland (females only)
Nasal tissues[d]
Ovaries (2) with oviducts[e]
Pancreas
Peripheral nerve (sciatic)
Pharynx
Pituitary
Prostate
Salivary glands [mandibular (2)]
Seminal vesicles (2)
Skeletal muscle (rectus femoris)
Skin
Spinal cord
  Cervical
  Thoracic
  Lumbar
Spleen
Testes (2)[c]
Thymus
Thyroids (with parathyroids[e])
Trachea
Urinary bladder
Uterus
Cervix
Vagina
All gross lesions (when possible)

a - Not taken from animals found dead, not placed in formalin; to be examined only if scientifically warranted.
b - To be placed in Davidson's solution.
c - To be placed in Bouin's solution.
d - Levels I and III according to the method of Young (Young 1981) will be examined.
e - Organ will be examined microscopically if in the plane of section, or if gross lesions are present.

Audited Draft

8.7.2 Organ Weights:

The following organs will be weighed from all animals at the scheduled necropsy:

Adrenals	Prostate
Brain	Seminal vesicles/coagulating gland
Epididymides	Spleen
Heart	Testes
Kidneys	Thymus
Liver	Thyroids with parathyroids*
Ovaries (with oviducts)	Uterus

* - Fixed in 10% neutral-buffered formalin prior to weighing.

Paired organs will be weighed together. Organ-to-body-weight and organ-to-brain-weight ratios will be calculated from animals euthanized at the scheduled necropsies.

8.7.3 Microscopic Examination:

Microscopic examination of hematoxylin-eosin stained paraffin sections will be performed on the tissues listed in Section 8.7.1 from all animals in the control and high dose groups, and from all animals that die or are euthanized *in extremis*. Gross lesions will be examined from animals in Groups 2, and 3. Microscopic examination may be extended by amendment (additional cost) to include other animals if a potential target organ is noted based on histopathological examination of tissues from the high dose group or other parameters (organ weights, clinical pathology, etc.). Special stains may be used at the discretion of the pathologist to further characterize lesions and changes. Any special stains used will be documented in the individual animal data and interpretation of results will be included in the final report.

9 STATISTICAL METHODS:

All analyses will be two-tailed for significance levels of 5% and 1%. All means will be presented with standard deviations. All statistical tests will be performed using appropriate computing devices or programs. Body weights, body weight changes, food consumption, as well as clinical pathology values and absolute and relative organ weights will be analyzed by a one-way analysis of variance (ANOVA) (Snedecor, 1980). If significant differences are indicated by the ANOVA, Dunnett's test (Dunnett, 1964) will be used to compare the control and treated groups.

10 QUALITY ASSURANCE:

The study will be audited by the WIL Quality Assurance Unit while in progress to assure compliance with the U.S EPA, OECD and MAFF Good Laboratory Practice regulations, and EU Directives 2004/9/ED and 2004/10/ED, adherence to the protocol and to WIL Standard Operating Procedures. The raw data and draft report will be audited by the WIL Quality Assurance Unit to assure that the final report accurately describes the conduct and the findings of the study.

This study is a regulated study and will be included on the WIL master list of regulated studies.

Audited Draft

11 RECORDS TO BE MAINTAINED:

All original raw data records, as defined by WIL SOPs and the applicable GLPs, will be stored as described in Section 12 in the Archives at WIL Research Laboratories, LLC.

12 WORK PRODUCT:

Sponsor will have title to all documentation records, raw data, slides, specimens, or other work product generated during the performance of the study. All work product including raw paper data, pertinent electronic storage media and specimens will be retained at no charge for a period of 6 months following issuance of the final report in the Archives at WIL Research Laboratories, LLC. All work product, including raw paper data, pertinent electronic storage media and specimens, will be returned to the Sponsor after a period of six months or following issuance of the final report. Any remaining formulation or clinical pathology samples will not be sent to Archives and will be discarded following issuance of the final report. All work product will be stored in compliance with regulatory requirements.

Any work product, including documents, specimens, and samples, that are required by this protocol, its amendments, or other written instructions of the Sponsor, to be shipped by WIL Research Laboratories, LLC to another location will be appropriately packaged and labeled as defined by WIL's SOPs and delivered to a common carrier for shipment. WIL Research Laboratories, LLC will not be responsible for shipment following delivery to the common carrier.

13 REPORTS:

The final report will contain a summary, test material data, methods and procedures, appropriate individual animal and summary data tables, a copy of the protocol and amendments (if any) and an interpretation and discussion of the study results. The report will contain all information necessary to conform with current U.S. EPA, OECD, MAFF and EU specifications. The report will be comprehensive and shall

attempt to define toxicity and the no-observed-effect level(s) under the conditions of this investigation.

WIL Research Laboratories will submit one copy of an audited draft report in a timely manner upon completion of data collection prior to issuance of the final report. One revision will be permitted as part of the cost of the study, from which the Sponsor's reasonable revisions and suggestions will be incorporated into the final report, as appropriate. Additional changes or revisions may be made, at extra cost. It is expected that the Sponsor will review the draft report and provide comments to WIL within a two-month time frame following submission. WIL will submit the final report within one month following receipt of comments. If the Sponsor's comments and/or authorization to finalize the report have not been received at WIL within one year following submission of the draft report, WIL may elect to finalize the report following appropriate written notification to the Sponsor. Two electronic copies (PDF) of the final report on CD-R will be provided. Requests for additional electronic or paper copies of the final report may result in additional charges.

Audited Draft

14 ANIMAL WELFARE ACT COMPLIANCE:

This study will comply with all applicable sections of the Final Rules of the Animal Welfare Act regulations (9 CFR Parts 1, 2 and 3). The Sponsor should make particular note of the following:

- The Sponsor Representative's signature on this protocol documents for the Study Director the Sponsor's assurance that the study described in this protocol does not unnecessarily duplicate previous experiments.

- Whenever possible, procedures used in this study have been designed to avoid or minimize discomfort, distress or pain to animals. All methods are described in this study protocol or in written laboratory standard operating procedures.

- Animals that experience severe or chronic pain or distress that cannot be relieved will be painlessly euthanized as deemed appropriate by the veterinary staff and Study Director. The Sponsor will be advised by the Study Director of all circumstances which could lead to this action in as timely a manner as possible.

- Methods of euthanasia used during this study are in conformance with the above-referenced regulation.

- The Sponsor/Study Director has considered alternatives to procedures that may cause more than momentary or slight pain or distress to the animals and has provided a written narrative description (AWA covered species) of the methods and sources used to determine that alternatives are not available.

Audited Draft

15 PROTOCOL MODIFICATION:

Modification of the protocol may be accomplished during the course of this investigation. However, no changes will be made in the study design without the verbal or written permission of the Sponsor. In the event that the Sponsor verbally requests or approves a change in the protocol, such changes will be made by appropriate documentation in the form of a protocol amendment. All alterations of the protocol and reasons for the modification(s) will be signed by the Study Director and the Sponsor Representative.

1. SUMMARY

1.1. OBJECTIVE

The objective of the study was to evaluate the ability of the test articles to induce effects on pubertal development in the intact juvenile female rat.

1.2. STUDY DESIGN

[ ] or [ ], in the vehicle, Mazola® corn oil, was administered orally by gavage once daily for 20 consecutive days to 3 groups each of 15 Crl:CD(SD) immature female rats. Dosage levels for each test article were 60, 250 and 1000 mg/kg/day, and the dosage volume was 5 mL/kg. A concurrent control group received the vehicle on a comparable regimen. These dosage levels were determined from the results of previous studies and were provided by the sponsor representative after consultation with the WIL study director.

Dosing procedures were performed from 14 March 2006 through 4 April 2006, when the animals were 22 to 41 days of age; the start of dose administration was staggered, based on age. At the initiation of dose administration, body weights ranged from 42.2 g to 63.8 g. The following table presents the study group assignment:

Group Number	Test Article	Dosage Level (mg/kg/day)	Dosage Concentration (mg/mL)	Dosage Volume (mL/kg)	Number of Females
1	Corn Oil	0	0	5	15
2	[ ]	60	12	5	15
3	[ ]	250	50	5	15
4	[ ]	1000	200	5	15
5	[ ]	60	12	5	15
6	[ ]	250	50	5	15
7	[ ]	1000	200	5	15

Due to spacing constraints, the dosage group names are presented on the tables and figures as corn oil, [ ]/60, [ ]/250 and [ ]/1000 for the vehicle control, 60, 250 and 1000 mg/kg/day [ ] groups, respectively, and [ ]/60, [

]/250 and [ ]/1000 for the 60, 250 and 1000 mg/kg/day [ ] groups, respectively.

Preparation, storage and sampling of the control and test article formulations were conducted as follows. For the control group, the appropriate amount of the vehicle (100% pure corn oil, exp. dates: 1 and 23 February 2007) was placed into a storage container and stirred throughout use. The [ ] and [ ] dosing formulations were prepared as follows. The appropriate amount of test article for each group was weighed into a tared, calibrated glass container. A stir bar and approximately 80% of the vehicle were added to each container, and the mixtures were stirred until uniform. The appropriate volume of vehicle was added to bring each formulation to the calibration mark, and the preparations were stirred until uniform and throughout use. The [ ] and [ ] dosing formulations were prepared approximately weekly, divided into aliquots for daily dispensation and stored at room temperature. Three samples from the middle stratum of the control group formulation and 3 sets of samples from the top, middle and bottom strata of the test article formulations were collected prior to the initiation of dose administration. Additional samples (3 sets) were collected for resuspension homogeneity from the same formulations following 10 days of room temperature storage. Two sets of samples for concentration verification were collected on each day of preparation and 2 sets were collected on the last day of use of each preparation. Two sets of homogeneity/stability samples and 6 sets of concentration samples were shipped under ambient conditions to the sponsor for homogeneity, stability and concentration analyses; the remaining samples were stored under normal laboratory conditions at WIL Research Laboratories, LLC, for possible future analysis.

Thirteen dams with 10 female pups each (130 pups total) were received from Charles River Laboratories, Inc., Raleigh, North Carolina, on 28 February 2006. The pups were 6 to 8 days old upon receipt. Pups were initially identified by tail tattoo, housed in plastic maternity cages (by litter with their own or a fostering dam for 14 to 16 days) during the acclimation period until randomization of the pups on postnatal day (PND) 21.

Following randomization, the female pups were weaned, identified by metal eartag and housed 3 per cage in plastic maternity cages. Environmental controls were set to maintain an average daily temperature of 71°F ± 5°F and an average daily relative humidity of 50% ± 20%. Actual mean daily temperatures ranged from 70.2°F to 70.8°F (21.2°C to 21.5°C) and mean daily relative humidity ranged from 38.3% to 56.1%. Light timers were calibrated to provide a 12-hour light (0600 hours to 1800 hours)/12-hour dark photoperiod. Air handling units were set to provide approximately 10 fresh air changes per hour. PMI Nutrition International, LLC, Certified Rodent LabDiet® 5002 and reverse osmosis-purified water were offered ad libitum.

All animals were observed twice daily for appearance, behavior, mortality and moribundity. A detailed physical examination was performed at the time of randomization. The rats were also observed daily (prior to dosing). Clinical findings approximately 1 hour following dose administration were recorded when observed. Individual body weights were recorded daily. Each female pup was observed daily for vaginal patency beginning on postnatal day (PND) 25 (Adams et al., 1985). Examination continued daily until vaginal patency was observed. Body weights were recorded on the day that vaginal patency was noted. Beginning on the day that vaginal patency was observed, vaginal lavages were performed daily, through the day of euthanasia, and the slides were examined to determine the stage of estrus. The mean estrous cycle length was calculated and reported for complete estrous cycles (i.e., the total number of returns to metestrus [M] or diestrus [D] from estrus [E] or proestrus [P] until the day of euthanasia). Estrous cycle length was determined by counting the number of days from the first M or D in a cycle to the first M or D in a subsequent cycle. In addition, the mean age at the onset of the first estrous cycle was calculated using the first day each animal was observed to be in estrus. A complete gross necropsy was performed only on the animal that was found dead; however, all surviving animals (euthanized on PND 42 by carbon dioxide) were examined for gross lesions (i.e., masses) at the scheduled euthanasia. In addition, at the scheduled euthanasia on PND 42, blood was collected via

the vena cava for evaluation of serum thyroxine (T_4), thyroid stimulating hormone (TSH), estradiol (E_2) and lutenizing hormone (LH) levels. Serum not utilized for these analyses was stored frozen for possible future analysis. The uterus (wet and blotted), kidneys, liver, ovaries and oviducts, adrenal glands, pituitary gland, spleen, thymus gland and thyroid glands (with parathyroid glands, following fixation) were weighed. Luminal fluid weight was calculated by subtracting the blotted uterus weight from the wet uterus weight. The ovaries, uterus (horns and body), cervix, vagina, pituitary gland, thyroid glands (with parathyroids), spleen, thymus, axillary lymph nodes and gross lesions were retained from all surviving females. Gross lesions were also retained for the single animal that was found dead.

Statistical tests were performed using appropriate computing devices or programs. Analyses were conducted using two-tailed tests for minimum significance levels of 1% and 5%, comparing each test article-treated group to the control group. Each mean was presented with the standard deviation (S.D.) and the number of animals (N) used to calculate the mean. In addition, percent difference from control was presented for body weights, clinical pathology parameters and organ weights. Mean body weights, body weight changes, days of acquisition of vaginal patency, estrous cycle lengths, ages at the first occurrence of estrus, serum hormone levels, luminal fluid weights and absolute and relative organ weights were subjected to a parametric one-way analysis of variance (ANOVA; Snedecor and Cochran, 1980) to determine intergroup differences. If the ANOVA revealed statistically significant ($p<0.05$) intergroup variance, Dunnett's test (Dunnett, 1964) was used to compare the test article-treated groups to the control group.

1.3. KEY STUDY DATES

Date(s)	Event(s)
28 February 2006	Experimental starting date (animal receipt)
14 March 2006	Experimental start date (first day of dose administration)
14 March - 4 April 2006	Test article administration
5 April 2006	Last euthanasia
20 April 2006	Experimental termination/completion date (last serum hormone analysis)

1.4. DATA RETENTION

The sponsor has title to all documentation records, raw data, specimens or other work product generated during the performance of the study. All work product generated by WIL Research Laboratories, LLC, including raw paper data and specimens, are retained in the Archives at WIL Research Laboratories, LLC, as specified in the study protocol. Data generated by the sponsor will be archived by the sponsor or the sponsor's designee.

Reserve samples of the test articles, pertinent electronic storage media and the original final report are retained in the Archives at WIL Research Laboratories, LLC in compliance with regulatory requirements.

1.5. RESULTS - [ ]

All females in the [ ]-treated groups survived to the scheduled euthanasia; there were no gross lesions at necropsy. Salivation and/or clear material around the mouth were noted infrequently for the 1000 mg/kg/day [ ] group females 1 hour following dose administration. These findings were attributed to the test article, but were not considered adverse.

No test article-related effects on mean body weights or body weight gains were noted in the 60, 250 and 1000 mg/kg/day [ ] groups. The only statistically significant ($p<0.05$) difference from the control group was a higher mean body weight gain in the 60 mg/kg/day [ ] group during PND 35-36.

Vaginal patency in the 1000 mg/kg/day [ ] group was attained earlier than in the control group; the difference was statistically significant ($p<0.01$). Mean ages of attainment were 32.1, 32.7, 31.7 and 28.1 days in the control, 60, 250 and 1000 mg/kg/day [ ] groups, respectively. The value in the 1000 mg/kg/day [ ] group was below the minimum mean value in the WIL historical control data for female pubertal assays (31.8 days). The value in the 250 mg/kg/day group was also slightly lower than the minimum mean value in the WIL historical control data for female pubertal assays; however, this was not considered toxicologically relevant because the value was similar to the concurrent control group. Because the females in the 1000 mg/kg/day group were younger on the day vaginal patency was observed, the mean body weight at the age of attainment of vaginal patency was statistically significantly lower ($p<0.01$) than the control group value and was lower than the minimum mean value in the WIL historical control data for female pubertal assays. The changes in these parameters in the 1000 mg/kg/day group were consistent with an interpretation of estrogenic effects resulting from the test article.

Corresponding to the earlier attainment of vaginal patency, the mean age at the first occurrence of estrus was earlier (not statistically significant) in the 1000 mg/kg/day [

] group (31.6 days) than in the concurrent control group (34.3 days). In the WIL historical control data for female pubertal assays, the mean age at the first occurrence of estrus ranged from 34.1-38.0 days. The mean age at first estrus in the 60 and 250 mg/kg/day groups (33.9 and 33.3 days, respectively) was also lower relative to the WIL historical control data. However, the values in these groups were similar to the value in the concurrent control group (34.3 days); therefore, no relationship to the test article was evident.

No differences in mean estrous cycle length were observed when the [ ]-treated groups were compared to the control group. Estrous cycle length could not be determined for 2 females each in the control, 250 and 1000 mg/kg/day [ ] groups, and for 4 females in the 60 mg/kg/day [ ] group, due to incomplete estrous cycles; estrous cycle lengths in females of this age are highly variable.

There were no test article-related effects on mean T_4, TSH, E_2 or LH values in the 60, 250 or 1000 mg/kg/day [ ] groups; none of the differences from the control group were statistically significant.

In the 1000 mg/kg/day group, the mean absolute wet uterus and luminal fluid weights were 33.7% and 65.9% lower than the concurrent control group values, respectively. The differences from the concurrent control group were not statistically significant; however, the mean absolute and relative (to final body weight) blotted uterus weights were statistically significantly lower than the concurrent control group. Based on the magnitudes of the changes and the effects on other endpoints (earlier occurrences of vaginal patency and first estrus), the lower values for luminal fluid and uterus weights were considered test article-related.

In the 60 and 250 mg/k/day groups, mean absolute wet uterus weight values were 18.4% and 14.4% lower than the control group, respectively, and mean luminal fluid weights were 53.7% and 38.9% lower than the control group value, respectively. However, the differences did not occur in a dose-related manner and were not statistically significant;

there was also no effect on the mean blotted uterus weights in these groups. In addition, there were no other indications of estrogenic effects at these dosage levels and the concurrent control group values for mean luminal fluid and absolute and relative (to final body weight) uterus weights exceeded the mean or maximum mean values in the WIL historical control data for female pubertal studies. Therefore, the apparent lower mean weights in the 60 and 250 mg/kg/day groups compared to the concurrent control group were not considered test article-related.

There were no other test article-related effects on absolute or relative (to final body weight) organ weights; differences from the control group were slight, did not occur in a dose-related manner and/or were not statistically significant. Based on the vaginal lavages performed immediately prior to euthanasia, females in estrus or proestrus numbered 8/15, 9/15, 3/15 and 2/15 in the control, 60, 250 and 1000 mg/kg/day [ ] groups, respectively.

1.6. CONCLUSIONS - [ ]

Based on the results of this study, the test article, [ ], administered orally to juvenile female rats at a dosage level of 1000 mg/kg/day resulted lower mean luminal fluid weights and absolute and relative (to final body weight) wet and blotted uterus weights. In addition, an acceleration in the age of attainment of vaginal patency in the 1000 mg/kg/day group was accompanied by an age-related lower body weight at the age of attainment. Because of the earlier attainment of vaginal patency in this group, the mean age at the first occurrence of estrus was lower. However, there were no test article-related effects on mean estrous cycle length at any dosage level evaluated. Mean luminal fluid and uterus weights were unaffected at 60 and 250 mg/kg/day, as were attainment of vaginal patency and initiation of estrus. There were no test article-related effects on survival, body weights or serum hormone levels at any dosage level; there were no gross lesions (i.e., masses) at necropsy.

1.7. RESULTS - [ ]

A single 1000 mg/kg/day [ ] group female was found dead on PND 25 within 1 hour of dose administration. There were no clinical signs or effects on body weight prior to death; macroscopic findings consisted of red areas on the lungs and red fluid in the thoracic cavity. The death was considered a probable intubation error.

There were no test article-related clinical findings at the daily examinations or 1 hour following dose administration at any dosage level.

No test article-related effects on mean body weights or body weight gains were noted in the 60, 250 and 1000 mg/kg/day [ ] groups. The only statistically significant ($p<0.05$) difference from the control group was a slightly lower mean body weight gain in the 1000 mg/kg/day [ ] group during PND 30-31.

Vaginal patency in the 1000 mg/kg/day [ ] group was attained slightly earlier than in the control group; the difference was not statistically significant. Mean ages of attainment were 32.1, 32.5, 32.5 and 31.1 days in the control, 60, 250 and 1000 mg/kg/day [ ] groups, respectively. The value in the 1000 mg/kg/day [ ] group was below the minimum mean value in the WIL historical control data for female pubertal assays (31.8 days). Because the females were younger on the day vaginal patency was observed, the mean body weight at the age of attainment of vaginal patency in the 1000 mg/kg/day [ ] group was slightly lower (not statistically significant) than the control group value. The changes in these parameters were consistent with an interpretation of estrogenic effects resulting from the test article.

Corresponding to the earlier attainment of vaginal patency, the mean age at the first occurrence of estrus was earlier (not statistically significant) in the 1000 mg/kg/day [ ] group than in the concurrent control group. The ages of the first occurrence of estrus in the concurrent control, 60, 250 and 1000 mg/kg/day groups were 34.3, 34.5, 34.0 and 32.6 days, respectively. In the WIL historical control data for female pubertal assays, the mean ages at the first occurrence of estrus ranged from 34.1-38.0 days. While the age at

first occurrence of estrus in the 250 mg/kg/day group was also slightly lower than the minimum mean value in the WIL historical control data, no relationship to the test article was evident because the value was similar to the concurrent control group value.

No differences in mean estrous cycle length were observed when the [ ]-treated groups were compared to the control group. Estrous cycle length could not be determined for 2, 4, 2 and 3 surviving females in the control, 60, 250 and 1000 mg/kg/day [ ] groups, due to incomplete estrous cycles; estrous cycle lengths in females of this age are highly variable.

There were no test article-related effects on mean T_4, TSH, E_2 or LH values in the 60, 250 or 1000 mg/kg/day [ ] groups; none of the differences from the control group were statistically significant.

There were no test article-related gross lesions in the [ ]-treated females. Single animals were noted with an ovarian cyst (60 mg/kg/day) or a depressed area on the kidney (1000 mg/kg/day).

There were no test article-related effects on organ weights at any dosage level. In the 250 and 1000 mg/kg/day [ ] groups, apparent reductions in luminal fluid weight (61.7% and 35.0% lower than the control group, respectively), mean absolute wet uterus weights (23.3% and 14.7% lower than the control group, respectively) and relative (to final body weight) uterus weights compared to the concurrent control group did not show a clear relationship to dosage level and were not statistically significant. These apparent reductions were likely the result of a higher number of concurrent control group females in estrus or proestrus at euthanasia, which resulted in mean luminal fluid and uterus weights for the concurrent control group that were higher than the mean or maximum mean values in the WIL historical control data for female pubertal assays. Based on the vaginal lavages performed immediately prior to euthanasia, females in estrus or proestrus numbered 8/15, 7/14, 3/15 and 4/14 in the control, 60, 250 and 1000 mg/kg/day [ ] groups, respectively. There were no effects on absolute or relative (to final body weight)

organ weights, including wet or blotted uterus weights or luminal fluid weights, at 60 mg/kg/day [ ].

1.8. CONCLUSIONS - [ ]

Based on the results of this study, the test article, [ ], administered orally to juvenile female rats resulted in a slight acceleration in the age of attainment of vaginal patency in the 1000 mg/kg/day group accompanied by an age-related lower body weight at the age of attainment. Because of the earlier attainment of vaginal patency in this group, the mean age at the first occurrence of estrus was slightly lower. However, there were no test article-related effects on mean estrous cycle length at any dosage level evaluated. There were no test article-related effects on mean uterus weights or luminal fluid weights, or on survival, body weights or serum hormone levels at any dosage level.

This study was inspected in accordance with the U.S. EPA Good Laboratory Practice Standards (40 CFR Part 792), the OECD Principles of Good Laboratory Practice, the Japanese MAFF Good Laboratory Practice Standards, the standard operating procedures of WIL Research Laboratories, LLC and the sponsor's protocol and protocol amendment with the following exceptions. The data located in Appendices A (Certificates of Analysis) and B (Analytical Chemistry Report) were the responsibility of the sponsor. Quality Assurance findings, derived from the inspections during the conduct of the study and from the inspections of the raw data and draft report, are documented and have been reported to the study director. A status report is submitted to management monthly.

This report accurately reflects the data generated during the study. The methods and procedures used in the study were those specified in the protocol, its amendments and the standard operating procedures of WIL Research Laboratories, LLC.

The raw data, the retention sample(s), and the final report will be stored in the Archives at WIL Research Laboratories, LLC or another location specified by the sponsor.

3.2. APPROVAL

This study was inspected according to the criteria discussed in Section 3.1.

5. DEVIATIONS FROM THE PROTOCOL

This study was conducted in accordance with the protocol and protocol amendments, except for the following.

- **Protocol Section 5.5** states that the body weight range at randomization would be 30 g to 50 g for immature females. The actual body weight range was 40.6 g to 58.2 g.
- **Protocol Section 5.7** states that the pups would be identified by tail tattoo prior to randomization and by an ear tag following randomization. In addition, the protocol states that individual cage cards would be affixed to each cage and would display the animal number, group number, study number, dosage level and sex of the animal. On PND 31, animals were placed into clean caging. At that time, new cage cards with the incorrect ear tag numbers were placed on the cages for 3 females in the 250 mg/kg/day [ ] group. The new cage cards had ear tag numbers recorded on them that did not match the original cage cards.
- **Protocol Section 7.4.4** states that individual doses would be calculated based on each daily body weight to provide the proper dosage. On PND 31, the following females in the 250 mg/kg/day [ ] group were dosed incorrectly. Female no. 20610-03 was dosed based on the body weight of female no. 20610-10 and received 256.4 mg/kg for that day. Female no. 20611-06 was dosed based on the body weight of female no. 20610-03 and received 213.8 mg/kg for that day. Female no. 20610-10 was dosed based on the body weight of female no. 20611-06 and received 288.4 mg/kg for that day.
- **Protocol Section 7.5.3** states that samples of the dosing mixtures would be collected on the first and last day of each weekly preparation and that for each time point, two 5-mL aliquots would be taken from each dosage level (including the control group formulation) for concentration analysis. On 20 March 2006, the last day of the first week of dose administration, three 5-mL samples were collected.
- **Protocol Section 7.6.4** states that daily vaginal lavages would be performed to determine the stage of estrus beginning on the day vaginal perforation was observed and continuing through the day of necropsy. Vaginal lavages were performed 1 day prior to complete vaginal opening for female no. 20604-01 in the 1000 mg/kg/day [ ] group (lavaged on PND 30, vaginal opening documented on PND 31) and female no. 20611-09 in the 1000 mg/kg/day [ ] group (lavaged on PND 35, vaginal opening documented on PND 36).

- **Protocol Section 7.6.4** states that daily vaginal lavages would be performed to determine the stage of estrus beginning on the day vaginal perforation was observed and continuing through the day of necropsy. On the day of euthanasia, the samples taken from female no. 20603-04 in the 1000 mg/kg/day [ ] group and female no. 20607-06 in the 60 mg/kg/day [ ] group were placed on the same slide. Therefore, the stage of estrus could not be determined for either female.

- **Protocol Section 7.7** states that the time of euthanasia would be recorded for each animal. The time of euthanasia was not recorded for female no. 20603-09 in the 250 mg/kg/day [ ] group, but was between 1015 hours (the time of euthanasia for the preceding animal) and 1029 hours (the time of euthanasia of the following animal).

These deviations did not negatively impact the quality or integrity of the data nor the outcome of the study.

APPENDIX D

Clinical Pathology Methods, Procedures And References

Revised Draft

CLINICAL PATHOLOGY METHODS, PROCEDURES AND REFERENCES

Immunoassay- DPC Immulite®

Estradiol (estradiol-17β) - Competitive Immunoassay for the quantitative measurement of estradiol in serum. Default unit: pg/mL.

Total T4 - Solid-phase, chemiluminescent enzyme immunoassay for the quantitative measurement of total circulating thyroxide. Default unit: µg/dL.

Revised Draft

Immunoassay-GAMMA-C12 Gamma Counter

Rat Luteinizing Hormone (rLH) - ^{125}I radioimmunoassay system for the quantitative determination of (rLH) DPC GAMMA C-12 gamma counter. Default unit: mIU/mL. Biotrak™ rat luteinizing hormone [^{125}I] assay system©. Amersham Life Science Ltd. Package Insert.

Rat Thyroid Stimulating Hormone (rTSH) - ^{125}I assay system with magnetic separation for the quantitative measurement of (rTSH). DPC GAMMA C-12 gamma counter. Biotrak™ rat thyroid stimulating hormone ^{125}I assay system. Amersham Pharmacia Biotech. Package insert.

Study Number: WIL-187055

PROTOCOL AMENDMENT II

Sponsor: [redacted]

Sponsor No.: 06-010

A. Title:

A Female Pubertal Assay of [redacted] and [redacted] Administered Orally in Juvenile Female Rats

B. Protocol Modification/Addition/Clarification:

1) **7.6.4 Determination of Estrous Cycles:**

In accordance with the Study Director Notification dated March 31, 2006, the vaginal lavage performed on the day of necropsy was collected immediately prior to euthanasia.

C. Reason for Protocol Modifications:

1) This change in procedure was made to allow a more accurate correlation of serum hormone levels with the stage of the estrous cycle.

PROTOCOL AMENDMENT I

Sponsor: [redacted]

Sponsor No.: 06-010

A. Title:

A Female Pubertal Assay of [redacted] and [redacted] Administered Orally in Juvenile Female Rats

B. Protocol Modification/Addition/Clarification:

1) **3** **STUDY SCHEDULE:**

Proposed Audited Report Date: June 14, 2006

2) **7.5.1** **Method and Frequency of Preparation:**

In accordance with the Study Director Notification dated March 10, 2006, the dosing formulations will be stored at room temperature.

3) **8** **HORMONE ANALYSIS:**

The following is added to this section:

Estradiol (E_2) and Lutenizing (LH) hormone concentration levels will be determined.

4) **9.1** **Macroscopic Examination:**

The following is added to this section:

The spleen, thymus and axillary lymph node are added to the list of tissues to be collected.

5) **9.2.2** **Ovary, Liver, Kidney, Pituitary, Thyroid and Adrenal Weights:**

The following is added to this section:

The spleen and thymus are added to the list of organs to be weighed.

Revised Draft

C. Reason for Protocol Modifications:

1) The proposed audited report date has been determined.

2) The storage requirement for dosing formulations has been added.

3) Additional hormones for analysis have been added.

4) The Sponsor has requested collection of additional tissues.

5) The additional tissues collected will be weighed.

PROTOCOL

A FEMALE PUBERTAL ASSAY OF [redacted] AND [redacted] ADMINISTERED ORALLY IN JUVENILE FEMALE RATS

Sponsor Study Number: 06-010

Submitted To:

[redacted]

WIL Research Laboratories, LLC
1407 George Road
Ashland, OH 44805-9281

1 OBJECTIVE:

The objective of this study is to evaluate the ability of the test articles to induce effects on pubertal development in the intact juvenile female rat.

The study will be conducted in compliance with the U.S. Environmental Protection Agency (EPA), 40 CFR Part 792, the OECD [C(97) 186/Final] and the Ministry of Agricultural, Forestry and Fisheries (MAFF), Law No. 82, 1948, Good Laboratory Practice (GLP) Standards. The study will be performed according to the protocol and WIL Standard Operating Procedures.

4 TEST ARTICLE DATA:

4.1 Identification:

[redacted]

4.1.1 Lot Number:

[redacted]

4.1.2 Purity:

100%.

4.1.3 Stability:

The test article is considered to be stable under the storage conditions provided by the Sponsor.

4.1.4 Physical Description:

To be determined

4.1.5 Storage Conditions:

Store at ambient conditions

4.1.6 Reserve Samples:

Reserve samples of the test article will be taken in accordance with WIL standard operating procedures and stored in the Archives at WIL Research Laboratories, LLC indefinitely unless otherwise specified.

4.1.7 Personnel Safety Data:

To be provided by the Sponsor. It is the responsibility of the Sponsor to notify the testing facility of any special handling requirements for the test article. A material safety data sheet (MSDS) will accompany the test article upon arrival at the laboratory.

4.2 Identification:

[redacted]

4.2.1 Lot Number:

[redacted]

Revised Draft

4.2.2 Purity:

100%.

4.2.3 Stability:

The test article is considered to be stable under the storage conditions provided by the Sponsor.

4.2.4 Physical Description:

To be determined

4.2.5 Storage Conditions:

Store at ambient conditions

4.2.6 Reserve Samples:

Reserve samples of the test article will be taken in accordance with WIL standard operating procedures and stored in the Archives at WIL Research Laboratories, LLC indefinitely unless otherwise specified.

4.2.7 Personnel Safety Data:

To be provided by the Sponsor. It is the responsibility of the Sponsor to notify the testing facility of any special handling requirements for the test article. A material safety data sheet (MSDS) will accompany the test article upon arrival at the laboratory.

5 TEST SYSTEM:

5.1 Species:

Rat

5.2 Strain:

Crl:CD(SD)

5.3 Source:

Charles River Laboratories
Raleigh, NC

Revised Draft

5.4 Number on Study:

One hundred-five females (maximum of 130 females and 13 dams purchased). Immature females will be supplied in litters of 10 animals with their own or another (fostering) dam. The immature females will be 6-8 days old upon receipt. Pups not expected to survive to the next observation period (moribund) will be euthanized by intraperitoneal injection of sodium pentobarbital (prior to PND 11) or by carbon dioxide inhalation (after PND 11) and the carcass discarded. Animals not assigned to the study will be transferred to the stock animal colony or will be euthanized by carbon dioxide inhalation and the carcasses discarded. Following weaning, the dams will be euthanized by carbon dioxide inhalation and the carcasses discarded.

5.5 Body Weight Range:

At randomization: 30-50 g for immature females. All animals assigned to study will be approximately ± 5 g of the mean.

5.6 Age:

At start of dosing animals will be 22 days of age.

5.7 Identification System:

The maternal animals will be uniquely identified by a Monel® metal eartag displaying the animal number. The pups will be identified by tail tattoo. Individual cage cards will be affixed to each cage and will display the animal number, group number, study number, dosage level and sex of the animal. Following randomization the pups will be individually identified by an ear tag.

5.8 Justification for Selection:

This species and strain of animal is recognized as appropriate for reproduction studies. WIL Research Laboratories, LLC has reproductive historical control data in this species and strain of rat. This animal model has been proven to be susceptible to the effects of reproductive toxicants. This number of animals is considered the minimum number required for meaningful interpretation of the data and fulfillment of agency requirements.

6 SPECIFIC MAINTENANCE SCHEDULE:

6.1 Animal Housing:

All animals will be initially housed by litter with their own or another (fostering) dam in plastic maternity cages containing ground corncob nesting material (Bed-O'Cobs®). Following randomization, the juvenile female animals

will be weaned and housed three animals per cage in plastic maternity (shoebox) cages. Control animals (Group 1) will be housed on a separate rack from exposed animals. The cage bedding will be changed at least three times each week. The cages will be subjected to routine cleaning at a frequency consistent with maintaining good animal health and WIL standard operating procedures. The facilities at WIL Research Laboratories, LLC are fully accredited by the Association for Assessment and Accreditation of Laboratory Animal Care International (AAALAC International).

6.2 Environmental Conditions:

Controls will be set to maintain an average daily temperature of 71 ± 5°F (22 ± 3°C) and an average daily relative humidity of 50 ± 20%. Temperature and relative humidity will be monitored continuously. Data for these two parameters will be scheduled for automatic collection on an hourly basis. Fluorescent lighting controlled by light timers will provide illumination for a 12-hour light/dark photoperiod. Temporary adjustments to the light/dark cycles may be made to accommodate protocol-specified activities. The ventilation rate will be set at a minimum of 10 room air changes per hour, 100% fresh air.

6.3 Drinking Water:

Reverse osmosis-purified water will be available *ad libitum*. Filters servicing the automatic watering system are changed regularly according to WIL Standard Operating Procedures. The municipal water supplying the laboratory is analyzed according to WIL Standard Operating Procedures on a routine basis to assure that contaminants are not present in concentrations that would be expected to affect the outcome of the study.

6.4 Basal Diet:

PMI Nutrition International, LLC Certified Rodent LabDiet® 5002 will be offered *ad libitum* during the study. Periodic analyses of the certified feed are performed by the manufacturer to ensure that heavy metals and pesticides are not present at concentrations that would be expected to affect the outcome of the study. Results of the analyses are provided to WIL Research Laboratories, LLC by the manufacturer and will be placed in the study records. Each lot utilized will be identified and recorded. Feeders will be changed and sanitized once per week.

7 EXPERIMENTAL DESIGN:

7.1 Animal Receipt and Acclimation:

Each animal will be inspected by a qualified technician upon receipt. Rats judged to be in good health and suitable as test animals will be immediately

Revised Draft

placed in quarantine for a minimum of nine days. All rats will be initially sexed and weighed. Maternal animals will be permanently identified with a metal ear tag, and juvenile animals will be identified by tail tattoo. During the quarantine period, each rat will be observed twice daily for changes in general appearance and behavior. Prior to the start of the in-life phase, those animals judged to be suitable test subjects will be identified and receive a detailed physical examination at the time of animal selection for randomization.

7.2 Randomization:

At the conclusion of the quarantine period (animals 21 days of age), animals judged to be suitable test subjects and meeting acceptable body weight requirements, will be assigned at random using a computer program. At that time, the animal numbers and corresponding body weights will be entered into the WIL Toxicology Data Management System (WTDMS™). A printout containing the animal numbers and individual group assignments will be generated based on body weight stratification into a block design. Animals will then be weaned and arranged into the groups according to the printout. Body weights at randomization will be within ± 20% of the mean. Each of 7 groups will consist of fifteen females. If after randomization statistically significant differences between groups exist, new randomizations will be generated until group mean body weights are homogeneous.

7.3 Route and Rationale of Test Article Administration:

The route of administration will be oral (gavage). Historically, this route has been used extensively for studies of this nature. Appropriate-sized flexible, Teflon®-shafted, stainless steel ball-tipped dosing cannulae will be used for the oral administration by gavage. Any losses or incomplete dosing will be recorded.

Revised Draft

Revised Draft

7.4 Organization of Test Groups, Dosage Levels and Treatment Regimen:

7.4.1 Organization of Test Groups:

The dosage levels were determined from the results of previous studies and were provided by the Sponsor Representative after consultation with the WIL Study Director. The following table presents the study group arrangement.

Group Number	Test Article	Dosage Level (mg/kg/day)	Dose Concentration (mg/mL)	Dose Volume (mL/kg)	Number of Females
1	Vehicle	0	0	5	15
2	[redacted]	60	12	5	15
3		250	50	5	15
4		1000	200	5	15
5		60	12	5	15
6		250	50	5	15
7		1000	200	5	15

7.4.2 Vehicle Control Article:

Corn oil

7.4.3 Treatment Regimen:

The test and control articles will be administered as single daily doses beginning on day 22 of age and continuing through 41 days of age. All animals will be dosed at approximately the same time each day, after 12:00 p.m., and the time of dosing will be recorded for each animal.

7.4.4 Adjustment of Dosages:

Individual doses will be calculated based on each daily body weight to provide the proper dosage. Individual animal body weights and individual animal dosages will be recorded.

7.5 Preparation and Analysis of Test Material Preparations:

7.5.1 Method and Frequency of Preparation:

Based on the physical characteristics of the test article, appropriate methods will be used to ensure the best possible formulations of the test article in the vehicle. Dosing formulations of the test article will be prepared weekly. The study director or the deputy director or designee will visually inspect the formulations prior to initiation of dosing. This

visual inspection will be performed to assure that the formulations are visibly homogeneous and acceptable for dosing. Any special procedures required for formulation will be documented according to Good Laboratory Practices and presented in the final report of this study.

7.5.2 Homogeneity and Stability of Test Article Formulation:

Dosing mixture homogeneity in bulk preparations will be collected prior to the initiation of test article administration, if possible. While undergoing stirring in the beaker, the following sample aliquots (5 mL) will be drawn for analysis: control, three aliquots (from the middle); all treatment groups, nine aliquots (3 each from the top, middle and bottom). Test article formulations will be divided into aliquots for daily dispensation. Resuspension homogeneity of aliquots will be determined over the longest period of aliquot storage. Three samples (5 mL) from the top and bottom of each group will be collected to assess the homogeneity after storage and resuspension. Two of the three samples will be sent to [redacted] c/o [redacted] for analysis of homogeneity and stability over a ten-day period. The samples will be shipped under ambient conditions. The remaining sample from each dose level and strata will be stored under normal laboratory conditions for possible future analysis.

7.5.3 Concentration Analysis:

Samples of the dosing mixtures will be collected on the first and last day of each weekly preparation. At each time point, two 5-mL aliquots will be taken from each dose level (middle stratum), including the control group. The dosing mixture will be thoroughly mixed before taking each sample. One sample from each dose level will be analyzed; the remaining sample will be retained by the Testing Laboratory for possible future analysis.

Dosing mixture samples for homogeneity, stability and concentration of the test article at all dose levels, including the control, will be analyzed by the Sponsor. Quality assurance (QA) auditing of the conduct, results and reporting of the analyses, as well as archiving of these data will be the responsibility of the Sponsor. Critical phase inspection reports and report audits will be submitted to the Study Director and management at WIL Research Laboratories, LLC. A QA statement will be issued for inclusion in the overall final report. The methods and results of the analysis will be provided by the Sponsor and included as an appendix to the WIL final report. The method employed will be:

[redacted] SOP: To be determined

Revised Draft

Concentration and stability data will be evaluated using percent difference. The acceptable tolerance between the theoretical and measured values is 15%.

Mixtures will be considered homogeneous if the difference between the overall group mean and the strata mean is10% or less.

7.5.4 Sample Handling and Shipment:

Each 5-mL sample will be placed in a glass vial with a Teflon-lined lid. The vial plus sample weight will be recorded with an accuracy of ± 0.0005 g. Each sample will be stored at ambient temperature. Each sample container will be labeled with the following information:

Accession Number
Sponsor's Reference Number
Testing Laboratory Study Number
Test Article Name
Dose Level (mg/kg)
Dosing Mixture Concentration (mg/mL)
Preparation Date
Sampling Date
Weight of Sample

The sample shall be packed in a suitable container to maintain the temperature conditions specified in Section 4 during transit plus an adequate margin of safety for any transit delays. The sample shall be sent by express courier to:

[redacted]

[redacted] shall be notified in advance of shipping by telefax at [redacted] This notification shall include test article and study identification, carrier, and estimated time/date of arrival. Sample shipments shall be accompanied by an inventory sheet describing the samples contained in the shipment with the information described above.

Revised Draft

Revised Draft

7.6 General Observations During the Experimental Period:

7.6.1 Clinical Signs:

The rats will be observed twice daily for appearance, behavior, moribundity and mortality. A detailed physical examination will be conducted at the time of randomization. Clinical observations regarding general appearance and behavior will be recorded daily prior to dosing. During the treatment period, the rats will be observed also approximately one hour following dosing and the observations will be recorded. Additional post-dosing observation periods may be necessary and will be documented in the study records. Observations shall include, but are not limited to, evaluations for changes in appearance of the skin and fur, eyes and mucous membranes, respiratory, circulatory, autonomic and central nervous system functions, somatomotor activity and behavior patterns. Observations will be recorded. Findings noted outside of the scheduled observation time periods will be recorded at the time they are observed.

7.6.2 Body Weights:

Daily body weights will be recorded individually (to the nearest 0.1 gram, PND 22-42) beginning one day prior to the start of dosing. Final body weights will be collected prior to euthanasia.

7.6.3 Vaginal Perforation:

Each female pup (15/group) will be observed once daily for vaginal perforation beginning on PND 25 (Adams, 1985). Examination of the females will be performed at approximately the same time each day and will continue daily until vaginal perforation is present. The body weight of each female will be recorded on the day of acquisition of vaginal perforation.

7.6.4 Determination of Estrous Cycles:

Daily vaginal lavages will be performed to determine the stage of estrus beginning on the day vaginal perforation is observed. Lavages will be performed at approximately the same time each day and will continue through the day of necropsy. The mean age of first estrous will be determined.

7.7 Euthanasia:

On PND 42, the animals will be euthanized by carbon dioxide inhalation, and the time of euthanasia will be recorded for each animal. Any animals not

expected to survive until the following dosing period or until the scheduled euthanasia will be euthanized by carbon dioxide inhalation and necropsied as described in section 9.

8 HOROMONE ANALYSIS:

8.1 Thyroid Hormones:

Following euthanasia, blood will be collected from the vena cava of all animals. Following collection, all blood samples (target volume of 2 mL) will be allowed to clot and then be placed in an ice bath and processed to generate serum. The following hormone concentrations will be determined from all serum samples:

Thyroid Stimulating Hormone (TSH) Thyroxine (T4)

Serum not utilized for TSH and T4 concentrations will be stored frozen for possible future analysis (added by amendment).

9 ANATOMIC PATHOLOGY:

9.1 Macroscopic Examination:

A complete necropsy examination will be conducted on all animals dying spontaneously or euthanized *in extremis*. This will include examination of the external surface, all orifices, the external surface of the brain and spinal cord and the thoracic, abdominal and pelvic cavities including viscera. A complete necropsy will not be conducted on animals surviving to study termination. Gross lesions (i.e., masses) will be collected and placed in 10% neutral-buffered formalin. The following tissues will be collected and placed in 10% neutral-buffered formalin at study termination:

Cervix and Uterine Body (one longitudinal section)	Thyroids with parathyroids
Ovaries	Uterine horns (four sections per horn)
Pituitary	Vagina
	All gross (internal) lesions

9.2 Organ Weights:

9.2.1 Uterine Weights:

Wet and blotted uterine weights will be measured for all animals surviving to the scheduled necropsy. Uterine weights will not be collected for any animals found dead or euthanized in extremis.

The uterus will be harvested from all animals using the following procedure. The harvesting of uteri will be performed in a round-robin

Revised Draft

Revised Draft

order. The pubic symphysis will be opened and each ovary and uterine horn will be detached from the dorsal abdominal wall. The ovaries are separated from the uterine horns at the oviduct/uterus junction. The urinary bladder and ureters will be removed from the ventral and lateral side of the uterus and vagina. The fibrous adhesion between the rectum and vagina is then detached until the junction of the vaginal orifice and perineal skin is identified. The uterus and vagina are detached from the body by incising the vaginal wall just above the junction between the perineal skin. The excess fat and adnexa will be trimmed away. The vagina is then removed from the uterus, leaving the cervix intact and attached to the uterus for uterus weight measurement. Care is to be taken during uterus harvesting such that the luminal contents are retained. A record will be made if any luminal contents are lost. The uterus will be transferred to a uniquely marked and tared plastic Petri dish with care to avoid desiccation before weighing. The Petri dish should be lined with saline-moistened filter paper (or equivalent) and covered to minimize desiccation.

The uterus harvesting and weighing procedure will be done in the order described below.

1. Animal is euthanized and uterus harvested.
2. Uterus (with luminal fluid) is immediately transferred to a Petri dish (lined with saline-moistened filter paper or equivalent) that was tared immediately prior to the transfer.
3. The uterus' wet weight is recorded to the nearest 0.1 mg.
4. The uterus is opened and blotted (see below).
5. The uterus is placed in a Petri dish (lined with saline-moistened filter paper or equivalent) that was tared immediately prior to the transfer.
6. The uterus' blotted weight is recorded to the nearest 0.1 mg.

Immediately following collection of the wet weight, the uterus will be individually processed by opening the uterine wall and carefully blotting the excess fluid. Both uterine horns will be pierced and cut longitudinally with small surgical scissors, placed on filter paper (ex. Whatman No. 3) and gently pressed with another piece of dry filter paper to absorb the luminal fluid. The procedure will not be so severe as to render the tissue unacceptable for histopathologic analysis, as this additional investigation may be performed at the discretion of the Sponsor (by protocol amendment).

Revised Draft

9.2.2 Ovary, Liver, Kidney, Pituitary, Thyroid and Adrenal Weights:

The following organs from all females euthanized at scheduled termination will be weighed (to the nearest 0.1 mg):

Adrenal glands	Ovaries and oviducts
Liver	Pituitary gland
Kidneys	Thyroids with parathyroids (following fixation)

Paired organs will be weighed together.

To minimize systematic bias in the weighing procedures, organ harvesting and weighing procedures will be divided as equally as possible among the prosecting and weighing technicians, such that all animals from a group are not processed by a single individual.

9.3 Microscopic Examination:

Following collection of wet uterine weight, blotting of the uterus and collection of blotted uterine weight, each uterus will be placed in a uniquely identified jar of 10% neutral-buffered formalin and preserved for microscopic examination. The vagina, ovaries, and thyroids with parathyroids from each animal will be similarly preserved.

Microscopic examination of hematoxylin-eosin stained paraffin sections may be performed on the following tissues from all animals at the discretion of the Sponsor (additional cost).

Ovaries	Thyroids with parathyroids
Cervix and Uterine Body (one longitudinal section)	Uterine Horns (four sections per horn)

10 DURATION OF STUDY:

The conduct of this study will require approximately five weeks for acclimation, dosing and necropsy.

11 STATISTICAL METHODS:

Body weights, body weight gains, organ weights, organ weights relative to final body weights, uterine weights (wet and blotted), luminal fluid weights, mean days of acquisition of vaginal perforation, mean age of first estrous, estrous cycle length and serum hormone concentrations will be analyzed by a parametric one-way analysis of variance (ANOVA) (Snedecor, 1980) to determine intergroup difference. If the

results of the ANOVA are significant ($p<0.05$), Dunnett's test (Dunnett, 1964) will be applied to the data to compare the treated groups to the control group.

12 QUALITY ASSURANCE:

The study will be audited by the WIL Quality Assurance Unit while in progress to assure compliance with the study protocol, protocol amendments and WIL Standard Operating Procedures. The study will be conducted in compliance with the U.S. Environmental Protection Agency (EPA), 40 CFR Part 792, the OECD [C(97) 186/Final] and the Ministry of Agricultural, Forestry and Fisheries (MAFF) Law No. 82, 1948, Good Laboratory Practice (GLP) Standards. The raw data and draft report will be audited by the WIL Quality Assurance Unit prior to submission to the Sponsor Representative to assure that the final report accurately describes the conduct and the findings of the study.

This study will be included on the WIL master list of regulated studies.

13 RECORDS TO BE MAINTAINED:

All original raw data records, as defined by WIL SOPs and the applicable GLPs, will be stored as described in Section 14 in the Archives at WIL Research Laboratories, LLC.

14 WORK PRODUCT:

The Sponsor will have title to all documentation records, raw data, slides, specimens and other work product generated during the performance of the study. All work product, including raw paper data, pertinent electronic storage media and specimens will be returned to the Sponsor after a period of six months or following issuance of the final report. All work product will be stored in compliance with regulatory requirements.

Any work product, including documents, specimens, and samples, that are required by this protocol, its amendments, or other written instructions of the Sponsor, to be shipped by WIL Research Laboratories, LLC to another location will be appropriately packaged and labeled as defined by WIL's SOPs and delivered to a common carrier for shipment. WIL Research Laboratories, LLC will not be responsible for shipment following delivery to the common carrier.

15 REPORTS:

The final report will consist of an abbreviated summary report, including data tables and an interpretation and discussion of the study results.

WIL Research Laboratories will submit one copy of an audited draft report in a timely manner upon completion of data collection prior to issuance of the final report.

Revised Draft

One revision will be permitted as part of the cost of the study, from which the Sponsor's reasonable revisions and suggestions will be incorporated into the final report, as appropriate. Additional changes or revisions may be made, at extra cost. It is expected that the Sponsor will review the draft report and provide comments to WIL within a two-month time frame following submission. WIL will submit the final report within one month following receipt of comments. If the Sponsor's comments and/or authorization to finalize the report have not been received at WIL within one year following submission of the draft report, WIL may elect to finalize the report following appropriate written notification to the Sponsor. Two electronic copies (PDF) of the final report on CD-R will be provided. Requests for additional paper copies of the final report may result in additional charges.

Revised Draft

16 ANIMAL WELFARE ACT COMPLIANCE:

This study will comply with all applicable sections of the Final Rules of the Animal Welfare Act regulations (9 CFR Parts 1, 2 and 3). The Sponsor should make particular note of the following:

- The Sponsor Representative's signature on this protocol documents for the Study Director the Sponsor's assurance that the study described in this protocol does not unnecessarily duplicate previous experiments.

- Whenever possible, procedures used in this study have been designed to avoid or minimize discomfort, distress or pain to animals. All methods are described in this study protocol or in written laboratory standard operating procedures.

- Animals that experience severe or chronic pain or distress that cannot be relieved will be painlessly euthanized as deemed appropriate by the veterinary staff and Study Director. The Sponsor will be advised by the Study Director of all circumstances which could lead to this action in as timely a manner as possible.

- Methods of euthanasia used during this study are in conformance with the above-referenced regulation.

- The Sponsor/Study Director has considered alternatives to procedures that may cause more than momentary or slight pain or distress to the animals and has provided a written narrative description (AWA covered species) of the methods and sources used to determine that alternatives are not available.

17 PROTOCOL MODIFICATION:

Modification of the protocol may be accomplished during the course of this investigation. However, no changes will be made in the study design without the written permission of the Sponsor. In the event that the Sponsor requests or approves a change in the protocol, such changes will be made by appropriate documentation in

the form of protocol amendment. All alterations of the protocol and reasons for the modification(s) will be signed by the Study Director and the Sponsor Representative.

1. SUMMARY

1.1. OBJECTIVE

The objective of the study was to evaluate the ability of the test articles to induce effects on pubertal development in the intact juvenile female rat.

1.2. STUDY DESIGN

[ ] or [ ], in the vehicle, Mazola® corn oil, was administered orally by gavage once daily for 20 consecutive days to 3 groups each of 15 Crl:CD(SD) immature female rats. Dosage levels for each test article were 60, 250 and 1000 mg/kg/day, and the dosage volume was 5 mL/kg. A concurrent control group received the vehicle on a comparable regimen. These dosage levels were determined from the results of previous studies and were provided by the sponsor representative after consultation with the WIL study director.

Dosing procedures were performed from 28 March 2006 through 18 April 2006, when the animals were 22 to 41 days of age; the start of dose administration was staggered, based on age. At the initiation of dose administration, individual body weights ranged from 39.2 g to 61.9 g. The following table presents the study group assignment:

Group Number	Test Article	Dosage Level (mg/kg/day)	Dosage Concentration (mg/mL)	Dosage Volume (mL/kg)	Number of Females
1	Corn Oil	0	0	5	15
2	[ ]	60	12	5	15
3	[ ]	250	50	5	15
4	[ ]	1000	200	5	15
5	[ ]	60	12	5	15
6	[ ]	250	50	5	15
7	[ ]	1000	200	5	15

Due to spacing constraints, the dosage group names are presented on the tables and figures as corn oil, [ ]/60, [ ]/250 and [ ]/1000 for the vehicle control,

60, 250 and 1000 mg/kg/day [ ] groups, respectively and [ ]/60, [ ]/250 and [ ]/1000 for the 60, 250 and 1000 mg/kg/day [ ] groups, respectively.

Preparation, storage and sampling of the control and test article formulations were conducted as follows. For the control group, the appropriate amount of the vehicle (corn oil, exp. dates: 1 and 23 February 2007) was placed in a storage container and stirred throughout use. The [ ] and [ ] dosing formulations were prepared as follows. The appropriate amount of test article for each group was weighed into a tared, calibrated glass container. A stir bar and approximately 80% of the vehicle were added to each container, and the mixtures were stirred until uniform. The appropriate volume of vehicle was added to bring each formulation to the calibration mark, and the preparations were stirred until uniform and throughout use. The [ ] and [ ] dosing formulations were prepared approximately weekly, divided into aliquots for daily dispensation and stored at room temperature. Three samples from the control group formulation and 3 sets of samples from the top, middle and bottom strata of the test article formulations were collected prior to the initiation of dose administration. Additional samples (3 sets) were collected for resuspension homogeneity from the same formulations following 10 days of room temperature storage. Two sets of samples for concentration verification were collected on each day of preparation and 2 sets were collected on the last day of use of each preparation. Two sets of homogeneity/stability samples and 6 sets of concentration samples were shipped under ambient conditions to the sponsor for homogeneity, stability and concentration analyses; the remaining samples were stored under normal laboratory conditions at WIL Research Laboratories, LLC, for possible future analysis.

Thirteen dams with 10 or 11 female pups each (131 pups total) were received from Charles River Laboratories, Inc., Raleigh, North Carolina, on 14 March 2006. The pups were 6 to 8 days old upon receipt. Pups were initially identified by tail tattoo, housed in plastic maternity cages (by litter with their own or a fostering dam for 14 to 16 days) during the acclimation period until randomization of the pups on postnatal day (PND) 21.

Following randomization, the female pups were weaned, identified by metal eartag and housed 3 per cage in plastic maternity cages; control group animals were housed in a separate rack than the test article-treated group animals. Environmental controls were set to maintain an average daily temperature of 71°F ± 5°F (22°C ±3°C) and an average daily relative humidity of 50% ± 20%. Actual mean daily temperatures ranged from 70.2°F to 70.6°F (21.2°C to 21.5°C) and mean daily relative humidity ranged from 37.9% to 49.6%. Light timers were calibrated to provide a 12-hour light (0600 hours to 1800 hours)/12-hour dark photoperiod. Air handling units were set to provide approximately 10 fresh air changes per hour. PMI Nutrition International, LLC, Certified Rodent LabDiet® 5002 and reverse osmosis-purified water were offered ad libitum.

All animals were observed twice daily for appearance, behavior, mortality and moribundity. A detailed physical examination was performed at the time of randomization. The rats were also observed daily (prior to dosing). Clinical findings at the time of dose administration and approximately 1 hour following dose administration were recorded when observed. Individual body weights were recorded daily. Each female pup was observed daily for vaginal patency beginning on PND 25 (Adams et al., 1985). Examination continued daily until vaginal patency was observed. Body weights were recorded on the day that vaginal patency was noted. Beginning on the day that vaginal patency was observed, vaginal lavages were performed daily, through the day of euthanasia, and the slides were examined to determine the stage of estrus. The mean estrous cycle length was calculated and reported for complete estrous cycles (i.e., the total number of returns to metestrus [M] or diestrus [D] from estrus [E] or proestrus [P] until the day of euthanasia). Estrous cycle length was determined by counting the number of days from the first M or D in a cycle to the first M or D in a subsequent cycle. In addition, the mean age at the onset of the first estrous cycle was calculated using the first day each animal was observed to be in estrus. As a result of mortality and clinical signs of overt toxicity, animals in the 1000 mg/kg/day [ ] group that were not found dead were euthanized by carbon dioxide inhalation (PND 23-25) and discarded without

further examination. A gross necropsy was performed only on animals that were found dead; at the scheduled euthanasia, organs that were weighed were also examined. All surviving animals were euthanized on PND 42 by carbon dioxide inhalation; blood was collected via the vena cava for evaluation of serum thyroxine (T_4), thyroid stimulating hormone (TSH), estradiol (E_2) and luteinizing hormone (LH) levels. The uterus (wet and blotted), kidneys, liver, ovaries and oviducts, adrenal glands, pituitary gland, spleen, thymus gland and thyroid glands with parathyroid glands (following fixation) were weighed. Luminal fluid weight was calculated by subtracting the blotted uterus weight from the wet uterus weight. The ovaries, uterus (horns and body), cervix, vagina, pituitary gland, thyroid/parathyroid glands, spleen, thymus gland, axillary lymph nodes and gross lesions were retained from all necropsied females.

Statistical tests were performed using appropriate computing devices or programs. Analyses were conducted using two-tailed tests for minimum significance levels of 1% and 5%, comparing each test article-treated group to the control group. Each mean was presented with the standard deviation (S.D.) and the number of animals (N) used to calculate the mean. In addition, percent change from control is presented for body weights, clinical pathology parameters and organ weights. Due to the different rounding conventions inherent in the types of software used, the means and standard deviations on the summary and individual tables may differ by ±1 in the last significant figure. Mean body weights, body weight changes, days of acquisition of vaginal patency, estrous cycle lengths, ages at the first occurrence of estrus, serum hormone levels, luminal fluid weights and absolute and relative organ weights were subjected to a parametric one-way analysis of variance (ANOVA; Snedecor and Cochran, 1980) to determine intergroup differences. If the ANOVA revealed statistically significant ($p<0.05$) intergroup variance, Dunnett's test (Dunnett, 1964) was used to compare the test article-treated groups to the control group.

1.3. KEY STUDY DATES

Date(s)	Event(s)
14 March 2006	Experimental starting date (animal receipt)
28 March 2006	Experimental start date (first day of dose administration)
28 March – 18 April 2006	Test article administration
27 April 2006	Experimental termination/completion date (last serum hormone analysis)

1.4. DATA RETENTION

The sponsor has title to all documentation records, raw data, specimens or other work product generated during the performance of the study. All work product generated by WIL Research Laboratories, LLC, including raw paper data and specimens, are retained in the Archives at WIL Research Laboratories, LLC, as specified in the study protocol. Data generated by the sponsor will be archived by the sponsor or the sponsor's designee.

Reserve samples of the test articles, pertinent electronic storage media and the original final report are retained in the Archives at WIL Research Laboratories, LLC in compliance with regulatory requirements.

1.5. RESULTS - [ ]

One or 2 occurrences of clear material around the mouth were noted in 6 of 15 females in the 1000 mg/kg/day [ ] group 1 hour following dose administration. Salivation was also observed for 2 females in this group at the time of dose administration. These findings were attributed to the test article, but were not considered adverse because of the infrequent nature and because clear material around the mouth and salivation did not persist to the following day.

All females in the control, 60, 250 and 1000 mg/kg/day [ ] groups survived to the scheduled euthanasia. No test article-related macroscopic findings were noted at the scheduled necropsy on PND 42. Only the tissues that were retained were examined.

Slightly lower mean body weight gains in the 1000 mg/kg/day [ ] group relative to the control group values were noted during PND 25-26 through PND 28-29, with general reductions occurring during the remainder of the treatment period. The differences were statistically significant ($p<0.05$ or $p<0.01$) during PND 26-27 and when the entire treatment period (PND 22-42) was evaluated. Mean body weights in this group were 5.3% to 8.1% lower than the control group values from PND 33-42. The differences were statistically significant ($p<0.05$) on PND 40 and 42. Mean body weights and body weight gains in the 60 and 250 mg/kg/day [ ] groups were unaffected by test article administration. Although mean body weights and body weight gains in the 60 mg/kg/day [ ] group were generally lower than those in the control group throughout the study, there was no dose-response relationship compared to the higher dosage levels. The only statistically significant ($p<0.05$) differences from the control group were lower mean body weight gains in the 60 mg/kg/day [ ] group during PND 26-27 and 22-42 and a higher mean body weight gain in the 250 mg/kg/day [ ] group during PND 34-35. No dose-related trends were evident.

The mean age of attainment of vaginal patency was approximately 5 days earlier in the 250 and 1000 mg/kg/day [ ] groups compared to the concurrent control group value. The differences were statistically significant ($p<0.01$). The mean age of attainment of vaginal patency in the 60 mg/kg/day [ ] group was 1 day earlier than in the concurrent control group; the difference was not statistically significant. Mean ages of attainment were 32.7, 31.7, 26.9 and 26.5 days in the control, 60, 250 and 1000 mg/kg/day [ ] groups, respectively. Because the females were younger at the attainment of vaginal patency, mean body weights at the age of attainment in the 60, 250 and 1000 mg/kg/day [ ] groups were lower than the concurrent control group values; the differences were statistically significant ($p<0.01$). The mean ages and body weights at attainment of vaginal patency in all [ ]-treated groups were below the minimum mean values in the WIL historical control data (31.8 days and 102.1 g,

respectively). The early attainment of vaginal patency in the 60, 250 and 1000 mg/kg/day [ ] groups was attributed to the test article.

The ages of the first occurrence of estrus in the 60, 250 and 1000 mg/kg/day [ ] groups (32.6, 28.8 and 26.7 days, respectively) were earlier than in the control group (34.5 days of age); the differences were statistically significant ($p<0.01$) in the 250 and 1000 mg/kg/day [ ] groups. No test article-related differences in mean estrous cycle length were observed when the [ ]-treated groups were compared with the control group. Estrous cycle lengths in females of this age are highly variable. However, 7 females in the 250 mg/kg/day [ ] group had 3-5 consecutive days of estrus and all 15 females in the 1000 mg/kg/day [ ] group had 5-16 consecutive days of estrus, whereas no females in the control group had more than 2 consecutive days of estrus. The early age of occurrence of first observation of estrus in the 60, 250 and 1000 mg/kg/day [ ] groups and the persistent estrus observed in the 250 and 1000 mg/kg/day [ ] groups were attributed to the test article.

Mean total T_4 and TSH levels in the 60, 250 and 1000 mg/kg/day [ ] groups were generally similar to those in the control group; there was no dose-response relationship in these groups. A slightly lower mean estradiol level was observed in the 1000 mg/kg/day [ ] group. The difference from the control group was not statistically significant; however, all females in this group with lower estradiol levels were in persistent estrus. Therefore, the lower mean estradiol level in this group was considered test article-related. Mean estradiol levels in the 60 and 250 mg/kg/day [ ] groups and mean luteinizing hormone levels in the 60, 250 and 1000 mg/kg/day [ ] groups were unaffected by test article administration.

Mean absolute and relative (to final body weight) wet and blotted uterus weights and mean absolute luminal fluid weight in the 1000 mg/kg/day [ ] group were lower than the control group values; the differences were not statistically significant. However, when comparing individual uterus weights (wet and blotted) for females that were in

estrus (E) or proestrus (P) just prior to necropsy, the majority of the weights in the 1000 mg/kg/day [ ] group (7 females in E or P) were lower than some of the weights for females in the control group that were in diestrus (D) and markedly lower than the control group females that were in E or P at euthanasia. While luminal fluid weights were highly variable, the same trend noted for mean wet uterus weights was evident for luminal fluid weights in the 1000 mg/kg/day [ ] group. Mean absolute and relative ovary/oviduct weights in this group were also lower than the control group values; the difference was statistically significant ($p<0.05$) for the mean absolute weight. These reductions in mean absolute and relative uterus (wet and blotted) and ovary/oviduct weights and mean absolute luminal fluid weight in the 1000 mg/kg/day [ ] group were attributed to the test article. In the 1000 mg/kg/day [ ] group, mean absolute and relative thymus gland weights were lower than the control group values. Mean absolute and relative adrenal gland weights in the 1000 mg/kg/day [ ] group and mean absolute adrenal gland weight in the 250 mg/kg/day [ ] group were higher than the control group values. The differences were not statistically significant; however, these effects on organ weights were also considered test article-related. No other test article-related effects on organ weights were noted in the [ ]-treated groups. Differences from the control group were slight, attributed to lower mean body weights (relative organ weights), not statistically significant and/or did not occur in a dose-related manner.

1.6. CONCLUSIONS - [ ]

Based on the results of this study, the test article, [ ], administered orally to juvenile female rats resulted in estrogenic effects for females at 60, 250 and 1000 mg/kg/day as evidenced by earlier attainment of vaginal patency (with corresponding lower mean body weight on the day of attainment) and age at the first occurrence of estrus. In addition, estrous cycle disturbances were noted in the 250 and 1000 mg/kg/day [ ] groups with 7 and 15 females, respectively, exhibiting persistent estrus (3-16 consecutive days of estrus). A lower mean estradiol level was observed in the 1000 mg/kg/day [ ]

group. No test article-related effects on TSH, T_4 or luteinizing hormone were noted in the 60, 250 and 1000 mg/kg/day [ ] groups. Mean absolute and relative (to final body weight) wet and blotted uterus weights (and thus, luminal fluid weight), ovary/oviduct and thymus gland weights in the 1000 mg/kg/day [ ] group were lower than the control group values; mean absolute and/or relative adrenal gland weights in the 250 and 1000 mg/kg/day [ ] groups were higher than the control group values.

1.7. RESULTS - [ ]

Yellow material on the ventral abdomen and/or urogenital area, red material around the nose and an unkempt appearance were noted in the 1000 mg/kg/day [ ] group at the daily examinations. Two females in this group were lethargic 1 hour following dose administration (PND 24 or 25); these females were found dead on these same days. These findings were attributed to the test article. Increased incidences of salivation or evidence thereof (clear material around the mouth) were observed at the time of and 1 hour following dose administration in the 250 mg/kg/day [ ] group females. A slight increase in the incidence of salivation was also noted in this group at the time of dose administration. These findings in the 250 mg/kg/day [ ] group were attributed to the test article, but were not considered adverse. One female in the 250 mg/kg/day [ ] group was prostrate immediately prior to death. No test article-related clinical findings were noted in the 60 mg/kg/day [ ] group.

One and 3 females in the 250 and 1000 mg/kg/day [ ] groups, respectively, were found dead on PND 24 or 25 (1000 mg/kg/day [ ] group) or PND 35 (250 mg/kg/day [ ] group). Because of the mortality and other signs of overt toxicity (clinical findings and lower mean body weight gain and body weight loss) in the 1000 mg/kg/day [ ] group, all remaining females were euthanized and discarded on 31 March 2006 (PND 23-25), precluding all scheduled evaluations thereafter. All other animals survived to the scheduled euthanasia. No test article-related macroscopic findings were noted for the females that were found dead (complete necropsy) or at the scheduled necropsy (only the retained tissues were examined).

Test article-related, lower mean body weight gain or body weight losses were noted in the 1000 mg/kg/day [ ] group prior to euthanasia (PND 22-23 through 24-25). The differences were statistically significant ($p<0.01$) compared to the control group values. Mean body weights in this group were 7.9% to 20.9% lower than the control group values during PND 23-25; the differences were statistically significant ($p<0.01$) on PND 24 and 25. Further evaluation of body weight data for the 1000 mg/kg/day [ ]

group was precluded by euthanasia. Mean body weights and body weight gains in the 60 and 250 mg/kg/day [ ] groups were generally similar to those in the control group throughout the study; no test article-related effects were noted. The only statistically significant ($p<0.01$) difference noted was a transient reduction in mean body weight gain in the 250 mg/kg/day [ ] group during PND 33-34.

The mean ages of attainment of vaginal patency in the 60 and 250 mg/kg/day [ ] group were earlier than that in the control group; therefore, mean body weight at the age of attainment of patency in these groups was lower than that in the control group. The differences were statistically significant ($p<0.01$). Mean ages of attainment were 27.5 and 26.5 days in the 60 and 250 mg/kg/day [ ] groups, respectively, compared to 32.7 days in the control group. These effects were attributed to the test article.

The ages of the first occurrence of estrus in the 60 and 250 mg/kg/day [ ] groups (29.8 and 27.7 days of age, respectively) were earlier than in the control group (34.5 days of age). The differences were statistically significant ($p<0.01$). The early onset of estrus in these groups was attributed to the test article. Mean estrous cycle length in the 250 mg/kg/day [ ] group (5.9 days) was slightly longer than that in the control group (4.9 days); this increase was primarily due to a single female with an 11-day estrous cycle (10 days of diestrus). However, 12 females in this group had 3-8 consecutive days of estrus (E), whereas no females in the control group had more than 2 consecutive days of E. Two females in the 60 mg/kg/day [ ] group had 3-4 consecutive days of E. The early age of occurrence of first observation of estrus in the 60 and 250 mg/kg/day [ ] groups and the extended period of time in estrus in the 250 mg/kg/day [ ] group were attributed to the test article.

Mean T_4 and TSH levels in the 60 and 250 mg/kg/day [ ] groups were generally similar to the control group values. The mean T_4 level in the 250 mg/kg/day group (3.96 µg/dL) was statistically significantly ($p<0.05$) lower than the concurrent control group value (5.07 µg/dL). In addition, a corresponding increase (not statistically

significant) was noted in the mean TSH level in this group, as reduced circulating levels of T_4 following a chemical or physiological insult tend to induce a compensatory release of TSH (Goldman et al., 2000). Therefore, the reduction in mean T_4 level in the 250 mg/kg/day [ ] group was considered test article-related. Mean estradiol levels in the 60 and 250 mg/kg/day [ ] groups were lower than the control group values. The differences from the concurrent control group were not statistically significant. However, the lower mean estradiol levels in these groups were considered test article-related based on the test article-related effects on attainment of vaginal patency and estrous cycles in these groups. Mean luteinizing hormone levels in the 60 and 250 mg/kg/day [ ] groups were similar to the concurrent control group value.

Mean absolute and relative (to final body weight) liver weights in the 250 mg/kg/day [ ] group were higher than the control group values; the difference was statistically significant ($p<0.01$) for the relative value. Mean absolute and relative wet and blotted uterus weights and mean absolute luminal fluid weight in the 60 and 250 mg/kg/day [ ] groups were lower than the control group values; the differences were statistically significant ($p<0.01$) in the 250 mg/kg/day [ ] group. When comparing individual uterus weights (wet and blotted) for females that were in estrus (E) or proestrus (P), the majority of the weights in the 250 mg/kg/day [ ] group (6 females in E or P) were generally similar to or lower than the weights for females in the control group that were in diestrus (D) and lower than the control group females that were in E or P at euthanasia. Mean absolute and relative ovary/oviduct weights in this group were also lower than the control group values; the differences were statistically significant ($p<0.05$ or $p<0.01$). These reductions in mean absolute and relative uterus (wet and blotted) weights and mean absolute luminal fluid weight in the 60 and 250 mg/kg/day [ ] groups and mean absolute and relative ovary/oviduct weight in the 250 mg/kg/day [ ] groups were attributed to the test article. Mean absolute and relative thymus gland weights in the 60 and 250 mg/kg/day [ ] groups were lower than the control group values; the differences were statistically significant ($p<0.01$) in the 250 mg/kg/day [ ] group.

Mean absolute and relative adrenal gland weights in the 250 mg/kg/day [ ] group were higher ($p<0.05$ or $p<0.01$) than the control group values. These effects on organ weights were also considered test article-related. No other test article-related effects on organ weights were noted in the [ ]-treated groups. Differences from the control group were slight, not statistically significant and/or did not occur in a dose-related manner.

1.8. CONCLUSIONS - [ ]

Based on the results of this study, the test article, [ ], at a dosage level of 1000 mg/kg/day [ ], administered orally to juvenile female rats exceeded the maximum tolerated dose. Estrogenic effects were noted at 60 and 250 mg/kg/day as evidenced by earlier attainment of vaginal patency (with corresponding lower mean body weight on the day of attainment) and age at the first occurrence of estrus. In addition, estrous cycle disturbances were noted in the 250 mg/kg/day [ ] groups with 12 females having 3-8 consecutive days of estrus compared to no females in the control group with more than 2 consecutive days of estrus. Lower mean estradiol levels were observed in the 60 and 250 mg/kg/day [ ] groups; a lower mean T_4 level and a higher mean TSH level were noted at 250 mg/kg/day. No test article-related effects on luteinizing hormone were noted in the 60 and 250 mg/kg/day [ ] groups. Mean absolute and relative (to final body weight) wet and blotted uterus weights and thymus gland weights in the 60 and 250 mg/kg/day [ ] groups and mean absolute and relative ovary/oviduct weights in the 250 mg/kg/day [ ] group were lower than the control group values. Mean absolute and relative thymus gland weights were lower in the 60 and 250 mg/kg/day [ ] groups than in the control group. In the 250 mg/kg/day [ ] group, mean absolute and relative adrenal gland and liver weights were higher than the control group values.

23-Jun-2006, 26-Jun-2006, 29-Jun-2006	Draft Report	29-Jun-2006	25-Jul-2006	[ ]

This study was inspected in accordance with the U.S. EPA Good Laboratory Practice Standards (40 CFR Part 792), the OECD Principles of Good Laboratory Practice, the Japanese MAFF Good Laboratory Practice Standards, the standard operating procedures of WIL Research Laboratories, LLC and the sponsor's protocol and protocol amendments with the following exceptions. The data located in Appendices A (Certificates of Analysis) and B (Analytical Chemistry Report) were the responsibility of the sponsor. Quality Assurance findings, derived from the inspections during the conduct of the study and from the inspections of the raw data and draft report, are documented and have been reported to the study director. A status report is submitted to management monthly.

This report accurately reflects the data generated during the study. The methods and procedures used in the study were those specified in the protocol, its amendments and the standard operating procedures of WIL Research Laboratories, LLC.

The raw data, the retention sample(s), and the final report will be stored in the Archives at WIL Research Laboratories, LLC or another location specified by the sponsor.

3.2. APPROVAL

This study was inspected according to the criteria discussed in Section 3.1.

5. DEVIATIONS FROM THE PROTOCOL

This study was conducted in accordance with the protocol and protocol amendments, except for the following.

- **Protocol Sections 5.4, 7.2 and 7.4.1** state that 105 females (15 per group) would be placed on study. One female was added to the 1000 mg/kg/day [ ] group (Group 7) following the death of another female on PND 24. This resulted in 16 animals in Group 7 and a total of 106 females on study.
- **Protocol Section 6.1** states that the control group animals would be housed in a separate rack from the exposed animals following randomization. Documentation of separate housing for the control group was not recorded.
- **Protocol Section 7.6.4** states that vaginal lavages would be performed daily beginning on the day vaginal perforation was observed. The slide containing the vaginal lavage sample from female no. 22808-06 (60 mg/kg/day [ ] group; vaginal perforation noted on PND 30) on PND 33 could not located; therefore, no sample was available for that female on PND 33.
- **Protocol Section 9.1** states that tissues would be collected at study termination. Tissues were also collected from female no. 22803-03 (250 mg/kg/day [ ] group) that was found dead prior to study termination.
- **Protocol Section 9.2.2** states that thyroid gland weights (paired) would be recorded. At the time of trimming the fixed organs for weight collection, it was noted that the right and left thyroid gland from female nos. 22802-09 (250 mg/kg/day [ ] group) and 22801-05 (250 mg/kg/day [ ] group), respectively, were missing. Therefore, single organ weights for the thyroid glands were recorded for these females. The single organ weights are presented on the absolute weight tables, but are not included in calculations of the means.

These deviations did not negatively impact the quality or integrity of the data nor the outcome of the study.

APPENDIX D

Clinical Pathology Methods, Procedures And References

Revised Draft

CLINICAL PATHOLOGY METHODS, PROCEDURES AND REFERENCES

Immunoassay- DPC Immulite®

Estradiol (estradiol-17β) - Competitive Immunoassay for the quantitative measurement of estradiol in serum. Default unit: pg/mL.

Total T4 - Solid-phase, chemiluminescent enzyme immunoassay for the quantitative measurement of total circulating thyroxide. Default unit: µg/dL.

Revised Draft

Immunoassay-GAMMA-C12 Gamma Counter

Rat Luteinizing Hormone (rLH) - ^{125}I radioimmunoassay system for the quantitative determination of (rLH) DPC GAMMA C-12 gamma counter. Default unit: mIU/mL. Biotrak™ rat luteinizing hormone [^{125}I] assay system©. Amersham Life Science Ltd. Package Insert.

Rat Thyroid Stimulating Hormone (rTSH) - ^{125}I assay system with magnetic separation for the quantitative measurement of (rTSH). DPC GAMMA C-12 gamma counter. Biotrak™ rat thyroid stimulating hormone ^{125}I assay system. Amersham Pharmacia Biotech. Package insert.

References:

Immulite®. Diagnostics Products Corporation. Package Insert.

PROTOCOL

A FEMALE PUBERTAL ASSAY OF [redacted] AND [redacted] ADMINISTERED ORALLY IN JUVENILE FEMALE RATS

Sponsor Study Number: 06-011

Submitted To:

[redacted]

WIL Research Laboratories, LLC
1407 George Road
Ashland, OH 44805-9281

Revised Draft

1 OBJECTIVE:

The objective of this study is to evaluate the ability of the test articles to induce effects on pubertal development in the intact juvenile female rat.

The study will be conducted in compliance with the U.S. Environmental Protection Agency (EPA), 40 CFR Part 792, the OECD [C(97) 186/Final] and the Ministry of Agricultural, Forestry and Fisheries (MAFF), Law No. 82, 1948, Good Laboratory Practice (GLP) Standards. The study will be performed according to the protocol and WIL Standard Operating Procedures.

2 PERSONNEL INVOLVED IN THE STUDY:

2.1 Sponsor Representative:

2.2 Sponsor Alternate:

2.3 WIL Study Director:

2.4 WIL Deputy Director:

2.5 WIL Departmental Responsibilities:

Revised Draft

3 STUDY SCHEDULE:

Proposed Animal Receipt Date:	March 14, 2006
Proposed Experimental Start Date (Experimental Starting Date):	March 28, 2006
Proposed Experimental Termination/ Completion Date:	April 19, 2006
Proposed Audited Report Date:	To be determined

4 TEST ARTICLE DATA:

4.1 Identification:

[redacted]

4.1.1 Lot Number:

[redacted]

4.1.2 Purity:

100%.

4.1.3 Stability:

The test article is considered to be stable under the storage conditions provided by the Sponsor.

4.1.4 Physical Description:

To be determined

4.1.5 Storage Conditions:

Store at ambient conditions.

4.1.6 Reserve Samples:

Reserve samples of the test article will be taken in accordance with WIL standard operating procedures and stored in the Archives at WIL Research Laboratories, LLC indefinitely unless otherwise specified.

4.1.7 Personnel Safety Data:

To be provided by the Sponsor. It is the responsibility of the Sponsor to notify the testing facility of any special handling requirements for the test article. A material safety data sheet (MSDS) will accompany the test article upon arrival at the laboratory.

4.2 Identification:

[redacted]

4.2.1 Lot Number:

[redacted]

Revised Draft

Revised Draft

4.2.2 Purity:

100%.

4.2.3 Stability:

The test article is considered to be stable under the storage conditions provided by the Sponsor.

4.2.4 Physical Description:

To be determined

4.2.5 Storage Conditions:

Store at ambient conditions

4.2.6 Reserve Samples:

Reserve samples of the test article will be taken in accordance with WIL standard operating procedures and stored in the Archives at WIL Research Laboratories, LLC indefinitely unless otherwise specified.

4.2.7 Personnel Safety Data:

To be provided by the Sponsor. It is the responsibility of the Sponsor to notify the testing facility of any special handling requirements for the test article. A material safety data sheet (MSDS) will accompany the test article upon arrival at the laboratory.

5 TEST SYSTEM:

5.1 Species:

Rat

5.2 Strain:

Crl:CD(SD)

5.3 Source:

Charles River Laboratories
Raleigh, NC

Revised Draft

5.4 Number on Study:

One hundred five females (maximum of 130 females and 13 dams purchased). Immature females will be supplied in litters of 10 animals with their own or another (fostering) dam. The immature females will be 6-8 days old upon receipt. Pups not expected to survive to the next observation period (moribund) will be euthanized by intraperitoneal injection of sodium pentobarbital (prior to PND 11) or by carbon dioxide inhalation (after PND 11) and the carcass discarded. Animals not assigned to the study will be transferred to the stock animal colony or will be euthanized by carbon dioxide inhalation and the carcasses discarded. Following weaning, the dams will be euthanized by carbon dioxide inhalation and the carcasses discarded.

5.5 Body Weight Range:

At randomization: 30-50 g for immature females. All animals assigned to study will be approximately ± 5 g of the mean.

5.6 Age:

At start of dosing animals will be 22 days of age.

5.7 Identification System:

The maternal animals will be uniquely identified by a Monel® metal eartag displaying the animal number. The pups will be identified by tail tattoo. Individual cage cards will be affixed to each cage and will display the animal number, group number, study number, dosage level and sex of the animal. Following randomization the pups will be individually identified by an ear tag.

5.8 Justification for Selection:

This species and strain of animal is recognized as appropriate for reproduction studies. WIL Research Laboratories, LLC has reproductive historical control data in this species and strain of rat. This animal model has been proven to be susceptible to the effects of reproductive toxicants. This number of animals is considered the minimum number required for meaningful interpretation of the data and fulfillment of agency requirements.

6 SPECIFIC MAINTENANCE SCHEDULE:

6.1 Animal Housing:

All animals will be initially housed by litter with their own or another (fostering) dam in plastic maternity cages containing ground corncob nesting material (Bed-O'Cobs®). Following randomization, the juvenile female animals

Revised Draft

will be weaned and housed three animals per cage in plastic maternity (shoebox) cages. Control animals (Group 1) will be housed on a separate rack from exposed animals. The cage bedding will be changed at least three times each week. The cages will be subjected to routine cleaning at a frequency consistent with maintaining good animal health and WIL standard operating procedures. The facilities at WIL Research Laboratories, LLC are fully accredited by the Association for Assessment and Accreditation of Laboratory Animal Care International (AAALAC International).

6.2 Environmental Conditions:

Controls will be set to maintain an average daily temperature of 71 ± 5°F (22 ± 3°C) and an average daily relative humidity of 50 ± 20%. Temperature and relative humidity will be monitored continuously. Data for these two parameters will be scheduled for automatic collection on an hourly basis. Fluorescent lighting controlled by light timers will provide illumination for a 12-hour light/dark photoperiod. Temporary adjustments to the light/dark cycles may be made to accommodate protocol-specified activities. The ventilation rate will be set at a minimum of 10 room air changes per hour, 100% fresh air.

6.3 Drinking Water:

Reverse osmosis-purified water will be available *ad libitum*. Filters servicing the automatic watering system are changed regularly according to WIL standard operating procedures. The municipal water supplying the laboratory is analyzed according to WIL standard operating procedures on a routine basis to assure that contaminants are not present in concentrations that would be expected to affect the outcome of the study.

6.4 Basal Diet:

PMI Nutrition International, LLC Certified Rodent LabDiet® 5002 will be offered *ad libitum* during the study. Periodic analyses of the certified feed are performed by the manufacturer to ensure that heavy metals and pesticides are not present at concentrations that would be expected to affect the outcome of the study. Results of the analyses are provided to WIL Research Laboratories, LLC by the manufacturer and will be placed in the study records. Each lot utilized will be identified and recorded. Feeders will be changed and sanitized once per week.

7 EXPERIMENTAL DESIGN:

7.1 Animal Receipt and Acclimation:

Each animal will be inspected by a qualified technician upon receipt. Rats judged to be in good health and suitable as test animals will be immediately

placed in quarantine for a minimum of nine days. All rats will be initially sexed and weighed. Maternal animals will be permanently identified with a metal ear tag, and juvenile animals will be identified by tail tattoo. During the quarantine period, each rat will be observed twice daily for changes in general appearance and behavior. Prior to the start of the in-life phase, those animals judged to be suitable test subjects will be identified and receive a detailed physical examination at the time of animal selection for randomization.

7.2 Randomization:

At the conclusion of the quarantine period (animals 21 days of age), animals judged to be suitable test subjects and meeting acceptable body weight requirements, will be assigned at random using a computer program. At that time, the animal numbers and corresponding body weights will be entered into the WIL Toxicology Data Management System (WTDMS™). A printout containing the animal numbers and individual group assignments will be generated based on body weight stratification into a block design. Animals will then be weaned and arranged into the groups according to the printout. Body weights at randomization will be within ± 20% of the mean. Each of 7 groups will consist of fifteen females. If after randomization statistically significant differences between groups exist, new randomizations will be generated until group mean body weights are homogeneous.

7.3 Route and Rationale of Test Article Administration:

The route of administration will be oral (gavage). Historically, this route has been used extensively for studies of this nature. Appropriate-sized flexible, Teflon®-shafted, stainless steel ball-tipped dosing cannulae will be used for the oral administration by gavage. Any losses or incomplete dosing will be recorded.

Revised Draft

Revised Draft

7.4 Organization of Test Groups, Dosage Levels and Treatment Regimen:

7.4.1 Organization of Test Groups:

The dosage levels were determined from the results of previous studies and were provided by the Sponsor Representative after consultation with the WIL Study Director. The following table presents the study group arrangement.

Group Number	Test Article	Dosage Level (mg/kg/day)	Dose Concentration (mg/mL)	Dose Volume (mL/kg)	Number of Females
1	Vehicle	0	0	5	15
2	[redacted]	60	12	5	15
3		250	50	5	15
4		1000	200	5	15
5		60	12	5	15
6		250	50	5	15
7		1000	200	5	15

7.4.2 Vehicle Control Article:

Corn oil

7.4.3 Treatment Regimen:

The test and control articles will be administered as single daily doses beginning on day 22 of age and continuing through 41 days of age. All animals will be dosed at approximately the same time each day, after 12:00 p.m., and the time of dosing will be recorded for each animal.

7.4.4 Adjustment of Dosages:

Individual doses will be calculated based on each daily body weight to provide the proper dosage. Individual animal body weights and individual animal dosages will be recorded.

7.5 Preparation and Analysis of Test Material Preparations:

7.5.1 Method and Frequency of Preparation:

Based on the physical characteristics of the test article, appropriate methods will be used to ensure the best possible formulations of the test article in the vehicle. Dosing formulations of the test article will be prepared weekly. The study director or the deputy director or designee will visually inspect the formulations prior to initiation of dosing. This visual inspection will be performed to assure that the formulations are

visibly homogeneous and acceptable for dosing. Any special procedures required for formulation will be documented according to Good Laboratory Practices and presented in the final report of this study.

7.5.2 Homogeneity and Stability of Test Article Formulation:

Dosing mixture homogeneity in bulk preparations will be collected prior to the initiation of test article administration, if possible. While undergoing stirring in the beaker, the following sample aliquots (5 mL) will be drawn for analysis: control, three aliquots (from the middle); all treatment groups, nine aliquots (3 each from the top, middle and bottom). Test article formulations will be divided into aliquots for daily dispensation. Resuspension homogeneity of aliquots will be determined over the longest period of aliquot storage. Three samples (5 mL) from the top and bottom of each group will be collected to assess the homogeneity after storage and resuspension. Two of the three samples will be sent to [redacted], for analysis of homogeneity and stability over a ten-day period. The samples will be shipped under ambient conditions. The remaining sample from each dose level and strata will be stored under normal laboratory conditions for possible future analysis.

7.5.3 Concentration Analysis:

Samples of the dosing mixtures will be collected on the first and last day of each weekly preparation. At each time point, two 5-mL aliquots will be taken from each dose level (middle stratum), including the control group. The dosing mixture will be thoroughly mixed before taking each sample. One sample from each dose level will be analyzed; the remaining sample will be retained by the Testing Laboratory for possible future analysis.

Dosing mixture samples for homogeneity, stability and concentration of the test article at all dose levels, including the control, will be analyzed by the Sponsor. Quality assurance (QA) auditing of the conduct, results and reporting of the analyses, as well as archiving of these data will be the responsibility of the Sponsor. Critical phase inspection reports and report audits will be submitted to the Study Director and management at WIL Research Laboratories, LLC. A QA statement will be issued for inclusion in the overall final report. The methods and results of the analysis will be provided by the Sponsor and included as an appendix to the WIL final report. The method employed will be:

[redacted] SOP: To be determined

Revised Draft

Concentration and stability data will be evaluated using percent difference. The acceptable tolerance between the theoretical and measured values is 15%.

Mixtures will be considered homogeneous if the difference between the overall group mean and the strata mean is 10% or less.

7.5.4 Sample Handling and Shipment:

Each 5-mL sample will be placed in a glass vial with a Teflon-lined lid. The vial plus sample weight will be recorded with an accuracy of ± 0.0005 g. Each sample will be stored at ambient temperature. Each sample container will be labeled with the following information:

Accession Number
Sponsor's Reference Number
Testing Laboratory Study Number
Test Article Name
Dose Level (mg/kg)
Dosing Mixture Concentration (mg/mL)
Preparation Date
Sampling Date
Weight of Sample

The sample shall be packed in a suitable container to maintain the temperature conditions specified in Section 4 during transit plus an adequate margin of safety for any transit delays. The sample shall be sent by express courier to:

[redacted]

[redacted] shall be notified in advance of shipping by telefax at [redacted]. This notification shall include test article and study identification, carrier, and estimated time/date of arrival. Sample shipments shall be accompanied by an inventory sheet describing the samples contained in the shipment with the information described above.

Revised Draft

Revised Draft

7.6 General Observations During the Experimental Period:

7.6.1 Clinical Signs:

The rats will be observed twice daily for appearance, behavior, moribundity and mortality. A detailed physical examination will be conducted at the time of randomization. Clinical observations regarding general appearance and behavior will be recorded daily prior to dosing. During the treatment period, the rats will be observed also approximately one hour following dosing and the observations will be recorded. Additional post-dosing observation periods may be necessary and will be documented in the study records. Observations shall include, but are not limited to, evaluations for changes in appearance of the skin and fur, eyes and mucous membranes, respiratory, circulatory, autonomic and central nervous system functions, somatomotor activity and behavior patterns. Observations will be recorded. Findings noted outside of the scheduled observation time periods will be recorded at the time they are observed.

7.6.2 Body Weights:

Daily body weights will be recorded individually (to the nearest 0.1 gram, PND 22-42) beginning one day prior to the start of dosing. Final body weights will be collected prior to euthanasia.

7.6.3 Vaginal Perforation:

Each female pup (15/group) will be observed once daily for vaginal perforation beginning on PND 25 (Adams, 1985). Examination of the females will be performed at approximately the same time each day and will continue daily until vaginal perforation is present. The body weight of each female will be recorded on the day of acquisition of vaginal perforation.

7.6.4 Determination of Estrous Cycles:

Daily vaginal lavages will be performed to determine the stage of estrus beginning on the day vaginal perforation is observed. Lavages will be performed at approximately the same time each day and will continue through the day of necropsy. The mean age of first estrous will be determined.

7.7 Euthanasia:

On PND 42, the animals will be euthanized by carbon dioxide inhalation, and the time of euthanasia will be recorded for each animal. Any animals not

expected to survive until the following dosing period or until the scheduled euthanasia will be euthanized by carbon dioxide inhalation and necropsied as described in section 9.

8 HOROMONE ANALYSIS:

8.1 Thyroid Hormones:

Following euthanasia, blood will be collected from the vena cava of all animals. Following collection, all blood samples (target volume of 2 mL) will be allowed to clot and then be placed in an ice bath and processed to generate serum. The following hormone concentrations will be determined from all serum samples:

Thyroid Stimulating Hormone (TSH) Thyroxine (T4)

Serum not utilized for TSH and T4 concentrations will be stored frozen for possible future analysis (added by amendment).

9 ANATOMIC PATHOLOGY:

9.1 Macroscopic Examination:

A complete necropsy examination will be conducted on all animals dying spontaneously or euthanized *in extremis*. This will include examination of the external surface, all orifices, the external surface of the brain and spinal cord and the thoracic, abdominal and pelvic cavities including viscera. A complete necropsy will not be conducted on animals surviving to study termination. Gross lesions (i.e., masses) will be collected and placed in 10% neutral-buffered formalin. The following tissues will be collected and placed in 10% neutral-buffered formalin at study termination:

Cervix and Uterine Body (one longitudinal section)	Thyroids with parathyroids
Ovaries	Uterine horns (four sections per horn)
Pituitary	Vagina
	All gross (internal) lesions

9.2 Organ Weights:

9.2.1 Uterine Weights:

Wet and blotted uterine weights will be measured for all animals surviving to the scheduled necropsy. Uterine weights will not be collected for any animals found dead or euthanized in extremis.

The uterus will be harvested from all animals using the following procedure. The harvesting of uteri will be performed in a round-robin

Revised Draft

Revised Draft

order. The pubic symphysis will be opened and each ovary and uterine horn will be detached from the dorsal abdominal wall. The ovaries are separated from the uterine horns at the oviduct/uterus junction. The urinary bladder and ureters will be removed from the ventral and lateral side of the uterus and vagina. The fibrous adhesion between the rectum and vagina is then detached until the junction of the vaginal orifice and perineal skin is identified. The uterus and vagina are detached from the body by incising the vaginal wall just above the junction between the perineal skin. The excess fat and adnexa will be trimmed away. The vagina is then removed from the uterus, leaving the cervix intact and attached to the uterus for uterus weight measurement. Care is to be taken during uterus harvesting such that the luminal contents are retained. A record will be made if any luminal contents are lost. The uterus will be transferred to a uniquely marked and tared plastic Petri dish with care to avoid desiccation before weighing. The Petri dish should be lined with saline-moistened filter paper (or equivalent) and covered to minimize desiccation.

The uterus harvesting and weighing procedure will be done in the order described below.

1. Animal is euthanized and uterus harvested.
2. Uterus (with luminal fluid) is immediately transferred to a Petri dish (lined with saline-moistened filter paper or equivalent) that was tared immediately prior to the transfer.
3. The uterus' wet weight is recorded to the nearest 0.1 mg.
4. The uterus is opened and blotted (see below).
5. The uterus is placed in a Petri dish (lined with saline-moistened filter paper or equivalent) that was tared immediately prior to the transfer.
6. The uterus' blotted weight is recorded to the nearest 0.1 mg.

Immediately following collection of the wet weight, the uterus will be individually processed by opening the uterine wall and carefully blotting the excess fluid. Both uterine horns will be pierced and cut longitudinally with small surgical scissors, placed on filter paper (ex. Whatman No. 3) and gently pressed with another piece of dry filter paper to absorb the luminal fluid. The procedure will not be so severe as to render the tissue unacceptable for histopathologic analysis, as this additional investigation may be performed at the discretion of the Sponsor (by protocol amendment).

Revised Draft

9.2.2 Ovary, Liver, Kidney, Pituitary, Thyroid and Adrenal Weights:

The following organs from all females euthanized at scheduled termination will be weighed (to the nearest 0.1 mg):

Adrenal glands	Ovaries and oviducts
Liver	Pituitary gland
Kidneys	Thyroids with parathyroids (following fixation)

Paired organs will be weighed together.

To minimize systematic bias in the weighing procedures, organ harvesting and weighing procedures will be divided as equally as possible among the prosecting and weighing technicians, such that all animals from a group are not processed by a single individual.

9.3 Microscopic Examination:

Following collection of wet uterine weight, blotting of the uterus and collection of blotted uterine weight, each uterus will be placed in a uniquely identified jar of 10% neutral-buffered formalin and preserved for microscopic examination. The vagina, ovaries, and thyroids with parathyroids from each animal will be similarly preserved.

Microscopic examination of hematoxylin-eosin stained paraffin sections may be performed on the following tissues from all animals at the discretion of the Sponsor (additional cost).

Ovaries	Thyroids with parathyroids
Cervix and Uterine Body (one longitudinal section)	Uterine Horns (four sections per horn)

10 DURATION OF STUDY:

The conduct of this study will require approximately five weeks for acclimation, dosing and necropsy.

11 STATISTICAL METHODS:

Body weights, body weight gains, organ weights, organ weights relative to final body weights, uterine weights (wet and blotted), luminal fluid weights, mean days of acquisition of vaginal perforation, mean age of first estrous, estrous cycle length and serum hormone concentrations will be analyzed by a parametric one-way analysis of variance (ANOVA) (Snedecor, 1980) to determine intergroup difference. If the

results of the ANOVA are significant ($p<0.05$), Dunnett's test (Dunnett, 1964) will be applied to the data to compare the treated groups to the control group.

12 QUALITY ASSURANCE:

The study will be audited by the WIL Quality Assurance Unit while in progress to assure compliance with the study protocol, protocol amendments and WIL Standard Operating Procedures. The study will be conducted in compliance with the U.S. Environmental Protection Agency (EPA), 40 CFR Part 792, the OECD [C(97) 186/Final] and the Ministry of Agricultural, Forestry and Fisheries (MAFF) Law No. 82, 1948, Good Laboratory Practice (GLP) Standards. The raw data and draft report will be audited by the WIL Quality Assurance Unit prior to submission to the Sponsor Representative to assure that the final report accurately describes the conduct and the findings of the study.

This study will be included on the WIL master list of regulated studies.

13 RECORDS TO BE MAINTAINED:

All original raw data records, as defined by WIL SOPs and the applicable GLPs, will be stored as described in Section 14 in the Archives at WIL Research Laboratories, LLC.

14 WORK PRODUCT:

The Sponsor will have title to all documentation records, raw data, slides, specimens and other work product generated during the performance of the study. All work product, including raw paper data, pertinent electronic storage media and specimens will be returned to the Sponsor after a period of six months or following issuance of the final report. All work product will be stored in compliance with regulatory requirements.

Any work product, including documents, specimens, and samples, that are required by this protocol, its amendments, or other written instructions of the Sponsor, to be shipped by WIL Research Laboratories, LLC to another location will be appropriately packaged and labeled as defined by WIL's SOPs and delivered to a common carrier for shipment. WIL Research Laboratories, LLC will not be responsible for shipment following delivery to the common carrier.

15 REPORTS:

The final report will consist of an abbreviated summary report, including data tables and an interpretation and discussion of the study results.

WIL Research Laboratories will submit one copy of an audited draft report in a timely manner upon completion of data collection prior to issuance of the final report.

Revised Draft

One revision will be permitted as part of the cost of the study, from which the Sponsor's reasonable revisions and suggestions will be incorporated into the final report, as appropriate. Additional changes or revisions may be made, at extra cost. It is expected that the Sponsor will review the draft report and provide comments to WIL within a two-month time frame following submission. WIL will submit the final report within one month following receipt of comments. If the Sponsor's comments and/or authorization to finalize the report have not been received at WIL within one year following submission of the draft report, WIL may elect to finalize the report following appropriate written notification to the Sponsor. Two electronic copies (PDF) of the final report on CD-R will be provided. Requests for additional paper copies of the final report may result in additional charges.

Revised Draft

16 ANIMAL WELFARE ACT COMPLIANCE:

This study will comply with all applicable sections of the Final Rules of the Animal Welfare Act regulations (9 CFR Parts 1, 2 and 3). The Sponsor should make particular note of the following:

- The Sponsor Representative's signature on this protocol documents for the Study Director the Sponsor's assurance that the study described in this protocol does not unnecessarily duplicate previous experiments.

- Whenever possible, procedures used in this study have been designed to avoid or minimize discomfort, distress or pain to animals. All methods are described in this study protocol or in written laboratory standard operating procedures.

- Animals that experience severe or chronic pain or distress that cannot be relieved will be painlessly euthanized as deemed appropriate by the veterinary staff and Study Director. The Sponsor will be advised by the Study Director of all circumstances which could lead to this action in as timely a manner as possible.

- Methods of euthanasia used during this study are in conformance with the above-referenced regulation.

- The Sponsor/Study Director has considered alternatives to procedures that may cause more than momentary or slight pain or distress to the animals and has provided a written narrative description (AWA covered species) of the methods and sources used to determine that alternatives are not available.

17 PROTOCOL MODIFICATION:

Modification of the protocol may be accomplished during the course of this investigation. However, no changes will be made in the study design without the written permission of the Sponsor. In the event that the Sponsor requests or approves a change in the protocol, such changes will be made by appropriate documentation in

the form of protocol amendment. All alterations of the protocol and reasons for the modification(s) will be signed by the Study Director and the Sponsor Representative.

PROTOCOL AMENDMENT I

Sponsor: [redacted]

Sponsor No.: 06-011

A. Title:

A Female Pubertal Assay of [redacted] and [redacted] Administered Orally in Juvenile Female Rats

B. Protocol Modification/Addition/Clarification:

1) **3** **STUDY SCHEDULE:**

Proposed Audited Report Date: June 28, 2006

2) **7.5.1** **Method and Frequency of Preparation:**

The following is added to this section:

The dosing formulations will be stored at room temperature.

3) **8** **HORMONE ANALYSIS:**

The following is added to this section:

Estradiol (E_2) and Lutenizing (LH) hormone concentration levels will be determined.

4) **9.1** **Macroscopic Examination:**

The following is added to this section:

The spleen, thymus and axillary lymph node are added to the list of tissues to be collected.

5) **9.2.2** **Ovary, Liver, Kidney, Pituitary, Thyroid and Adrenal Weights:**

The following is added to this section:

The spleen and thymus are added to the list of organs to be weighed.

Revised Draft

Revised Draft

C. Reason for Protocol Modifications:

1) The proposed audited report date has been determined.

2) The storage requirement for dosing formulations has been added.

3) Additional hormones for analysis have been added.

4) The Sponsor has requested collection of additional tissues.

5) The additional tissues collected will be weighed.

Sponsor: [redacted]

Sponsor No.: 06-011

A. Title:

A Female Pubertal Assay of [redacted] and [redacted] Administered Orally in Juvenile Female Rats

B. Protocol Modification/Addition/Clarification:

1) **7.6.4 Determination of Estrous Cycles:**

In accordance with the Study Director Notification dated April 11, 2006, the vaginal lavage performed on the day of necropsy was collected immediately prior to euthanasia.

C. Reason for Protocol Modifications:

1) This change in procedure was made to allow a more accurate correlation of serum hormone levels with the stage of the estrous cycle.

I. Study Protocol

1. SUMMARY

1.1. OBJECTIVE

The objective of the study was to evaluate the ability of the test article to induce effects on pubertal development in the intact juvenile female rat.

1.2. STUDY DESIGN

[ ] in the vehicle, Mazola® corn oil, was administered orally by gavage once daily for 20 consecutive days to 4 groups each of 15 Crl:CD(SD) immature female rats. Dosage levels were 10, 50, 200 and 800 mg/kg/day, and the dosage volume was 5 mL/kg. A concurrent control group received the vehicle on a comparable regimen. These dosage levels were determined from the results of previous studies and were provided by the sponsor representative after consultation with the WIL study director. **Stability of the test article to be addressed by the sponsor.**

Dosing procedures were performed from 26 September 2006 through 17 October 2006, when the animals were 22 to 41 days of age; the start of dose administration was staggered, based on age. At the initiation of dose administration, individual body weights ranged from 40.5 g to 63.7 g. The following table presents the study group assignment:

Group Number	Test Article	Dosage Level (mg/kg/day)	Dosage Concentration (mg/mL)	Dosage Volume (mL/kg)	Number of Females
1	Corn Oil	0	0	5	15
2		10	2	5	15
3		50	10	5	15
4		200	40	5	15
5		800	160	5	15

Preparation, storage and sampling of the control and test article formulations were conducted as follows. For the control group, the appropriate amount of the vehicle (corn oil, exp. dates: 23 October 2007 and 16 November 2007) was placed in a glass storage container and stirred throughout use. The test article formulations were prepared as follows. The appropriate amount of test article for each group was weighed into a tared,

calibrated glass container. A stir bar and approximately 80% of the vehicle were added to each container, and the mixtures were stirred until uniform. The appropriate volume of vehicle was added to bring each formulation to the calibration mark, and the preparations were stirred until uniform and throughout use. The test article formulations were prepared approximately weekly, divided into aliquots for daily dispensation and stored at room temperature. Three samples from the middle stratum of the control group formulation and 3 sets of samples from the top, middle and bottom strata of the test article formulations were collected prior to the initiation of dose administration. Additional samples (3 sets) were collected for resuspension homogeneity from the same formulations following 10 days of room temperature storage. Two sets of samples for concentration verification were collected on each day of preparation and 2 sets were collected on the last day of use of each preparation. Two sets of homogeneity/stability samples and 6 sets of concentration samples were shipped under ambient conditions to the sponsor for homogeneity, stability and concentration analyses; the remaining samples were stored under normal laboratory conditions at WIL Research Laboratories, LLC for possible future analysis.

Ten dams with 10 female pups each (100 pups total) were received from Charles River Laboratories, Inc., Raleigh, North Carolina, on 12 September 2006. The pups were 6 to 8 days old upon receipt. Pups were initially identified by tail tattoo, housed in plastic maternity cages (by litter with their own or a fostering dam for 14 to 16 days) during the acclimation period until randomization of the pups on postnatal day (PND) 21. Following randomization, the female pups were weaned, identified by metal eartag and housed in plastic maternity cages. Environmental controls were set to maintain an average daily temperature of 71°F ± 5°F and an average daily relative humidity of 50% ± 20%. Actual mean daily temperatures ranged from 70.3°F to 71.0°F (21.3°C to 21.7°C) and mean daily relative humidity ranged from 36.9% to 47.7%. Light timers were calibrated to provide a 12-hour light (0600 hours to 1800 hours)/12-hour dark photoperiod. Air handling units were set to provide approximately 10 fresh air changes

per hour. PMI Nutrition International, LLC, Certified Rodent LabDiet® 5002 and reverse osmosis-purified water were offered ad libitum.

All animals were observed twice daily for appearance, behavior, mortality and moribundity. A detailed physical examination was performed at the time of randomization. The rats were also observed daily (prior to dosing). Clinical findings at the time of dose administration and approximately 1 hour following dose administration were recorded when observed. Individual body weights were recorded daily. Each female pup was observed daily for vaginal patency beginning on PND 23 (Adams et al., 1985). Examination continued daily until vaginal patency was observed. Body weights were recorded on the day that vaginal patency was noted. Beginning on the day that vaginal patency was observed, vaginal lavages were performed daily, through the day of euthanasia, and the slides were examined to determine the stage of estrus. The mean estrous cycle length was calculated and reported for complete estrous cycles (i.e., the total number of returns to metestrus [M] or diestrus [D] from estrus [E] or proestrus [P] until the day of euthanasia). Estrous cycle length was determined by counting the number of days from the first M or D in a cycle to the first M or D in a subsequent cycle. In addition, the mean age at the onset of the first estrous cycle was calculated using the first day each animal was observed to be in estrus. A complete gross necropsy was performed only on animals that were found dead. All surviving animals were euthanized on PND 42 by carbon dioxide inhalation; blood was collected via the vena cava for evaluation of serum estradiol (E_2), luteinizing hormone (LH), thyroxine (T_4) and thyroid stimulating hormone (TSH) levels. The uterus (wet and blotted), kidneys, liver, ovaries and oviducts, pituitary gland, spleen, adrenal glands, thymus gland and thyroid glands (with parathyroid glands) were weighed at the scheduled euthanasia. Luminal fluid weight was calculated by subtracting the blotted uterus weight from the wet uterus weight. The adrenal glands, axillary lymph nodes, ovaries, oviducts, uterus (horns and body), cervix, vagina, kidneys, liver, spleen, thymus gland, pituitary gland, thyroid glands (with parathyroid glands) and internal gross lesions were examined from all

females, including those found dead; all of these tissues were retained with the exception of the adrenal glands, kidneys and liver.

Statistical tests were performed using appropriate computing devices or programs. Analyses were conducted using two-tailed tests for minimum significance levels of 1% and 5%, comparing each test article-treated group to the control group. Each mean was presented with the standard deviation (S.D.) and the number of animals (N) used to calculate the mean. In addition, percent difference from control is presented for body weights, clinical pathology parameters and organ weights. Statistical analyses were not conducted if the number of animals was 2 or less. Due to the different rounding conventions inherent in the types of software used, the means and standard deviations on the summary and individual tables may differ by ±1 in the last significant figure. Mean body weights, body weight changes, days of acquisition of vaginal patency, estrous cycle lengths, ages at the first occurrence of estrus, serum hormone levels, luminal fluid weights and absolute and relative organ weights were subjected to a parametric one-way analysis of variance (ANOVA; Snedecor and Cochran, 1980) to determine intergroup differences. If the ANOVA revealed statistically significant ($p<0.05$) intergroup variance, Dunnett's test (Dunnett, 1964) was used to compare the test article-treated groups to the control group.

1.3. KEY STUDY DATES

Date(s)	Event(s)
12 September 2006	Experimental starting date (animal receipt)
26 September 2006	Experimental start date (first day of dose administration)
26 September – 17 October 2006	Test article administration
15 November 2006	Last serum hormone analysis
[redacted]	Experimental termination/completion date ([redacted])

1.4. DATA RETENTION

The sponsor has title to all documentation records, raw data, specimens or other work product generated during the performance of the study. All work product generated by WIL Research Laboratories, LLC, including raw paper data and specimens, are retained in the Archives at WIL Research Laboratories, LLC, as specified in the study protocol. Data generated by the sponsor will be archived by the sponsor or the sponsor's designee.

Reserve samples of the test article, pertinent electronic storage media and the original final report are retained in the Archives at WIL Research Laboratories, LLC in compliance with regulatory requirements.

1.5. RESULTS

Brown material on various body surfaces (primarily the anogenital and urogenital areas) was noted in the 800 mg/kg/day group females beginning as early as PND 24. Clear material around the mouth was noted in the 200 and 800 mg/kg/day group females 1 hour following dose administration beginning as early as PND 29 and 27, respectively. This finding was attributed to the test article, but was not considered adverse because they did not persist to the daily examinations. Salivation prior to dose administration was also noted in the 50, 200 and 800 mg/kg/day group females beginning as early as PND 39, 28 and 28, respectively; however, this finding was not considered adverse because it generally did not persist to the daily examinations on the following day.

Eight females in the 800 mg/kg/day were found dead at 23, 25 or 26 days of age as a result of test article administration. Three females in this group were found dead at approximately 1-2 hours following dose administration; the remaining 5 females were found dead on the morning following their last dose. In addition to the findings noted above, 5 of the 8 females in the 800 mg/kg/day group that were found dead had a hunched posture on the day prior to or the day of death; 1 of these females was observed rocking, lurching or swaying while ambulating. A hunched posture was also noted for 1 female in the 800 mg/kg/day group that survived to the scheduled necropsy. At the

necropsy of the females that were found dead, 1 female had dark red discoloration in the lungs and another female had clear fluid contents in the uterus. No other internal findings were noted for females in the 800 mg/kg/day group that died prematurely. All other animals survived to the scheduled euthanasia.

Test article-related lower mean body weight gains and body weight losses in the 800 mg/kg/day group were noted during the first 4 days of dose administration. The differences were statistically significant ($p<0.01$) compared to the control group. Throughout the remainder of the dosing period (following the deaths of the most sensitive animals) mean body weight gains in this group were sporadically lower than the control group; the difference was statistically significant ($p<0.01$) during PND 27-28. However, when the entire treatment period (PND 22-42) was evaluated, mean body weight gain in the 800 mg/kg/day group was lower (not statistically significant) compared to the control group value. As a result of the decrements in mean body weight gains, mean body weights in the 800 mg/kg/day group were 9.7% to 16.1% lower than the control group values during PND 24-42. The differences were statistically significant ($p<0.05$ or $p<0.01$) from PND 24-40. Mean body weight gains in the 200 mg/kg/day group were similar to those in the control group during PND 22-23 through PND 27-28. Thereafter, mean body weight gain in this group was generally lower than that noted in the control group; the difference was statistically significant ($p<0.01$) during PND 39-40. Mean body weight gain in the 200 mg/kg/day group was lower (not statistically significant) than the control group value when the entire treatment period (PND 22-42) was evaluated. The decrements in mean body weight gain in this group were attributed to the test article and resulted in mean body weights that were 5.5% to 8.8% lower (not statistically significant) than the control group values during PND 35-42. Mean body weights and body weight gains in the 10 and 50 mg/kg/day groups were generally similar to those in the control group throughout the study; none of the differences were statistically significant.

The mean age of attainment of vaginal patency was earlier in the 50, 200 and 800 mg/kg/day groups; this change was attributed to the test article. The differences from the concurrent control group were statistically significant ($p<0.01$). Mean ages of attainment were 32.5, 33.3, 28.3, 28.2 and 28.9 days in the control, 10, 50, 200 and 800 mg/kg/day groups, respectively. The values in the 50, 200 and 800 mg/kg/day groups were also lower than the mean minimum value in the WIL historical control data for female pubertal studies (31.8 days of age). Mean body weights at the age of attainment (85.4 g, 83.4 g and 73.9 g) in the 50, 200 and 800 mg/kg/day groups, respectively, were statistically significantly ($p<0.01$) lower than the concurrent control group value; the values were also below the minimum mean value in the WIL historical control data (102.1 g).

Consistent with an earlier age of attainment of vaginal patency, the ages of the first occurrence of estrus in the 50, 200 and 800 mg/kg/day groups (32.1, 31.2 and 28.9 days of age, respectively) were earlier than in the concurrent control group (34.4 days of age); the differences in the 200 and 800 mg/kg/day groups were statistically significant ($p<0.05$ or $p<0.01$). These values were also lower than the minimum mean value in the WIL historical control data (34.1 days of age). Estrous cycle lengths could only be determined for 5/15, 8/15, 13/15, 7/15 and 1/7 females in the control, 10, 50, 200 and 800 mg/kg/day groups, respectively, due to a high number of females with incomplete cycles. No differences in estrous cycle lengths were noted in the 10, 50 and 200 mg/kg/day groups with number of cycling animals available for evaluation. Estrous cycle lengths in females of this age are highly variable. Abnormal estrous cycles ($\geq$3 consecutive days estrus [E]) were noted in 12/15 and 6/7 females in the 200 and 800 mg/kg/day groups, respectively, as presented in the following table.

Text Table 1: Number of Females with Abnormal Estrous Cycles

Group (mg/kg/day)	Number with Extended D	Number with Extended E	Number with Both Extended E and D
0	6/15	0/15	0/15
10	4/15	0/15	0/15
50	6/15	1/15	0/15
200	5/15	12/15	2/15
800	2/7	6/7	1/7

The majority of females in the control, 10 and 50 mg/kg/day groups with abnormal estrous cycles had extended diestrus, whereas a shift toward extended estrus was noted in the 200 and 800 mg/kg/day groups. The persistent estrus noted at the 2 highest dosage levels was consistent with the earlier attainment (3.2 and 5.5 days earlier, respectively) of vaginal patency in these groups.

There were no test article-related effects in thyroid hormone levels (total T_4 and TSH) at any dosage level. In addition, E_2 and LH were unaffected by test article administration at all dosage levels. A high LH value was noted for 1 control group female, resulting in a higher-than-average mean for this group; this sample was re-analyzed and the re-tested value was similar. No statistically significant differences from the control group were noted.

Test article-related, generally statistically significant ($p<0.05$ or $p<0.01$) increases in mean absolute and relative (to final body weight) liver weights (800 mg/kg/day group) and decreases in mean absolute and relative spleen (800 mg/kg/day group), luminal fluid (absolute only), wet and blotted uterus and thymus gland (200 and 800 mg/kg/day groups) and ovary/oviduct weights (50, 200 and 800 mg/kg/day groups) were observed compared to the control group values. The following table presents these changes.

Text Table 2: Summary of Test Article-Related Effects on Absolute Organ Weights [G] with Percent Difference from the Control Group

Organ	0 mg/kg/day	10 mg/kg/day	50 mg/kg/day	200 mg/kg/day	800 mg/kg/day
Liver	8.2487	7.8837 (-4.4%)	7.9892 (-3.1%)	8.3159 (+0.8%)	12.1045** (+46.7%)
Spleen	0.4681	0.4643 (-0.8%)	0.4877 (+4.2%)	0.4209 (-10.1%)	0.3611** (-22.9%)
Wet Uterus	0.4201	0.3760 (-10.5%)	0.4013 (-4.5%)	0.2177** (-48.2%)	0.2143** (-49.0%)
Blot. Uterus	0.3371	0.3277 (-2.8%)	0.3083 (-8.5%)	0.2022** (-40.0%)	0.1992** (-40.9%)
Luminal Fluid	0.0829	0.0482 (-41.9%)	0.0930 (+12.2%)	0.0155 (-81.3%)	0.0151 (-81.8%)
Thymus	0.5948	0.5867 (-1.4%)	0.5768 (-3.0%)	0.4598** (-22.7%)	0.3105** (-47.8%)
Ovary	0.0936	0.0855 (-8.7%)	0.0787* (-15.9%)	0.0548** (-41.5%)	0.0393** (-58.0%)

Blot. = Blotted, Ovary = Ovaries/Oviducts
* = $p<0.05$ ** = $p<0.01$

One and 2 females in the 200 and 800 mg/kg/day groups had small ovaries at necropsy, and 1 of the 800 mg/kg/day group females had small oviducts, corresponding to the lower ovary/oviduct weights noted in these groups. The mean relative liver weight in the 200 mg/kg/day group was statistically significantly ($p<0.05$) higher than the control group value; however, the absolute value was comparable to that in the control group. Therefore, the increase in relative liver weight in this group was not considered test article-related.

Microscopically, 14/15 rats from the 800 mg/kg/day group had absent corpora lutea. This effect was accompanied by moderate (9/15 rats) to severe (6/15 rats) granulosa cell necrosis, and moderate (10/15 rats) to severe (5/15 rats) oocyte degeneration. In the 200 mg/kg/day group, there were 9 rats with absent corpora. Fourteen rats from this group had mild granulosa cell necrosis, and 1 rat had moderate granulosa cell necrosis.

The uterus of 7 rats from the 800 mg/kg/day group that were found dead had mild (4/14 rats) to severe (3/14 rats) atrophy, consisting of decreased endometrial and myometrial thickness as well as a reduced number of endometrial glands. The atrophic glandular

epithelial cells had an inactive appearance with a reduced amount of cytoplasm. All the examined tissues from the control group were microscopically normal.

Text Table 3. Incidence Of Selected Histopathologic Findings

	0 mg/kg/day	200 mg/kg/day	800 mg/kg/day
Ovaries [a]	15	15	15
Corpora lutea absent, bilateral	0	9	14
Necrosis, granulosa cell, bilateral	0	15	15
Mild	0	14	0
Moderate	0	1	9
Severe	0	0	6
Degeneration, oocyte, bilateral	0	15	15
Mild	0	14	0
Moderate	0	1	10
Severe	0	0	5
Uterus[a]	15	15	14[b,c]
Atrophy	0	0	7
Mild	0	0	4
Severe	0	0	3

[a] = Number of tissues examined from each group.
[b] = Missing 1 uterus and cervix at trimming.
[c] = Only noted for females that were found dead.

Mild follicular cell hypertrophy was noted in the thyroid gland of 3 rats from the 800 mg/kg/day group. The relationship of this finding to the test article was unclear. Also in the 800 mg/kg/day group, there was mild focal necrosis in ectopic thymic tissue that was present in the thryoid gland section of 1 rat that was found dead, and minimal focal lymphocytic infiltration was present in the thyroid gland of 1 rat from the 800 mg/kg/day group that was euthanized at the scheduled termination. Remaining histologic changes were considered to be incidental findings, manifestations of spontaneous diseases, or related to some aspect of experimental manipulation other than administration of the test article. There was no test article-related alteration in the incidence, severity or histologic character of those incidental and spontaneous tissue alterations.

1.6. CONCLUSIONS

Based on the results of this study, [ ] administered orally to juvenile female rats resulted in estrogenic effects for females at 50, 200 and 800 mg/kg/day as evidenced by earlier attainment of vaginal patency (with corresponding lower mean body weight on the day of attainment) and at 200 and 800 mg/kg/day by earlier age at the first occurrence of estrus. In addition, estrous cycle disturbances were noted in the 200 and 800 mg/kg/day groups with 12/15 and 6/7 females, respectively, exhibiting persistent estrus (≥3 consecutive days of estrus). No test article-related effects on mean serum E_2, LH, T_4 or TSH levels were observed at any dosage level. Mean absolute and relative (to final body weight) spleen weight in the 800 mg/kg/day group and mean absolute and relative wet and blotted uterus weights (and thus, luminal fluid weight) and thymus gland weights in the 200 and 800 mg/kg/day groups were lower than the control group values. Lower mean absolute and relative ovary/oviduct weights were observed in the 50, 200 and 800 mg/kg/day groups. Mean absolute and relative liver weights in the 800 mg/kg/day groups were higher than the control group values. Microscopic findings corresponding to the lower mean ovary and uterus weights were observed in the 800 mg/kg/day group. The 800 mg/kg/day dosage level resulted in complete absence of corpora lutea in 14 of 15 rats. All ovaries in this group had moderate to severe granulosa cell necrosis and moderate to severe oocyte degeneration. Mild or severe atrophy of the uterus was present in 7 rats from the 800 mg/kg/day group that were found dead. In the 200 mg/kg/day group, similar but milder morphologic changes in ovaries were present.

This study was inspected in accordance with the U.S. EPA Good Laboratory Practice Standards (40 CFR Part 792), the OECD Principles of Good Laboratory Practice, the Japanese MAFF Good Laboratory Practice Standards, the standard operating procedures of WIL Research Laboratories, LLC and the sponsor's protocol and protocol amendment with the following exceptions. The data located in Appendices A (Certificate of Analysis) and B (Analytical Chemistry Report) were the responsibility of the sponsor. Quality Assurance findings, derived from the inspections during the conduct of the study and from the inspections of the raw data and draft report, are documented and have been reported to the study director. A status report is submitted to management monthly.

This report accurately reflects the data generated during the study. The methods and procedures used in the study were those specified in the protocol, its amendments and the standard operating procedures of WIL Research Laboratories, LLC.

The raw data, the retention sample(s), and the final report will be stored in the Archives at WIL Research Laboratories, LLC or another location specified by the sponsor.

3.2. APPROVAL

This study was inspected according to the criteria discussed in Section 3.1.

5. DEVIATIONS FROM THE PROTOCOL

This study was conducted in accordance with the protocol and protocol amendments, except for the following.

- **Protocol Section 5.5** states that the females would weigh 30 g to 50 g at the time of randomization and that body weights for all animals assigned to the study would be within approximately ±5 g of the mean. The upper limit was extended to 60 g in order to obtain a sufficient number of females for the study. The animals assigned to study were -8.4 g to +11.4 g of the mean.
- **Protocol Section 6.1** states that animals would be housed 3 per cage in plastic maternity cages following weaning. Although PND 21 females were randomized into treatment groups and placed into plastic maternity cages, there is no documentation that females were housed 3 per cage.
- **Protocol Section 7.6.1** states that animals would be observed approximately 1 hour following dose administration. On 29 September 2006, 3 control group females were observed 1 hour and 16 minutes or 1 hour and 17 minutes following dose administration. On 9 October 2006, 8 females in the 10 mg/kg/day group were observed 1 hour and 16 minutes to 1 hour and 20 minutes following dose administration.
- **Protocol Section 7.7** states that the time of euthanasia would be recorded for each animal. On 18 October 2006, times of euthanasia were recorded for each animal; however, it is unclear whether the time recorded was at the initiation or completion of euthanasia.
- **Protocol Section 9.1** states that the ovaries from each animal would be preserved. The oviducts were also retained.
- **Protocol Section 9.3** states that the cervix, uterine body and horns, ovaries and thyroids/parathyroids would be examined microscopically for females in the control, 200 and 800 mg/kg/day groups. The oviducts for female no. 38696-10 in the 800 mg/kg/day group were also examined microscopically.
- **Protocol Section 9.3** states that the uterus, vagina, ovaries and thyroids/parathyroids would be retained for microscopic examination. Lung tissue for female no. 38703-07 in the 800 mg/kg/day group (collected due to a gross lesion) was also processed for microscopic examination, but was not examined.

- **Protocol Section 9.3** states that microscopic examinations would be performed on specified tissues. Although not specified by protocol, a peer review of the study pathologist's findings was also conducted.

These deviations did not negatively impact the quality or integrity of the data nor the outcome of the study.

1. INTRODUCTION

The objective of this study was to evaluate the ability of the test article to induce effects on pubertal development in the intact juvenile female rat.

2. STUDY DESIGN

Female Crl:CD(SD) rats were administered [redacted] via oral gavage as single daily doses beginning on postnatal day (PND) 22 and continuing through PND 41. All animals were dosed at approximately the same time each day (after 12:00 pm). The dosage volume was 5 mL/kg for all groups.

Group Number	Test Article	Dosage Level (mg/kg/day)	Number of Females
1	Corn Oil	0	15
2	[redacted]	10	15
3		50	15
4		200	15
5		800	15

All surviving animals were euthanized by carbon dioxide inhalation on PND 42.

3. METHODS

3.1. HORMONE ANALYSES

Following euthanasia on PND 42, blood was collected from the vena cava of from all animals that survived until scheduled euthanasia. All blood samples were allowed to clot, processed to generate serum and then placed in an ice bath. The following hormone concentrations were determined from all serum samples:

Thyroid Stimulating Hormone (TSH)
Estradiol
Thyroxine (Total T4)
Luteinizing Hormone (Lutein' Hormone)

( ) - Designates tabular abbreviation

Revised Audited Draft

3.2. ANATOMIC PATHOLOGY

3.2.1. MACROSCOPIC EXAMINATION

Complete postmortem examinations were performed on all animals found dead, or at the scheduled necropsies. At the scheduled necropsy, animals were euthanized by carbon dioxide inhalation. At the time of necropsy, the following tissues and organs were collected and placed in 10% neutral-buffered formalin fixative unless otherwise noted:

- Axillary Lymph Node
- Cervix and Uterine Body (1 longitudinal section)
- Ovaries
- Pituitary
- Spleen
- Thymus
- Thyroid with parathyroids
- Uterine horns (4 sections per horn)
- Vagina
- All gross (internal) lesions (when possible)

3.2.2. ORGAN WEIGHTS

The following organs were weighed from all animals at the scheduled necropsy:

- Adrenal glands
- Kidneys
- Liver
- Ovaries and oviducts
- Pituitary gland
- Spleen
- Thymus
- Thyroid with parathyroids *

Paired organs were weighed together. Designated (*) organs were weighed after fixation. Organ-to-final-body-weights were calculated.

In addition, wet and blotted uterine weights were measured for all animals that survived to the scheduled necropsy. The uterus harvesting and weighing procedure was performed as described below.

1) Animal was euthanized and uterus harvested.
2) Uterus (with luminal fluid) was immediately transferred to a Petri dish (lined with saline-moistened filter paper or equivalent) that was tared immediately prior to the transfer.
3) The uterus' wet weight was recorded to the nearest 0.1 mg.

4) The uterus was opened and blotted.
5) The uterus was placed in a Petri dish (lined with saline-moistened filter paper or equivalent) that was tared immediately prior to the transfer.
6) The uterus' blotted weight was recorded to the nearest 0.1 mg.

3.2.3. MICROSCOPIC EXAMINATION

Microscopic examination of routinely prepared hematoxylin-eosin stained paraffin sections was performed on the cervix and uterine body (1 longitudinal section), ovaries, thyroids with parathyroids and uterine horns (4 sections per horn) collected at necropsy from all animals in the 0, 200 and 800 mg/kg/day groups.

The stained histologic sections were examined by routine light microscopy and histologic observations were entered in the WIL Toxicology Data Management System (WTDMS™) by the pathologist at the time of examination. At the time of histologic examination, all gross necropsy observations were addressed. Due to sectioning difficulties or minor laboratory errors, the number of tissues examined from each dosage group does not necessarily correlate with the number of animals included in the group. The number of missing tissues was small and did not interfere with detection of test article-related histologic alterations in the study. The histologic sections were of adequate size and quality for detailed histologic evaluation. The WTDMS™ histopathology tables contain a record of tissues examined and histologic findings, and serve as the basis for this narrative report. Histopathologic lesions were classified using standard published terminology to the extent possible.

3.3. ABBREVIATIONS

The following abbreviations may apply to this report:

Interval - point in the study at which an animal died or was euthanized
FD - found dead
SN - scheduled necropsy

Revised Audited Draft

Revised Audited Draft

3.4. DATA INTERPRETATION

In the discussion of hormones, values derived from the control group animals were considered as concurrent control values for purposes of constructing a 'normal' range for the present study. Unless otherwise stated in this report, the 'normal' historical control range was considered to be the mean value ± 2 standard deviations. This narrative report addresses all clinical pathology values that were identified as statistically significantly different from control group values on the clinical pathology data tables.

In the discussion of organ weight changes, the indication of higher or lower mean organ weights refers to a statistically significant ($p<0.05$ or $p<0.01$ using Dunnett's test) difference between test article-treated versus control group animals in the present study. In addition, historical control values for this laboratory were consulted to refine data interpretation. This narrative report addresses all organ weight values that were identified as statistically significantly different from control group values on the organ weight data tables.

Revised Audited Draft

4. RESULTS

4.1. SURVIVAL

Eight 800 mg/kg/day females were found dead prior to the scheduled necropsy. The causes of death were undetermined because only reproductive organs, thyroids and parathyroids were provided for microscopic examination. All other rats survived until the scheduled necropsy without clinical signs of distress or physiologic impairment.

4.2. HORMONE ANALYSES

There were no test article-related effects or statistically significant differences on analyzed hormone levels.

4.3. GROSS OBSERVATIONS

Review of the gross necropsy observations revealed the following test article-related alterations:

Text Table 1. Toxicologically Relevant Gross Necropsy Observations

Organ	Observation	Dosage Level(s) (mg/kg/day)	Sex	Interval(s)
Ovaries	(A) small	800	F	SN
		200	F	SN
Uterus	(B) contents, clear fluid	800	F	FD
Histologic correlates	(A) Corpora lutea absence (B) Dilatation			

Descriptions of test article-related histologic alterations are discussed in Section 4.5. (Histologic Changes).

Revised Audited Draft

4.4. ORGAN WEIGHTS

The following organ weight changes were considered to be test article-related:

Text Table 2. Toxicologically Relevant Organ WeightS

Organ	Direction and magnitude of change	Dosage Level(s) (mg/kg/day)	Sex	Interval	Histologic Correlate
Ovaries/Oviducts					
absolute relative to FBW	↓15.9%* ↓16.9%*	50	F	SN	No correlate

Uterus-Blotted					
absolute relative to FBW	↓40.0%** ↓36.3%**	200	F	SN	No correlate
absolute relative to FBW	↓40.9%** ↓34.4%**	800	F	SN	Atrophy[a]
Uterus-Wet					
absolute relative to FBW	↓48.2%** ↓45.3%**	200	F	SN	No correlate
absolute relative to FBW	↓49.0%** ↓44.2%**	800	F	SN	Atrophy[a]
Liver					
relative to FBW	↑8.4%*	200	F	SN	NA (Not examined)
absolute relative to FBW	↑46.7%** ↑62.5%**	800	F	SN	NA (Not examined)
Spleen					
absolute relative to FBW	↓22.9%** ↓15.1%*	800	F	SN	NA (Not examined)
Thymus					
absolute relative to FBW	↓22.7%** ↓17.6%**	200	F	SN	NA (Not examined)
absolute relative to FBW	↓47.8%** ↓42.8%**	800	F	SN	NA (Not examined)

* = Significantly ($p<0.05$) different from the control group using Dunnett's test.
** = Significantly ($p<0.01$) different from the control group using Dunnett's test.
FBW = Final body weight. NA = Not available.
[a] = One rat from scheduled necropsy in this group had uterine atrophy.

There were no other test article-related effects on organ weights.

4.5. HISTOLOGIC CHANGES

4.5.1. CHANGES ASSOCIATED WITH TEST ARTICLE ADMINISTRATION

Histopathologic effects attributable to test article administration are tabulated in Text Table 3. Fourteen of 15 rats from 800 mg/kg/day group had absent corpora lutea. This effect was accompanied by moderate (9 of 15 rats) and severe (6 of 15 rats) granulosa cell necrosis, and moderate (10 of 15 rats) to severe (5 of 15 rats) oocyte degeneration. In the 200 mg/kg/day group, there were 9 rats with absent corpora. Fourteen rats from this group had mild granulosa cell necrosis, and 1 rat had moderate granulosa cell necrosis.

The uterus of 7 rats from the 800 mg/kg/day group that were found dead had mild (4 of 14 rats) to severe (3 of 14 rats) atrophy, consisting of decreased endometrial and myometrial thickness as well as a reduced number of endometrial glands. The atrophic glandular epithelial cells had an inactive appearance with a reduced amount of cytoplasm. All the examined tissues from the control group were microscopically normal.

Revised Audited Draft

Revised Audited Draft

Text Table 3. Incidence Of Selected Histopathologic Findings

Dosage (mg/kg/day)	0	200	800
Ovaries [a]	15	15	15
Corpora lutea absent, bilateral	0	9	14
Necrosis, granulosa cell, bilateral	0	15	15
Mild	0	14	0
Moderate	0	1	9
Severe	0	0	6
Degeneration, oocyte, bilateral	0	15	15
Mild	0	14	0
Moderate	0	1	10
Severe	0	0	5
Uterus [a]	15	15	14 [b,c]
Atrophy	0	0	7
Mild	0	0	4
Severe	0	0	3

[a] = Number of tissues examined from each group.
[b] = Missing 1 uterus and cervix at the tissue trim.
[c] = Only noted for females that were found dead

4.5.2. CHANGES OF UNCERTAIN RELATIONSHIP TO TEST ARTICLE ADMINISTRATION

Mild follicular cell hypertrophy was noted in the thyroid glands of 3 rats from the 800 mg/kg/day group that were found dead.

4.5.3. CHANGES UNRELATED TO TEST ARTICLE ADMINISTRATION

In the 800 mg/kg/day group, there was mild focal necrosis in ectopic thymic tissue that was present in the thryoid gland section of 1 rat that was found dead, and minimal focal lymphocytic infiltration was present in the thyroid gland of 1 rat that was euthanized at the scheduled termination. Remaining histologic changes were considered to be incidental findings, manifestations of spontaneous diseases, or related to some aspect of

experimental manipulation other than administration of the test article. There was no test article-related alteration in the incidence, severity or histologic character of those incidental and spontaneous tissue alterations.

5. DISCUSSION

Chemicals can cause type I toxicity characterized by an absence of corpora lutea and impairment of follicular development (Yuan and Foley, 2002). In those cases, atrophy of uterus is secondary to deficiency of ovarian steroid hormone (Yuan and Foley, 2002). The histologic changes present in this study indicated the test article had effects on reproductive organs. The mild hypertrophy of thyroids that was seen in 3 rats from the 800 mg/kg/day group was of concern, but the low incidence and mild degree of histologic alteration and no statistically significant differences on analyzed hormone levels prohibited a conclusion with regard to the etiology of the alteration. Lymphocytic infiltration in the thyroid gland of 1 rat was incidental finding. The lesion was minimal focal and the adjacent thyroid parenchyma were normal. The mild focal necrosis of thymus of 1 rat was also incidental finding. Individual necrotic cells in thymus are common (Stefanski, et al., 1990). The organ weight changes of liver, spleen and thymus may be test article related, but this interpretation can not be confirmed without histopathological evaluations.

6. CONCLUSIONS

Female Crl:CD(SD) rats were administered [redacted] via oral gavage as single daily doses beginning on post-natal day (PND) 22 and continuing through PND 41. Groups 1-5 were administered the test article at dosages of 0, 10, 50, 200 and 800 mg/kg/day, respectively. Thyroid stimulating hormone (TSH), thyroxine (T_4), estradiol (E_2) and luteinizing hormone (LH) were determined on PND 42. There were no test article-related effects or statistically significant differences on analyzed hormone levels.

Revised Audited Draft

The reproductive organs (ovaries, uterus, and cervix), thyroids and parathyroids were examined grossly and histopathologically. The 800 mg/kg/day dosage level resulted in complete absence of corpora lutea in 14 of 15 rats. All ovaries in this group had moderate to severe granulosa cell necrosis and moderate to severe oocyte degeneration. Mild to severe atrophy of the uterus was present in 7 rats in the 800 mg/kg/day group. In the 200 mg/kg/day group, similar but milder morphologic changes in ovaries were present. Both absolute and relative to final body weight organ weights of ovary and uterus from both the 200 and 800 mg/kg/day groups were significantly lower than control group ($p<0.01$or $p<0.05$). Collectively, histopathologic evaluations and organ weight data indicated that test article when given orally at dosages of 200 and 800mg/kg/day had mild to severe effects on the reproductive tract of intact juvenile female rats.

WIL Study No. 187060

Peer Review Statement

A peer review of histopathology data was performed as follows for this study:

1. All processed tissues and diagnoses were reviewed from five numbered female rats selected randomly from the control and high dose groups. Identification numbers for the control animals evaluated were 38694-07, 38695-01, 38694-04, 38697-03 and 38702-05 and for the high-dose animals were 38695-08, 38694-01, 38695-03, 38699-09 and 38700-07.

2. Potential target organs for which all diagnoses were verified from all animals in all treatment groups were as follows: ovary, uterus, cervix and vagina.

Following review of the microscopic findings reported by the study pathologist, the results were discussed and appropriate terminology and diagnoses were mutually agreed upon. Differences of opinion between the study and reviewing pathologists were resolved with agreement on the final diagnoses. The tables contained in the final report reflect the mutually agreed-upon diagnoses.

Study Protocol

Revised Audited Draft

Revised Audited Draft

Study Number: WIL-187060

PROTOCOL AMENDMENT II

Sponsor: [redacted]

Sponsor No.: 06-023

A. Title:

A Female Pubertal Assay of [redacted] Administered Orally in Juvenile Female Rats

B. Protocol Modification/Addition/Clarification:

1) **9.3 Microscopic Examination:**

The second paragraph is changed to read:

Microscopic examination of hematoxylin-eosin stained paraffin sections will be performed on the following tissues from the 0, 200 and 800 mg/kg/day animals.

C. Reason for Protocol Modifications:

1) The client has authorized microscopic examination of the preserved tissues.

Sponsor No.: 06-023

A. Title:

A Female Pubertal Assay of [redacted] Administered Orally in Juvenile Female Rats

B. Protocol Modification/Addition/Clarification:

1) **3** **STUDY SCHEDULE:**

Proposed Audited Report Date: January 4, 2007

2) **7.6.3** **Vaginal Perforation:**

The first sentence is changed to the following:

Each female pup (15/group) will be observed daily for vaginal perforation beginning on PND 23 (Adams, 1985).

C. Reason for Protocol Modifications:

1) The proposed audited report date has been determined.

Revised Audited Draft

2) To correct the postnatal day on which to begin observation for vaginal perforation to PND 23.

1 OBJECTIVE:

The objective of this study is to evaluate the ability of the test article to induce effects on pubertal development in the intact juvenile female rat.

This study will be conducted in compliance with the U.S. Environmental Protection Agency (EPA), 40 CFR Part 792, the OECD [C(97) 186/Final] and the Ministry of Agricultural, Forestry and Fisheries (MAFF), Law No. 82, 1984, Good Laboratory Practice (GLP) Standards. The study will be performed according to the protocol and WIL Standard Operating Procedures.

Proposed Animal Receipt Date: (Experimental Starting Date)	September 12, 2006
Proposed Experimental Start Date:	September 26, 2006
Proposed Experimental Termination/Completion Date:	October 18, 2006
Proposed Audited Report Date:	To be determined.

4 TEST ARTICLE DATA:

4.1 Identification:

[redacted]

4.2 Lot Number:

To be determined.

4.3 Purity:

100%

4.4 Stability:

The test article is considered to be stable under the storage conditions provided by the Sponsor.

4.5 Physical Description:

To be determined.

4.6 Storage Conditions:

Store at ambient conditions.

4.7 Reserve Samples:

Reserve samples of the test article will be taken in accordance with WIL standard operating procedures and stored in the Archives at WIL Research Laboratories, LLC indefinitely unless otherwise specified.

4.8 Personnel Safety Data:

To be provided by the Sponsor. It is the responsibility of the Sponsor to notify the testing facility of any special handling requirements for the test article. A material safety data sheet (MSDS) will accompany the test article upon arrival at the laboratory.

5 TEST SYSTEM:

5.1 Species:

Rat

5.2 Strain:

Crl:CD(SD)

5.3 Source:

Charles River Laboratories
Raleigh, NC

5.4 Number on Study:

Seventy-five females (maximum of 100 females and 10 dams purchased). Immature females will be supplied in litters of 10 animals with their own or another (fostering) dam. The immature females will be 6-8 days old upon receipt. Pups not expected to survive to the next observation period (moribund) will be euthanized by intraperitoneal injection of sodium pentobarbital (prior to PND11) or by carbon dioxide inhalation (after PND11) and the carcass discarded. Animals not assigned to the study will be transferred to the stock animal colony or will be euthanized by carbon dioxide inhalation and the carcasses discarded. Following weaning, the dams will be euthanized by carbon dioxide inhalation and the carcasses discarded.

5.5 Body Weight Range:

At randomization: 30-50 g for immature females. All animals assigned to study will be approximately ± 5 g of the mean.

5.6 Age:

At start of dosing animals will be 22 days of age.

5.7 Identification System:

The maternal animals will be uniquely identified by a Monel® metal ear tag displaying the animal number. The pups will be identified by tail tattoo.

Revised Audited Draft

Revised Audited Draft

Individual cage cards will be affixed to each cage and will display the animal number, group number, study number, dosage level and sex of the animal. Following randomization the pups will be individually identified by an ear tag.

5.8 Justification for Selection:

This species and strain of animal is recognized as appropriate for reproduction studies. WIL Research Laboratories, LLC has reproductive historical control data in this species and strain of rat. This animal model has been proven to be susceptible to the effects of reproductive toxicants. This number of animals is considered the minimum number required for meaningful interpretation of the data and fulfillment of agency requirements.

6 SPECIFIC MAINTENANCE SCHEDULE:

6.1 Animal Housing:

All animals will be initially housed by litter with their own or another (fostering) dam in plastic maternity cages containing ground corncob nesting material (Bed O'Cobs®). Following randomization, the juvenile female animals will be weaned and housed three animals per cage in plastic maternity (shoebox) cages. Control animals (Group 1) will be housed on a separate rack from exposed animals. Exposed animals from a companion study, housed concurrently in the same animal room, will also be housed on a separate rack. The cage bedding will be changed at least three times each week. The cages will be subjected to routine cleaning at a frequency consistent with maintaining good animal health and WIL standard operating procedures. The facilities at WIL Research Laboratories, LLC are fully accredited by the Association for Assessment and Accreditation of Laboratory Animal Care International (AAALAC International).

6.2 Environmental Conditions:

Controls will be set to maintain an average daily temperature of 71 ± 5°F (22 ± 3°C) and an average daily relative humidity of 50 ± 20%. Temperature and relative humidity will be monitored continuously. Data for these two parameters will be scheduled for automatic collection on an hourly basis. Fluorescent lighting controlled by light timers will provide illumination for a 12 hour light/dark photoperiod. Temporary adjustments to the light/dark cycles may be made to accommodate protocol specified activities. The ventilation rate will be set at a minimum of 10 room air changes per hour, 100% fresh air.

6.3 Drinking Water:

Reverse osmosis-purified water will be available *ad libitum*. Filters servicing the automatic watering system are changed regularly according to WIL

Standard Operating Procedures. The municipal water supplying the laboratory is analyzed according to WIL Standard Operating Procedures on a routine basis to assure that contaminants are not present in concentrations that would be expected to affect the outcome of the study.

6.4 Basal Diet:

PMI Nutrition International, LLC Certified Rodent LabDiet® 5002 will be offered *ad libitum* during the study. Periodic analyses of the certified feed are performed by the manufacturer to ensure that heavy metals and pesticides are not present at concentrations that would be expected to affect the outcome of the study. Results of the analyses are provided to WIL Research Laboratories, LLC by the manufacturer and will be placed in the study records. Each lot utilized will be identified and recorded. Feeders will be changed and sanitized once per week.

7 EXPERIMENTAL DESIGN:

7.1 Animal Receipt and Quarantine:

Each animal will be inspected by a qualified technician upon receipt. Rats judged to be in good health and suitable as test animals will be immediately placed in quarantine for a minimum of nine days. All rats will be initially sexed and weighed. Maternal animals will be permanently identified with a metal ear tag, and juvenile animals will be identified by tail tattoo. During the quarantine period, each rat will be observed twice daily for changes in general appearance and behavior. Prior to the start of the in-life phase, those animals judged to be suitable test subjects will be identified and receive a detailed physical examination at the time of animal selection for randomization.

7.2 Randomization:

At the conclusion of the quarantine period (animals 21 days of age), animals judged to be suitable test subjects and meeting acceptable body weight requirements, will be assigned at random using a computer program. At that time, the animal numbers and corresponding body weights will be entered into the WIL Toxicology Data Management System (WTDMS™). A printout containing the animal numbers and individual group assignments will be generated based on body weight stratification into a block design. Animals will then be weaned and arranged into the groups according to the printout. Body weights at randomization will be within ± 20% of the mean. Each of 5 groups will consist of fifteen females. If after randomization statistically significant differences between groups exist, new randomizations will be generated until group mean body weights are homogeneous.

Revised Audited Draft

Revised Audited Draft

7.3 Route and Rationale of Test Article Administration:

The route of administration will be oral (gavage). Historically, this route has been used extensively for studies of this nature. Appropriate-sized flexible, Teflon®-shafted, stainless steel, ball-tipped dosing cannulae will be used for the oral administration by gavage. Any losses, or incomplete dosing will be recorded.

7.4 Organization of Test Groups, Dosage Levels and Treatment Regimen:

7.4.1 Organization of Test Groups:

The dosage levels were determined from the results of previous studies and were provided by the Sponsor Representative after consultation with the WIL Study Director. The following table presents the study group arrangement:

Group Number	Test Article	Dosage Level (mg/kg/day)	Dose Concentration (mg/mL)	Dose Volume (mL/kg)	Number of Females
1	Corn Oil	0	0	5	15
2	[redacted]	10	2	5	15
3	[redacted]	50	10	5	15
4	[redacted]	200	40	5	15
5	[redacted]	800	160	5	15

7.4.2 Vehicle Control Article:

Corn oil.

7.4.3 Treatment Regimen:

The test and control articles will be administered as single daily doses beginning on day 22 and continuing through 41 days of age. All animals will be dosed at approximately the same time each day, after 12:00 p.m., and the time of dosing will be recorded for each animal.

7.4.4 Adjustment of Dosages:

Individual doses will be calculated based on each daily body weight to provide the proper dosage. Individual animal body weights and individual animal dosages will be recorded.

Revised Audited Draft

7.5 Preparation and Analysis of Test Article Formulations:

7.5.1 Method and Frequency of Preparation:

Based on the physical characteristics of the test article, appropriate methods will be used to ensure the best possible formulations of the test article in the vehicle. Dosing formulations of the test article will be prepared weekly and stored at room temperature. The study director or the deputy director or designee will visually inspect the formulations prior to initiation of dosing. This visual inspection will be performed to assure that the formulations are visibly homogeneous and acceptable for dosing. Any special procedures required for formulation will be documented according to Good Laboratory Practices and presented in the final report of this study.

7.5.2 Homogeneity and Stability of Test Article Formulation:

Dosing mixture homogeneity in bulk preparations will be collected prior to the initiation of test article administration, if possible. While undergoing stirring in the beaker, the following sample aliquots (5 mL) will be drawn for analysis: control, three aliquots (from the middle); all treatment groups, nine aliquots (3 each from the top, middle and bottom). Test article formulations will be divided into aliquots for daily dispensation. Resuspension homogeneity of aliquots will be determined over the longest period of aliquot storage. Three samples (5mL) from the top and bottom of each group will be collected to assess the homogeneity after storage and resuspension. Two of the three samples will be sent to [redacted] c/o [redacted], for analysis of homogeneity and stability over a ten-day period. The samples will be shipped under ambient conditions. The remaining sample from each dose level and strata will be stored under normal laboratory conditions for possible future analysis.

7.5.3 Concentration Analysis:

Samples of the dosing mixtures will be collected on the first and last day of each weekly preparation. At each time point, two 5-mL aliquots will be taken from each dose level (middle stratum), including the control group. The dosing mixture will be thoroughly mixed before taking each sample. One sample from each dose level will be analyzed; the remaining sample will be retained by the Testing Laboratory for possible future analysis.

Dosing mixture samples for homogeneity, stability and concentration of the test article at all dose levels, including the control, will be analyzed

Revised Audited Draft

by the Sponsor. Quality assurance (QA) auditing of the conduct, results and reporting of the analyses, as well as archiving of these data will be the responsibility of the Sponsor. Critical phase inspection reports and report audits will be submitted to the Study Director and management at WIL Research Laboratories, LLC. A QA statement will be issued for inclusion in the overall final report. The methods and results of the analysis will be provided by the Sponsor and included as an appendix to the WIL final report. The method employed will be listed in the analytical report.

Concentration and stability data will be evaluated using percent difference. The acceptable tolerance between the theoretical and measured values is 15%.

Mixtures will be considered homogeneous if the difference between the overall group mean and the strata mean is 10% or less.

7.5.4 Sample Handling and Shipment:

Each 5-mL sample will be placed in a glass vial with a Teflon-lined lid. The vial plus sample weight will be recorded with an accuracy of ± 0.0005 g. Each sample will be stored at ambient temperature. Each sample container will be labeled with the following information:

Accession Number
Sponsor's Reference Number
Testing Laboratory Study Number
Test Article Name
Dose Level (mg/kg)
Dosing Mixture Concentration (mg/mL)
Preparation Date
Sampling Date
Weight of Sample

The sample shall be packed in a suitable container to maintain the temperature conditions specified in Section 4 during transit plus an adequate margin of safety for any transit delays. The sample shall be sent by express courier to:

[redacted]

[redacted] shall be notified in advance of shipping by telefax at [redacted] This notification shall include test article and study identification, carrier, and estimated time/date of arrival. Sample shipments shall be accompanied by an inventory sheet describing the samples contained in the shipment with the information described above.

7.6 General Observations During the Experimental Period:

7.6.1 Clinical Signs:

The rats will be observed twice daily for appearance, behavior, moribundity and mortality. A detailed physical examination will be conducted at the time of randomization. Clinical observations regarding general appearance and behavior will be recorded daily prior to dosing. During the treatment period, the rats will also be observed at the time of dosing and again approximately one hour after administration. Additional post-dosing observation periods may be necessary and will be documented in the study records. Observations shall include, but are not limited to, evaluations for changes in appearance of the skin and fur, eyes and mucous membranes, respiratory, circulatory, autonomic and central nervous system functions, somatomotor activity and behavior patterns. Observations will be recorded. Findings noted outside of the scheduled observation time periods will be recorded at the time they are observed.

7.6.2 Body Weights:

Body weights will be recorded individually (to the nearest 0.1 gram PND 22-42) beginning one day prior to the start of dosing. Final body weights will be collected prior to euthanasia.

7.6.3 Vaginal Perforation:

Each female pup (15/group) will be observed daily for vaginal perforation beginning on PND 25 (Adams, 1985). Examination of the females will be performed at approximately the same time each day and will continue daily until vaginal perforation is present. The body weight of each female will be recorded on the day of acquisition of vaginal perforation.

7.6.4 Determination of Estrous Cycles:

Daily vaginal lavages will be performed to determine the stage of estrus beginning on the day vaginal perforation is observed. Lavages will be performed at approximately the same time each day (with the exception

Revised Audited Draft

that the lavage performed on the day of necropsy will be collected immediately prior to euthanasia) and will continue through the day of necropsy. The mean age of first estrous will be determined.

7.7 Euthanasia:

On PND 42, the animals will be euthanized by carbon dioxide inhalation, and the time of euthanasia will be recorded for each animal. Any animals not expected to survive until the following dosing period or until the scheduled euthanasia will be euthanized by carbon dioxide inhalation and necropsied as described in section 9.

8 HORMONE ANALYSIS:

8.1 Thyroid Hormones:

Following euthanasia, blood will be collected from the vena cava of all animals. Following collection, all blood samples (target volume of 2mL) will be allowed to clot and then be placed in an ice bath and processed to generate serum. The following hormone concentrations will be determined from all serum samples:

Thyroid Stimulating Hormone (TSH)	Thyroxine (T_4)
Estradiol (E_2)	Lutenizing Hormone (LH)

9 ANATOMIC PATHOLOGY:

9.1 Macroscopic Examination:

A complete necropsy examination will be conducted on all animals dying spontaneously or euthanized *in extremis*. This will include examination of the external surface, all orifices, the external surface of the brain and spinal cord and the thoracic, abdominal and pelvic cavities including viscera. A complete necropsy will not be conducted on animals surviving to study termination. Gross lesions (i.e., masses) will be collected and placed in 10% neutral-buffered formalin. The following tissues will be collected and placed in 10% neutral-buffered formalin:

Axillary Lymph Node	Spleen
Cervix and Uterine Body (one longitudinal section)	Thymus
	Thyroid with parathyroids
Ovaries	Uterine Horns (four sections per horn)
Pituitary	Vagina
	All gross (internal) lesions

Revised Audited Draft

Revised Audited Draft

9.2 Organ Weights:

9.2.1 Uterine Weights:

Wet and blotted uterine weights will be measured for all animals surviving to the scheduled necropsy. Uterine weights will not be collected for any animals found dead or euthanized *in extremis*.

The uterus will be harvested from all animals using the following procedure. The harvesting of uteri will be performed in a round-robin order. The pubic symphysis will be opened and each ovary and uterine horn will be detached from the dorsal abdominal wall. The ovaries are separated from the uterine horns at the oviduct/uterus junction. The urinary bladder and ureters will be removed from the ventral and lateral side of the uterus and vagina. The fibrous adhesion between the rectum and vagina is then detached until the junction of the vaginal orifice and perineal skin is identified. The uterus and vagina are detached from the body by incising the vaginal wall just above the junction between the perineal skin. The excess fat and adnexa will be trimmed away. The vagina is then removed from the uterus, leaving the cervix intact and attached to the uterus for uterus weight measurement. Care is to be taken during uterus harvesting such that the luminal contents are retained. A record will be made if any luminal contents are lost. The uterus will be transferred to a uniquely marked and tared plastic Petri dish with care to avoid desiccation before weighing. The Petri dish should be lined with saline-moistened filter paper (or equivalent) and covered to minimize desiccation.

The uterus harvesting and weighing procedure will be done in the order described below.

1. Animal is euthanized and uterus harvested.
2. Uterus (with luminal fluid) is immediately transferred to a Petri dish (lined with saline-moistened filter paper or equivalent) that was tared immediately prior to the transfer.
3. The uterus' wet weight is recorded to the nearest 0.1 mg.
4. The uterus is opened and blotted (see below).
5. The uterus is placed in a Petri dish (lined with saline-moistened filter paper or equivalent) that was tared immediately prior to the transfer.
6. The uterus' blotted weight is recorded to the nearest 0.1 mg.

Immediately following collection of the wet weight, the uterus will be individually processed by opening the uterine wall and carefully blotting the excess fluid. Both uterine horns will be pierced and cut longitudinally with small surgical scissors, placed on filter paper (ex.

Revised Audited Draft

Whatman No. 3) and gently pressed with another piece of dry filter paper to absorb the luminal fluid. The procedure will not be so severe as to render the tissue unacceptable for histopathologic analysis, as this additional investigation may be performed at the discretion of the Sponsor (by protocol amendment).

9.2.2 Ovary, Liver, Pituitary, Kidney, Spleen, Thymus, Thyroid and Adrenal Weights:

The following organs from all females euthanized at scheduled termination will be weighed (to the nearest 0.1 mg):

Adrenal glands	Pituitary gland
Kidneys	Spleen
Liver	Thymus
Ovaries and oviducts	Thyroid with parathyroids (following fixation)

Paired organs will be weighed together.

To minimize systematic bias in the weighing procedures, organ harvesting and weighing procedures will be divided as equally as possible among the prosecting and weighing technicians, such that all animals from a group are not processed by a single individual.

9.3 <u>Microscopic Examination:</u>

Following collection of wet uterine weight, blotting of the uterus and collection of blotted uterine weight, each uterus will be placed in a uniquely identified jar of 10% neutral-buffered formalin and preserved for microscopic examination. The vagina, ovaries, and thyroids with parathyroids from each animal will be similarly preserved.

Microscopic examination of hematoxylin-eosin stained paraffin sections may be performed on the following tissues from all animals at the discretion of the Sponsor (additional cost).

Cervix and Uterine Body (one longitudinal section)	Thyroids with parathyroids
Ovaries	Uterine Horns (four sections per horn)

10 DURATION OF STUDY:

The conduct of this study will require approximately five weeks for acclimation, dosing and necropsy.

Revised Audited Draft

11 STATISTICAL METHODS:

Body weights, body weight gains, organ weights, organ weights relative to body weights, uterine weights (wet and blotted), luminal fluid weights, mean days of acquisition of vaginal perforation, mean age at first estrous, estrous cycle length, and serum hormone concentrations will be analyzed by a parametric one-way analysis of variance (ANOVA) (Snedecor, 1980) to determine intergroup difference. If the results of the ANOVA are significant ($p<0.05$), Dunnett's test (Dunnett, 1964) will be applied to the data to compare the treated groups to the control group.

12 QUALITY ASSURANCE:

The study will be audited by the WIL Quality Assurance Unit while in progress to assure compliance with the study protocol, protocol amendments and WIL Standard Operating Procedures. The study will be conducted in compliance with the U.S. Environmental Protection Agency (EPA), 40 CFR Part 792, the OECD [C(97) 186/final] and the Ministry of Agricultural, Forestry and Fisheries (MAFF) Law No. 82, 1984, Good Laboratory Practices (GLP) Standards. The raw data and draft report will be audited by the WIL Quality Assurance Unit prior to submission to the Sponsor Representative to assure that the final report accurately describes the conduct and the findings of the study.

This study will be included on the WIL master list of regulated studies.

13 RECORDS TO BE MAINTAINED:

All original raw data records, as defined by WIL SOPs and the applicable GLPs, will be stored as described in Section 14 in the Archives at WIL Research Laboratories, LLC.

14 WORK PRODUCT:

The Sponsor will have title to all documentation records, raw data, slides, specimens and other work product generated during the performance of the study. All work product, including raw paper data, pertinent electronic storage media and specimens will be returned to the Sponsor after a period of six months or following issuance of the final report. All work product will be stored in compliance with regulatory requirements.

Any work product, including documents, specimens, and samples, that are required by this protocol, its amendments, or other written instructions of the Sponsor, to be shipped by WIL Research Laboratories, LLC to another location will be appropriately packaged and labeled as defined by WIL's SOPs and delivered to a common carrier for shipment. WIL Research Laboratories, LLC will not be responsible for shipment following delivery to the common carrier.

Revised Audited Draft

15 REPORTS:

The final report will consist of an abbreviated summary report, including data tables and an interpretation and discussion of the study results.

WIL Research Laboratories, LLC will provide one copy of an audited draft report, submitted in a timely manner upon completion of the study prior to issuance of the final report. One revision will be permitted as part of the cost of the study, from which the Sponsor's reasonable revisions and suggestions will be incorporated into the final report, as appropriate. Additional changes or revisions may be made, at extra cost. It is expected that the Sponsor will review the draft report and provide comments to WIL within a two-month time frame following submission. WIL will submit the final report within one month following receipt of comments. If the Sponsor's comments and/or authorization to finalize the report have not been received at WIL within one year following submission of the draft report, WIL may elect to finalize the report following appropriate written notification to the Sponsor. Two electronic copies (PDF) of the final report on CD-R and one paper copy will be provided. Requests for additional paper copies of the final report may result in additional charges.

16 ANIMAL WELFARE ACT COMPLIANCE:

This study will comply with all applicable sections of the Final Rules of the Animal Welfare Act regulations (9 CFR Parts 1, 2 and 3). The Sponsor should make particular note of the following:

- The Sponsor Representative's signature on this protocol documents for the Study Director the Sponsor's assurance that the study described in this protocol does not unnecessarily duplicate previous experiments.

- Whenever possible, procedures used in this study have been designed to avoid or minimize discomfort, distress or pain to animals. All methods are described in this study protocol or in written laboratory standard operating procedures.

- Animals that experience severe or chronic pain or distress that cannot be relieved will be painlessly euthanized as deemed appropriate by the veterinary staff and Study Director. The Sponsor will be advised by the Study Director of all circumstances which could lead to this action in as timely a manner as possible.

- Methods of euthanasia used during this study are in conformance with the above-referenced regulation.

- The Sponsor/Study Director has considered alternatives to procedures that may cause more than momentary or slight pain or distress to the animals and has

provided a written narrative description (AWA covered species) of the methods and sources used to determine that alternatives are not available.

17 PROTOCOL MODIFICATION:

Modification of the protocol may be accomplished during the course of this investigation. However, no changes will be made in the study design without the written permission of the Sponsor. In the event that the Sponsor requests or approves a change in the protocol, such changes will be made by appropriate documentation in the form of protocol amendment. All alterations of the protocol and reasons for the modification(s) will be signed by the Study Director and the Sponsor Representative.

I. Study Protocol....

1. SUMMARY

1.1. OBJECTIVE

The objective of the study was to evaluate the ability of the test article to induce effects on pubertal development in the intact juvenile female rat.

1.2. STUDY DESIGN

[,] in the vehicle, Mazola® corn oil, was administered orally by gavage once daily for 20 consecutive days to 4 groups each of 15 Crl:CD(SD) immature female rats. Dosage levels were 10, 50, 200 and 800 mg/kg/day, and the dosage volume was 5 mL/kg. A concurrent control group received the vehicle on a comparable regimen. These dosage levels were determined from the results of previous studies and were provided by the sponsor representative after consultation with the WIL study director. **Stability of the test article to be addressed by the sponsor.**

Dosing procedures were performed from 26 September 2006 through 17 October 2006, when the animals were 22 to 41 days of age; the start of dose administration was staggered, based on age. At the initiation of dose administration, individual body weights ranged from 40.7 g to 63.7 g. The following table presents the study group assignment:

Group Number	Test Article	Dosage Level (mg/kg/day)	Dosage Concentration (mg/mL)	Dosage Volume (mL/kg)	Number of Females
1*	Corn Oil	0	0	5	15
2		10	2	5	15
3		50	10	5	15
4		200	40	5	15
5		800	160	5	15

*The control group data was collected under a companion study (WIL-187060). Record of dose administration was collected under WIL-187060 and transferred to the computer protocol for this study.

Dose administration and sampling procedures for the vehicle control group were conducted under a companion study Preparation, storage and sampling of the test article formulations were conducted as follows. The appropriate amount of test article for each group was weighed into a tared, calibrated glass container. A stir bar and approximately 80% of the vehicle were added to each container, and the mixtures were stirred until uniform. The appropriate volume of vehicle was added to bring each formulation to the calibration mark, and the preparations were stirred until uniform and throughout use. The test article formulations were prepared approximately weekly, divided into aliquots for daily dispensation and stored at room temperature. Three sets of samples from the top, middle and bottom strata of the test article formulations were collected prior to the initiation of dose administration. Additional samples (3 sets) were collected for resuspension homogeneity from the same formulations following 10 days of room temperature storage. Two sets of samples for concentration verification were collected on each day of preparation and 2 sets were collected on the last day of use of each preparation. Two sets of homogeneity/stability samples and 6 sets of concentration samples were shipped under ambient conditions to the sponsor for homogeneity, stability and concentration analyses; the remaining samples were stored under normal laboratory conditions at WIL Research Laboratories, LLC for possible future analysis.

Eight dams with 10 female pups each (80 pups total) were received from Charles River Laboratories, Inc., Raleigh, North Carolina, on 12 September 2006. The pups were 6 to 8 days old upon receipt. Pups were initially identified by tail tattoo, housed in plastic maternity cages (by litter with their own or a fostering dam for 14 to 16 days) during the acclimation period until randomization of the pups on postnatal day (PND) 21. Following randomization, the female pups were weaned, identified by metal eartag and housed 3 per cage in plastic maternity cages. Environmental controls were set to maintain an average daily temperature of 71°F ± 5°F and an average daily relative humidity of 50% ± 20%. Actual mean daily temperatures ranged from 70.3°F to 71.0°F

(21.3°C to 21.7°C) and mean daily relative humidity ranged from 36.9% to 47.7%. Light timers were calibrated to provide a 12-hour light (0600 hours to 1800 hours)/12-hour dark photoperiod. Air handling units were set to provide approximately 10 fresh air changes per hour. PMI Nutrition International, LLC, Certified Rodent LabDiet® 5002 and reverse osmosis-purified water were offered ad libitum.

All animals were observed twice daily for appearance, behavior, mortality and moribundity. A detailed physical examination was performed at the time of randomization. The rats were also observed daily (prior to dosing). Clinical findings at the time of dose administration and approximately 1 hour following dose administration were recorded when observed. Individual body weights were recorded daily. Each female pup was observed daily for vaginal patency beginning on PND 23 (Adams et al., 1985). Examination continued daily until vaginal patency was observed. Body weights were recorded on the day that vaginal patency was noted. Beginning on the day that vaginal patency was observed, vaginal lavages were performed daily, through the day of euthanasia, and the slides were examined to determine the stage of estrus. The mean estrous cycle length was calculated and reported for complete estrous cycles (i.e., the total number of returns to metestrus [M] or diestrus [D] from estrus [E] or proestrus [P] until the day of euthanasia). Estrous cycle length was determined by counting the number of days from the first M or D in a cycle to the first M or D in a subsequent cycle. In addition, the mean age at the onset of the first estrous cycle was calculated using the first day each animal was observed to be in estrus. A complete gross necropsy was performed only on animals that were found dead. All surviving animals were euthanized on PND 42 by carbon dioxide inhalation; blood was collected via the vena cava for evaluation of serum estradiol (E_2), luteinizing hormone (LH), thyroxine (T_4) and thyroid stimulating hormone (TSH) levels. The uterus (wet and blotted), kidneys, liver, ovaries and oviducts, pituitary gland, spleen, adrenal glands, thymus gland and thyroid glands (with parathyroid glands) were weighed at the scheduled euthanasia. Luminal fluid weight was calculated by subtracting the blotted uterus weight from the wet uterus

weight. The adrenal glands, axillary lymph nodes, ovaries, oviducts, uterus (horns and body), cervix, vagina, kidneys, liver, spleen, thymus gland, pituitary gland, thyroid glands (with parathyroid glands) and internal gross lesions were examined from all females, including those found dead; all of these tissues were retained with the exception of the adrenal glands, kidneys and liver. Microscopic examination was performed on the cervix and uterine body, ovaries, thyroids with parathyroids and uterine horns from all animals in the control, 200 and 800 mg/kg/day groups.

Statistical tests were performed using appropriate computing devices or programs. Analyses were conducted using two-tailed tests for minimum significance levels of 1% and 5%, comparing each test article-treated group to the control group. Each mean was presented with the standard deviation (S.D.) and the number of animals (N) used to calculate the mean. In addition, percent difference from control is presented for body weights, clinical pathology parameters and organ weights. Statistical analyses were not conducted if the number of animals was 2 or less. Due to the different rounding conventions inherent in the types of software used, the means and standard deviations on the summary and individual tables may differ by ±1 in the last significant figure. Mean body weights, body weight changes, days of acquisition of vaginal patency, estrous cycle lengths, ages at the first occurrence of estrus, serum hormone levels, luminal fluid weights and absolute and relative organ weights were subjected to a parametric one-way analysis of variance (ANOVA; Snedecor and Cochran, 1980) to determine intergroup differences. If the ANOVA revealed statistically significant ($p<0.05$) intergroup variance, Dunnett's test (Dunnett, 1964) was used to compare the test article-treated groups to the control group.

1.3. KEY STUDY DATES

Date(s)	Event(s)
12 September 2006	Experimental starting date (animal receipt)
26 September 2006	Experimental start date (first day of dose administration)
26 September – 17 October 2006	Test article administration
12 April 2007	Experimental termination/completion date (last microscopic examination)

1.4. DATA RETENTION

The sponsor has title to all documentation records, raw data, specimens or other work product generated during the performance of the study. All work product generated by WIL Research Laboratories, LLC, including raw paper data and specimens, are retained in the Archives at WIL Research Laboratories, LLC, as specified in the study protocol. Data generated by the sponsor will be archived by the sponsor or the sponsor's designee.

Reserve samples of the test article, pertinent electronic storage media and the original final report are retained in the Archives at WIL Research Laboratories, LLC in compliance with regulatory requirements.

1.5. RESULTS

Brown material on various body surfaces (primarily urogenital and anogenital areas) and hunched posture were noted in the 800 mg/kg/day group at the daily examinations beginning as early as PND 23; hunched posture was also observed at the time of and 1 hour following dose administration. These findings were attributed to the test article. Clear material around the mouth was noted in the 200 and 800 mg/kg/day groups 1 hour following dose administration beginning as early as PND 31 and 27, respectively. This finding was attributed to the test article, but was not considered adverse because it was not observed prior to administration of the daily dose on the following day. Salivation prior to dose administration was also observed in the 200 and 800 mg/kg/day groups beginning as early as PND 27 and 28, respectively; however, this finding was not

considered adverse because it was not observed prior to administration of the daily dose on the following day.

Eleven females in the 800 mg/kg/day group were found dead at 24-28 days of age as a result of test article administration. All females were found dead on the morning after the previous daily dose. Findings noted in the 800 mg/kg/day group animals that died (in addition to those noted above) included eyelids that were half-closed and rocking, lurching or swaying while ambulating for a single animal on PND 23; 2 females had red material around the nose on PND 24. At necropsy, 1 female each in this group had a small spleen and clear fluid contents in the uterus. All other females survived to the scheduled necropsy.

Lower mean body weight gains (PND 22-23 and 25-26) and mean body weight losses (PND 23-24 and 24-25) were noted in the 800 mg/kg/day group during the first 4 days of dose administration. The differences from the control group values were statistically significant ($p<0.01$). Throughout the remainder of the dosing period (following the deaths of the most sensitive females), sporadically lower mean body weight gains were observed in this group; the difference was statistically significant ($p<0.01$) during PND 29-30. When the entire treatment period (PND 22-42) was evaluated, a lower ($p<0.05$) mean body weight gain was observed in the 800 mg/kg/day group compared to the control group value. As a result of the decrements in mean body weight gain, mean body weights in this group were 9.7% to 24.5% lower than the control group values from PND 23-42. The differences were statistically significant ($p<0.05$ or $p<0.01$) from PND 24-41. Mean body weight gains in the 200 mg/kg/day group were similar to those in the control group during PND 22-23 through 26-27. Slightly lower (not statistically significant) mean body weight gains were noted in this group compared to the control group generally throughout the remainder of the study; however, there were often no dose-related trends in comparison to the 800 mg/kg/day group (N=4), as the most sensitive animals in that group had died prior to the onset of lower body weight gains in the 200 mg/kg/day group. The lower mean body weight gains (not statistically

significant) in the 200 mg/kg/day resulted in a slightly lower mean body weight gain when the entire treatment period (PND 22-42) was evaluated and mean body weights that were 5.0% to 9.8% lower than the control group values during PND 30-42. The differences in mean body weight were statistically significant ($p<0.05$ or $p<0.01$) during PND 34-41. Mean body weights and body weight gains in the 10 and 50 mg/kg/day groups were generally similar to those in the control group throughout the study. The only statistically significant ($p<0.01$) difference from the control group was a higher mean body weight gain in the 10 mg/kg/day group observed during PND 41-42.

The mean age of attainment of vaginal patency in the 50, 200 and 800 mg/kg/day groups was earlier than in the control group; this change was attributed to the test article. The differences from the concurrent control group were statistically significant ($p<0.05$ or $p<0.01$). Mean ages of attainment were 32.5, 32.3, 29.3, 29.2 and 29.4 days in the control, 10, 50, 200 and 800 mg/kg/day groups, respectively. The values in the 50, 200 and 800 mg/kg/day groups were also lower than the mean minimum value in the WIL historical control data for female pubertal studies (31.8 days of age). Mean body weights at the age of attainment (87.3 g, 86.1 g and 71.6 g) in the 50, 200 and 800 mg/kg/day groups, respectively, were statistically significantly ($p<0.01$) lower than the concurrent control group value (111.9 g); the values were also below the minimum mean value in the WIL historical control data (102.1 g).

Consistent with an earlier age of attainment of vaginal patency, the ages of the first occurrence of estrus in the 50, 200 and 800 mg/kg/day groups (31.6, 32.1 and 29.4 days of age, respectively) were earlier than in the concurrent control group (34.4 days of age); the difference in the 800 mg/kg/day group was statistically significant ($p<0.05$). These values were also lower than the minimum mean value in the WIL historical control data (34.1 days of age). Estrous cycle lengths could only be determined for 5/15, 9/15, 12/15, 10/15 and 2/4 females in the control, 10, 50, 200 and 800 mg/kg/day groups, respectively, due to a high number of females with incomplete cycles. No differences in estrous cycle lengths were noted in the 10, 50 and 200 mg/kg/day groups with the number of cycling

animals available for evaluation. Estrous cycle lengths in females of this age are highly variable. Abnormal estrous cycles (≥5 consecutive days of diestrus [D] or ≥3 consecutive days estrus [E]) were noted in 6/15, 6/15, 8/15, 14/15 and 3/4 females in the control, 10, 50, 200 and 800 mg/kg/day groups, respectively, as presented in the following table.

Text Table 1: Number of Females with Abnormal Estrous Cycles

Group (mg/kg/day)	Number with Extended D	Number with Extended E	Number with Both Extended E and D
0	6/15	0/15	0/15
10	6/15	0/15	0/15
50	6/15	2/15	0/15
200	10/15	6/15	2/15
800	0/4	3/4	0/4

All females in the control and 10 mg/kg/day groups with abnormal estrous cycles had extended diestrus, whereas a shift toward extended estrus was noted in the 200 and 800 mg/kg/day groups. The persistent estrus in the 50, 200 and 800 mg/kg/day groups was consistent with elevated estradiol levels and earlier attainment of vaginal patency in these groups.

Test article-related higher mean TSH and E_2 levels were observed in the 800 mg/kg/day group; the differences from the control group were statistically significant ($p<0.01$). Mean T_4 and LH levels in this group were not statistically significantly different compared to the control group values. No test article-related effects on serum hormones were noted in the 10, 50 and 200 mg/kg/day groups; differences from the control group were not statistically significant.

Test article-related, generally statistically significant ($p<0.05$ or $p<0.01$) increases in mean absolute and relative (to final body weight) liver weights (800 mg/kg/day group) and decreases in mean absolute pituitary gland weight (800 mg/kg/day group), absolute and/or relative spleen, luminal fluid, wet and blotted uterus and thymus gland (200 and 800 mg/kg/day groups) and absolute and relative ovary/oviduct weights (200 and

800 mg/kg/day groups) were observed compared to the control group values. In addition, lower, generally statistically significant ($p<0.05$) mean absolute and relative ovary/oviduct weights were observed in the 10 and 50 mg/kg/day groups; however, there was no dose-response relationship. The following table presents these changes.

Text Table 2: Summary of Test Article-Related Effects on Absolute Organ Weight [G] with Percent Difference from the Control Group

Organ	0 mg/kg/day	10 mg/kg/day	50 mg/kg/day	200 mg/kg/day	800 mg/kg/day
Liver	8.2487	7.9599 (-3.5%)	7.7336 (-6.2%)	7.6668 (-7.1%)	12.1067** (+46.8%)
Spleen	0.4681	0.4814 (+2.8%)	0.4170 (-10.9%)	0.3917* (-16.3%)	0.3555* (-24.1%)
Wet Uterus	0.4201	0.3166 (-24.6%)	0.3398 (-19.1%)	0.2170** (-48.3%)	0.2229* (-46.9%)
Blot. Uterus	0.3371	0.2761* (-18.1%)	0.2863 (-15.1%)	0.1988** (-41.0%)	0.2071** (-38.6%)
Luminal Fluid	0.0829	0.0405 (-51.1%)	0.0535 (-35.5%)	0.0182 (-78.0%)	0.0158 (-80.9%)
Thymus	0.5948	0.5931 (-0.3%)	0.5735 (-3.6%)	0.5127* (-13.8%)	0.2482** (-58.3%)
Ovary	0.0936	0.0796* (-15.0%)	0.0793* (-15.3%)	0.0603** (-35.6%)	0.0441** (52.9%)
Pituitary	0.0097	0.0093 (-4.1%)	0.0094 (-3.1%)	0.0085 (-12.4%)	0.0074* (-23.7%)

Blot. = Blotted, Ovary = Ovaries/Oviducts
* = $p<0.05$ ** = $p<0.01$

One female each in the 800 mg/kg/day group had small ovaries/oviducts and a small thymus gland at necropsy, corresponding to the lower ovary and thymus gland weights noted in this group. Mean absolute and relative blotted uterus weight in the 10 mg/kg/day group and mean relative wet uterus weight in the 10 mg/kg/day group were statistically significantly ($p<0.05$) lower than the control group values; however, no dose-related trend was evident. Therefore, the decreases in the wet and blotted uterus weights in this group were not considered test article-related.

Degeneration of oocytes, necrosis of granulosa cells in the ovarian follicles and complete absence or decrease in the number of corpora lutea were noted in the ovaries of rats

administered the test article at dosage levels 200 and 800 mg/kg/day, corresponding to the lower mean ovary weights observed in these groups..

In all of the female rats (15/15) administered the test article at the highest dosage level (800 mg/kg/day), all of the ovaries were completely devoid of corpora lutea. Corpora lutea were occasionally completely absent (1/15) or reduced in number (3/15) in rats from the 200 mg/kg/day group.

An increase in severity of microscopic alterations (as mentioned above) was observed in the ovaries of rats in the 800 mg/kg/day group, relative to rats administered the test article at 200 mg/kg/day. Because the severity of the microscopic alterations correlated with increasing dosage level, these microscopic alterations were considered to be test article-related.

Microscopic alterations present in the uterus of rats administered the test article were most consistent with atrophy affecting primarily the muscular and mucosal tunics characterized by reduced thickness of the tunica muscularis and/or tunica mucosa or generalized reduction in size of the organ due to symmetric atrophy of all of the tunics. The uterine atrophy was more severe in rats administered the test article at 800 mg/kg/day versus 200 mg/kg/day. Additionally, mild (4/15) to moderate (4/15) atrophy of the cervix was present in rats from the 800 mg/kg/day group. This alteration was also attributed to administration of the test article.

Microscopic alterations in ovaries, uterus and cervix considered to be related to administration of the test article are summarized in the following table.

Text Table 3. Summary Of Microscopic Findings

Tissue	0 mg/kg/day	200 mg/kg/day	800 mg/kg/day
Ovaries [a]	15	15	15
Corpora Lutea Absent	0	1	15
Decreased corpora lutea	0	3	0
Mild	0	1	0
Severe	0	2	0
Granulosa cell necrosis	0	14	15
Minimal	0	5	0
Mild	0	8	2
Moderate	0	1	13
Oocyte degeneration	0	14	15
Mild	0	1	2
Moderate	0	13	9
Severe	0	0	4
Uterus [a]	15	15	15
Atrophy	0	8	15
Minimal	0	5	0
Mild	0	3	4
Moderate	0	0	11
Cervix [a]	15	15	15
Atrophy	0	0	8
Mild	0	0	4
Moderate	0	0	4

[a] = Number of tissues examined from each group.

Minimal to mild depletion of colloid in the thyroid glands was present in 11/15 rats administered the test article at 800 mg/kg/day. Occasionally, colloid depletion occurred in conjunction with hypertrophy of the follicular epithelial cells, possibly due to enhanced stimulation to the thyroid glands from elevated TSH. Similar microscopic alterations were also present in rats administered the test article at 200 mg/kg/day, albeit at a much reduced frequency (colloid depletion was present in 2/15 rats in this groups). Microscopic alterations in the thyroid gland were also considered related to test article

administration because of the higher frequency and severity of colloid depletion in rats administered the test article at 800 mg/kg/day. Microscopic alterations in thyroid gland considered to be related to administration of the test article are summarized in the following table.

Text Table 4. Summary Of Microscopic Findings In The Thyroid Gland

	0 mg/kg/day	200 mg/kg/day	800 mg/kg/day
Thyroid [a]	15	15	15
Colloid depletion	0	2	11
Minimal	0	2	4
Mild	0	0	7
Follicular cell hypertrophy	0	4	2
Minimal	0	2	0
Mild	0	2	2
Ectopic thymus	0	1	2

[a] = Number of tissues examined from each group.

There were no other test article-related histologic changes. Remaining histologic changes were considered to be incidental findings, manifestations of spontaneous diseases, or related to some aspect of experimental manipulation other than administration of the test article. There was no test article-related alteration in the incidence, severity or histologic character of those incidental and spontaneous tissue alterations.

1.6. CONCLUSIONS

Based on the results of this study, [ ] administered orally to juvenile female rats resulted in estrogenic effects for females at 50, 200 and 800 mg/kg/day as evidenced by earlier attainment of vaginal patency (with corresponding lower mean body weight on the day of attainment) and by earlier age at the first occurrence of estrus. In addition, estrous cycle disturbances were noted in the 50, 200 and 800 mg/kg/day groups with 2/15, 6/15 and 3/4 females, respectively, exhibiting persistent estrus (≥3 consecutive days of estrus). Test article-related increases in mean E_2 and TSH levels were noted in the 800 mg/kg/day group. No test article-related effects on mean serum E_2, LH, T_4 or TSH levels were observed at 10, 50 and 200 mg/kg/day. Mean absolute and relative (to final body weight) wet and blotted uterus weights (and thus,

luminal fluid weight), ovary/oviduct, spleen weights and thymus gland weights in the 200 and 800 mg/kg/day groups were lower than the control group values. Microscopic correlates in the ovary included absence or reduction in the number of corpora lutea, degeneration of oocytes and necrosis of granulosa cells in ovarian follicles in the 200 and 800 mg/kg/day groups. Severity of the ovarian and uterine changes was generally dose-related. Although lower mean absolute and relative ovary/oviduct weights were also noted in the 10 and 50 mg/kg/day groups, no clear indication of an effect was apparent based on the lack of a dose response. Mean absolute and relative liver weights in the 800 mg/kg/day groups were higher than the control group values, and mean absolute pituitary gland weight in this group was lower than the control group value.

This study was inspected in accordance with the U.S. EPA Good Laboratory Practice Standards (40 CFR Part 792), the OECD Principles of Good Laboratory Practice, the Japanese MAFF Good Laboratory Practice Standards, the standard operating procedures of WIL Research Laboratories, LLC and the sponsor's protocol and protocol amendment with the following exceptions. The data located in Appendices A (Certificate of Analysis) and B (Analytical Chemistry Report) were the responsibility of the sponsor. Quality Assurance findings, derived from the inspections during the conduct of the study and from the inspections of the raw data and draft report, are documented and have been reported to the study director. A status report is submitted to management monthly.

This report accurately reflects the data generated during the study. The methods and procedures used in the study were those specified in the protocol, its amendments and the standard operating procedures of WIL Research Laboratories, LLC.

The raw data, the retention sample(s), and the final report will be stored in the Archives at WIL Research Laboratories, LLC or another location specified by the sponsor.

3.2. APPROVAL

This study was inspected according to the criteria discussed in Section 3.1.

5. DEVIATIONS FROM THE PROTOCOL

This study was conducted in accordance with the protocol and protocol amendments, except for the following.

- **Protocol Section 5.5** states that the females would weigh 30 g to 50 g at the time of randomization, and that body weights for all animals assigned to the study would be within approximately ± 5 g of the mean. The upper limit was extended to 60 g in order to obtain a sufficient number of females for the study. The animals assigned to study were -8.9 g to +11.4 g of the mean.
- **Protocol Section 6.1** states that animals would be housed 3 per cage in plastic maternity cages following weaning. Although PND 21 females were randomized into treatment groups and placed into plastic maternity cages, there is no documentation that females were housed 3 per cage.
- **Protocol Section 7.6.4** states that vaginal lavages would be performed daily to determine the stage of estrous cycle. No estrous slide could be located for female no. 38705-03 in the 10 mg/kg/day group for the day that vaginal patency was observed (PND 33). Therefore, estrous cycle data was not recorded for that female on PND 33.
- **Protocol Section 9.1** states that the ovaries from each animal would be preserved. The oviducts were also retained.
- **Protocol Section 9.3** states that microscopic examinations would be performed on specified tissues. Although not specified by protocol, a peer review of the study pathologist's findings was also conducted.

These deviations did not negatively impact the quality or integrity of the data nor the outcome of the study.

1. INTRODUCTION

The objective of this study was to evaluate the ability of the test article to induce effects on pubertal development in the intact juvenile female rat.

2. STUDY DESIGN

Female Crl:CD(SD) rats were administered [redacted] via oral gavage as single daily doses beginning on post-natal day (PND) 22 and continuing through PND 41. All animals were dosed at approximately the same time each day (after 12:00 pm). The dosage volume was 5 mL/kg for all groups.

Group Number	Test Article	Dosage Level (mg/kg/day)	Number of Females
1*	Vehicle [a]	0	15
2	[redacted]	10	15
3		50	15
4		200	15
5		800	15

[a] = The vehicle was corn oil.
*Control group data were collected in the companion study, WIL-187060.

All surviving animals were euthanized by carbon dioxide inhalation on PND 42.

3. METHODS

3.1. HORMONE ANALYSES

Following euthanasia on PND 42, blood was collected from the vena cava of all surviving animals. All blood samples were allowed to clot, placed in an ice bath and processed to generate serum. The following hormone concentrations were determined from all serum samples:

Thyroid Stimulating Hormone (TSH)	Thyroxine (Total T_4)
Estradiol	Luteinizing Hormone (Lutein' Hormone)

( ) - Designates tabular abbreviation

3.2. ANATOMIC PATHOLOGY

3.2.1. MACROSCOPIC EXAMINATION

Complete postmortem examinations were performed on all animals found dead, or euthanized in extremis. At the scheduled necropsy, animals were euthanized by carbon dioxide inhalation and exsanguinated. At the time of necropsy, the following tissues and organs [including gross lesions (i.e., masses)] were collected and placed in 10% neutral-buffered formalin fixative unless otherwise noted:

Axillary Lymph Node	Thymus
Cervix and Uterine Body (1 longitudinal section)	Thyroid with parathyroids
	Uterine horns (4 sections per horn)
Ovaries/Oviducts	Vagina
Pituitary	All gross (internal) lesions (when possible)
Spleen	

3.2.2. ORGAN WEIGHTS

The following organs were weighed from all animals at the scheduled necropsy:

Adrenal glands	Pituitary gland
Kidneys	Spleen
Liver	Thymus
Ovaries and oviducts	Thyroid with parathyroids *

Paired organs were weighed together. Designated (*) organs were weighed after fixation. Organ-to-final-body-weight ratios were calculated.

Revised Audited Draft

In addition, wet and blotted uterine weights were measured for all animals that survived to the scheduled necropsy. The uterus harvesting and weighing procedure was performed as described below.

1) Animal was euthanized and uterus harvested.
2) Uterus (with luminal fluid) was immediately transferred to a Petri dish (lined with saline-moistened filter paper or equivalent) that was tared immediately prior to the transfer.
3) The uterus' wet weight was recorded to the nearest 0.1 mg.
4) The uterus was opened and blotted.
5) The uterus was placed in a Petri dish (lined with saline-moistened filter paper or equivalent) that was tared immediately prior to the transfer.
6) The uterus' blotted weight was recorded to the nearest 0.1 mg.

3.2.3. MICROSCOPIC EXAMINATION

Microscopic examination of routinely prepared hematoxylin-eosin stained paraffin sections was performed on the cervix and uterine body (1 longitudinal section), ovaries, thyroids with parathyroids and uterine horns (4 sections per horn) collected at necropsy from all animals in the 0, 200 and 800 mg/kg/day groups.

The stained histologic sections were examined by routine light microscopy and histologic observations were entered in the WIL Toxicology Data Management System (WTDMS™) by the pathologist at the time of examination. Due to sectioning difficulties or minor laboratory errors, the number of tissues examined from each dosage group does not necessarily correlate with the number of animals included in the group. The number of missing tissues was small and did not interfere with detection of test article-related histologic alterations in the study. The histologic sections were of adequate size and quality for detailed histologic evaluation. The WTDMS™ histopathology tables contain a record of tissues examined and histologic findings, and serve as the basis for this narrative report. Histopathology lesions were classified using standard published terminology to the extent possible.

Revised Audited Draft

3.3. ABBREVIATIONS

The following abbreviations may apply to this report:

Interval - point in the study at which an animal died or was euthanized
FD - found dead
SN - scheduled necropsy

3.4. DATA INTERPRETATION

In the discussion of hormones, values derived from the control group animals were considered as concurrent control values for purposes of constructing a 'normal' range for the present study. Unless otherwise stated in this report, the 'normal' historical control range was considered to be the mean value ± 2 standard deviations. This narrative report addresses all clinical pathology values that were identified as statistically significantly different from control group values on the clinical pathology data tables.

In the discussion of organ weight changes, the indication of higher or lower mean organ weights refers to a statistically significant ($p<0.05$ or $p<0.01$ using Dunnett's test) difference between test article-treated versus control group animals in the present study. In addition, historical control values for this laboratory were consulted to refine data interpretation. This narrative report addresses all organ weight values that were identified as statistically significantly different from control group values on the organ weight data tables.

Revised Audited Draft

Revised Audited Draft

4. RESULTS

4.1. SURVIVAL

Eleven of 15 rats administered the test article at 800 mg/kg/day (Group 5) died at various time points during the study. In the 800 mg/kg/day group, 2 animals died on postnatal day (PND) 24, 5 animals died on PND 25, 3 animals died on PND 26, 1 animal died on PND 28. The rats from the control group, the 200 mg/kg/day group (Group 4) and the remaining 4/15 rats from the 800 mg/kg/day group survived until the scheduled necropsy. The cause of death was not determined for any of the animals that died during the course of the study.

4.2. HORMONES ANALYSES

The following **bolded and underlined** alterations in hormone levels were considered to be related to test article administration:

Text Table 1. Selected Hormonal Findings - Females

Group (mg/kg/day) Analysis:	0	10	50	200	800
Estradiol (pg/mL)					
Day 42 Mean	101.79	108.25	110.29	105.15	**142.50****
% Difference		6.3	8.4	3.3	40.0
TSH (ng/mL)					
Day 42 Mean	8.16	9.35	11.40	9.60	**14.73****
% Difference		14.6	39.7	17.6	80.5

** = Significantly different from the control group at 0.01 using Dunnett's test

Estradiol and TSH levels were significantly higher in the 800 mg/kg/day group females.

There were no other test article-related effects or statistically significant differences on hormone analyses.

4.3. GROSS OBSERVATIONS

Test article-related macroscopic changes were not observed in the 200 mg/kg/day group. Small ovaries and oviducts were noted in 1 rat from the 800 mg/kg/day group. Decreased

size of the ovaries was confirmed microscopically to be resulting from the loss of parenchyma characterized by absence of corpora lutea, necrosis of granulosa cells and degeneration of oocytes in this rat. A 2-mm cyst in 1 ovary of a rat from the 800 mg/kg/day group was microscopically consistent with a paraovarian cyst. This alteration was considered unrelated to test article administration due to its absence in other test article-treated animals in the same dose group and also due the absence of a dose-related response.

Descriptions of test article-related histologic alterations are discussed in Section 4.5. (Histologic Changes).

4.4. ORGAN WEIGHTS

The weight of ovaries and oviducts of rats administered the test article at dosage levels of 10, 50, 200 and 800 mg/kg/day were statistically significantly lower compared to the control group animals. The extent of weight loss paralleled the increase in the dose rate and therefore was considered to be related to administration of the test article.

Revised Audited Draft

Revised Audited Draft

Text Table 2. Toxicologically Relevant Ovary/Oviduct Weight Changes - Scheduled Necropsy

Organ	Direction & magnitude of change - absolute weight (% difference)	Direction & magnitude of change - relative to final body weight (% difference)	Dosage Level(s) (mg/kg/day)	Histologic Correlates
Ovaries& oviducts	↓52.9**	↓49.2**	800	Absence of corpora lutea Necrosis of granulosa cells Degeneration of oocytes
Ovaries& oviducts	↓35.6**	↓32.2**	200	Decreased/absent corpora lutea Necrosis of granulosa cells Degeneration of oocytes

** = Significantly different from the control group at 0.01 using Dunnett's test

Similarly, the weight of the uterus in rats administered the test article at dosage levels of rates of 10 (blotted weight), 200 (wet and blotted weight) and 800 mg/kg/day (wet and blotted weight) were statistically significantly lower than the control group animals. Although the magnitude of weight change did not correlate with the increasing dose rate, more severe microscopic alterations were present in rats administered the high dose level (800 mg/kg/day). Accordingly, weight changes in the uterus were considered significant and attributable to administration of the test article.

Revised Audited Draft

Text Table 3. Toxicologically Relevant Uterine Weight Changes - Scheduled Necropsy

Organ	Direction & magnitude of change - absolute weight (% difference)	Direction & magnitude of change - relative to final body weight (% difference)	Dosage Level(s) (mg/kg/day)	Histologic Correlate
Uterus-wet	↓46.9*	↓41.6*	800	Atrophy
Uterus-blotted	↓38.6**	↓31.6*	800	Atrophy
Uterus-wet	↓48.3**	↓45.7**	200	Atrophy
Uterus-blotted	↓41.0**	↓37.3**	200	Atrophy

* = Significantly different from the control group at 0.05 using Dunnett's test
** = Significantly different from the control group at 0.01 using Dunnett's test

The following organ weight changes were statistically significant when compared to the control group. Microscopic examination of the corresponding tissue sections was not performed. Therefore, the histologic basis of these weight changes was not determined.

Text Table 4. Other Toxicologically Relevant Organ Weight Changes

Organ	Direction and magnitude of change - absolute weight (% difference)	Direction and magnitude of change - relative to final body weight (% difference)	Dosage Level(s) (mg/kg/day)
Pituitary	↓23.7*	↓16.7	800
Liver	↑46.8**	↑62.6**	800
Thymus	↓58.3**	↓54.5**	800
Thymus	↓13.8*	↓7.8	200
Spleen	↓24.1*	↓17.5*	800
Spleen	↓16.3*	↓9.9	200

* = Significantly different from the control group at 0.05 using Dunnett's test
** = Significantly different from the control group at 0.01 using Dunnett's test

4.5. HISTOLOGIC CHANGES

4.5.1. CHANGES ASSOCIATED WITH TEST ARTICLE ADMINISTRATION

The following microscopic alterations were present in the ovaries of rats administered the test article at dosage levels 200 and 800 mg/kg/day.

- Degeneration of oocytes
- Necrosis of granulosa cells in the ovarian follicles and,
- Complete absence or decrease in the number of corpora lutea.

In all of the female rats (15/15) administered the test article at the highest dose level (800 mg/kg/day), all of the ovaries were completely devoid of corpora lutea. Corpora lutea were occasionally reduced in number (3/15) or completely absent (1/15) in the ovaries of rats of the 200 mg/kg/day group.

An increase in severity of microscopic alterations (as mentioned above) were observed in the ovaries of rats in the 800 mg/kg/day group, relative to rats administered the test article at 200 mg/kg/day. Since the severity of the microscopic alterations correlated with increasing dose rate, these microscopic alterations were considered to be related to administration of the test article.

Microscopic alterations present in the uterus of rats administered the test article were most consistent with atrophy affecting the muscular and mucosal tunics characterized by reduced thickness of the tunica muscularis and/or tunica mucosa or generalized reduction in size of the organ due to symmetric atrophy of all the tunics. The uterine atrophy was more severe in rats administered the test article at 800 mg/kg/day versus 200 mg/kg/day. Additionally, mild (4/15) to moderate (4/15) atrophy of the cervix was present in rats from the 800 mg/kg/day group. This alteration was also attributed to administration of the test article.

Microscopic alterations in ovaries, uterus and cervix considered to be related to administration of the test article are summarized in Text Table 5 below.

Atrophy	0	0	8
Mild	0	0	4
Moderate	0	0	4

[a] = Number of tissues examined from each group.

Minimal to mild depletion of colloid in the thyroid glands was present in 11/15 rats administered the test article at 800 mg/kg/day. Occasionally, colloid depletion occurred in conjunction with hypertrophy of the follicular epithelial cells. Similar microscopic

alterations were also present in rats administered the test article at 200 mg/kg/day; albeit at a much reduced frequency (colloid depletion was present in 2/15 rats). Microscopic alterations in the thyroid gland were also considered related to test article administration because of the higher frequency of incidence and severity of colloid depletion in rats administered the test article at 800 mg/kg/day.

Microscopic alterations in thyroid gland considered to be related to administration of the test article are summarized in Text Table 6 below.

Text Table 6. Summary Of Microscopic Findings In The Thyroid Gland

Dosage (mg/kg/day)	0	200	800
Thyroid [a]	15	15	15
Colloid depletion	0	2	11
Minimal	0	2	4
Mild	0	0	7

Minimal	0	2	0
Mild	0	2	2
Ectopic thymus	0	1	2

[a] = Number of tissues examined from each group.

4.5.2. CHANGES OF UNCERTAIN RELATIONSHIP TO TEST ARTICLE ADMINISTRATION

No histologic changes of uncertain relationship to administration of the test article were observed in tissues evaluated microscopically.

4.5.3. CHANGES UNRELATED TO TEST ARTICLE ADMINISTRATION

There were no other test article-related histologic changes. Remaining histologic changes were considered to be incidental findings, manifestations of spontaneous diseases, or related to some aspect of experimental manipulation other than administration of the test

Revised Audited Draft

article. There was no test article-related alteration in the incidence, severity or histologic character of those incidental and spontaneous tissue alterations.

5. DISCUSSION

The suspected test article-related changes in the ovaries involved a much larger number of follicles than would be expected with typical physiologic follicular atresia, and tended to involve more late stage rather than immature follicles.

There was significantly ($p<0.01$) lower thymus weight (58.3% absolute and 54.5% relative to body weight) in animals administered the test article at 800 mg/kg/day.

Colloid depletion in the thyroid glands of 11/15 rats administered test article at 800 mg/kg/day may be due to enhanced stimulation to the thyroid glands from elevated levels of thyroid stimulating hormone, which was demonstrated in the present study.

6. CONCLUSIONS

Female Crl:CD(SD) rats were administered [redacted] via oral gavage as single daily doses beginning on post-natal day (PND) 22 and continuing through PND 41. Groups 1-5 were administered the test article at dosages of 0, 10, 50, 200 and 800 mg/kg/day, respectively. Thyroid stimulating hormone (TSH), thyroxine (Total T_4), estradiol (E2) and luteinizing hormone (LH) were determined on PND 42. Estradiol and TSH levels were significantly higher in the 800 mg/kg/day group females than control group values.

Ovaries/oviduct and uterus weights of rats administered [redacted] at 200 and 800 mg/kg/day were significantly lower than control group values. Microscopic correlates in the ovary included absence or reduction in the number of corpora lutea, degeneration of oocytes and necrosis of granulosa cells in ovarian follicles. Severity of the ovarian and uterine changes was generally dose-associated.

WIL Study No. 187061

Peer Review Statement

A peer review of histopathology data was performed as follows for this study:

1. All processed tissues and diagnoses were reviewed from five numbered female rats selected randomly from the control and high dose groups. Identification numbers for the control animals evaluated were 38694-07, 38695-01, 38694-04, 38697-03 and 38702-05 and for the high-dose animals were 38705-09, 38705-02, 38706-06, 38709-05 and 38711-02.

2. Potential target organs for which all diagnoses were verified from all animals in all treatment groups were as follows: ovary, uterus, cervix and vagina.

Following review of the microscopic findings reported by the study pathologist, the results were discussed and appropriate terminology and diagnoses were mutually agreed upon. Differences of opinion between the study and reviewing pathologists were resolved with agreement on the final diagnoses. The tables contained in the final report reflect the mutually agreed-upon diagnoses.

PROTOCOL AMENDMENT II

Sponsor: [redacted]

Sponsor No.: 06-025

A. Title:

A Female Pubertal Assay of [redacted] Administered Orally in Juvenile Female Rats

B. Protocol Modification/Addition/Clarification:

1) **9.3 Microscopic Examination:**

The second paragraph is changed to read:

Microscopic examination of hematoxylin-eosin stained paraffin sections will be performed on the following tissues from the 0, 200 and 800 mg/kg/day animals.

C. Reason for Protocol Modifications:

1) The client has authorized microscopic examination of the preserved tissues.

Study Number: WIL-187061

PROTOCOL AMENDMENT I

Sponsor: [redacted]

Sponsor No.: 06-025

A. Title:

A Female Pubertal Assay of [redacted] Administered Orally in Juvenile Female Rats

B. Protocol Modification/Addition/Clarification:

1) **3** **STUDY SCHEDULE:**

Proposed Audited Report Date: January 4, 2007

2) **7.4.1** **Organization of Test Groups:**

The second sentence provided in footnote "*" is changed to the following:

Record of dose administration will be collected and maintained under the companion study (WIL-187060).

3) **7.6.3** **Vaginal Perforation:**

The first sentence is changed to the following:

Each female pup (15/group) will be observed daily for vaginal perforation beginning on PND 23 (Adams, 1985).

C. Reason for Protocol Modifications:

1) The proposed audited report date has been determined.

2) To designate that the dose administration records for the control group will be maintained with the companion study.

Revised Audited Draft

3) To correct the postnatal day on which to begin observation for vaginal perforation to PND 23.

PROTOCOL

A FEMALE PUBERTAL ASSAY OF [redacted] ADMINISTERED ORALLY IN JUVENILE FEMALE RATS

Sponsor Study Number: 06-025

Submitted To:

[redacted]

WIL Research Laboratories, LLC
1407 George Road
Ashland, OH 44805-9281

Revised Audited Draft

1 OBJECTIVE:

The objective of this study is to evaluate the ability of the test article to induce effects on pubertal development in the intact juvenile female rat.

This study will be conducted in compliance with the U.S. Environmental Protection Agency (EPA), 40 CFR Part 792, the OECD [C(97) 186/Final] and the Ministry of Agricultural, Forestry and Fisheries (MAFF), Law No. 82, 1984, Good Laboratory Practice (GLP) Standards. The study will be performed according to the protocol and WIL Standard Operating Procedures.

2 PERSONNEL INVOLVED IN THE STUDY:

2.1 Sponsor Representatives:

[redacted]

2.2 Principal Investigator – Dose Formulation Analysis:

[redacted]

2.3 WIL Study Director:

Revised Audited Draft

3 STUDY SCHEDULE:

Proposed Animal Receipt Date: (Experimental Starting Date)	September 12, 2006
Proposed Experimental Start Date:	September 26, 2006
Proposed Experimental Termination/Completion Date:	October 18, 2006
Proposed Audited Report Date:	To be determined.

4 TEST ARTICLE DATA:

4.1 Identification:

[redacted]

4.2 Lot Number:

To be determined.

4.3 Purity:

100%

4.4 Stability:

The test article is considered to be stable under the storage conditions provided by the Sponsor.

4.5 Physical Description:

To be determined.

4.6 Storage Conditions:

Store at ambient conditions.

4.7 Reserve Samples:

Reserve samples of the test article will be taken in accordance with WIL standard operating procedures and stored in the Archives at WIL Research Laboratories, LLC indefinitely unless otherwise specified.

Revised Audited Draft

5.7 Identification System:

The maternal animals will be uniquely identified by a Monel® metal ear tag displaying the animal number. The pups will be identified by tail tattoo. Individual cage cards will be affixed to each cage and will display the animal number, group number, study number, dosage level and sex of the animal. Following randomization the pups will be individually identified by an ear tag.

5.8 Justification for Selection:

This species and strain of animal is recognized as appropriate for reproduction studies. WIL Research Laboratories, LLC has reproductive historical control data in this species and strain of rat. This animal model has been proven to be susceptible to the effects of reproductive toxicants. This number of animals is considered the minimum number required for meaningful interpretation of the data and fulfillment of agency requirements.

6 SPECIFIC MAINTENANCE SCHEDULE:

6.1 Animal Housing:

All animals will be initially housed by litter with their own or another (fostering) dam in plastic maternity cages containing ground corncob nesting material (Bed O'Cobs®). Following randomization, the juvenile female animals will be weaned and housed three animals per cage in plastic maternity (shoebox) cages. Exposed animals from a companion study, housed concurrently in the same animal room, will be housed on a separate rack. A separate control group will be housed in the room on its own separate rack. The cage bedding will be changed at least three times each week. The cages will be subjected to routine cleaning at a frequency consistent with maintaining good animal health and WIL standard operating procedures. The facilities at WIL Research Laboratories, LLC are fully accredited by the Association for Assessment and Accreditation of Laboratory Animal Care International (AAALAC International).

6.2 Environmental Conditions:

Controls will be set to maintain an average daily temperature of 71 ± 5°F (22 ± 3°C) and an average daily relative humidity of 50 ± 20%. Temperature and relative humidity will be monitored continuously. Data for these two parameters will be scheduled for automatic collection on an hourly basis. Fluorescent lighting controlled by light timers will provide illumination for a 12 hour light/dark photoperiod. Temporary adjustments to the light/dark cycles may be made to accommodate protocol specified activities. The ventilation rate will be set at a minimum of 10 room air changes per hour, 100% fresh air.

Revised Audited Draft

6.3 Drinking Water:

Reverse osmosis-purified water will be available *ad libitum*. Filters servicing the automatic watering system are changed regularly according to WIL Standard Operating Procedures. The municipal water supplying the laboratory is analyzed according to WIL Standard Operating Procedures on a routine basis to assure that contaminants are not present in concentrations that would be expected to affect the outcome of the study.

6.4 Basal Diet:

PMI Nutrition International, LLC Certified Rodent LabDiet® 5002 will be offered *ad libitum* during the study. Periodic analyses of the certified feed are performed by the manufacturer to ensure that heavy metals and pesticides are not present at concentrations that would be expected to affect the outcome of the study. Results of the analyses are provided to WIL Research Laboratories, LLC by the manufacturer and will be placed in the study records. Each lot utilized will be identified and recorded. Feeders will be changed and sanitized once per week.

7 EXPERIMENTAL DESIGN:

7.1 Animal Receipt and Quarantine:

Each animal will be inspected by a qualified technician upon receipt. Rats judged to be in good health and suitable as test animals will be immediately placed in quarantine for a minimum of nine days. All rats will be initially sexed and weighed. Maternal animals will be permanently identified with a metal ear tag, and juvenile animals will be identified by tail tattoo. During the quarantine period, each rat will be observed twice daily for changes in general appearance and behavior. Prior to the start of the in-life phase, those animals judged to be suitable test subjects will be identified and receive a detailed physical examination at the time of animal selection for randomization.

7.2 Randomization:

At the conclusion of the quarantine period (animals 21 days of age), animals judged to be suitable test subjects and meeting acceptable body weight requirements, will be assigned at random using a computer program. At that time, the animal numbers and corresponding body weights will be entered into the WIL Toxicology Data Management System (WTDMS™). A printout containing the animal numbers and individual group assignments will be generated based on body weight stratification into a block design. Animals will then be weaned and arranged into the groups according to the printout. Body weights at randomization will be within ± 20% of the mean. Each of 4 groups

4.8 Personnel Safety Data:

To be provided by the Sponsor. It is the responsibility of the Sponsor to notify the testing facility of any special handling requirements for the test article. A material safety data sheet (MSDS) will accompany the test article upon arrival at the laboratory.

5 TEST SYSTEM:

5.1 Species:

Rat

5.2 Strain:

Crl:CD(SD)

5.3 Source:

Charles River Laboratories
Raleigh, NC

5.4 Number on Study:

Sixty females (maximum of 80 females and 8 dams purchased). Immature females will be supplied in litters of 10 animals with their own or another (fostering) dam. The immature females will be 6-8 days old upon receipt. Pups not expected to survive to the next observation period (moribund) will be euthanized by intraperitoneal injection of sodium pentobarbital (prior to PND11) or by carbon dioxide inhalation (after PND11) and the carcass discarded. Animals not assigned to the study will be transferred to the stock animal colony or will be euthanized by carbon dioxide inhalation and the carcasses discarded. Following weaning, the dams will be euthanized by carbon dioxide inhalation and the carcasses discarded.

5.5 Body Weight Range:

At randomization: 30-50 g for immature females. All animals assigned to study will be approximately ± 5 g of the mean.

5.6 Age:

At start of dosing animals will be 22 days of age.

Revised Audited Draft

will consist of fifteen females. If after randomization statistically significant differences between groups exist, new randomizations will be generated until group mean body weights are homogeneous.

7.3 Route and Rationale of Test Article Administration:

The route of administration will be oral (gavage). Historically, this route has been used extensively for studies of this nature. Appropriate-sized flexible, Teflon®-shafted, stainless steel, ball-tipped dosing cannulae will be used for the oral administration by gavage. Any losses, or incomplete dosing will be recorded.

7.4 Organization of Test Groups, Dosage Levels and Treatment Regimen:

7.4.1 Organization of Test Groups:

The dosage levels were determined from the results of previous studies and were provided by the Sponsor Representative after consultation with the WIL Study Director. The following table presents the study group arrangement.

Group Number	Test Article	Dosage Level (mg/kg/day)	Dose Concentration (mg/mL)	Dose Volume (mL/kg)	Number of Females
1*	Corn Oil	0	0	5	15
2	[redacted]	10	2	5	15
3	[redacted]	50	10	5	15
4	[redacted]	200	40	5	15
5	[redacted]	800	160	5	15

* – The control group data will be collected under a companion study (WIL-187060). Record of dose administration will be collected under the companion study and transferred to the computer protocol for this study.

7.4.2 Vehicle Control Article:

Corn oil.

7.4.3 Treatment Regimen:

The test and control articles will be administered as single daily doses beginning on day 22 and continuing through 41 days of age. All animals

Revised Audited Draft

Revised Audited Draft

6.3 Drinking Water:

Reverse osmosis-purified water will be available *ad libitum*. Filters servicing the automatic watering system are changed regularly according to WIL Standard Operating Procedures. 7.2 Randomization:

At the conclusion of the quarantine period (animals 21 days of age), animals judged to be suitable test subjects and meeting acceptable body weight requirements, will be assigned at random using a computer program. At that time, the animal numbers and corresponding body weights will be entered into the WIL Toxicology Data Management System (WTDMS™). A printout containing the animal numbers and individual group assignments will be generated based on body weight stratification into a block design. Animals will then be weaned and arranged into the groups according to the printout. Body weights at randomization will be within ± 20% of the mean. Each of 4 groups

will consist of fifteen females. If after randomization statistically significant differences between groups exist, new randomizations will be generated until group mean body weights are homogeneous.

7.3 Route and Rationale of Test Article Administration:

The route of administration will be oral (gavage). Historically, this route has been used extensively for studies of this nature. Appropriate-sized flexible, Teflon®-shafted, stainless steel, ball-tipped dosing cannulae will be used for the oral administration by gavage. Any losses, or incomplete dosing will be recorded.

7.4 Organization of Test Groups, Dosage Levels and Treatment Regimen:

7.4.1 Organization of Test Groups:

The dosage levels were determined from the results of previous studies and were provided by the Sponsor Representative after consultation with the WIL Study Director. The following table presents the study group arrangement.

Group Number	Test Article	Dosage Level (mg/kg/day)	Dose Concentration (mg/mL)	Dose Volume (mL/kg)	Number of Females
1*	Corn Oil	0	0	5	15
2	[redacted]	10	2	5	15
3	[redacted]	50	10	5	15
4	[redacted]	200	40	5	15
5	[redacted]	800	160	5	15

* – The control group data will be collected under a companion study (WIL-187060). Record of dose administration will be collected under the companion study and transferred to the computer protocol for this study.

7.4.2 Vehicle Control Article:

Corn oil.

7.4.3 Treatment Regimen:

The test and control articles will be administered as single daily doses beginning on day 22 and continuing through 41 days of age. All animals

Revised Audited Draft

will be dosed at approximately the same time each day, after 12:00 p.m., and the time of dosing will be recorded for each animal.

7.4.4 Adjustment of Dosages:

Individual doses will be calculated based on each daily body weight to provide the proper dosage. Individual animal body weights and individual animal dosages will be recorded.

7.5 Preparation and Analysis of Test Article Formulations:

7.5.1 Method and Frequency of Preparation:

Based on the physical characteristics of the test article, appropriate methods will be used to ensure the best possible formulations of the test article in the vehicle. Dosing formulations of the test article will be prepared weekly and stored at room temperature. The study director or the deputy director or designee will visually inspect the formulations prior to initiation of dosing. This visual inspection will be performed to assure that the formulations are visibly homogeneous and acceptable for dosing. Any special procedures required for formulation will be documented according to Good Laboratory Practices and presented in the final report of this study.

7.5.2 Homogeneity and Stability of Test Article Formulation:

Dosing mixture homogeneity in bulk preparations will be collected prior to the initiation of test article administration, if possible. While undergoing stirring in the beaker, the following sample aliquots (5 mL) will be drawn for analysis: control, three aliquots (from the middle); all treatment groups, nine aliquots (3 each from the top, middle and bottom). Test article formulations will be divided into aliquots for daily dispensation. Resuspension homogeneity of aliquots will be determined over the longest period of aliquot storage. Three samples (5mL) from the top and bottom of each group will be collected to assess the homogeneity after storage and resuspension. Two of the three samples will be sent to [redacted] c/o [redacted] for analysis of homogeneity and stability over a ten-day period. The samples will be shipped under ambient conditions. The remaining sample from each dose level and strata will be stored under normal laboratory conditions for possible future analysis.

7.5.3 Concentration Analysis:

Samples of the dosing mixtures will be collected on the first and last day of each weekly preparation. At each time point, two 5-mL aliquots will

Revised Audited Draft

Revised Audited Draft

be taken from each dose level (middle stratum), including the control group. The dosing mixture will be thoroughly mixed before taking each sample. One sample from each dose level will be analyzed; the remaining sample will be retained by the Testing Laboratory for possible future analysis.

Dosing mixture samples for homogeneity, stability and concentration of the test article at all dose levels, including the control, will be analyzed by the Sponsor. Quality assurance (QA) auditing of the conduct, results and reporting of the analyses, as well as archiving of these data will be the responsibility of the Sponsor. Critical phase inspection reports and report audits will be submitted to the Study Director and management at WIL Research Laboratories, LLC. A QA statement will be issued for inclusion in the overall final report. The methods and results of the analysis will be provided by the Sponsor and included as an appendix to the WIL final report. The methods employed will be listed in the analytical report.

Concentration and stability data will be evaluated using percent difference. The acceptable tolerance between the theoretical and measured values is 15%.

Mixtures will be considered homogeneous if the difference between the overall group mean and the strata mean is 10% or less.

7.5.4 Sample Handling and Shipment:

Each 5-mL sample will be placed in a glass vial with a Teflon-lined lid. The vial plus sample weight will be recorded with an accuracy of ± 0.0005 g. Each sample will be stored at ambient temperature. Each sample container will be labeled with the following information:

Accession Number
Sponsor's Reference Number
Testing Laboratory Study Number
Test Article Name
Dose Level (mg/kg)
Dosing Mixture Concentration (mg/mL)
Preparation Date
Sampling Date
Weight of Sample

The sample shall be packed in a suitable container to maintain the temperature conditions specified in Section 4 during transit plus an

adequate margin of safety for any transit delays. The sample shall be sent by express courier to:

[redacted]

[redacted] shall be notified in advance of shipping by telefax at [redacted] This notification shall include test article and study identification, carrier, and estimated time/date of arrival. Sample shipments shall be accompanied by an inventory sheet describing the samples contained in the shipment with the information described above.

7.6 General Observations During the Experimental Period:

All control group data will be collected under a companion study (WIL-187060) which will be housed concurrently in the same animal room. The control group data will be transferred to this study for reporting purposes.

7.6.1 Clinical Signs:

The rats will be observed twice daily for appearance, behavior, moribundity and mortality. A detailed physical examination will be conducted at the time of randomization. Clinical observations regarding general appearance and behavior will be recorded daily prior to dosing. During the treatment period, the rats will also be observed at the time of dosing and again approximately one hour after administration. Additional post-dosing observation periods may be necessary and will be documented in the study records. Observations shall include, but are not limited to, evaluations for changes in appearance of the skin and fur, eyes and mucous membranes, respiratory, circulatory, autonomic and central nervous system functions, somatomotor activity and behavior patterns. Observations will be recorded. Findings noted outside of the scheduled observation time periods will be recorded at the time they are observed.

7.6.2 Body Weights:

Body weights will be recorded individually (to the nearest 0.1 gram PND 22-42) beginning one day prior to the start of dosing. Final body weights will be collected prior to euthanasia.

Revised Audited Draft

Revised Audited Draft

7.6.3 Vaginal Perforation:

Each female pup (15/group) will be observed daily for vaginal perforation beginning on PND 25 (Adams, 1985). Examination of the females will be performed at approximately the same time each day and will continue daily until vaginal perforation is present. The body weight of each female will be recorded on the day of acquisition of vaginal perforation.

7.6.4 Determination of Estrous Cycles:

Daily vaginal lavages will be performed to determine the stage of estrus beginning on the day vaginal perforation is observed. Lavages will be performed at approximately the same time each day (with the exception that the lavages performed on the day of necropsy will be collected immediately prior to euthanasia) and will continue through the day of necropsy. The mean age of first estrous will be determined.

7.7 Euthanasia:

On PND 42, the animals will be euthanized by carbon dioxide inhalation, and the time of euthanasia will be recorded for each animal. Any animals not expected to survive until the following dosing period or until the scheduled euthanasia will be euthanized by carbon dioxide inhalation and necropsied as described in section 9.

8 HORMONE ANALYSIS:

8.1 Thyroid Hormones:

Following euthanasia, blood will be collected from the vena cava of all animals. Following collection, all blood samples (target volume of 2 mL) will be allowed to clot and then be placed in an ice bath and processed to generate serum. The following hormone concentrations will be determined from all serum samples:

Thyroid Stimulating Hormone (TSH)	Thyroxine (T_4)
Estradiol (E_2)	Lutenizing Hormone (LH)

9 ANATOMIC PATHOLOGY:

9.1 Macroscopic Examination:

A complete necropsy examination will be conducted on all animals dying spontaneously or euthanized *in extremis*. This will include examination of the external surface, all orifices, the external surface of the brain and spinal cord and the thoracic, abdominal and pelvic cavities including viscera. A complete

necropsy will not be conducted on animals surviving to study termination. Gross lesions (i.e., masses) will be collected and placed in 10% neutral-buffered formalin. The following tissues will be collected and placed in 10% neutral-buffered formalin:

Axillary Lymph Node	Spleen
Cervix and Uterine Body (one longitudinal section)	Thymus
	Thyroid with parathyroids
Ovaries	Uterine Horns (four sections per horn)
Pituitary	Vagina
	All gross (internal) lesions

Revised Audited Draft

9.2 Organ Weights:

9.2.1 Uterine Weights:

Wet and blotted uterine weights will be measured for all animals surviving to the scheduled necropsy. Uterine weights will not be collected for any animals found dead or euthanized *in extremis*.

The uterus will be harvested from all animals using the following procedure. The harvesting of uteri will be performed in a round-robin order. The pubic symphysis will be opened and each ovary and uterine horn will be detached from the dorsal abdominal wall. The ovaries are separated from the uterine horns at the oviduct/uterus junction. The urinary bladder and ureters will be removed from the ventral and lateral side of the uterus and vagina. The fibrous adhesion between the rectum and vagina is then detached until the junction of the vaginal orifice and perineal skin is identified. The uterus and vagina are detached from the body by incising the vaginal wall just above the junction between the perineal skin. The excess fat and adnexa will be trimmed away. The vagina is then removed from the uterus, leaving the cervix intact and attached to the uterus for uterus weight measurement. Care is to be taken during uterus harvesting such that the luminal contents are retained. A record will be made if any luminal contents are lost. The uterus will be transferred to a uniquely marked and tared plastic Petri dish with care to avoid desiccation before weighing. The Petri dish should be lined with saline-moistened filter paper (or equivalent) and covered to minimize desiccation.

The uterus harvesting and weighing procedure will be done in the order described below.

1. Animal is euthanized and uterus harvested.
2. Uterus (with luminal fluid) is immediately transferred to a Petri dish

(lined with saline-moistened filter paper or equivalent) that was tared immediately prior to the transfer.
3. The uterus' wet weight is recorded to the nearest 0.1 mg.
4. The uterus is opened and blotted (see below).

5. The uterus is placed in a Petri dish (lined with saline-moistened filter paper or equivalent) that was tared immediately prior to the transfer.
6. The uterus' blotted weight is recorded to the nearest 0.1 mg.

Immediately following collection of the wet weight, the uterus will be individually processed by opening the uterine wall and carefully blotting the excess fluid. Both uterine horns will be pierced and cut longitudinally with small surgical scissors, placed on filter paper (ex. Whatman No. 3) and gently pressed with another piece of dry filter paper to absorb the luminal fluid. The procedure will not be so severe as to render the tissue unacceptable for histopathologic analysis, as this additional investigation may be performed at the discretion of the Sponsor (by protocol amendment).

9.2.2 Ovary, Liver, Pituitary, Kidney, Spleen, Thymus, Thyroid and Adrenal Weights:

The following organs from all females euthanized at scheduled termination will be weighed (to the nearest 0.1 mg):

Adrenal glands	Pituitary gland
Kidneys	Spleen
Liver	Thymus
Ovaries and oviducts	Thyroid with parathyroids (following fixation)

Paired organs will be weighed together.

To minimize systematic bias in the weighing procedures, organ harvesting and weighing procedures will be divided as equally as possible among the prosecting and weighing technicians, such that all animals from a group are not processed by a single individual.

9.3 <u>Microscopic Examination:</u>

Following collection of wet uterine weight, blotting of the uterus and collection of blotted uterine weight, each uterus will be placed in a uniquely identified jar of 10% neutral-buffered formalin and preserved for microscopic examination. The vagina, ovaries, and thyroids and parathyroids from each animal will be similarly preserved.

Revised Audited Draft

Microscopic examination of hematoxylin-eosin stained paraffin sections may be performed on the following tissues from all animals at the discretion of the Sponsor (additional cost).

- Cervix and Uterine Body (one longitudinal section)
- Ovaries
- Thyroids with parathyroids
- Uterine Horns (four sections per horn)

10 DURATION OF STUDY:

The conduct of this study will require approximately five weeks for acclimation, dosing and necropsy.

11 STATISTICAL METHODS:

Body weights, body weight gains, organ weights, organ weights relative to body weights, uterine weights (wet and blotted), luminal fluid weights, mean days of acquisition of vaginal perforation, mean age at first estrous, estrous cycle length and serum hormone concentrations will be analyzed by a parametric one-way analysis of variance (ANOVA) (Snedecor, 1980) to determine intergroup difference. If the results of the ANOVA are significant ($p<0.05$), Dunnett's test (Dunnett, 1964) will be applied to the data to compare the treated groups to the control group.

12 QUALITY ASSURANCE:

The study will be audited by the WIL Quality Assurance Unit while in progress to assure compliance with the study protocol, protocol amendments and WIL Standard Operating Procedures. The study will be conducted in compliance with the U.S. Environmental Protection Agency (EPA), 40 CFR Part 792, the OECD [C(97) 186/Final] and the Ministry of Agricultural, Forestry and Fisheries (MAFF) Law No. 82, 1984, Good Laboratory Practice (GLP) Standards. The raw data and draft report will be audited by the WIL Quality Assurance Unit prior to submission to the Sponsor Representative to assure that the final report accurately describes the conduct and the findings of the study.

This study will be included on the WIL master list of regulated studies.

13 RECORDS TO BE MAINTAINED:

All original raw data records, as defined by WIL SOPs and the applicable GLPs, will be stored as described in Section 14 in the Archives at WIL Research Laboratories, LLC.

Revised Audited Draft

Revised Audited Draft

14 WORK PRODUCT:

The Sponsor will have title to all documentation records, raw data, slides, specimens and other work product generated during the performance of the study. All work product, including raw paper data, pertinent electronic storage media and specimens will be returned to the Sponsor after a period of six months or following issuance of the final report. All work product will be stored in compliance with regulatory requirements.

Any work product, including documents, specimens, and samples, that are required by this protocol, its amendments, or other written instructions of the Sponsor, to be shipped by WIL Research Laboratories, LLC to another location will be appropriately packaged and labeled as defined by WIL's SOPs and delivered to a common carrier for shipment. WIL Research Laboratories, LLC will not be responsible for shipment following delivery to the common carrier.

15 REPORTS:

The final report will consist of an abbreviated summary report, including data tables and an interpretation and discussion of the study results.

WIL Research Laboratories, LLC will provide one copy of an audited draft report, submitted in a timely manner upon completion of the study prior to issuance of the final report. One revision will be permitted as part of the cost of the study, from which the Sponsor's reasonable revisions and suggestions will be incorporated into the final report, as appropriate. Additional changes or revisions may be made, at extra cost. It is expected that the Sponsor will review the draft report and provide comments to WIL within a two-month time frame following submission. WIL will submit the final report within one month following receipt of comments. If the Sponsor's comments and/or authorization to finalize the report have not been received at WIL within one year following submission of the draft report, WIL may elect to finalize the report following appropriate written notification to the Sponsor. Two electronic copies (PDF) of the final report on CD-R and one paper copy will be provided. Requests for additional paper copies of the final report may result in additional charges.

16 ANIMAL WELFARE ACT COMPLIANCE:

This study will comply with all applicable sections of the Final Rules of the Animal Welfare Act regulations (9 CFR Parts 1, 2 and 3). The Sponsor should make particular note of the following:

- The Sponsor Representative's signature on this protocol documents for the Study Director the Sponsor's assurance that the study described in this protocol does not unnecessarily duplicate previous experiments.

- Whenever possible, procedures used in this study have been designed to avoid or minimize discomfort, distress or pain to animals. All methods are described in this study protocol or in written laboratory standard operating procedures.

- Animals that experience severe or chronic pain or distress that cannot be relieved will be painlessly euthanized as deemed appropriate by the veterinary staff and Study Director. The Sponsor will be advised by the Study Director of all circumstances which could lead to this action in as timely a manner as possible.

- Methods of euthanasia used during this study are in conformance with the above-referenced regulation.

- The Sponsor/Study Director has considered alternatives to procedures that may cause more than momentary or slight pain or distress to the animals and has provided a written narrative description (AWA covered species) of the methods and sources used to determine that alternatives are not available.

17 PROTOCOL MODIFICATION:

Modification of the protocol may be accomplished during the course of this investigation. However, no changes will be made in the study design without the written permission of the Sponsor. In the event that the Sponsor requests or approves a change in the protocol, such changes will be made by appropriate documentation in the form of protocol amendment. All alterations of the protocol and reasons for the modification(s) will be signed by the Study Director and the Sponsor Representative.
