

FYI. 0804 - 01476

COURTNEY M. PRICE  
VICE PRESIDENT  
CHEMSTAR

American  
Chemistry  
Council

November 18, 2003

Mr. Charlie Auer  
Director  
TSCA Document Control Office (7407)  
EPA East Building, Room 6248  
Office of Pollution Prevention and Toxics  
US Environmental Protection Agency  
1201 Constitution Avenue, NW  
Washington, DC 20460-0001

MIR 278075  
278075

→ Jaden

Dear Mr. Auer:

The American Chemistry Council makes available to the public and appropriate government agencies final reports of environmental, health, and safety research that it manages. In keeping with this policy, the following report that the American Chemistry Council's Oxo Process Panel recently conducted is enclosed:

An Inhalation Two-Generation Reproductive Toxicity Study of Isobutanol in Rats

The report does not include confidential information.

If you have any questions, please call Barbara Francis of my staff at (703) 741-5609.

Contain No CBI Sincerely yours,  
*C. M. Price*

Enclosure

**FINAL REPORT**

Volume 1 of 10  
(Text and Summary Tables 1-124)

**STUDY TITLE**

AN INHALATION TWO-GENERATION  
REPRODUCTIVE TOXICITY STUDY OF ISOBUTANOL IN RATS

**STUDY NUMBER**

WIL-186013

**TEST GUIDELINE**

OPPTS Guideline 870.3800

**STUDY DIRECTOR**

Mark D. Nemec, B.S., D.A.B.T.

**STUDY INITIATION DATE**

August 27, 2001

**STUDY COMPLETION DATE**

November 13, 2003

**PERFORMING LABORATORY**

WIL Research Laboratories, Inc.  
1407 George Road  
Ashland, OH 44805-9281

**SPONSOR**

Oxo Process Panel  
of the American Chemistry Council  
1300 Wilson Boulevard  
Arlington, VA 22209

**COMPLIANCE STATEMENT**

This study, designated WIL-186013, was conducted in compliance with the United States Environmental Protection Agency (EPA) Good Laboratory Practice Standards (40 CFR Parts 160 and 792), October 16, 1989 and September 18, 1989, respectively; the standard operating procedures of WIL Research Laboratories, Inc., and the protocol as approved by the sponsor.

The protocol was designed to be in general accordance with the United States Environmental Protection Agency (EPA) Office of Prevention, Pesticides and Toxic Substances (OPPTS) Health Effects Test Guidelines 870.3800, Reproduction and Fertility Effects, August 1998.

## INDEX OF TABLES

<b>VOLUME 1 (continued)</b>	<u>Page</u>
<b>SUMMARY DATA - F<sub>0</sub> GENERATION</b>	
1. Summary Of Survival And Disposition (F <sub>0</sub> Males) .....	89
2. Summary Of Survival And Disposition (F <sub>0</sub> Females) .....	90
3. Summary Of Clinical Findings: Total Occurrence/No. Of Animals (F <sub>0</sub> Males - Detailed Physical Examinations) .....	91
4. Summary Of Clinical Findings: Total Occurrence/No. Of Animals (F <sub>0</sub> Females - Detailed Physical Examinations) .....	93
5. Summary Of Clinical Findings: Total Occurrence/No. Of Animals (F <sub>0</sub> Males - Response To Novel Stimulus) .....	96
6. Summary Of Clinical Findings: Total Occurrence/No. Of Animals (F <sub>0</sub> Females - Response To Novel Stimulus) .....	97
7. Summary Of Clinical Findings: Total Occurrence/No. Of Animals (F <sub>0</sub> Males - 1-Hour Post-Exposure) .....	98
8. Summary Of Clinical Findings: Total Occurrence/No. Of Animals (F <sub>0</sub> Females - 1-Hour Post-Exposure) .....	99
9. Summary Of Reproductive Performance (F <sub>0</sub> ) .....	100
10. Summary Of Estrous Cycle Data (F <sub>0</sub> Females) .....	103
11. Summary Of Body Weights [G] (F <sub>0</sub> Males) .....	104
12. Summary Of Body Weights [G] (F <sub>0</sub> Females) .....	109
13. Summary Of Body Weight Changes [G] (F <sub>0</sub> Males) .....	114
14. Summary Of Body Weight Changes [G] (F <sub>0</sub> Females) .....	119
15. Summary Of Cumulative Body Weight Changes [G] (F <sub>0</sub> Males) .....	124
16. Summary Of Cumulative Body Weight Changes [G] (F <sub>0</sub> Females) .....	129

<b>VOLUME 1 (continued)</b>	<u>Page</u>
17. Summary Of Body Weights During Gestation [G] (F <sub>0</sub> Females).....	134
18. Summary Of Body Weight Changes During Gestation [G] (F <sub>0</sub> Females) .....	135
19. Summary Of Body Weights During Lactation [G] (F <sub>0</sub> Females) .....	136
20. Summary Of Body Weight Changes During Lactation [G] (F <sub>0</sub> Females).....	137
21. Summary Of Weekly Food Consumption [G/Animal/Day] (F <sub>0</sub> Males).....	138
22. Summary Of Weekly Food Consumption [G/Animal/Day] (F <sub>0</sub> Females) .....	143
23. Summary Of Weekly Food Consumption [G/Kg/Day] (F <sub>0</sub> Males).....	148
24. Summary Of Weekly Food Consumption [G/Kg/Day] (F <sub>0</sub> Females) .....	153
25. Summary Of Food Efficiency (F <sub>0</sub> Males) .....	158
26. Summary Of Food Efficiency (F <sub>0</sub> Females).....	163
27. Summary Of Food Consumption During Gestation [G/Animal/Day] (F <sub>0</sub> Females) .....	168
28. Summary Of Food Consumption During Gestation [G/Kg/Day] (F <sub>0</sub> Females).....	169
29. Summary Of Food Efficiency During Gestation (F <sub>0</sub> Females).....	170
30. Summary Of Food Consumption During Lactation [G/Animal/Day] (F <sub>0</sub> Females).....	171
31. Summary Of Food Consumption During Lactation [G/Kg/Day] (F <sub>0</sub> Females).....	172
32. Summary Of Food Efficiency During Lactation (F <sub>0</sub> Females).....	173
33. Summary Of Gestation Lengths [Days] (F <sub>0</sub> Females) .....	174
34. Summary Of Sperm Numbers [Sperm In Millions/G Tissue] (F <sub>0</sub> Males - Scheduled Necropsy).....	175
35. Summary Of Sperm Production Rate [Sperm In Millions/G Tissue/Day] - (F <sub>0</sub> Males - Scheduled Necropsy).....	176

<b>VOLUME 1 (continued)</b>	<u>Page</u>
36. Summary Of Sperm Motility Assessments [Percentage] (F <sub>0</sub> Males - Scheduled Necropsy).....	177
37. Summary Of Sperm Morphology Differential Counts [Percentage] (F <sub>0</sub> Males - Scheduled Necropsy).....	178
38. Summary Of Sperm Morphology Counts [Absolute Number] (F <sub>0</sub> Males - Scheduled Necropsy).....	180
39. Summary Of Macroscopic Findings (F <sub>0</sub> Females - Unscheduled Death) .....	182
40. Summary Of Macroscopic Findings (F <sub>0</sub> Males - Scheduled Necropsy).....	183
41. Summary Of Macroscopic Findings (F <sub>0</sub> Females - Scheduled Necropsy) .....	186
42. Summary Of Implantation Sites (F <sub>0</sub> Females) .....	189
43. Summary Of Organ Weights [G] (F <sub>0</sub> Males) .....	190
44. Summary Of Organ Weights [G] (F <sub>0</sub> Females).....	193
45. Summary Of Organ Weights Relative To Final Body Weights [G/100 G] (F <sub>0</sub> Males).....	195
46. Summary Of Organ Weights Relative To Final Body Weights [G/100 G] (F <sub>0</sub> Females) .....	199
47. Summary Of Microscopic Findings (F <sub>0</sub> Females - Unscheduled Death) .....	201
48. Summary Of Microscopic Findings (F <sub>0</sub> Males - Scheduled Necropsy) .....	204
49. Summary Of Microscopic Findings (F <sub>0</sub> Females - Scheduled Necropsy).....	212
<b>SUMMARY DATA - F<sub>1</sub> LITTERS</b>

## **1. SUMMARY**

### **1.1. OBJECTIVE**

This study was conducted to evaluate the potential adverse effects of whole-body inhalation exposure of F<sub>0</sub> and F<sub>1</sub> parental animals to isobutanol on the reproductive capabilities, encompassing growth, mating, parturition and lactation, of the F<sub>0</sub> and F<sub>1</sub> generations and F<sub>1</sub> and F<sub>2</sub> neonatal survival, growth, and development. One litter per dam was produced in each generation.

### **1.2. STUDY DESIGN**

Groups of male and female Crl:CD<sup>®</sup>(SD)IGS BR rats (30/sex/group) were exposed to either clean filtered air or vapor atmospheres of the test article for six hours daily, seven days a week, for at least 70 consecutive daily exposures prior to mating. F<sub>0</sub> animals were approximately seven weeks of age at the beginning of exposure; offspring selected to become the F<sub>1</sub> generation began exposure at weaning. Exposure of the F<sub>0</sub> and F<sub>1</sub> males continued throughout mating, and through the day prior to euthanasia. The F<sub>0</sub> and F<sub>1</sub> females continued to be exposed throughout mating and gestation through gestation day 20. After parturition, exposure of the F<sub>0</sub> and F<sub>1</sub> females was re-initiated on lactation day 5 and continued through the day prior to euthanasia.

Target test article concentrations were 500, 1000 and 2500 ppm (parts per million). Mean overall analyzed exposure concentrations were 500, 1008 and 2522 ppm (1476, 2975 and 7444 mg/m<sup>3</sup>, respectively) for the F<sub>0</sub> generation and 494, 1012 and 2521 ppm (1458, 2987 and 7442 mg/m<sup>3</sup>, respectively) for the F<sub>1</sub> generation. Target concentrations were selected based on a previous range-finding study (WIL-186023<sup>1</sup>). Exposure concentrations in that study were 100, 250, 1000 and 2500 ppm. The only test article-related effects were reductions in F<sub>1</sub> pup mean body weights and body weight gains. No evidence of F<sub>0</sub> systemic or reproductive toxicity was observed at those exposure levels.

All animals were observed twice daily for appearance and behavior. Clinical observations, body weights, and food consumption were recorded at appropriate intervals

prior to mating and during gestation and lactation. All F<sub>0</sub> and F<sub>1</sub> females were allowed to deliver and rear their pups until weaning on lactation day 28 (F<sub>0</sub>) or lactation day 21 (F<sub>1</sub>). For both generations (F<sub>1</sub> and F<sub>2</sub>) eight pups per litter (four per sex, when possible) were selected on postnatal day (PND) 4 to reduce the variability among the litters. Direct exposure of the F<sub>1</sub> animals was initiated on PND 28. Offspring (30/sex/group) from the pairing of the F<sub>0</sub> animals were selected prior to weaning (PND 28) to constitute the F<sub>1</sub> generation. Developmental landmarks (balanopreputial separation and vaginal patency) were evaluated for the selected F<sub>1</sub> rats. Unselected F<sub>1</sub> pups were necropsied on PND 28, 34, 36 or 37, and F<sub>2</sub> pups were necropsied on PND 21. Selected organs were weighed for pups that were necropsied on PND 28 (F<sub>1</sub>) or PND 21 (F<sub>2</sub>). Each surviving F<sub>0</sub> and F<sub>1</sub> parental animal received a complete detailed gross necropsy following the completion of weaning of the F<sub>1</sub> and F<sub>2</sub> pups, respectively; selected organs were weighed. Spermatogenic endpoints (sperm motility, morphology and numbers) were recorded for all F<sub>0</sub> and F<sub>1</sub> males, and ovarian primordial follicle counts and corpora lutea counts were recorded for all F<sub>1</sub> females in the control and high-exposure groups. Designated tissues from ten F<sub>0</sub> and F<sub>1</sub> parental animals/sex/group and from all parental animals that were euthanized *in extremis* or failed to breed, conceive or deliver offspring were examined microscopically.

### **1.3. RESULTS**

F<sub>0</sub> and F<sub>1</sub> parental survival were unaffected by test article exposure in all exposure groups. No test article-related effects were observed on F<sub>0</sub> and F<sub>1</sub> reproductive performance (estrous cycles, mating and fertility indices, the mean number of days between pairing and coitus and the mean length of gestation), body weights, food consumption and food efficiency in the 500, 1000 and 2500 ppm group males or females. Spermatogenic endpoints (mean testicular and epididymal sperm numbers, sperm production rate, motility, progressive motility and the percentage of morphologically normal sperm) in the F<sub>0</sub> and F<sub>1</sub> test article-exposed groups were unaffected by test article exposure. There were no test article-related macroscopic findings or changes in mean

organ weights in the F<sub>0</sub> or F<sub>1</sub> males and females in the 500, 1000 and 2500 ppm groups. Microscopic evaluation of the F<sub>0</sub> and F<sub>1</sub> males and females revealed no test article-related histopathologic lesions, including for animals that failed to breed or produce a litter. No test article-related effects on primordial follicle counts and corpora lutea counts were observed in the F<sub>1</sub> 2500 ppm group females. F<sub>1</sub> and F<sub>2</sub> pup survival and the general physical condition of the pups were unaffected by exposure to the test article. No test article-related effects on mean pup body weights were observed in the 500, 1000 or 2500 ppm group F<sub>1</sub> or F<sub>2</sub> pups. No test article-related macroscopic findings were observed in F<sub>1</sub> or F<sub>2</sub> pups that were found dead or euthanized at the scheduled necropsy. There were no test article-related changes in mean organ weights for the F<sub>1</sub> or F<sub>2</sub> pups. The mean day of acquisition of balanopreputial separation or vaginal patency and mean body weights on the day of acquisition in the F<sub>1</sub> test article-exposed pups were not affected by the test article.

#### **1.4. CONCLUSIONS**

Based on the results of this study, an exposure level of 2500 ppm was considered to be the NOAEL (no-observed-adverse-effect level) for parental systemic, reproductive and neonatal toxicity of isobutanol when administered for two generations via whole-body inhalation exposure to rats.

## **2. INTRODUCTION**

### **2.1. GENERAL STUDY INFORMATION**

This report presents the data from “An Inhalation Two-Generation Reproductive Toxicity Study of Isobutanol in Rats.” Due to software spacing constraints, the study title is presented as “Inhalation Two-Gen. Repro. Toxicity Study of Isobutanol in Rats” on the report tables. For clarification of the terminology used to differentiate the generations in the report text, the offspring of the F<sub>0</sub> generation were defined as the F<sub>1</sub> litters; pups from the F<sub>1</sub> litters were selected to constitute the F<sub>1</sub> generation. The offspring of the F<sub>1</sub> generation were defined as the F<sub>2</sub> litters.

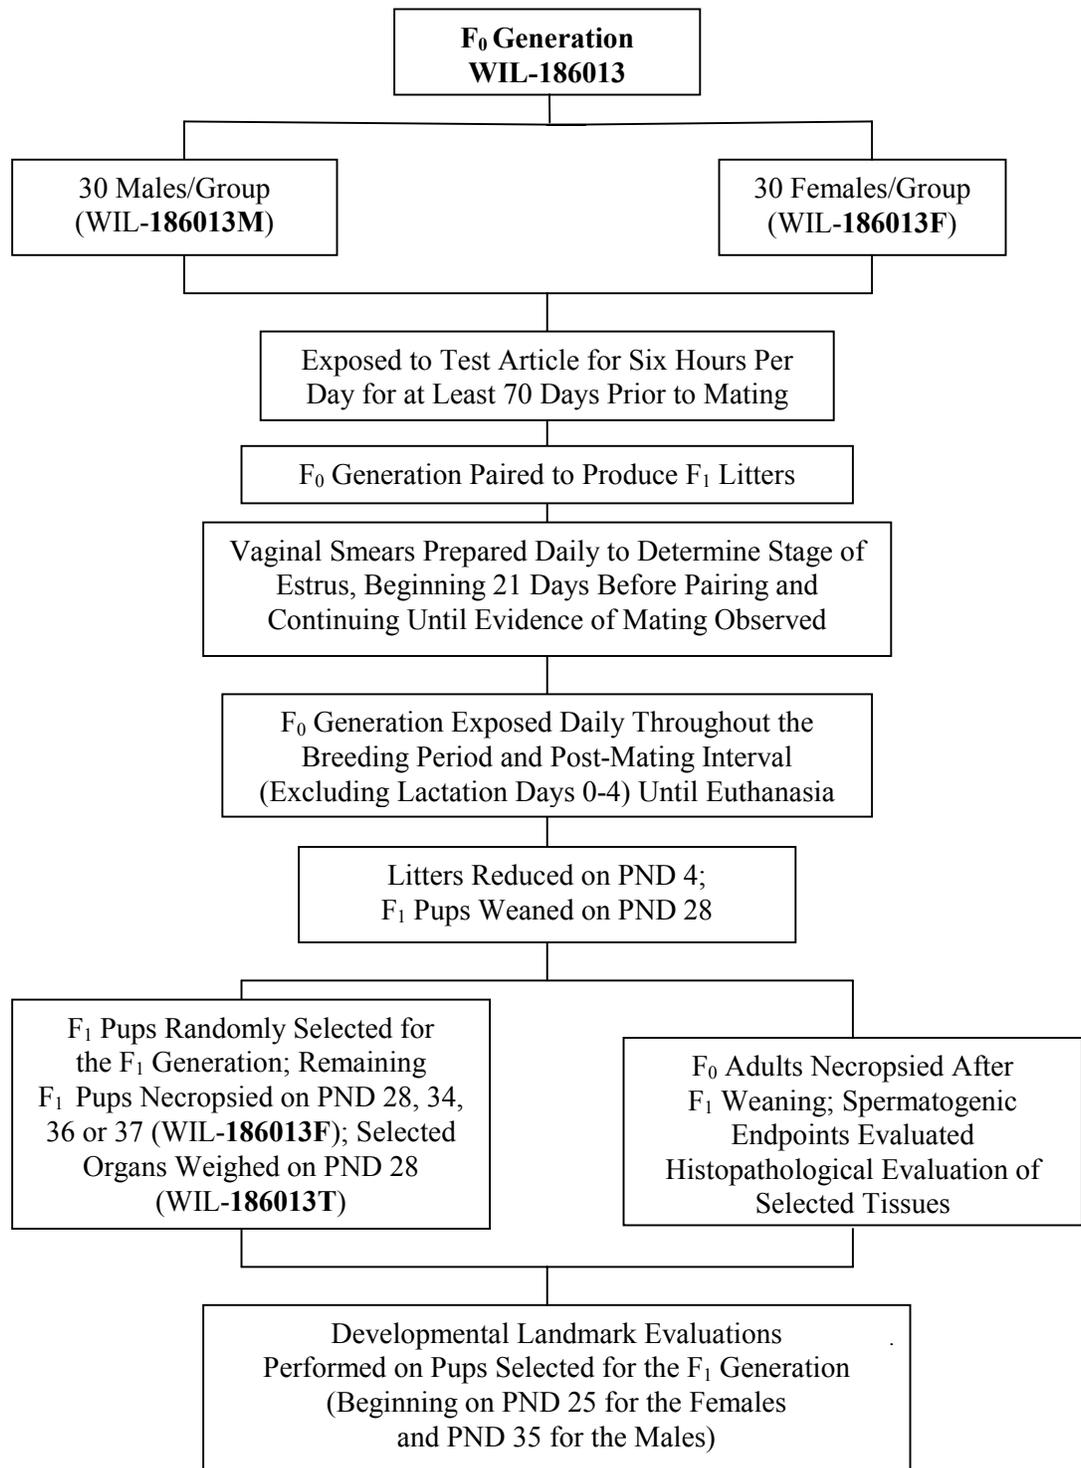

The following computer protocols were used for data collection during the study:

<b><u>Computer Protocol</u></b>	<b><u>Type of Data Collected</u></b>
WIL-186013M .....	F <sub>0</sub> parental (paternal) data
WIL-186013F .....	F <sub>0</sub> parental (maternal) and F <sub>1</sub> litter data
WIL-186013A .....	F <sub>1</sub> parental (paternal) data
WIL-186013D .....	F <sub>1</sub> parental (maternal) and F <sub>2</sub> litter data
WIL-186013T .....	F <sub>1</sub> selected weanling necropsy and organ weight data
WIL-186013F .....	F <sub>1</sub> weanling necropsy (PND 28, 34, 36 or 37) data
WIL-186013S .....	F <sub>2</sub> selected weanling necropsy and organ weight data

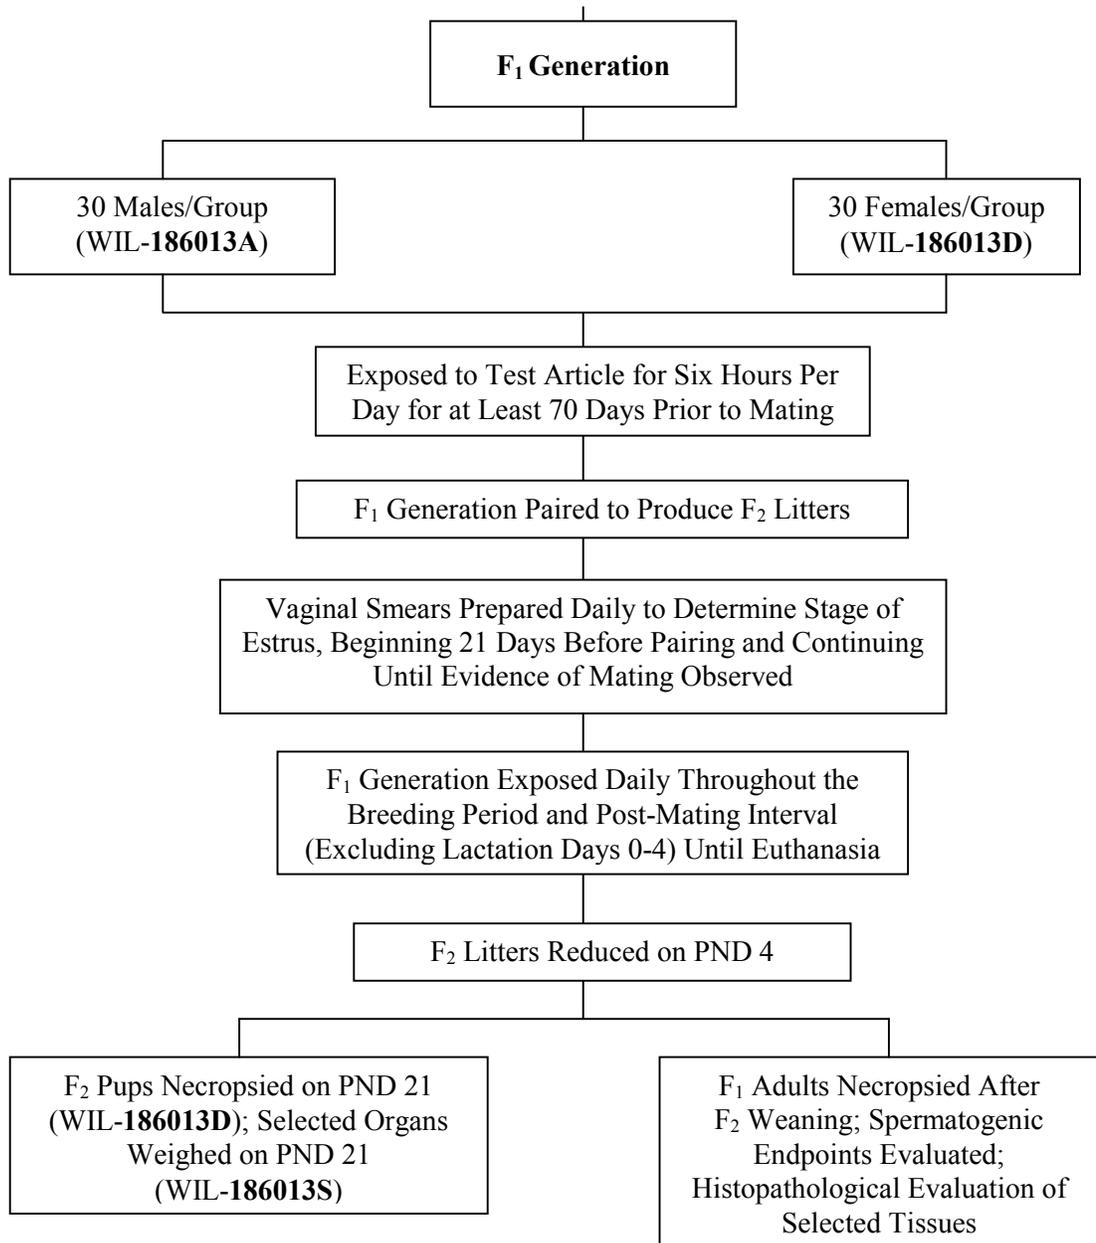

**2.2. KEY STUDY DATES**

<b><u>Date(s)</u></b>	<b><u>Event(s)</u></b>
August 14, 2001 .....	Experimental starting date (animal receipt)
September 4, 2001 .....	Initiation of F <sub>0</sub> exposures
November 13-27, 2001 .....	F <sub>0</sub> breeding range
December 30, 2001-February 9, 2002 .....	Evaluation of acquisition of developmental landmarks for selected F <sub>1</sub> pups
January 15, 2002 .....	Last necropsy of non-selected F <sub>1</sub> pups
January 15, 2002 .....	Last necropsy of F <sub>0</sub> parental generation
January 2, 2002 .....	Initiation of F <sub>1</sub> exposures (first PND 28)
March 28-April 11, 2002 .....	F <sub>1</sub> breeding range
May 22, 2002 .....	Last necropsy of F <sub>2</sub> pups
May 31, 2002 .....	Last necropsy of F <sub>1</sub> parental generation
February 14, 2003 .....	Experimental termination date (last microscopic examination)

### 3. STUDY DESIGN

**STUDY DESIGN (CONTINUED)**

#### **4. EXPERIMENTAL PROCEDURES – MATERIALS AND METHODS**

##### **4.1. TEST AND CONTROL ARTICLES**

###### **4.1.1. TEST ARTICLE IDENTIFICATION**

The test article, isobutanol, was received for the American Chemistry Council, from Union Carbide Corporation (a subsidiary of the Dow Chemical Company), Pasadena, Texas, on September 8, 2000, as follows:

<u>Identification</u>	<u>Quantity Received</u>	<u>Description</u>
Isobutanol Batch No. 15867 CAS No. 78-83-1 [WIL Log No. 4945A]	Drums 1-4 Total Gross Weight: 739.6 kg	Clear, colorless liquid

Characterization of the test article was performed by the sponsor. Characterization of the test article was supplied by the sponsor and is presented in Appendix A. Additional stability and purity analyses were performed by the Analytical Chemistry Department at WIL Research Laboratories, Inc. The results of these analyses are presented in Appendix B. The test article was stored at room temperature and was proven stable under this condition. A reserve sample of the test article was collected from each drum used and stored in the Archives at WIL Research Laboratories, Inc.

###### **4.1.2. TEST ATMOSPHERE MONITORING**

Exposure concentrations within each chamber were measured 9 to 10 times (approximately every 35 minutes) during each daily exposure period by a validated gas chromatographic method. At least one standard was analyzed each day prior to exposure to confirm gas chromatographic calibration. Chamber temperature, relative humidity, ventilation rate, and negative pressure within the chambers were monitored continuously and were recorded approximately every 35 minutes. Oxygen content within the chamber was measured during the pre-study method development phase. Nominal chamber concentrations were determined daily. Total air volume was calculated by multiplying

mean chamber ventilation rate (in liters per minute) by the exposure duration (in minutes). Test atmosphere homogeneity was demonstrated during pre-study method development. There were no detectable aerosols at any evaluation interval. The methodology and results of these analyses are presented in Appendix C.

#### **4.1.3. EXPOSURE METHODS**

Each group of animals was exposed in a 2.0-m<sup>3</sup> stainless steel and glass whole-body inhalation chamber. The chambers were operated under dynamic conditions at air flows of at least 12 to 15 air changes per hour. The overall mean analyzed concentrations for the F<sub>0</sub> generation were 500 ppm, 1008 ppm and 2522 ppm for the 500, 1000 and 2500 ppm groups, respectively. The overall mean analyzed concentrations for the F<sub>1</sub> generation were 494 ppm, 1012 ppm and 2521 ppm for the same respective groups.

The F<sub>0</sub> and F<sub>1</sub> males and females were exposed to the test atmosphere for daily six-hour exposures (seven days a week) for a minimum of 70 consecutive days prior to mating. Exposure of the F<sub>0</sub> and F<sub>1</sub> males continued throughout mating and through the day prior to euthanasia. The F<sub>0</sub> and F<sub>1</sub> females continued to be exposed throughout mating and gestation through gestation day 20. Exposure of the F<sub>0</sub> and F<sub>1</sub> females was re-initiated on lactation day 5 and continued through the day prior to euthanasia. During lactation, the dams were removed from their litters during each daily six-hour exposure period. The offspring of the F<sub>0</sub> generation (F<sub>1</sub> litters) were potentially exposed to the test article *in utero*, through nursing during PND 5-28 and via exposure following weaning (beginning on PND 28). The F<sub>1</sub> pups selected for breeding (30/sex/group) were exposed to the test article for six hours daily for at least 70 days prior to mating and throughout mating, gestation and lactation (with the exception of gestation day 21 through lactation day 4) until the day prior to necropsy. The offspring of the F<sub>1</sub> generation (F<sub>2</sub> litters) were potentially exposed to the test article *in utero* and through nursing during PND 5-28. The control group was exposed to clean, filtered air under conditions identical to those used for the groups exposed to the test article. Each cage battery was separated into three tiers. The position within the cage battery assigned to each animal was rotated daily over the

different days of exposure. The rats were removed from their home cages in the animal room and transported to the inhalation chambers for the six-hour exposure period. The animals were exposed to the test article at approximately the same time each day. Following exposure, the animals were returned to their home cages. Instrumentation was set to maintain the temperature inside the exposure chamber between 18°C and 26°C and relative humidity between 30% and 60%. Daily mean chamber temperatures ranged from 19-26°C, 20-25°C, 20-26°C and 20-23°C in the control, 500, 1000 and 2500 ppm groups, respectively, for both generations combined. Daily chamber humidity ranged from 30-49%, 33-56%, 35-55% and 26-44% in the same respective groups for both generations combined. Exposure methods and conditions are detailed in Appendix C.

Each chamber was dedicated to one exposure group. In order to minimize any potential variation occurring due to positioning within the chamber, the cages were sequentially rotated around the available rack positions within the chamber on a daily basis throughout the study, in accordance with the standard operating procedures at WIL Research Laboratories, Inc.

The F<sub>0</sub> and F<sub>1</sub> parental animals were assigned to study groups as follows:

<u>Group Number</u>	<u>Test Article</u>	<u>Target Exposure Level (ppm)</u>	<u>Number of Animals</u>	
			<u>Males</u>	<u>Females</u>
1	Filtered Air	0	30	30
2	Isobutanol	500	30	30
3	Isobutanol	1000	30	30
4	Isobutanol	2500	30	30

Exposure levels were selected based upon a reduction in response to external stimuli (during exposure) observed in a previous 90-day neurotoxicity study<sup>2</sup> and a non-statistically significant reduction in body weights and body weight changes during postnatal days 4-7 and 7-14 in pups from dams exposed to 2500 ppm isobutanol in a probe study<sup>1</sup>.

The selected route of administration was whole-body inhalation exposure because inhalation is a likely route of human exposure. The animal model selected, the CrI:CD<sup>®</sup>(SD)IGS BR rat, is recognized as appropriate for reproduction studies. WIL Research Laboratories, Inc. has reproductive historical control data for the CrI:CD<sup>®</sup>(SD)IGS BR rat.

#### **4.1.4. SAMPLING AND ANALYSES**

Prior to initiation of the previous range-finding study (WIL-186023<sup>2</sup>; Nemeč, 2002) and after the completion of this study, 5-g samples of the test article were sent to Nancy A. Broyles, Union Carbide Corporation, South Charleston, West Virginia, for purity analysis; the test article was found to be 99.9% pure. The results of this analysis are presented in Appendix A. Duplicate 10-mL retention samples (collected prior to the initiation of exposure) were collected from each test article container; these samples were analyzed for purity by the Analytical Chemistry Department at WIL Research Laboratories, Inc. The purity of the test article was found to be a minimum of 98.05%. Samples were collected and analyzed at the end of use of each test article container following the same procedure used for the initial purity samples (duplicate 10-mL samples were provided to the Analytical Chemistry Department). The resulting isobutanol concentrations were compared to time zero values as an assessment of stability. Unused duplicate samples were stored until no longer needed and discarded. The analysis of the residual samples demonstrated that the test article was stable throughout the course of the study. The methodology and results of these analyses are presented in Appendix B.

#### **4.2. F<sub>0</sub> ANIMAL RECEIPT AND ACCLIMATION**

One hundred thirty-six male and 137 female CrI:CD<sup>®</sup>(SD)IGS BR rats were received from Charles River Laboratories, Inc., Raleigh, North Carolina, on August 14, 2001. The animals were 30 days old upon receipt. Animals were individually housed except during mating. Each animal was examined by a qualified technician upon receipt and weighed the day following receipt. All animals were uniquely identified by a Monel<sup>®</sup> metal eartag

displaying the animal number. During the acclimation period (21 days), the animals were observed twice daily for mortality and morbidity.

#### **4.3. F<sub>0</sub>, F<sub>1</sub> AND F<sub>2</sub> ANIMAL HOUSING**

Following the initial acclimation period (F<sub>0</sub>) or selection (F<sub>1</sub>) and until pairing, all F<sub>0</sub> and F<sub>1</sub> parental test animals were individually housed in clean, wire-mesh cages suspended above cage-board. Cage board was changed three times per week. The animals were paired for mating in the home cage of the male. Following positive evidence of mating, the males were housed in suspended wire-mesh cages until the scheduled necropsy of the parental generations, and the females were transferred to plastic maternity cages with nesting material (Bed-O'Cobs<sup>®</sup>; The Andersons, Industrial Products Division, Maumee, Ohio). The dams were housed in these cages until weaning on lactation day 28 (F<sub>0</sub>) or lactation day 21 (F<sub>1</sub>). Following weaning of the litters in each generation (F<sub>1</sub> and F<sub>2</sub>), the maternal females were individually housed in suspended wire-mesh cages until the scheduled necropsy. Beginning on PND 28, the F<sub>1</sub> pups were individually housed in suspended wire-mesh cages until the start of the mating period. Maternal females for which there was no evidence of mating were placed in plastic maternity cages with nesting material upon completion of a 14-day mating period. Animals were housed in accordance with the "Guide for the Care and Use of Laboratory Animals."<sup>3</sup> The animal facilities at WIL Research Laboratories, Inc., are accredited by the Association for Assessment and Accreditation of Laboratory Animal Care International (AAALAC International).

#### **4.4. DIET, DRINKING WATER AND MAINTENANCE OF F<sub>0</sub> AND F<sub>1</sub> ANIMALS**

The basal ration used in this study was PMI Nutrition International, Inc., Certified Rodent LabDiet<sup>®</sup> 5002. The diet used at WIL Research Laboratories, Inc., was a certified feed with appropriate analyses performed and provided by the manufacturer. Municipal water supplying the facility is regularly sampled for contaminants according to standard operating procedures. Contaminants were not present in animal feed or water at concentrations expected to interfere with the objectives of this study. The basal diet and

reverse-osmosis-treated (on-site) drinking water, delivered by an automatic watering system, were provided *ad libitum* throughout the acclimation period and during the study (except during exposure). Food jars were equipped with retainers to minimize spillage. Feeders were sanitized weekly.

#### **4.5. ENVIRONMENTAL CONDITIONS**

Animals were housed throughout the acclimation period and during the study in an environmentally controlled room. Controls were set to maintain a temperature of  $72 \pm 5^\circ\text{F}$  ( $22 \pm 3^\circ\text{C}$ ) and a relative humidity of approximately 30-70%. Prior to March 1, 2002, room temperature and relative humidity were monitored continuously using the Metasys<sup>®</sup> Network and manually recorded daily. The actual temperature ranged from  $70.0^\circ\text{F}$  to  $75.2^\circ\text{F}$  ( $21.1^\circ\text{C}$  to  $24.0^\circ\text{C}$ ) and humidity ranged from 30.0% to 57.9% during this period. Beginning on March 1, 2002 until study termination on May 31, 2002, room temperature and relative humidity were monitored using the Metasys DDC Electronic Environmental control system and were recorded approximately hourly. These data are summarized in Appendix D. Actual mean daily temperature ranged from  $71.6^\circ\text{F}$  to  $72.1^\circ\text{F}$  ( $22.0^\circ\text{C}$  to  $22.3^\circ\text{C}$ ) and mean daily relative humidity ranged from 34.8% to 49.2% during the study. Light timers were calibrated to provide a 12-hour light (6 a.m. to 6 p.m.)/12-hour dark photoperiod. Air handling units were set to provide approximately 10 fresh air changes per hour.

#### **4.6. ASSIGNMENT OF F<sub>0</sub> ANIMALS TO TREATMENT GROUPS**

At the conclusion of the acclimation period, all available F<sub>0</sub> animals were weighed and examined in detail for physical abnormalities. At the discretion of the study director, animals judged to be in good health and meeting acceptable body weight requirements (200 to 300 g for males and 150 to 250 g for females) were selected for use in the computerized randomization procedure. At that time, the individual body weights and corresponding animal identification numbers were entered into the WIL Toxicology Data Management System (WTDMS<sup>™</sup>). A printout containing the animal numbers, corresponding body weights and individual group assignment was generated based on

body weight stratification randomized in a block design. The animals were then arranged into groups according to the printout. The animals were approximately seven weeks old at the initiation of test article exposure. Male body weights ranged from 200 g to 305 g and female body weights ranged from 150 g to 199 g on the day of randomization (prior to study initiation). Body weights on study day 0 ranged from 236 g to 350 g for the males and from 159 g to 213 g for the females. Although the body weights for some males were above the range specified in the protocol, the group mean body weights were similar across all male groups. The individual randomization weights are not presented in this report but are contained in the study records.

#### **4.7. DATA RETENTION**

The sponsor has title to all documentation records, raw data, specimens or other work product generated during the performance of the study. All work product generated by WIL Research Laboratories, Inc., including raw paper data and specimens, are retained in the Archives at WIL Research Laboratories, Inc., as specified in the study protocol. Analytical (test article characterization) data generated by Union Carbide Corporation will be archived by the sponsor or the sponsor's designee.

Reserve samples of the test and control articles (if appropriate), pertinent electronic storage media and the original final report are retained in the Archives at WIL Research Laboratories, Inc., in compliance with regulatory requirements.

## **5. PARAMETERS EVALUATED**

### **5.1. F<sub>0</sub> AND F<sub>1</sub> OBSERVATIONS**

#### **5.1.1. CLINICAL OBSERVATIONS AND MORTALITY**

Detailed physical examinations were recorded weekly for all parental animals throughout the study period. All animals were observed twice daily for moribundity and mortality; in addition, the animals were observed for appearance, behavior and pharmacotoxic signs within one hour after completion of exposure. Females expected to deliver were also observed twice daily during the period of expected parturition and at parturition for dystocia (prolonged labor, delayed labor) or other difficulties.

During exposure, special attention was given to the state of arousal and response to novel stimuli by producing a loud-noise stimulus (only for individual animals visible in the chamber). The noise was produced by allowing a ¾-inch PVC pipe coupling (approximately 50 g) to strike the glass of the exposure chamber at the approximate level of the cage rack. The coupling was attached to a length of cotton rope that was held against the glass approximately 60 cm from the coupling. The coupling was raised until the rope was approximately perpendicular to the glass, and the coupling was released. The response was recorded as: 1) no reaction to stimulus, 2) slight reaction, ear flick or some evidence that stimulus was heard, or 3) more energetic response (jump, flinch, may include vocalization). Due to the cage rotation procedure, approximately 10-30% of the animals could be visible on a given day.

#### **5.1.2. BODY WEIGHTS**

Individual F<sub>0</sub> and F<sub>1</sub> male body weights were recorded on study days 0, 1, 4 and 7, weekly thereafter throughout the study, and prior to the scheduled necropsy. Individual F<sub>0</sub> and F<sub>1</sub> female body weights were recorded on study days 0, 1, 4 and 7 and weekly thereafter until evidence of copulation was observed. Mean weekly body weights and body weight changes are presented for each interval. Once evidence of mating was observed, female body weights were recorded on gestation days 0, 4, 7, 11, 14 and 20 and on lactation days 1, 4, 7, 14 and 21; for the F<sub>0</sub> females, body weights were also recorded on lactation day

28. Body weight changes are presented for each of these intervals. After weaning (lactation day 28), weekly body weights were recorded for these F<sub>0</sub> females until the scheduled necropsy.

### **5.1.3. FOOD CONSUMPTION**

Individual F<sub>0</sub> and F<sub>1</sub> male and female food consumption was measured on study days 0, 1, 4 and 7 and weekly thereafter until pairing. Food intake was not recorded during the mating period. Male food consumption was measured after mating on a weekly basis until the scheduled necropsy. Female food consumption was recorded on gestation days 0, 4, 7, 11, 14 and 20 and lactation days 1, 4, 7, 14 and 21; for the F<sub>0</sub> females, food consumption was also recorded on lactation day 28. For the F<sub>0</sub> generation, the last scheduled interval for weekly recording of food consumption was study day 126. Since final body weights and clinical observations were recorded on the scheduled necropsy days (after study day 126), food consumption was manually recorded at that time. These data are not presented in the report tables, but will be maintained in the raw data. Food consumption was calculated and reported as g/animal/day and g/kg/day for the corresponding body weight change intervals. Food efficiency (body weight gained as a percentage of food consumed) was also calculated and reported for these intervals. When food consumption could not be determined for an animal during a given interval (due to a weighing error, food spillage, obvious erroneous value, *etc.*), the appropriate interval was footnoted as "NA" (Not Applicable) on the individual tables.

## **5.2. F<sub>0</sub> AND F<sub>1</sub> REPRODUCTIVE PERFORMANCE**

### **5.2.1. ESTROUS CYCLES**

Vaginal smears were prepared daily to determine the stage of estrus for each female, beginning 21 days prior to pairing and continuing until evidence of mating was observed. For females with no evidence of mating, smearing was continued until termination of the mating period. The average cycle length was calculated for complete estrous cycles (*i.e.*, the total number of returns to metestrus [M] or diestrus [D] from estrus [E] or proestrus [P] beginning 21 days prior to initiation of the mating period and until the detection of

evidence of mating). Estrous cycle length was determined by counting the number of days from the first M or D in a cycle to the first M or D in a subsequent cycle. The cycle during which evidence of mating was observed for a given animal was not included in the mean individual estrous cycle length calculation. Vaginal smears were also performed on the day of necropsy to determine the stage of estrus.

### **5.2.2. BREEDING PROCEDURES**

The animals were paired on a 1:1 basis within each treatment group after a minimum of 70 days of exposure. A breeding record containing the male and female identification numbers and the start date of cohabitation was prepared. Each female was housed in the home cage of the male. Positive evidence of mating was confirmed by the presence of a copulatory plug or the presence of sperm in a vaginal smear. Each mating pair was examined daily. The day when evidence of mating was identified was termed day 0 of gestation. Then the animals were separated and the female was housed in an individual plastic cage with nesting material. When evidence of mating was not apparent after 14 days, the female was placed in a plastic maternity cage with nesting material.

Each generation was mated once to produce one litter per generation (the F<sub>1</sub> and F<sub>2</sub> litters). Prior to the F<sub>0</sub> pairing (day 70), male body weights ranged from 276 g to 598 g and female body weights ranged from 238 g to 341 g. The animals were approximately 17 weeks old. All animals were randomly selected for pairing.

Prior to the F<sub>1</sub> pairing (day 205), male body weights ranged from 344 g to 604 g and female body weights ranged from 195 g to 354 g. The animals were 15 to 16 weeks old. All animals were randomly selected for pairing avoiding sibling matings.

Pre-coital intervals were calculated according to the following method: rats paired over a 12-hour dark cycle were considered to have been paired for "one" day.

Mating and fertility indices were calculated as follows:

$$\text{Male (Female) Mating Index (\%)} = \frac{\text{No. of Males (Females) with Evidence of Mating (or Confirmed Pregnancy)}}{\text{Total No. of Males (Females) Used for Mating}} \times 100$$

$$\text{Female Fertility Index (\%)} = \frac{\text{No. of Females with Confirmed Pregnancy}}{\text{Total No. of Females Used for Mating}} \times 100$$

$$\text{Male Fertility Index (\%)} = \frac{\text{No. of Males Siring a Litter}}{\text{Total No. of Males Used for Mating}} \times 100$$

### **5.3. F<sub>0</sub> AND F<sub>1</sub> PARTURITION**

All females were allowed to deliver naturally and rear their young to weaning (PND 28 for the F<sub>1</sub> pups and PND 21 for the F<sub>2</sub> pups). During the period of expected parturition, the females were observed twice daily for initiation and completion of parturition and for signs of dystocia. On the day parturition was judged complete (PND 0), pups were sexed and examined for gross malformations, and the numbers of stillborn and live pups were recorded. Individual gestation lengths were calculated using the date delivery started.

### **5.4. F<sub>1</sub> AND F<sub>2</sub> LITTER DATA**

#### **5.4.1. LITTER VIABILITY AND DEATHS**

Each litter was examined twice daily for survival, and all deaths were recorded. All pups were individually identified by application of tattoo markings on the digits on PND 0. A daily record of litter size was maintained. Intact offspring dying from PND 0 to 4 were necropsied using a fresh dissection technique described by Stuckhardt and Poppe.<sup>4</sup> Pups with external abnormalities which would warrant further skeletal examination were eviscerated and stained as described by Dawson<sup>5</sup> for subsequent skeletal evaluation. Findings were recorded as either developmental variations (alterations in anatomic structure that are considered to have no significant biological effect on animals health or body conformity, representing slight deviations from normal) or malformations (those anomalies that alter general body conformity, disrupt or interfere with body function, or may be incompatible with life). A detailed gross necropsy was performed on any pup

dying after PND 4 and prior to weaning; tissues were preserved for possible future histopathological examination only as deemed necessary by the gross findings.

#### **5.4.2. LITTER REDUCTION**

To reduce variability among the litters, 8 pups per litter, 4 per sex when possible, were randomly selected on PND 4. All selections were performed by computerized randomization without regard to body weight. The remaining offspring were weighed, euthanized and discarded on PND 4. Standardization of litter size was not performed on litters with fewer than eight pups.

#### **5.4.3. CLINICAL OBSERVATIONS**

Litters were examined daily for survival and any adverse changes in appearance or behavior. Each F<sub>1</sub> and F<sub>2</sub> pup received a detailed physical examination on PND 1, 4, 7, 14 and 21. F<sub>1</sub> pups also received a detailed physical examination on PND 28, 32 and/or 35.

#### **5.4.4. BODY WEIGHTS**

Pups were individually weighed on PND 1, 4, 7, 14, 21, 28 (F<sub>1</sub> only), 32 (F<sub>1</sub> only) and 35 (F<sub>1</sub> only). Mean pup weights were presented by sex for each litter and by exposure group.

#### **5.4.5. SEX DETERMINATION**

Pups were individually sexed on PND 0, 4, 7, 14, 21 and 28 (F<sub>1</sub> only).

**5.4.6. CALCULATION OF LITTER PARAMETERS**

Litter parameters were defined as follows:

Live Litter Size	=	$\frac{\text{Total Viable Pups Day 0}}{\text{No. Litters With Viable Pups Day 0}}$	
Postnatal Survival Between Birth and PND 0 or PND 4 (Pre-Selection) (% Per Litter)	=	$\frac{\Sigma (\text{Viable Pups Per Litter on PND 0 or PND 4/No. of Pups Born Per Litter})}{\text{No. of Litters Per Group}}$	X 100
Postnatal Survival for All Other Intervals (% Per Litter)	=	$\frac{\Sigma (\text{Viable Pups Per Litter at End of Interval N/Viable Pups Per Litter at Start of Interval N})}{\text{No. of Litters Per Group}}$	X 100
Where N	=	PND 0-1, 1-4 (Pre-Selection), 4 (Post-Selection)-7, 7-14, 14-21, 21-28 or 4 (Post-Selection)-21 or 4 (Post-Selection)-28	

**5.4.7. WEANING AND SELECTION**

Each F<sub>0</sub> dam and litter remained housed together until weaning on lactation day 28. Thirty male and 30 female F<sub>1</sub> pups from each group (control, 500, 1000 and 2500 ppm) were randomly selected prior to weaning (lactation day 28) to comprise the F<sub>1</sub> generation. These pups (a minimum of one male and one female per litter, when available) were exposed to the test article for six hours per day beginning on day 28 *post partum*. Additional weanlings from each group were exposed to the test article from PND 28-34, 36 or 37. The additional pups were selected as potential replacement animals for selected F<sub>1</sub> weanlings dying between PND 28 and 37.

Pups were selected for the F<sub>1</sub> generation as follows. A computerized randomization procedure was used to select a minimum of one male and one female per litter, when available. An additional male and/or female were selected from a litter, if necessary, to obtain 30 males and 30 females for each group. Pups selected for the F<sub>1</sub> generation also retained the dam number, followed by a hyphen "-" and the digit tattoo marking (*i.e.* 99999-01).

## **5.5. F<sub>1</sub> DEVELOPMENTAL LANDMARKS**

The following investigations were used to assess the maturation of the selected F<sub>1</sub> pups. These procedures were concluded when the last pup to demonstrate balanopreputial separation was 62 days old. Cumulative litter values include pups which tested positive for the event but were found dead prior to the end of the testing period.

### **5.5.1. BALANOPREPUTIAL SEPARATION**

Each male pup was observed for balanopreputial separation beginning on PND 35 as described by Korenbrot *et al.*<sup>6</sup> The day on which balanopreputial separation was first observed was recorded for each pup. Examination of the pups continued daily until balanopreputial separation was present. Body weights were recorded on the day of acquisition of this landmark.

### **5.5.2. VAGINAL PATENCY**

Each female pup was observed for vaginal perforation beginning on PND 25 as described by Adams *et al.*<sup>7</sup> The day on which the vaginal lumen was first observed to open was recorded for each pup. Examination of the females was continued daily until vaginal patency was present. Body weights were recorded on the day of acquisition of this landmark.

## **5.6. SPERMATOGENIC ENDPOINT EVALUATIONS**

Immediately upon euthanasia, the reproductive tract of each F<sub>0</sub> and F<sub>1</sub> male was exposed via a ventral mid-line incision. The right epididymis was excised and weighed. An incision was made in the distal region of the right cauda epididymis. The right cauda epididymis was then placed in Dulbecco's phosphate-buffered saline (maintained at approximately 37°C) with 10 mg/mL bovine serum albumin (BSA). After a ten-minute incubation period, a sample of sperm was loaded into a 100- $\mu$ m cannula for determination of sperm motility. Because sperm motility can be affected by temperature shock, all cannulas and diluents were pre-warmed in an incubator, and motility determinations were performed under constant temperature (approximately 37°C) using

the Hamilton-Thorne HTM-IVOS Version 10 computer-assisted sperm analysis (CASA) system. Analysis of a minimum of 200 motile and nonmotile spermatozoa per animal (if possible) in all exposure groups was performed by the analyzer. The motility score (percent) for motile (showing motion only) and progressively motile (showing net forward motion) sperm was reported:

$$\begin{array}{l} \text{Percent Motile} \\ \text{(or Progressively Motile Sperm)} \end{array} = \frac{\text{Number of Motile} \\ \text{(or Progressively Motile) Sperm}}{\text{Total Number of Sperm Counted}} \times 100$$

Sperm morphology was evaluated by light microscopy via a modification of the wet-mount evaluation technique described by Linder *et al.*<sup>8</sup> Abnormal forms of sperm (double heads, double tails, microcephalic or megacephalic, *etc.*) from a differential count of 200 spermatozoa per animal, if possible, were recorded.

The left testis and epididymis from all F<sub>0</sub> and F<sub>1</sub> males from all exposure groups were stored frozen, homogenized and evaluated for determination of homogenization-resistant spermatid count and sperm production rate, using the method described by Blazak *et al.*<sup>9</sup> and the Hamilton-Thorne CASA system.

For determination of homogenization-resistant spermatid count and sperm production rate, the samples were thawed and homogenized, and a sample was retained for subsequent analysis. An aliquot of the sample was added to a solution containing a DNA-specific fluorescent dye (the dye stains DNA that is present in the head of the sperm). For analysis, each sample was mixed, and an aliquot was placed on a slide with a 20- $\mu$ m chamber depth. Illumination from a xenon lamp within the HTM-IVOS analyzer allowed for the visualization and quantitation of the sperm. A minimum of 200 cells, if possible, or 20 fields were counted for each sample.

## **5.7. SCHEDULED NECROPSY EXAMINATIONS**

### **5.7.1. F<sub>0</sub> AND F<sub>1</sub> GENERATIONS - ADULTS**

All surviving F<sub>0</sub> adults were euthanized following the selection of the F<sub>1</sub> generation and completion of a detailed clinical observation. All surviving F<sub>1</sub> adults were euthanized following weaning of the F<sub>2</sub> pups. A complete necropsy and selective histopathologic examination were conducted as described in Section 5.8.

### **5.7.2. F<sub>1</sub> AND F<sub>2</sub> PUPS**

Prior to weaning, 30 F<sub>1</sub> pups/sex/group were randomly selected for the F<sub>1</sub> parental generation and for evaluation of developmental landmarks. Additional F<sub>1</sub> pups were retained as potential replacement animals, and were euthanized by CO<sub>2</sub> inhalation and necropsied on PND 34, 36 or 37. In addition, one F<sub>1</sub> and one F<sub>2</sub> pup/sex/litter (when available) were selected from the F<sub>1</sub> and F<sub>2</sub> weanlings for complete necropsy on PND 28 and PND 21, respectively; brain, spleen and thymus gland weights were recorded. All remaining non-selected F<sub>1</sub> and F<sub>2</sub> weanlings were euthanized by CO<sub>2</sub> inhalation and necropsied on PND 28 and PND 21, respectively, with emphasis on developmental and reproductive system morphology. All gross lesions from F<sub>1</sub> and F<sub>2</sub> weanlings were preserved in 10% neutral-buffered formalin for possible future histopathologic examination; all other tissues were discarded.

## **5.8. PATHOLOGY**

### **5.8.1. MACROSCOPIC EXAMINATION**

A complete necropsy was conducted on all parental animals (F<sub>0</sub> and F<sub>1</sub>) euthanized *in extremis* or at termination. All animals were euthanized by isoflurane inhalation. The necropsy included examination of the external surface, all orifices, the cranial cavity, the external surfaces of the brain and spinal cord, and the thoracic, abdominal and pelvic cavities including viscera. At the time of necropsy, the following F<sub>0</sub> and F<sub>1</sub> parental tissues and organs were collected and were placed in 10% neutral-buffered formalin:

Adrenals (2)	Lymph node (mesenteric)
Aorta	Ovaries and oviducts (2)
Bone with marrow (sternebrae)	Pancreas
Brain (forebrain, midbrain, hindbrain)	Peripheral nerve (sciatic)
Coagulating gland	Pituitary
Eyes with optic nerve (2)	Prostate
Gastrointestinal tract	Salivary gland [submandibular (2)]
Esophagus	Seminal vesicles (2)
Stomach	Skeletal muscle (rectus femoris)
Duodenum	Skin with mammary gland
Jejunum	Spinal cord (cervical)
Ileum	Spleen
Cecum	Testes with epididymides <sup>a</sup> (1)
Colon	and vas deferens
Rectum	Thymus
Heart	Thyroids [with parathyroids,
Kidneys (2)	if present (2)]
Liver (sections of two lobes)	Trachea
Lungs (including bronchi,	Urinary bladder
fixed by inflation with fixative)	Uterus with cervix and vagina
	All gross lesions

<sup>a</sup> = The right testis and epididymis were fixed in Bouin's solution.

### **5.8.2. ORGAN WEIGHTS**

The following organs from all F<sub>0</sub> and F<sub>1</sub> parental animals euthanized at scheduled termination were weighed:

Adrenals	Prostate
Brain	Seminal vesicles with coagulating
Epididymides <sup>a</sup> (total and cauda)	glands (with accessory fluids)
Kidneys	Spleen
Liver	Testes <sup>a</sup>
Ovaries	Thymus gland
Pituitary	Uterus with oviducts and
	cervix

<sup>a</sup> = These paired organs were weighed separately.

Except as noted, paired organs were weighed together. Absolute weights and organ-to-final-body-weight ratios were reported.

### **5.8.3. HISTOLOGICAL PROCEDURES AND MICROSCOPIC EXAMINATION**

Microscopic evaluations were performed on the following tissues for 10 parental animals/sex/group from the control and high exposure groups and for all F<sub>0</sub> and F<sub>1</sub> adult animals that were euthanized *in extremis* or failed to breed, conceive or deliver offspring:

Adrenal glands: cortex and medulla	Prostate
Brain	Seminal vesicles with coagulating glands (with accessory fluids)
Cervix	Spleen
Epididymis <sup>a</sup> (right): caput, corpus and cauda	Testis <sup>a</sup> (right)
Kidneys	Thymus
Liver	Uterus (with oviducts)
Ovaries <sup>b</sup>	Vagina
Pituitary	All gross (internal) lesions <sup>c</sup>

<sup>a</sup> = PAS and hematoxylin staining were used for the right testis and epididymis. Transverse sections of 2 to 4 microns of the testes and longitudinal sections of the epididymides were made.

<sup>b</sup> = One section from each ovary from the selected F<sub>0</sub> females were examined. Five sections from each ovary from all F<sub>1</sub> females in the control and high exposure groups were examined. Quantitative histopathological evaluation from multiple sections (including enumeration of primordial follicles<sup>10,11</sup> and corpora lutea) was conducted on all F<sub>1</sub> females from the control and high exposure groups. Due to the size of the corpora lutea (much larger than primordial follicles), each corpus luteum was possibly sectioned and counted multiple times, resulting in a value that was larger than would be expected.

<sup>c</sup> = All gross lesions were examined from all F<sub>0</sub> and F<sub>1</sub> adults.

After fixation, protocol-specified tissues were trimmed according to standard operating procedures and the protocol. Trimmed tissues were processed into paraffin blocks, sectioned at 4-8 microns, mounted on glass microscope slides and stained with hematoxylin and eosin, except as noted above. The cervix from four, two, three and two F<sub>1</sub> females in the control, 500, 1000 and 2500 ppm groups, respectively, was cut

cross-wise instead of longitudinally. Due to processing, it was not possible to re-trim these tissues.

Microscopic examinations were conducted by Ann Radovsky, D.V.M., Ph.D., D.A.C.V.P., D.A.B.T., Senior Pathologist, WIL Research Laboratories, Inc.

## **5.9. STATISTICAL METHODS**

All statistical tests were performed using appropriate computing devices or programs. Analyses were conducted using two-tailed tests (except as noted otherwise) for minimum significance levels of 5%, comparing each test article-exposed group to the control group by sex. Each mean was presented with the standard deviation (S.D.) and the number of animals (N) used to calculate the mean. Due to the different rounding conventions inherent in the types of software used, the means and standard deviations on the summary and individual tables may differ by  $\pm 1$  in the last significant figure. Statistical analyses were not conducted if the number of animals was two or less. Data obtained from nonpregnant animals were excluded from statistical analyses following the mating period. Statistical analyses were not performed when weekly food or body weight data for one or more animals were not available because the animals remained in the lactation phase. The litter was used as the experimental unit.

Parental mating and fertility indices were analyzed using the Chi-square test with Yates' correction factor.<sup>12</sup> Mean parental (weekly, gestation and lactation) and offspring body weight gains, parental food consumption and food efficiency data, estrous cycle data, pre-coital intervals, gestation lengths, implantation sites, live litter sizes, unaccounted sites, numbers of pups born, balanopreputial separation (mean litter day of acquisition and body weight), vaginal patency (mean litter day of acquisition and body weight), absolute and relative organ weights, sperm production rate, epididymal and testicular sperm numbers, and ovarian primordial follicle counts were subjected to a parametric one-way analysis of variance (ANOVA)<sup>13</sup> to determine intergroup differences. If the ANOVA revealed statistically significant ( $p < 0.05$ ) intergroup variance, Dunnett's test<sup>14</sup> was used to compare the test article-exposed groups to the control group. Mean offspring weights

were subjected to a parametric one-way analysis of covariance (ANCOVA)<sup>15</sup>, with litter size as the covariant, to determine intergroup differences. If the ANCOVA revealed statistically significant ( $p < 0.05$ ) intergroup variance, Student's T-test<sup>15</sup> was used to compare the test article-exposed groups to the control group. Mean litter proportions (percent per litter) of postnatal pup survival, pup sexes at birth (percentage of males per litter), percentage of motile sperm, and percentage of sperm with normal morphology were subjected to the Kruskal-Wallis nonparametric ANOVA test<sup>16</sup> to determine intergroup differences. If the ANOVA revealed statistically significant ( $p < 0.05$ ) intergroup variance, the Mann-Whitney U-test<sup>16</sup> was used to compare the test article-exposed groups to the control group. Histopathological findings in the test article-exposed groups were compared to the control group using a two-tailed Fisher's Exact test.<sup>17</sup>

## **6. RESULTS AND DISCUSSION**

### **6.1. F<sub>0</sub> GENERATION**

#### **6.1.1. CLINICAL OBSERVATIONS AND SURVIVAL**

Summary Data: Tables 1, 2, 3, 4, 5, 6, 7, 8

Individual Data: Tables 125, 126, 127, 128, 129, 130

After 91 days of exposure to the test article, female no. 74805 in the 500 ppm group had pale eyes and ears and appeared to be having difficulty during parturition (gestation day 23) and was euthanized *in extremis* on lactation day 0. This female delivered 12 pups and had four pups retained *in utero*. On the day of euthanasia, this female had pale ears and eyes and red discharge from the vagina. Microscopically, the cause of death for this female was determined to be severe acute renal tubular necrosis and moderate acute hepatic necrosis. Therefore, this death was not attributed to the test article; no evidence of dystocia was observed in females in the 1000 or 2500 ppm groups. All other animals survived to the scheduled necropsy.

There were no test article-related clinical observations at the weekly detailed physical examinations or one hour following exposure. The response to novel stimulus was similar in all groups, including the control group.

#### **6.1.2. REPRODUCTIVE PERFORMANCE**

Summary Data: Tables 9, 10

Individual Data: Tables 131, 132

Historical Control Data: Appendix E

No test article-related effects on reproductive performance were observed. Male and female mating indices were 86.7%, 100.0%, 96.7% and 100.0% in the control, 500, 1000, and 2500 ppm groups, respectively. Male and female fertility indices were 73.3%, 96.7%, 93.3% and 93.3% in the same respective groups. The only statistically significant ( $p < 0.05$ ) differences from the control group were increases in the male and female fertility indices in the 500 ppm group. It should be noted that the fertility index for the

control group (73.3%) was reduced compared to the mean value in the WIL historical control data (90.4%). However, the values in the isobutanol-exposed groups exceeded the mean value in the WIL historical control data. Males that did not sire a litter numbered 8, 1, 2 and 2 in the control, 500, 1000 and 2500 ppm groups, respectively. Females that had evidence of mating but did not deliver numbered 4, 1, 2 and 3 in the same respective groups.

The mean numbers of days between pairing and coitus in the test article-exposed groups were similar to the control group value. The mean lengths of estrous cycles in these groups were similar to that in the control group. None of the differences were statistically significant.

### **6.1.3. BODY WEIGHTS**

#### **6.1.3.1. WEEKLY**

Summary Data: Tables 11, 12, 13, 14, 15, 16

Individual Data: Tables 133, 134, 135, 136

Mean F<sub>0</sub> body weights, body weight gains and cumulative body weight gains in the 500, 1000 and 2500 ppm groups were unaffected by exposure to the test article during the pre-mating period and one week following weaning (females) and throughout the study (males). The only statistically significant ( $p < 0.05$ ) difference from the control group was a decreased mean body weight gain in the 1000 ppm group males during study days 84-91. A similar reduction was not observed in the 2500 ppm group; therefore, this transient decrease was not attributed to the test article.

#### **6.1.3.2. GESTATION**

Summary Data: Tables 17, 18

Individual Data: Tables 137, 138

No test article-related effects on maternal body weights or body weight gains were observed in the test article-exposed groups during the F<sub>0</sub> gestation period. Differences from the control group were slight and were not statistically significant.

### **6.1.3.3. LACTATION**

Summary Data: Tables 19, 20

Individual Data: Tables 139, 140

No test article-related effects on F<sub>0</sub> lactation body weights or body weight gains were observed in the test article-exposed groups. The only statistically significant ( $p < 0.01$ ) differences from the control group were a mean body weight loss of 33 grams in the 500 ppm group compared to a loss of 53 grams in the control group during lactation days 21-28, resulting in a statistically significant ( $p < 0.05$  or  $p < 0.01$ ) increase in mean body weight on lactation day 28 and in mean body weight gain during the entire lactation period (days 1-28). Since the control group lost more weight than the 500 ppm group, this difference was not considered to be an adverse change.

### **6.1.4. FOOD CONSUMPTION AND EFFICIENCY**

#### **6.1.4.1. WEEKLY**

Summary Data: Tables 21, 22, 23, 24, 25, 26

Individual Data: Tables 141, 142, 143, 144, 145, 146

Food consumption, evaluated as g/animal/day and g/kg/day, and food efficiency in the 500, 1000 and 2500 ppm groups were unaffected by exposure to the test article during the pre-mating period and one week following weaning (females) and throughout the study (males). Occasional statistically significant ( $p < 0.05$  or  $p < 0.01$ ) reductions in food consumption (primarily g/kg/day) were observed in the 2500 ppm group males compared to the control group values during study days 14-21 through 112-119. Food consumption (g/animal/day) in these males was generally not affected during these intervals. Mean body weights and food efficiency in the 2500 ppm group males and females were similar to or greater than the control values. Therefore, these sporadic reductions were not attributed to exposure to the test article. The only other statistically significant differences ( $p < 0.05$  or  $p < 0.01$ ) from the control group were a decrease in food consumption (g/animal/day) in the 2500 ppm group males during study days 28-35, an

increase in food consumption (g/kg/day) during day 0-1 in the 1000 ppm group males and a decrease in food efficiency in the 1000 ppm group males during study days 1-4. Similar differences were not observed in the 2500 ppm group males during this interval; therefore, no relationship to exposure was evident.

#### **6.1.4.2. GESTATION**

Summary Data: Tables 27, 28, 29

Individual Data: Tables 147, 148, 149

F<sub>0</sub> maternal food consumption and food efficiency during gestation were unaffected by test article exposure in the 500, 1000 and 2500 ppm groups. The only statistically significant difference from the control group was a slight reduction in food consumption (g/kg/day) in the 2500 ppm group when the entire gestation period (days 0-20) was evaluated. Food efficiency and gestation body weight gain in this group was unaffected during this interval. Therefore, the reduction was not attributed to test article exposure.

#### **6.1.4.3. LACTATION**

Summary Data: Tables 30, 31, 32

Individual Data: Tables 150, 151, 152

F<sub>0</sub> maternal food consumption and food efficiency in the test article-exposed groups were similar to the control group values throughout lactation. The only statistically significant ( $p < 0.01$ ) differences were a smaller decrement in food efficiency in the 500 ppm group during lactation days 21-28 than the control group and an increase in food efficiency in this group during the entire lactation period (days 1-28). Because similar effects were not observed at higher exposure levels, these differences were not considered test article-related.

### **6.1.5. GESTATION LENGTH AND PARTURITION**

Summary Data: Table 33

Individual Data: Table 153

Historical Control Data: Appendix E

Mean F<sub>0</sub> gestation lengths in the test article-exposed groups were unaffected by exposure to the test article. Differences from the control group value were slight and were not statistically significant. The mean gestation lengths in the 500, 1000 and 2500 ppm groups were 21.9, 21.9 and 21.8 days, respectively, compared to a mean gestation length of 22.0 days in the control group.

Female no. 74805 in the 500 ppm group was euthanized *in extremis* due to apparent difficulty during parturition. The cause of moribundity for this animal was determined to be renal and liver necrosis with multiple organ failure. Because dystocia was not observed in females in the 1000 and 2500 ppm groups, the difficulty during delivery was not attributed to the test article.

### **6.1.6. F<sub>0</sub> SPERMATOGENIC ENDPOINT EVALUATIONS**

Summary Data: Tables 34, 35, 36, 37, 38

Individual Data: Tables 154, 155, 156, 157, 158

Historical Control Data: Appendix E

No test article-related effects were observed on F<sub>0</sub> spermatogenesis endpoints (mean testicular and epididymal sperm numbers, sperm production rate, motility, progressive motility and morphology) in males at any exposure level. Differences from the control group were slight and were not statistically significant. A slight reduction in the percentage of morphologically normal sperm in the 2500 ppm group (95.9%) compared to the control group value (97.9%) was attributed to a single male (no. 74628) with an abnormally low percentage of morphologically normal sperm (0.5%). The values for the remaining males in this group were comparable to those in the control group. Therefore,

the reduction in morphologically normal sperm in the single male in the 2500 ppm group was attributed to biological variation.

### **6.1.7. F<sub>0</sub> NECROPSY EXAMINATIONS**

#### **6.1.7.1. MACROSCOPIC EXAMINATION**

Summary Data: Tables 39, 40, 41, 42

Individual Data: Tables 159, 160, 161, 162

Female no. 74805 in the 500 ppm group was euthanized on lactation day 0 due to difficulties during parturition. This female delivered 12 pups and had four fetuses with no apparent malformations retained *in utero*. This animal had dark red contents in the ileum and jejunum and a pale pituitary gland. Similar findings were not observed in females at the scheduled necropsy in the higher exposure groups. Therefore, these findings were not attributed to the test article.

At the scheduled necropsy, no exposure-related trends were observed in the macroscopic findings noted in the test article-exposed groups. Findings were observed similarly in control group animals, were noted infrequently and/or did not occur in an exposure-related manner. The mean number of implantation sites and the mean number of unaccounted sites in the F<sub>0</sub> test article-exposed females were similar to the control group values; no statistically significant differences were observed.

#### **6.1.7.2. ORGAN WEIGHTS**

Summary Data: Tables 43, 44, 45, 46

Individual Data: Tables 163, 164, 165, 166

No test article-related effects on organ weights were observed in the 500, 1000 and 2500 ppm group males or females. The only statistically significant ( $p < 0.05$  or  $p < 0.01$ ) differences from the control group were increases in mean absolute prostate weights in the 1000 ppm group males and mean relative prostate weights in the 500 and 1000 ppm group males and a decrease in mean absolute pituitary weight in the 500 ppm group

females. Because similar effects were not observed in the 2500 ppm group males and females, these changes were not attributed to the test article.

### **6.1.7.3. MICROSCOPIC EXAMINATION**

Summary Data: Tables 47, 48, 49

Individual Data: Tables 159, 160, 161

Female no. 74805 was euthanized *in extremis* during parturition. Microscopic findings for this female included severe acute renal tubular necrosis, moderate acute hepatic necrosis, lymphoid depletion of the spleen and lymphoid necrosis of the thymus. The cause of the moribund condition of this female was renal and liver necrosis with multiple organ failure.

At the scheduled necropsy, no test article-related microscopic findings were observed including for animals that failed to breed or produce a litter. The only statistically significant ( $p < 0.05$ ) differences from the control group values were an increase in the incidence of hydronephrosis in the 500 ppm group females and a decrease in the incidence of dilatation of the uterine lumen in the 2500 ppm group females. A slightly increased incidence (not statistically significant) of basophilic tubules was observed in the kidneys of the 2500 ppm group males; however, the severity of this lesion was minimal, and a similar increase was not observed in the 2500 ppm group females. Therefore, this common, spontaneous alteration was not considered to be test article-related. Other microscopic findings were typical of spontaneous conditions in young rats.

### **6.1.8. F<sub>1</sub> LITTER DATA**

#### **6.1.8.1. PND 0 LITTER DATA AND POSTNATAL SURVIVAL**

Summary Data: Tables 50, 51

Individual Data: Tables 167, 168

Historical Control Data: Appendix E

The mean numbers of F<sub>1</sub> pups born, live litter sizes and percentages of males per litter were similar among all groups; no statistically significant differences were noted.

Postnatal survival on PND 0 (relative to the number born) and during PND 0-1, 1-4, 4-7, 7-14, 14-21, 21-28, birth to PND 4 and PND 4-28 were unaffected by test article exposure. Statistically significant ( $p < 0.05$  or  $p < 0.01$ ) decreases in postnatal survival were observed in the test article-exposed groups relative to the control group values. These reductions occurred in the 500 ppm group during PND 0-1, 4-7 and 4-28 and in the 1000 ppm group during PND 0-1. Reductions (not statistically significant) were observed in the 2500 ppm group during PND 0-1, birth to PND 4 and PND 4-28. Because no exposure concentration-dependent response was observed, these decreases in postnatal survival were not considered test article-related.

#### **6.1.8.2. GENERAL PHYSICAL CONDITION AND MORTALITIES**

Summary Data: Tables 52, 53

Individual Data: Table 169

The numbers of pups (litters) available for clinical signs were 299 (22), 390 (29), 390 (27) and 388 (27) in the control, 500, 1000 and 2500 ppm groups, respectively. The numbers of pups found dead during the lactation period were 13, 22, 21 and 30 in the control, 500, 1000 and 2500 ppm groups, respectively. In the same respective exposure groups, 3, 19, 9 and 11 pups were missing and presumed cannibalized. The incidence of dead/missing pups was slightly higher in the 2500 ppm group, although this was not considered exposure-related. In general, larger-sized litters tend to have increased postnatal deaths due to competition with littermates for access to maternal resources (nursing, thermoregulation, grooming, *etc.*). The dams in the 2500 ppm group had approximately one additional pup/litter compared to the control group. The pups from female no. 74805 (500 ppm group) were euthanized on PND 0 due to the euthanasia of the dam. The general physical condition of the F<sub>1</sub> pups during lactation was generally similar in all groups, including the control group.

### **6.1.8.3. OFFSPRING BODY WEIGHTS**

Summary Data: Tables 54, 55, 56, 57

Individual Data: Tables 170, 171

Historical Control Data: Appendix E

#### **6.1.8.3.1. PRE-WEANING**

No exposure-related effects on mean pup body weights or body weight gains were observed during the pre-weaning period (PND 1-28). Numerous statistically significant ( $p < 0.05$  or  $p < 0.01$ ) decreases in mean pup body weights and/or pup body weight gains were observed in the 500 and 1000 ppm group F<sub>1</sub> males and females, primarily during PND 4-28. Mean pup body weights in the test article-exposed groups were similar to the control group value on PND 1. Mean pup body weights in the 2500 ppm group were also reduced (not statistically significant) between PND 14 and 28 (6.4%-8.1% for the males and 4.9%-7.7% for the females). Mean pup body weight gains in the 2500 ppm group were similar to those in the control group during PND 1-4, 4-7 and 7-14. Mean pup body weight gains in this group were slightly reduced during PND 14-21 and 21-28 (statistically significant at  $p < 0.05$  during PND 14-21, males only). These reductions in mean body weights and mean body weight gains followed neither a concentration-dependent nor a time-course response. The earliest, most severe reductions were observed in the 500 ppm group and began on PND 4, which was prior to the re-initiation of maternal exposure and continued throughout the pre-weaning periods. The onset of reductions in mean body weight in the 1000 ppm group occurred, at a lesser extent, on PND 14; statistical significance in this group was not observed after PND 21. There were no reductions in mean body weight observed during the pre-weaning period in the 2500 ppm group; only slight reductions (statistically significant only in males at one time point) in mean body weight gains were observed during the last half of the pre-weaning period. Because of the lack of an exposure-related effect, none of the decreases were attributed to the test article.

#### **6.1.8.3.2. POST-WEANING**

No exposure-related effects on mean pup body weights or body weight gains were observed during the post-weaning period (PND 28-32 and 32-35). Statistically significant ( $p < 0.05$  or  $p < 0.01$ ) decreases in mean pup body weights and/or pup body weight gains were observed in the 500 and 1000 ppm group F<sub>1</sub> males and females during this period. The reductions did not occur in a concentration-dependent manner; therefore, the decreases were not attributed to the test article. Mean pup body weights and body weight gains in the 2500 ppm group were similar to those in the control group. No statistically significant differences were noted.

#### **6.1.8.4. NECROPSIES OF PUPS FOUND DEAD**

Summary Data: Table 58

Individual Data: Table 172

There were no test article-related internal findings noted at the necropsies of pups that were found dead. Pup no. 74782-14 in the 500 ppm group had dark red discoloration of the brain. Pup no. 74782-08 in the same group had lungs that were not fully collapsed (PND 29). In the 2500 ppm group, pup no. 74803-14 had a mechanical injury (fractured right parietal bone with associated hemorrhage). Aside from the presence or absence of milk in the stomach, no other internal findings were noted in pups that died.

#### **6.1.8.5. NECROPSIES OF WEANLINGS NOT SELECTED FOR ORGAN WEIGHTS (PND 28, 34, 36 AND 37)**

Summary Data: Table 59

Individual Data: Table 173

No test article-related internal findings were observed in the weanlings necropsied on PND 28, 34, 36 or 37, or in the pups euthanized due to the death of the dam. Pup no. 74785-10 in the 500 ppm group had a raised, white area on the median lobe of the liver. Pup nos. 74739-03 and 74849-12 in the 1000 ppm group had a dilated renal pelvis (unilateral). In the 2500 ppm group, pup no. 74813-14 had a cystic oviduct. Pup

no. 74862-12 in the same group had a mechanical injury (the frontal and parietal bones were fractured). No other internal findings were observed.

#### **6.1.8.6. NECROPSIES OF WEANLINGS SELECTED FOR ORGAN WEIGHTS - PND 28**

##### **6.1.8.6.1. MACROSCOPIC EXAMINATION**

Summary Data: Table 60

Individual Data: Table 174

No internal findings were observed at the necropsy of pups selected for organ weights.

##### **6.1.8.6.2. ORGAN WEIGHTS**

Summary Data: Tables 61, 62

Individual Data: Tables 175, 176

No test article-related changes in mean organ weights (absolute or relative to final body weight) were observed in F<sub>1</sub> pups in the 500, 1000 or 2500 ppm groups. The only statistically significant (p<0.05) differences from the control group were decreases in the mean absolute thymus weight in the 500 ppm group males and the mean absolute brain weight in the 500 ppm group females. Mean body weights on PND 28 was reduced in the 500 ppm group males and females. In addition, similar decreases were not observed in the 1000 or 2500 ppm groups nor in the relative organ weights in the 500 ppm group animals; therefore, these reductions were not attributed to the test article.

#### **6.1.9. F<sub>1</sub> DEVELOPMENTAL LANDMARKS**

##### **6.1.9.1. BALANOPREPUTIAL SEPARATION**

Summary Data: Tables 63, 64

Individual Data: Tables 177, 178

Historical Control Data: Appendix E

There were no test article-related differences in the mean day of acquisition of balanopreputial separation or mean body weight on the day of acquisition. The only

statistically significant difference ( $p < 0.05$ ) from the control group was a reduced mean body weight on the day of balanopreputial separation in the 500 ppm group. However, because similar decreases were not observed in the 1000 and 2500 ppm groups, the decrease was not attributed to the test article.

#### **6.1.9.2. VAGINAL PATENCY**

Summary Data: Tables 65, 66

Individual Data: Tables 179, 180

Historical Control Data: Appendix E

There were no test article-related differences in the mean day of acquisition of vaginal patency or mean body weight on the day of acquisition. The only statistically significant difference ( $p < 0.05$ ) from the control group was a delay in the day of acquisition of vaginal patency in the 500 ppm group. Similar effects were not observed in the 1000 and 2500 ppm groups; therefore, the delay was not attributed to the test article.

### **6.2. F<sub>1</sub> GENERATION**

#### **6.2.1. CLINICAL OBSERVATIONS AND SURVIVAL**

Summary Data: Tables 67, 68, 69, 70, 71, 72, 73, 74

Individual Data: Tables 181, 182, 183, 184, 185, 186, 187

All F<sub>1</sub> adults survived to the scheduled necropsy. There were no test article-related clinical observations at the detailed physical examinations or one hour following exposure. The response to novel stimulus in the test article-exposed groups was similar to that in the control group.

## **6.2.2. REPRODUCTIVE PERFORMANCE**

Summary Data: Tables 75, 76

Individual Data: Tables 188, 189

Historical Control Data: Appendix E

Reproductive performance was unaffected by test article exposure at concentrations of 500, 1000 and 2500 ppm.

F<sub>1</sub> male and female fertility indices were 73.3%, 83.3%, 76.7% and 80.0% in the control, 500, 1000 and 2500 ppm groups, respectively. Male and female mating indices in the same respective groups were 96.7%, 93.3%, 90.0% and 83.3%. None of the differences from the control group were statistically significant. Males that did not sire a litter numbered 8, 5, 7 and 6 in the control, 500, 1000 and 2500 ppm groups, respectively. Females that had evidence of mating but did not deliver numbered 7, 3, 4 and 1 in the same respective groups.

The mean numbers of days between pairing and coitus in the test article-exposed groups were similar to the control group value. The mean lengths of estrous cycles in these groups were similar to that in the control group. None of the differences were statistically significant.

## **6.2.3. BODY WEIGHTS**

### **6.2.3.1. WEEKLY**

Summary Data: Tables 77, 78, 79, 80, 81, 82

Individual Data: Tables 190, 191, 192, 193

No test article-related trends in F<sub>1</sub> mean body weights, body weight gains or cumulative body weight gains were observed in the test article-exposed groups. Numerous statistically significant ( $p < 0.05$  or  $p < 0.01$ ) differences (primarily decreases) in mean body weights and body weight gains were observed in males and females in the test article-exposed groups. The majority of the differences were observed in the 500 and 1000 ppm group males. Mean body weights in these males were 10.3% and 9.7%,

respectively, lower than the control group value at the end of the pre-mating period (study day 204). These decrements appeared to be a continuation of the decreases in mean body weight gain observed in the 500 and 1000 ppm groups during the pre-weaning and early post-weaning periods (refer to Section 6.1.8.3). The effects were most pronounced at the low-exposure level, less pronounced at the mid-exposure level and not expressed at the high-exposure level. Because the changes were not concentration-dependent, they were not attributed to exposure to the test article.

#### **6.2.3.2. GESTATION**

Summary Data: Tables 83, 84

Individual Data: Tables 194, 195

No test article-related differences in mean maternal body weights or body weight gains were observed in the F<sub>1</sub> females during gestation. Differences from the control group values were slight, and none were statistically significant.

#### **6.2.3.3. LACTATION**

Summary Data: Tables 85, 86

Individual Data: Tables 196, 197

No test article-related differences in mean maternal body weights or body weight gains were observed in the F<sub>1</sub> females during lactation. Differences from the control group values were slight, and none were statistically significant.

#### **6.2.4. FOOD CONSUMPTION**

##### **6.2.4.1. WEEKLY**

Summary Data: Tables 87, 88, 89, 90, 91, 92

Individual Data: Tables 198, 199, 200, 201, 202, 203

No test article-related trends in F<sub>1</sub> food consumption (g/animal/day and g/kg/day) or food efficiency were observed in the test article-exposed groups. Occasional statistically significant ( $p < 0.05$  or  $p < 0.01$ ) differences from the control group were noted, but no test

article-related trends were apparent. Statistically significant ( $p < 0.05$  or  $p < 0.01$ ) decreases in food consumption evaluated as g/animal/day were observed in the 500 and 1000 ppm group males. Because the changes observed in the test article-exposed groups were not concentration-dependent, there were no exposure-related changes in food efficiency and food consumption in the males, evaluated as g/kg/day, was generally similar to that in the control group, the decreases were not attributed to test article exposure. These reductions in food consumption (g/animal/day) were attributed to the smaller size of the males in these groups. In the 2500 ppm group males and females, food consumption (g/animal/day and/or g/kg/day) was occasionally reduced (statistically significant at  $p < 0.05$  or  $p < 0.01$ ) compared to the control group values. Specifically, food consumption (g/kg/day) in the 2500 ppm group females was generally reduced throughout the pre-mating period and also during the post-mating period (study days 260-266). The differences from the control group were often statistically significant ( $p < 0.05$  or  $p < 0.01$ ). However, food efficiency in the 2500 ppm group males and females was similar to that in the control group and no trends were apparent that would be consistent with a test article-related effect.

#### **6.2.4.2. GESTATION**

Summary Data: Tables 93, 94, 95

Individual Data: Tables 204, 205, 206

F<sub>1</sub> maternal food consumption and food efficiency during gestation in the test article exposure groups was unaffected by test article exposure. The only statistically significant ( $p < 0.05$  or  $p < 0.01$ ) differences from the control group were reductions in food consumption (evaluated as g/kg/day) in the 2500 ppm group during gestation days 0-4 and 11-14. Because similar decreases were not observed in the g/animal/day values, they were not attributed to exposure.

### **6.2.4.3. LACTATION**

Summary Data: Tables 96, 97, 98

Individual Data: Tables 207, 208, 209

F<sub>1</sub> maternal food consumption and food efficiency in the test article exposure groups were unaffected by test article exposure during lactation. The only statistically significant ( $p < 0.05$  or  $p < 0.01$ ) differences from the control group were reductions in food consumption (evaluated as g/animal/day and/or g/kg/day) in the 500, 1000 and 2500 ppm groups during lactation days 14-21. Because of the absence of a concentration-dependent response, these decreases were not attributed to test article exposure.

### **6.2.5. GESTATION LENGTH AND PARTURITION**

Summary Data: Table 99

Individual Data: Table 210

Historical Control Data: Appendix E

The mean lengths of gestation were comparable between the F<sub>1</sub> test article-exposed groups and the control group. The differences were not statistically significant. The mean gestation lengths in the 500, 1000 and 2500 ppm groups were 22.0, 21.9 and 21.8 days, respectively, compared to a mean gestation length of 22.0 days in the control group. No signs of dystocia were noted.

### **6.2.6. F<sub>1</sub> SPERMATOGENIC ENDPOINT EVALUATIONS**

Summary Data: Tables 100, 101, 102, 103, 104

Individual Data: Tables 211, 212, 213, 214, 215

Historical Control Data: Appendix E

No test article-related effects on F<sub>1</sub> spermatogenic endpoints (mean testicular and epididymal sperm numbers, sperm production rate, sperm motility, progressive motility and the percentage of morphologically normal sperm) were observed at any exposure level. Differences from the control group were slight and were not statistically significant.

## **6.2.7. F<sub>1</sub> NECROPSY EXAMINATIONS**

### **6.2.7.1. MACROSCOPIC EXAMINATION**

Summary Data: Tables 105, 106, 107

Individual Data: Tables 216, 217, 218

No test article-related internal findings were observed at the scheduled necropsy of F<sub>1</sub> adult males and females. Findings observed were noted similarly in the control group, did not occur in an exposure concentration-related manner and/or were common to laboratory rats. The mean numbers of implantation sites and the numbers of unaccounted sites in the test article-exposed groups were similar to the control group values.

### **6.2.7.2. ORGAN WEIGHTS**

Summary Data: Tables 108, 109, 110, 111

Individual Data: Tables 220, 221, 222, 223

No test article-related changes in mean organ weights (absolute or relative to final body weight) were observed. The only statistically significant ( $p < 0.05$  or  $p < 0.1$ ) differences from the control group values were reductions in mean absolute liver weight in the 500 ppm group males and mean absolute pituitary weight in the 500 and 1000 ppm group females, and increases in the mean relative (to final body weight) thymus and brain weights in the 500 ppm group males. Mean final body weights in these groups were reduced compared to the control group values, resulting in reduced absolute weights for the liver and pituitary. Because the brain is unaffected by reductions in body weight, increased mean relative brain weights would be expected. Similar changes were not observed in the 2500 ppm group males and females. Therefore, these changes were not attributed to the test article.

### **6.2.7.3. MICROSCOPIC EXAMINATION**

Summary Data: Tables 112, 113, 114

Individual Data: Tables 216, 217, 219

There were no test article-related histopathologic alterations observed in F<sub>1</sub> animals at exposure levels of 500, 1000 and 2500 ppm, including for animals that failed to breed or produce a litter. Findings in the test article-exposed groups occurred similarly in the control group and were considered spontaneous or incidental in nature. The only statistically significant ( $p < 0.05$ ) difference from the control group was a decrease in the number of males in the 2500 ppm group with subacute inflammation in the kidneys. A decrease in the number of animals with microscopic lesions is not considered adverse. Therefore, these differences were not considered test article-related. No test article-related effects on primordial follicle counts or corpora lutea counts were observed in the 2500 ppm group females.

### **6.2.8. F<sub>2</sub> LITTER DATA**

#### **6.2.8.1. PND 0 LITTER DATA AND POSTNATAL SURVIVAL**

Summary Data: Tables 115, 116

Individual Data: Tables 224, 225

Historical Control Data: Appendix E

Postnatal survival, the mean number of pups born, the percentage of males at birth and live litter size on PND 0 in the 500, 1000 and 2500 ppm groups were unaffected by exposure to the test article. Differences from the control group were slight and were not statistically significant.

#### **6.2.8.2. GENERAL PHYSICAL CONDITION AND MORTALITIES**

Summary Data: Table 117

Individual Data: Table 226

The numbers of pups (litters) litters available for clinical signs were 286 (22), 348 (25), 316 (23) and 334 (24) for the control, 500, 1000 and 2500 ppm groups, respectively. The

numbers of pups found dead over the entire lactation period numbered 6, 11, 10 and 10 in the control, 500, 1000 and 2500 ppm groups, respectively. In the same respective exposure groups, 1, 4, 4 and 1 pups were missing and presumed cannibalized. The general condition of the pups in the test article exposure groups was similar to that in the control group; findings were noted infrequently and/or did not occur in an exposure concentration-related manner.

### **6.2.8.3. OFFSPRING BODY WEIGHTS**

Summary Data: Tables 118, 119

Individual Data: Tables 227, 228

Historical Control Data: Appendix E

No test article-related effects were observed on mean F<sub>2</sub> pup body weights or body weight gains. The F<sub>2</sub> control group litters were slightly smaller by approximately one pup than the 500 (PND 1 only), 1000 and 2500 ppm group litters (PND 1 and 4); however, the statistical analyses on mean body weight and body weight gains were performed using the litter size as the covariant. The F<sub>2</sub> control group pups generally weighed more than the F<sub>1</sub> control group pups in this study and the pups in the WIL historical control data for inhalation studies.

**Comparison of the F<sub>2</sub> Pup Weights (Grams) to the F<sub>1</sub> Control Group and the WIL Historical Control Data for Inhalation Studies and % Difference from F<sub>1</sub>/% Difference from Historical Control (HC)**

NA = Not Applicable

The slightly increased litter sizes (0.8-1.1 pups/dam) in the 1000 and 2500 ppm groups correlated with concomitant reductions in F<sub>2</sub> mean pup body weights (7% and 3%, respectively, in the males; 7% and 4%, respectively, in the females) on PND 1. Mean pup F<sub>2</sub> body weights in the 500 ppm group males and females were 7% and 9%, respectively, lower than the concurrent control group values on PND 1. The differences in the 500 and

1000 ppm groups were statistically significant ( $p < 0.05$ ) compared to the control group values. However, the F<sub>2</sub> mean male and female pup weights in the concurrent control group on PND 1 were 4%-6% greater than the mean male and female pup weights in the inhalation studies in the WIL historical control data and 6% greater than the concurrent control group pups in the F<sub>1</sub> generation in this study. Mean body weight gain in the 1000 and 2500 ppm group males and females were similar to the control group values during PND 1-4. Mean body weight gains in the 500 ppm group males and females were decreased (statistically significant at  $p < 0.05$ ) compared to the control group values during PND 1-4. On PND 4, mean male pup body weights were 12%, 8% and 1% lower than the concurrent control group value in the 500, 1000 and 2500 ppm groups, respectively; mean female pup weights were 12%, 7% and 2% lower in the same respective groups. The differences in both genders were statistically significant ( $p < 0.01$ ) only in the 500 ppm group. However, the concurrent F<sub>2</sub> control group male and female mean body weights were 8% greater than those in the WIL historical control data for inhalation studies and 11% and 9% greater than the mean F<sub>1</sub> male and female pup weights, respectively, on PND 4. Due to the lack of effects in the 1000 and 2500 ppm groups, the apparent influence of litter size on mean pup weights and the difference of the concurrent control group values compared to the historical control data for inhalation studies, the differences in mean body weights and body weight gains in the F<sub>2</sub> pups during PND 1-4 were not attributed to test article exposure.

Following standardization of litters (to eight pups/dam) on PND 4, mean male and female pup weights in the 500 ppm group were 17% and 15%, respectively, lower than the concurrent control group values (statistically significant at  $p < 0.01$ ) on PND 7. Mean male and female pup weights in the 1000 ppm group were 9% lower than the concurrent control group values; the difference was statistically significant ( $p < 0.05$ ) only for the females. Mean pup body weights in the 2500 ppm group were unaffected by F<sub>1</sub> maternal exposure on PND 7. Mean body weights gains in the 500 and 1000 ppm groups were reduced during PND 4-7. The differences from the control group were statistically

significant ( $p < 0.01$ ) only for the 500 ppm group males and females. Mean body weight gains in the 2500 ppm group males and females was slightly (not statistically significant) less than those in the concurrent control group, but consistent with the calculated gain in the WIL historical control data for inhalation studies. The mean body weight gains in the 1000 and 2500 ppm groups were comparable to those in the F<sub>1</sub> control group. Due to the lack of effect at the highest exposure concentration and the difference of the concurrent control group values from the historical control values, these differences in F<sub>2</sub> postnatal body weights and body weight gains were not considered exposure-related.

On PND 14, mean male and female pup body weights in the 500 ppm group were 11% and 10%, respectively, lower than the concurrent control group values; the differences were statistically significant ( $p < 0.05$  or  $p < 0.01$ ). The mean body weights for the 1000 and 2500 ppm group males and females were similar to the historical control values for inhalation studies, but were lower (5%-8%) than the concurrent control group values (not statistically significant). In addition, the PND 14 mean body weights for the 500, 1000 and 2500 ppm group males and females were comparable to or greater than the values for the F<sub>1</sub> control group pups. Mean body weight gains in the 500, 1000 and 2500 ppm group males and females were slightly reduced (not statistically significant) compared to the concurrent control group values during PND 7-14. The concurrent control group values during this interval were 3% higher than the calculated mean gain in the WIL historical control data for inhalation studies. In addition, mean F<sub>2</sub> body weight gains in all groups during PND 7-14 were equal to or higher than the gain in the F<sub>1</sub> control group pups at this same interval. Due to the lack of effect in the 1000 and 2500 ppm groups and the difference of the concurrent F<sub>2</sub> control group values compared to the F<sub>1</sub> control group values, the differences in mean body weights on PND 14 was not considered exposure-related.

On PND 21, mean male and female pups body weights in the 500, 1000 and 2500 ppm groups were reduced (statistically significant at  $p < 0.05$  or  $p < 0.01$ ) compared to the concurrent control group values. However, the F<sub>2</sub> control group values on this day were

14% higher than the F<sub>1</sub> pups on PND 21 and 5% higher than the mean body weight on PND 21 in the WIL historical control data for inhalation studies. The 2500 ppm group values were higher than the F<sub>1</sub> control group values, while the 500 and 1000 ppm group values were lower than the F<sub>1</sub> control group and the inhalation historical control group values. Mean body weight gains in the 500, 1000 and 2500 ppm group males and females were also reduced (statistically significant at p<0.01) compared to the concurrent control group value. Mean body weight gains in these groups were also reduced compared to the F<sub>1</sub> control group value and the calculated value in the WIL historical control data. However, the most severe reductions occurred in the 1000 ppm group males and females and the least severe reductions were observed in the 2500 ppm group males and females. Therefore, these reductions were not considered exposure-related due to the lack of an exposure-response relationship.

#### **6.2.8.4. NECROPSIES OF PUPS FOUND DEAD**

Summary Data: Table 120

Individual Data: Table 229

No test article-related internal findings were observed in F<sub>2</sub> pups that were found dead. Pup no. 1 from the litter of dam no. 74789-09 in the control group had a mechanical injury consisting of fractured pubis, ischium and ilium bones and all sacral vertebrae. Pup no. 1 from the litter of dam no. 74748-11 in the 1000 ppm group had dark red discoloration of all lobes of the lungs. Aside from the presence or absence of milk in the stomach, no other internal findings were observed.

**6.2.8.5. NECROPSIES OF WEANLINGS NOT SELECTED FOR ORGAN WEIGHTS - PND 21**

Summary Data: Table 121

Individual Data: Table 230

No test article-related internal findings were observed in the F<sub>2</sub> weanlings not selected for organ weights. Two pups each in the 500 and 1000 ppm groups had a dilated renal pelvis (unilateral). No other internal findings were observed.

**6.2.8.6. NECROPSIES OF WEANLINGS SELECTED FOR ORGAN WEIGHTS - PND 21**

**6.2.8.6.1. MACROSCOPIC EXAMINATION**

Summary Data: Table 122

Individual Data: Table 231

No test article-related internal findings were observed in the F<sub>2</sub> weanlings selected for organ weights. One pup in the 2500 ppm group had a dilated renal pelvis (unilateral). No other internal findings were observed.

**6.2.8.6.2. ORGAN WEIGHTS**

Summary Data: Tables 123, 124

Individual Data: Tables 232, 233

No test article-related effects on mean F<sub>2</sub> pup organ weights (absolute and relative to final body weight) were observed. Occasional statistically significant ( $p < 0.05$  or  $p < 0.01$ ) differences from the control group were noted in the 500, 1000 and 2500 ppm groups, but no exposure-related trends were evident.

## **7. CONCLUSIONS**

Exposure levels were selected based upon a reduction in response to external stimuli (during exposure) observed in a previous 90-day neurotoxicity study<sup>1</sup> and a non-statistically significant reduction in body weights and body weight changes during postnatal days 4-7 and 7-14 in pups from dams exposed to 2500 ppm isobutanol in a probe study<sup>2</sup>. Neither of these effects was observed in this definitive two-generation reproductive toxicity study.

F<sub>0</sub> and F<sub>1</sub> parental survival were unaffected by test article exposure in all exposure groups. No test article-related effects were observed on F<sub>0</sub> and F<sub>1</sub> reproductive performance (estrous cycles, mating and fertility indices, the mean number of days between pairing and coitus and the mean length of gestation), body weights, food consumption and food efficiency in the 500, 1000 and 2500 ppm group males or females. Spermatogenic endpoints (mean testicular and epididymal sperm numbers, sperm production rate, motility, progressive motility and the percentage of morphologically normal sperm) in the F<sub>0</sub> and F<sub>1</sub> test article-exposed groups were unaffected by test article exposure. There were no test article-related macroscopic findings or changes in mean organ weights in the F<sub>0</sub> or F<sub>1</sub> males and females in the 500, 1000 and 2500 ppm groups. Microscopic evaluation of the F<sub>0</sub> and F<sub>1</sub> males and females revealed no test article-related histopathologic lesions, including for animals that failed to breed or produce a litter. No test article-related effects on primordial follicle counts and corpora lutea counts were observed in the F<sub>1</sub> 2500 ppm group females. F<sub>1</sub> and F<sub>2</sub> pup survival and the general physical condition of the pups were unaffected by exposure to the test article. No test article-related effects on mean pup body weights were observed in the 500, 1000 or 2500 ppm group F<sub>1</sub> or F<sub>2</sub> pups. No test article-related macroscopic findings were observed in F<sub>1</sub> or F<sub>2</sub> pups that were found dead or euthanized at the scheduled necropsy. There were no test article-related changes in mean organ weights for the F<sub>1</sub> or F<sub>2</sub> pups. The mean day of acquisition of balanopreputial separation or vaginal patency and mean

body weights on the day of acquisition in the F<sub>1</sub> test article-exposed pups were not affected by the test article.

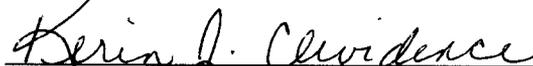

Based on the results of this study, an exposure level of 2500 ppm was considered to be the NOAEL (no-observed-adverse-effect level) for parental systemic, reproductive and neonatal toxicity of isobutanol when administered for two generations via whole-body inhalation exposure to rats.

5/30/03	Study Records (P-4)	5/30/03	6/30/03

This study was inspected in accordance with the U.S. EPA Good Laboratory Practice Regulations (40 CFR Parts 160 and 792), the standard operating procedures of WIL Research Laboratories, Inc., and the sponsor's protocol and protocol amendments with the following exceptions. The data located in Appendix A (Test Article Characterization) were the responsibility of the sponsor. Quality Assurance findings, derived from the inspections during the conduct of the study and from the inspections of the raw data and draft report, are documented and have been reported to the study director. A status report is submitted to management monthly.

This report accurately reflects the data generated during the study. The methods and procedures used in the study were those specified in the protocol, its amendments and the standard operating procedures of WIL Research Laboratories, Inc.

The raw data, the retention sample(s), if applicable, and the final report will be stored in the Archives at WIL Research Laboratories, Inc., or another location specified by the sponsor.

**9.2. APPROVAL**

This study was inspected according to the criteria discussed in Section 9.1.

## 11. DEVIATIONS FROM THE PROTOCOL

This study was conducted in accordance with the protocol and protocol amendments, except for the following.

- **Section 4.1.2.** Aerosol monitoring was not performed for the control- and high-concentration chambers during the method development phase. Monitoring was performed in a pilot study (WIL-186023<sup>1</sup>) at similar exposure levels.
- **Section 4.1.2.** Due to malfunctioning or loose connection of the multi-position sampling valve, less than 10 samples per chamber were available as follows:

<u>Date</u>	<u>Chamber</u>
September 11 and 21, 2001	4
September 13, 2001	2, 3, 4
October 31, November 6 and 27, 2001	4
February 15, 2002	1, 2, 3, 4
March 10, 2002	4
March 25, 2002	3, 4

- **Section 4.1.2.** On March 13, 2002, one of the rubber stoppers in the door of chamber 4 was ajar, allowing room air to be drawn into the chamber. Some negative pressure was maintained; however, due to the air being drawn into the bottom of the chamber, the air coming through the generation system stagnated at the top of the chamber around the sample probe. Concentration values for chamber 4 for the second and third sample rounds were in excess of 4000 ppm. The rubber stopper was replaced and the target concentration for chamber 4 returned to approximately 2500 ppm with no adjustments. Therefore, it was believed that the concentration within the chamber was actually elevated to the excessive levels, and the second and third concentration values were deleted.
- **Section 4.1.3.** The protocol and protocol amendments state the FMI pumps, pistons and test material flow rates to be used for test atmosphere generation. When compared to standard operating procedures, it was determined that the flow rates indicated in the protocol were incorrect for the pumps and pistons used in this study. The appropriate flow rates, pumps and pistons were documented in the system description and are maintained in the raw data.
- **Section 4.1.3.** The detector temperature was set at 175°C during the method development phase and remained at this temperature throughout the entire study. The protocol required the detector temperature to be 250°C.

- **Section 4.1.3.** Due to an equipment change (a new gas chromatograph was installed) on October 8, 2001, values for gas chromatograph settings stated in Protocol Amendment I were revised accordingly. It became apparent on this date that a malfunction was present in the gas chromatograph. Attempts to rectify the problem did not correct the malfunction. The exposure was run with samples taken both by the gas chromatograph and by taking Tedlar (manual) bag samples to be analyzed at a later time. At the end of the exposure, a new gas chromatograph was installed. Prior to the start of the exposure the next day (October 9, 2001), a single point calibration curve was generated to allow the use of the gas chromatograph for the duration of exposure that day. The second round of the prime calibration curve was generated prior to exposure on the following day (October 10, 2001), with the final round being generated following exposure that same day. Due to the large discrepancy in performing back-calculations of this prime calibration curve, another prime calibration curve was generated in triplicate on October 11, 2001. This new curve was entered into the computer prior to the initiation of exposure on October 12, 2001. The study director decided that the samples that were automatically collected by the data collection system were questionable since the instrument was not operating properly. These samples were not used in calculating the mean concentrations for October 8, 2001. The samples that were collected in Tedlar bags were analyzed using the new gas chromatograph calibration on October 9, 2001, and these values were used in mean concentration calculations.
- **Section 4.1.3.** On October 12, 2001, no negative pressure was recorded for the low-concentration chamber for the majority of the exposure period.
- **Section 4.1.3.** On November 4, 2001, the heat tape on the bead column for the 2500 ppm chamber malfunctioned. This was observed after a concentration of 1447 had been measured. A new heat tape was installed, which vaporized the test material in the bead column causing the concentration to rise to 3796 ppm. The following sample was within the appropriate concentration range.
- **Section 4.1.3.** During gestation, females were to be exposed daily until gestation 20, and exposure was to be suspended during gestation days 21 through lactation day 4. Female nos. 74816 (500 ppm group) and 74830 (1000 ppm group) had no evidence of mating, but were determined to be pregnant based on rapid weight gain. Exposure was suspended for these females, to avoid parturition occurring in the inhalation chamber, beginning on December 5, 2001 until lactation day 5. Female no. 74816 delivered on December 7, 2001 and female no. 74830 delivered on December 9, 2001.
- **Section 4.1.3.** F<sub>1</sub> males were to be exposed daily for a minimum of 70 days prior to mating. Exposure was suspended on January 24, 2002 for male no. 74766-02 (1000 ppm group) due to poor health, as recommended by the veterinarian and approved by the study director.

- **Section 4.3.** The protocol states that the F<sub>0</sub> animals were to be housed three per cage by sex for 3-5 days upon receipt. Documentation that these animals were triple-housed could not be located.
- **Section 4.3.** On December 10, 2001, the litter from F<sub>0</sub> female no. 74784 (2500 ppm group) was accidentally drowned on PND 2.
- **Section 4.5.** Temperature and humidity in the animal room were not recorded on December 23, 2001 or February 19, 2002.
- **Section 4.6.** Body weights at the initiation of the in-life phase were to range from 200 g to 300 g for the males. Actual male body weights ranged from 236 g to 350 g on study day 0. Animals were within the age range specified in the protocol
- **Section 5.1.1.** The responses to novel stimulus during exposure were not recorded for F<sub>0</sub> female no. 74743 (1000 ppm group) on January 12, 2002, for F<sub>1</sub> female no. 74789-09 (control group) on January 16, 2002 or for F<sub>1</sub> female no. 74867-07 (control group) on May 11, 2002.
- **Sections 5.1.2, 5.1.3 and 5.1.8.** On May 29, 2002, it was discovered at necropsy that the animal thought to be no. 74856-06 (eartag no. 83558) in the 500 ppm group was actually animal no. 74816-05 (eartag no. 83550) in the same group. Animal no. 74856-06 (eartag no. 83558) was inadvertently sent to necropsy on May 28, 2002 as animal no. 74816-05 (eartag no. 83550). It was noted that on May 22, 2002, the animal no. 74816-05 lost 102 grams and that animal no. 74856-06 gained 88 grams. In addition, the eartags for each animal were examined following necropsy and it was discovered that eartag no. 83558 was not clearly stamped. Therefore, it was deduced that between May 15 and 22, 2002, the animals were inadvertently misplaced into each other's caging. The body weight and food consumption data were deleted for these animals for May 22, 2002. Body weight and food consumption for May 28, 2002 were edited to reflect the proper data for each animal. Necropsy data were also edited accordingly.
- **Section 5.1.3.** On September 10, 2001, food left in the feed jars was not weighed for 14 F<sub>0</sub> males and all F<sub>0</sub> females in the control group. Therefore, food consumption data for study days 4-7 is incomplete (males) or not available (females) in the control group.
- **Section 5.4.2.** F<sub>1</sub> surplus pups with external abnormalities that were culled on PND 4 were to be sent to necropsy. Pup no. 74858-01 in the 1000 ppm group had a filamentous tail and was not sent to necropsy.
- **Sections 5.4.3. and 5.4.4.** F<sub>1</sub> pup no. 74743-09 (1000 ppm group) had no observations or body weight recorded on PND 4.

- **Section 5.6.** Upon review of the F<sub>1</sub> sperm motility data, it was discovered that two analyses were present for male no. 74864-06 (control group) and no analysis was present for male no. 74845-01 (control group). It was not possible to determine animal identity for the values. Therefore, neither was included in the report tables.
- **Section 5.8.1.** A section of the vastus medialis was collected for the skeletal muscle instead of the rectus femoris.
- **Section 5.8.3.** Skin with hair loss was trimmed and examined by the pathologist for male nos. 74619, 74720 (F<sub>0</sub>, 1000 and 2500 ppm groups, respectively) and 74772-02 (F<sub>1</sub>, control group) and female nos. 74844 and 74815 (F<sub>0</sub>, control group).
- **Section 5.8.3.** Tissues from 11 F<sub>0</sub> control group males, 11 F<sub>0</sub> 2500 ppm group females and 13 F<sub>1</sub> group females were processed and examined microscopically.

These deviations did not negatively impact the quality or integrity of the data nor the outcome of the study.

**FINAL REPORT**

Volume 5 of 10  
(Individual Tables 170-176)

**STUDY TITLE**

AN INHALATION TWO-GENERATION  
REPRODUCTIVE TOXICITY STUDY OF ISOBUTANOL IN RATS

**STUDY NUMBER**

WIL-186013

**TEST GUIDELINE**

OPPTS Guideline 870.3800

**STUDY DIRECTOR**

Mark D. Nemec, B.S., D.A.B.T.

**STUDY INITIATION DATE**

August 27, 2001

**STUDY COMPLETION DATE**

November 13, 2003

**PERFORMING LABORATORY**

WIL Research Laboratories, Inc.  
1407 George Road  
Ashland, OH 44805-9281

**SPONSOR**

Oxo Process Panel  
of the American Chemistry Council  
1300 Wilson Boulevard  
Arlington, VA 22209
