**FINAL REPORT**

Volume 6 of 10  
(Individual Tables 177-185)

**STUDY TITLE**

AN INHALATION TWO-GENERATION  
REPRODUCTIVE TOXICITY STUDY OF ISOBUTANOL IN RATS

**STUDY NUMBER**

WIL-186013

**TEST GUIDELINE**

OPPTS Guideline 870.3800

**STUDY DIRECTOR**

Mark D. Nemec, B.S., D.A.B.T.

**STUDY INITIATION DATE**

August 27, 2001

**STUDY COMPLETION DATE**

November 13, 2003

**PERFORMING LABORATORY**

WIL Research Laboratories, Inc.  
1407 George Road  
Ashland, OH 44805-9281

**SPONSOR**

Oxo Process Panel  
of the American Chemistry Council  
1300 Wilson Boulevard  
Arlington, VA 22209

**FINAL REPORT**

Volume 8 of 10  
(Individual Tables 204-219)

**STUDY TITLE**

AN INHALATION TWO-GENERATION  
REPRODUCTIVE TOXICITY STUDY OF ISOBUTANOL IN RATS

**STUDY NUMBER**

WIL-186013

**TEST GUIDELINE**

OPPTS Guideline 870.3800

**STUDY DIRECTOR**

Mark D. Nemec, B.S., D.A.B.T.

**STUDY INITIATION DATE**

August 27, 2001

**STUDY COMPLETION DATE**

November 13, 2003

**PERFORMING LABORATORY**

WIL Research Laboratories, Inc.  
1407 George Road  
Ashland, OH 44805-9281

**SPONSOR**

Oxo Process Panel  
of the American Chemistry Council  
1300 Wilson Boulevard  
Arlington, VA 22209

**DATE:** August 8, 2002  
**STUDY #:** 2000-GLP-05-NB  
**SUPERVISORS:** B. A. Chiasson  
**FILE NO:** SC AL-2002-008

**SUMMARY** Isobutanol was analyzed to provide analytical data for toxicology studies conducted at WIL Research Laboratories, Inc. The analyses were performed in compliance with the U. S. EPA TSCA Good Laboratory Practice (GLP) Standards: 40 CFR 792. Gas chromatography/mass spectrometry (GC/MS) and nuclear magnetic resonance (NMR) spectroscopy techniques were independently used to confirm the sample's identity. Sample purity, measured by capillary GC, was 99.9 % for both the prestudy (2000-GLP-05-NB) and poststudy (2000-GLP-05-NBR) samples. This indicates that the sample remained stable over the course of the toxicity studies. These samples were received from WIL Research Laboratories, Inc., located in Ashland.

Shown at right is the structure of isobutanol. Its Chemical Abstracts Service Registry number (CAS #) is 78-83-1.

## Isobutanol- Analytical Characterization

**ABSTRACT** Isobutanol was analyzed to provide analytical data for toxicology studies conducted at WIL Research Laboratories, Inc. The analyses were performed in compliance with the U. S. EPA TSCA Good Laboratory Practice (GLP) Standards: 40 CFR 792. Gas chromatography/mass spectrometry (GC/MS) and nuclear magnetic resonance (NMR) spectroscopy techniques were independently used to confirm the sample's identity. Sample purity, measured by capillary GC, was 99.9 % for both the prestudy (2000-GLP-05-NB) and poststudy (2000-GLP-05-NBR) samples. This indicates that the sample remained stable over the course of the toxicity studies. These samples were received from WIL Research Laboratories, Inc.

**INTRODUCTION** The American Chemistry Council (ACC) requested that WIL Research Laboratories, Inc. conduct toxicology studies on isobutanol in accordance with the GLP standards established by the EPA under TSCA. This report documents the results of the analytical characterization study (2000-GLP-05-NB) that was conducted in accordance with UCC GLP Standard Operating Procedures (SOPs) to verify the identity, purity, and stability of this lot of isobutanol.

The prestudy and poststudy samples were received from WIL Research Laboratories, Inc., located in Ashland, Ohio. The isobutanol used in this study was a subsample of a sample taken from UCC's Texas City Plant located in Texas City, Texas (Batch No. 15867). On November 30, 2000, the prestudy sample of isobutanol (2000-GLP-05-NB) was received in a 40-mL amber glass vial that contained  $\approx$  14 grams of material. This prestudy sample was used for analytical characterization testing as described in the GLP protocol prepared December 13, 2000 (Appendix I). The protocol called for structural identification by NMR and GC/MS and purity by capillary GC. A protocol amendment (Appendix II) was prepared on November 26, 2001 to document the addition of a second batch of isobutanol (Batch No. 15874) for characterization and to change the sponsor's representative. Since the toxicology lab was able to complete their studies using the original batch of isobutanol, the poststudy sample for this second batch was not submitted for analysis. The prestudy results for this second batch of isobutanol (2000-GLP-05-NB1) are documented in the raw data file, but are not presented in this report. On June 27, 2002, the poststudy sample of the original batch of isobutanol (2000-GLP-05-NBR) was received in a 4-dram amber glass bottle that contained  $\approx$  15 grams of material. This poststudy sample was used for stability testing and was analyzed for purity only using capillary GC.

Shown at right is the structure of isobutanol. Its Chemical Abstracts Service Registry number (CAS #) is 78-83-1.

**DISCUSSION** The data from the analyses are summarized below.

**NMR Analyses** Proton and carbon NMR data were collected in the UCC NMR Skill Center using a General Electric GN-300NB spectrometer. The acquisition parameters are shown in the figures; for the  $^1\text{H}$  NMR spectrum, the pulses used correspond to  $<3^\circ$  flip angles; the  $^{13}\text{C}$  flip angles were  $30^\circ$ ; the  $^{13}\text{C}\{^1\text{H}\}$  (proton decoupled  $^{13}\text{C}$ ) spectrum used Waltz 16 modulation for  $^1\text{H}$  decoupling. The spectra were not acquired under quantitative conditions; the acquisition conditions were established to identify the major component and to look for any substantial impurities. A 25 weight % solution of isobutanol was prepared by dissolving the sample in a premixed solution of deuteriochloroform ( $\text{CDCl}_3$ ; 99.8% purity) and 0.05% tetramethylsilane (TMS) purchased from Isotec, Incorporated, (Lot No. IG1939). The TMS was used as an internal chemical shift reference and the  $\text{CDCl}_3$  triplet in the  $^{13}\text{C}$  NMR spectrum was used as a secondary chemical shift reference (77 ppm).

Figure 1 shows the  $^1\text{H}$  NMR spectrum obtained from the prestudy sample 2000-GLP-05-NB. The observed chemical shifts and relative intensities are appropriate for isobutanol: the hydroxyl hydrogen is seen as a triplet at 4.3 ppm; the methylene hydrogens are seen as a doublet of doublets centered at 3.33 ppm; the methine hydrogen is seen as a nine-line pattern centered at 1.74 ppm; the methyl hydrogens are seen as a doublet at 0.90 ppm.  $^{13}\text{C}$ -satellites are seen as small lines around the methyl and methylene doublets. The 7.4 and 0.0 ppm peaks are due to residual protons in the  $\text{CDCl}_3$  solvent and the TMS, respectively. The minor peak at 3.6 ppm may be due to a small water impurity.

Figure 2 shows the  $^{13}\text{C}\{^1\text{H}\}$  NMR spectrum for the same sample as Figure 1. No unusual or unexpected resonances are seen. The expected solvent 1:1:1 triplet appears at 77.0 ppm and was used as a secondary chemical shift reference. Three resonances are seen corresponding to the three types of carbon present in isobutanol: the methylene carbon at 68.9 ppm, the methine carbon at 30.4 ppm, and the methyl carbons at 18.6 ppm. The NMR spectra are totally consistent with the sample being isobutanol which contains no major organic impurities.

**GC/MS Analysis** Electron ionization (EI) and isobutane reagent gas chemical ionization (CI) mass spectral data were collected in the UCC Mass Spectrometry Skill Center using a Finnigan TSQ<sup>®</sup>-7000 mass spectrometer interfaced to a ThermoQuest TRACE<sup>™</sup> 2000 Series gas chromatograph. The purpose of the GC/MS analysis was to verify the identification of the major GC component as isobutanol and to identify other GC components present in concentrations of at least 0.1 area %. The prestudy sample, 2000-GLP-05-NB, was analyzed in the EI mode by injecting a 0.3  $\mu\text{L}$  aliquot (split 33:1) onto a 30m CP-Sil-5-CB MS capillary column held at 60°C for 4 minutes, then programmed at 12°C/minute to 250°C and held for 15 minutes. The sample was analyzed in the CI mode under the same conditions except that a 0.5  $\mu\text{L}$  aliquot was used. The sample was scanned from m/z 10 to m/z 310 in the EI mode, and from m/z 60 to m/z 360 in the CI mode. A methanol blank was analyzed (EI mode only) prior to sample analysis.

The EI total ion current chromatogram for the prestudy sample is shown in Figure 3. Identifications annotated on the chromatogram are based on the EI and CI spectra of the components. Both the EI and CI spectra of the major component are consistent with isobutanol (2-methyl-1-propanol, MW = 74,  $\text{C}_4\text{H}_{10}\text{O}$ ). No other components were detected in concentrations  $\geq 0.1$  area % by GC analysis. Reference spectra for the identified component were obtained from the National Institute of Standards and Technology (NIST) mass spectral library included in the GC/MS instrument software.

**Capillary GC Analysis** The prestudy and poststudy samples were analyzed to determine the area % purity of the GC components (see Figures 4 and 5). The samples were analyzed on a Hewlett-Packard 5890A gas chromatograph equipped with a DB-1 capillary column. Pre-use inspections and QA/QC checks (flow rate check and system blank) were performed prior to sample analysis. The samples were analyzed by injecting 1.0  $\mu\text{L}$  aliquots (split 100:1) onto the GC column using a HP 7673A autosampler. The column temperature was held at 60°C for 4 minutes, then programmed at a rate of 12°C/minute to 250°C and held for 15 minutes. Triplicate analyses of the prestudy and poststudy samples were performed and the average area % purity for all GC components detected at a concentration  $\geq 0.1$  area % are reported in the Table below.

Component name:	Retention time, min.	Prestudy Sample 2000-GLP-05-NB (Analyzed 12/19/00)		Poststudy Sample 2000-GLP-05-NBR (Analyzed 7/30/02)	
		area %	% RSD	area %	% RSD
Isobutanol	$\approx 3.0$	99.9	0.0018	99.9	0.0021

The GC peaks were identified using the GC/MS data. The GC data are considered acceptable since the precision for the triplicate analyses is  $\leq 2$  % relative standard deviation (RSD) for the main GC component; the GC and GC/MS chromatograms are comparable; and the average area % purity agrees with the 99.9 % purity listed on the certificate of analysis dated September 5, 2000.

**CONCLUSION** NMR spectral data and mass spectral fragmentation data from the UCC Skill Centers show that this sample is isobutanol. These independent methods satisfy the analytical requirements for structural identification as defined in the protocol. Sample purity, measured by capillary GC, was 99.9 % for both the prestudy (2000-GLP-05-NB) and poststudy (2000-GLP-05-NBR) samples. This indicates that the sample remained stable over the course of the toxicity studies.

**ARCHIVES** All original copies of the raw data, records, protocols, and final reports will be archived at UCC, South Charleston, WV, in accordance with GLPs. The Sponsor intends to transfer the data and records to the Archives Center, La Porte Road, Morrisville, VT, and such transfer will be documented appropriately in the archive records at South Charleston, WV, and Morrisville, VT.

**ACKNOWLEDGMENTS** We would like to thank Susanne Chambers for sample handling and collecting the GC data, Charlie Warner for collecting the GC/MS data, and Kathy Canterbury for collecting the NMR data.

GOOD LABORATORY PRACTICE (GLP) STUDY

---

Title: Isobutanol - Analytical Characterization

Purpose: Analytical Characterization of Samples for Toxicology Studies at WIL Research Laboratories, Inc.

Study Number: 2000-GLP-05-NB

Sponsor: American Chemistry Council (ACC)

Testing Facility: Union Carbide Corporation (UCC)  
Technical Center  
3200 Kanawha Turnpike  
South Charleston, WV 25303 (Location 511)

Study Director: Nancy A. Broyles  
UCC Technical Center  
South Charleston, WV 25303

Proposed Starting Date: December 13, 2000

Proposed Completion Date: July 10, 2002

GLP Authority: This study will be conducted in compliance with the U. S. EPA TSCA GLP Standards (40 CFR 792).

Records to be Maintained: All experimental data arising from this study (including sample handling records, hand and computer generated raw data, notebook pages, and study related correspondence, collectively defined as "study materials") will remain the property of the sponsor. These study materials, the original protocol, and the final report will be archived at the UCC Technical Center in South Charleston, WV.

## Test Substance

Name: Isobutanol

Source: Sample from UCC, Texas City, TX; Batch No. 15867

CAS Registry No.: 78-83-1

Description: Transparent colorless liquid

Purity: 99.9 wt % isobutanol (as listed on Certificate of Analysis)

Health/Safety: Harmful if inhaled; irritant; flammable; stable; MSDS available

Storage Conditions: Room temperature

Isobutanol - Analytical Characterization

Page 2 of 2

Study Design

Prestudy and poststudy samples will be analyzed.

The prestudy sample will be characterized by:

- GC for determination of area % purity;
- GC/MS for verification of identity;
- Proton- and carbon-NMR for verification of identity.

The poststudy sample will be analyzed to determine stability by:

- GC for determination of area % purity.

Experimental Procedures

**GC:** The prestudy and poststudy samples will be analyzed to determine the area % purity of the GC components. The samples will be analyzed on a Hewlett-Packard 5890A gas chromatograph equipped with a flame ionization detector (FID) and a DB-1 capillary column. Pre-use inspections and QA/QC checks (flow rate check and system blank) shall be performed prior to sample analysis. The samples will be analyzed by injecting 1.0  $\mu$ L aliquots (split 100:1) onto the GC column. The column temperature will be held at 60°C for 4 minutes, then programmed at a rate of 12°C/minute to 250°C and held for 15 minutes. Triplicate analyses of the prestudy and poststudy samples shall be performed and the average area percent purity shall be reported for all GC components detected at a concentration  $\geq$  0.1 area %. The GC peaks detected at a concentration  $\geq$  0.1 area % shall be identified using the GC/MS data. The GC data are considered acceptable if the precision for triplicate analyses is  $\leq$  2 % relative standard deviation (RSD) for the main GC component; the GC and GC/MS chromatograms are comparable; and the average area percent purity agrees with the purity listed on the certificate of analysis.

**GC/MS:** The prestudy sample will be analyzed to verify the identification of the GC components detected at a concentration  $\geq$  0.1 area %. Electron ionization (EI) and chemical ionization (CI) data will be collected using a Finnigan TSQ-7000 or SSQ-710 mass spectrometer interfaced to a gas chromatograph equipped with a 30m CP-Sil-5-CB MS capillary column. The sample will be analyzed in the EI and CI mode by injecting a minimum of 0.3  $\mu$ L aliquots (minimum split 20:1) onto the GC column. The column temperature will be held at 60°C for 4 minutes, then programmed at a rate of 12°C/minute to 250°C and held for 15 minutes. The sample will be scanned from m/z 10 to m/z 310 in the EI mode and from m/z 60 to m/z 360 in the CI mode. The instrument will be tuned using FC-43 and a methanol blank will be analyzed in the EI mode prior to sample analysis.

**NMR:** The prestudy sample will be dissolved in a premixed solution of deuteriochloroform and tetramethylsilane (TMS) for analysis. Proton and carbon NMR data will be collected using a General Electric GN-300NB spectrometer. The acquisition parameters will be identified in the raw data and presented in the final study report. The spectra will not be acquired under quantitative conditions; the acquisition conditions will be established to identify the major component and to look for any substantial impurities.

<b>Study Title:</b> Isobutanol – Analytical Characterization
<b>Study Number:</b> 2000-GLP-05-NB
<b>Study Director:</b> Nancy A. Broyles
<b>An addition or change is intended to the following section(s) of the protocol:</b>  The test substance source information section, the study design section, and the sponsor approval section of the protocol will be changed.
<b>Intended addition(s) or change(s):</b>  1) A change was made to the test substance source information section to include the addition of a second batch of isobutanol (Batch No. 15874) for characterization. 2) The same study design will be used for this second batch of isobutanol; however, in the event that this second batch is not needed to complete the toxicology studies, a poststudy sample for this second batch will not be analyzed. 3) The sponsor representative for the ACC will be changed to Doug Anderson.
<b>Reason(s) for intended addition(s) or change(s):</b>  The toxicology lab has indicated that they may need more isobutanol to complete their studies. The original batch of isobutanol is not available, so a new batch will be supplied to the toxicology lab and a subsample will be submitted for characterization.
<b>Effect on quality or integrity of study data:</b>  This protocol amendment has no adverse effect on the quality or integrity of the study data.

## **1. INTRODUCTION**

This report provides a detailed description of the purity analyses of isobutanol test article samples. Pre-initiation samples (taken prior to initial use of each drum in the study) and post-completion samples (taken after final use of each drum in the study) were analyzed by gas chromatography with flame ionization detection to assess and verify purity. With two exceptions, the test article samples that were analyzed were greater than 99.9% pure. The results demonstrated that the test article was stable for the duration of use on this study.

## **2. EXPERIMENTAL**

### **2.1. HIGH PERFORMANCE LIQUID CHROMATOGRAPHY**

<b>Instrument:</b>	Hewlett Packard 5890 gas chromatograph equipped with a flame ionization detector (FID), an autosampler, and an HP ChemStation data system, or equivalent system
<b>Column:</b>	J&W Scientific DB-Wax; 30 m x 0.54 mm ID; 1.0 $\mu$ m film thickness; cat. # 125-7032.
<b>Temperature Program:</b>	40°C for 5 min, ramp at 20°C/min to 225°C, hold 10 min
<b>Carrier Gas:</b>	Helium at 11.0 psi at 40°C
<b>Injector Temperature:</b>	250°C
<b>Injection Volume:</b>	0.2 $\mu$ L using an autosampler with 10- $\mu$ L syringe and nanoliter adapter; or 1 $\mu$ L with a 5:1 split ratio
<b>Detector:</b>	FID at 300°C
<b>Retention Time:</b>	Approximately 5.7 min for isobutanol

## **2.2. PREPARATION OF SAMPLES**

Aliquots (approximately 1 mL) from the collected test article samples were transferred into amber autosampler vials. The vials were capped and placed in an autosampler tray for analysis.

## **2.3. CONCENTRATION QUANTITATION**

Duplicate injections were made of each collected sample. The purity of the injected, undiluted test article was calculated based on the area percent of the resulting peaks.

All calculations were performed by the ChemStation instrument control and data management software or in a PC spreadsheet program (Microsoft<sup>®</sup> Excel).

## **3. RESULTS AND DISCUSSION**

### **3.1. ANALYSIS OF THE PRE-INITIATION AND POST-COMPLETION SAMPLES**

Samples were collected from containers (drums) of test article both prior to and after final use in this study. The four drums used in this study were identified as WIL-4945A#1 through #4 (hereafter referred to as drums #1 through #4, respectively).

The dates that the samples were collected, the dates they were analyzed, and the results obtained from analysis of these samples are presented in Tables I through VIII. With the exception of the analyses conducted on 3/28/02 (drum #3 post use and drum #4 pre use) the measured purity of all samples was greater than 99.9%. This data is summarized in the table below.

<u>Container Identification</u>	<u>Date Collected</u>	<u>Date Analyzed</u>	<u>Pre or Post</u>	<u>Mean Purity</u>
WIL-4945A#1	08/17/01	08/21/01	Pre	99.91
WIL-4945A#1	10/31/01	11/13/01	Post	99.92
WIL-4945A#2	10/31/01	11/13/01	Pre	99.91

Since it is extremely unlikely that during use on the study, the isobutanol purity of drum #4 improved from 98.05% to 99.93%, it is concluded that a chromatographic problem was associated with the 3/28/02 analyses. This same problem resulted in the low post dose purity of drum #3 and erroneously indicated the apparent reduction in purity of drum #3 (i.e., a lack of test article stability in that container). The purity of all other samples was greater than 99.9% indicating no significant change from the times of their initial sampling and use in the study.

#### **4. CONCLUSION**

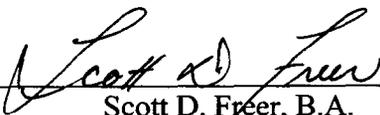

The test article (isobutanol) was analyzed to assess test article purity. The test article used for inhalation exposures was greater than 99.9% pure. The results demonstrated that the test article was stable for the duration of this study.

## **1. EXPOSURE METHODS**

### **1.1. EXPOSURE REGIMEN**

The test article or air (control group) was administered as a daily six-hour exposure. Exposures were conducted seven days per week at approximately the same time each day according to the following regimen. F<sub>0</sub> male animals were exposed for a minimum of 70 days prior to mating and continuing until euthanasia. F<sub>0</sub> females were exposed for a minimum of 70 days prior to mating, continuing throughout mating and gestation until gestation day 20. The F<sub>1</sub> generation animals were potentially exposed to the test article *in utero* and through nursing during lactation. Beginning on PND 28, all weanlings per group were exposed for a minimum of 70 days prior to mating and continuing throughout mating, gestation and lactation until euthanasia beginning after weaning of F<sub>2</sub> pups. To avoid confounding effects on nesting and nursing behavior, exposure for the F<sub>0</sub> dams was suspended from gestation day 21 through lactation day 4. Exposures were then re-initiated on lactation day 5 and continued until one day prior to euthanasia. No F<sub>2</sub> animals were exposed. Animals in the control group were subjected to the identical exposure regimen.

### **1.2. INHALATION EXPOSURE SYSTEMS DESCRIPTION**

Exposures were conducted in four 2.0 m<sup>3</sup> stainless steel and glass whole-body inhalation chambers. One chamber was dedicated for each group for the duration of the study. Chamber supply air was provided from a HEPA- and charcoal-filtered, temperature- and humidity-controlled source. Treatment of exhaust air consisted of charcoal- and HEPA-filtration.

### **1.3. ANIMAL TRANSPORT AND PLACEMENT**

Animals were individually housed in stainless steel, wire-mesh caging. Food and water were not available during exposure periods.

Animals were housed in a normal colony room during the non-exposure hours. For each day's exposure, the animals were transferred to exposure caging, transported to the exposure chamber room, exposed for the requisite duration and returned to their home cages.

The cage batteries were rotated on a daily basis through six battery positions in the chambers to help ensure a similar exposure for all animals within each group over the duration of the exposure period.

#### **1.4. EXPOSURE ENVIRONMENTAL CONDITIONS**

Temperature, relative humidity, chamber ventilation rate, and negative pressure within the chambers were continually monitored and recorded approximately every 35 minutes through the use of a data acquisition program written in LabVIEW<sup>®</sup> for Windows<sup>®</sup> from National Instruments, Inc. (Austin, Texas) and a Pentium<sup>®</sup>-based computer with appropriate hardware.

Chamber temperature and relative humidity were monitored by Omega model no. HX94C temperature and humidity transmitter probes (Omega Engineering, Inc., Stamford, Connecticut). Protocol-defined ranges for daily mean temperature and relative humidity were 18°-26°C and 30-60%, respectively. Airflow through the chamber was monitored by the pressure drop across a sharp-edge orifice plate as measured by differential pressure gauges (Magnehelic<sup>®</sup> Indicating Transmitter, Dwyer, Michigan City, Indiana) and was set such that there were 12-15 air changes per hour. These gauges had been calibrated under the conditions of exposure for conversion from pressure to airflow in liters per minute (LPM) through the use of an FM Series Axial Turbine Flow Transducer and a 915 BATRT Indicator (Flowmetrics, Inc., Canoga Park, California). Oxygen content was to be at least 19% and was measured for group 4, only, during the pre-exposure method development phase with a calibrated oxygen sensor (Remote Sampling System,

MSA-RSS-p-04-C-5, Mine Safety Appliances Co., Pittsburgh, Pennsylvania). Oxygen content was above 19%.

Daily means for chamber temperature, relative humidity, and chamber ventilation rate over the study period are presented in Tables 1 through 3. The actual ranges from daily mean temperature and relative humidity were 19°-26°C and 26-56%, respectively. For 15 of the 269 exposures for chamber 4, the daily mean relative humidity was below the protocol-defined lower limit of 30%. The following table summarizes the grand means for environmental conditions for all four study groups:

	<u>Group 1</u>	<u>Group 2</u>	<u>Group 3</u>	<u>Group 4</u>
<b>Temperature Mean (°C):</b>	23	23	24	22
<b>Standard Deviation:</b>	1.2	0.9	1.0	0.6
<b>Number of days:</b>	269	269	269	269
<b>Relative Humidity Mean (%):</b>	39	43	45	35
<b>Standard Deviation:</b>	4.5	3.3	3.6	3.3
<b>Number of days:</b>	269	269	269	269
<b>Chamber Ventilation</b>				
<b>Rate Mean (SLPM):</b>	448	431	456	457
<b>Standard Deviation:</b>	19.6	18.5	20.4	22.5
<b>Number of days:</b>	269	269	269	269

## **2. TEST ATMOSPHERE GENERATION METHODS**

The test atmosphere generation and exposure system is shown schematically in Figure 1. The generation system was operated as follows: Vapors of the test article were generated using a heated bead column. The test article was introduced to the top of the column, while nitrogen entering the bottom of the column served as the carrier gas. For Groups 2 and 3 the column was 2.4 cm in diameter (ID), 40 cm long filled with 2, 3 and 4 mm beads. For Group 4, the column was 5 cm in diameter (ID) and 68 cm long filled with 3, 6, 8 and 12-mm beads. The columns were wrapped with heating tapes (Omega

Engineering). Temperatures were set to approximately 100°C for chambers 2 and 3, and approximately 170-185°C for chamber 4 using an Omega CN370 temperature controller. The chamber 4 temperature was significantly higher due to the need to maintain an internal temperature of at least 70°C to ensure vaporization of the test article. The test article was vaporized as it dripped from 1/16-inch Teflon<sup>®</sup> tubing onto the glass beads contained within each heated column.

The test article was metered from an amber glass reservoir to the column using an FMI pump (Fluid Metering, Inc., Oyster Bay, New York). Calibrated FMI pumps included 2 model no. QG-6 pumps with a 1/4-inch piston for chamber 2, and a 3/8-inch piston for chamber 3 and a model no. QG-20 pump with a 1/4-inch piston for chamber 4. Vaporization nitrogen was delivered from the facility nitrogen generation system and was controlled using calibrated flowmeters (Gilmont Instruments, Barrington, Illinois). The vaporization nitrogen carried the isobutanol vapor through Teflon<sup>®</sup> delivery lines (3/8-inch O.D. tubing for chambers 2 and 3, 1-inch O.D. tubing for chamber 4) to the chamber inlet where the concentration was reduced to the desired level with chamber ventilation air. The animal exposure was initiated by switching the FMI pumps and the compressed nitrogen on simultaneously. The following table indicates generation and exposure system operating parameters for each exposure group.

<u>Group Number</u>	<u>FMI Pump Setting</u>	<u>Target Concentration (ppm)</u>	<u>Column Temperature (Deg C)</u>	<u>Internal Temperature (Deg C)</u>	<u>Test Article Flow Rate (ml/min)</u>	<u>Nitrogen Flow Rate (LPM)</u>
1	NA	0	100	NA	NA	40
2	4.8	500	100	NA	1.06	20
3	3.8	1000	100	NA	1.80	20
4	6.5	2500	170	~70	4.64	40

On April 29, 2002, an error in the startup procedure for chamber 2 (500 ppm) occurred. This error resulted in the recording of a 0 ppm concentration for the first sample round,

and a concentration of 344 ppm for the second. Due to this incidence, the exposure for chamber 2 was extended an appropriate length of time, and an additional sample was taken in the extended time, with the values being edited accordingly. The 344 ppm sample is most likely a result of the original error.

### **3. METHODS OF CHARACTERIZATION OF EXPOSURE ATMOSPHERES**

#### **3.1. NOMINAL EXPOSURE CONCENTRATIONS**

A nominal exposure concentration was calculated for each chamber for every daily exposure from the total amount of test article used during the exposure and the total volume of air passed through the chamber during that day's exposure. The amount of test article used was obtained by weighing the reservoir containing the test article for each chamber prior to and after each day's exposure. The total volume of air passed through each chamber was calculated from the daily average chamber ventilation flow rate in liters per minute (LPM) and the exposure duration. The nominal concentration was calculated as follows:

$$\text{ppm Isobutanol} = \frac{\text{Wt. Isobutanol} \bullet \text{Mol. Vol.} \bullet 10^6}{\text{MW} \bullet \text{Ch. Flow} \bullet \text{Exp. Dur.}}$$

Where:

- Wt. Isobutanol = Weight of test article in grams
- Mol. Vol. = Molar volume at 730 mmHg and 21°C, 25.11 L/mol
- $10^6$  = ppm conversion factor
- MW = Isobutanol molecular weight, 74.12 g/mol
- Ch. Flow = Daily average chamber flowrate for a given day, in LPM
- Exp. Dur. = Duration of a given day's exposure plus length of priming, in minutes

### **3.2. ANALYZED EXPOSURE CONCENTRATIONS**

#### **3.2.1. ANALYTICAL METHODS**

Analyzed exposure concentrations were obtained using a gas chromatograph (GC). Samples of the exposure atmospheres were automatically collected at approximately 35-minute intervals using a sample loop and a computer-controlled multiposition valve (model E16, S/N 52385, Valco Instruments Co., Inc. Houston, Texas). Daily concentration averages were to be within  $\pm 10\%$  of the target concentration, and any individual sample was to be  $\pm 15\%$  of the target concentration.

The following table summarizes the GC conditions:

GC Manufacturer .....	Hewlett–Packard
Model No. ....	5890 Series
Detector Type .....	FID
Detector Temperature .....	175°C
Column Diameter X Length .....	0.25 mm x 5 m
Column Type .....	DB-WAX
Fuel Gas .....	Hydrogen
Fuel Pressure .....	15 psig
Fuel Flowrate .....	43 mL/min.
Air Pressure .....	35 psig
Air Flowrate .....	311 mL/min.
Carrier Gas .....	Helium
Carrier Gas Pressure .....	34 psig
Carrier Gas Flowrate .....	7 mL/min
Injection Volume .....	0.25 mL
Retention Time .....	Approx. 1.6
Integrator Manufacturer: HP Model 3396A	
Chart Zero Offset .....	0
Chart Attenuation .....	4

Chart Speed ..... 1.0 cm/min  
Peak Area Rejection Value ..... 0  
Peak Threshold ..... 4  
Peak Width ..... 0.04

Following exposure on October 8, 2001, due to problems encountered with the GC, it was necessary to re-calibrate the instrument and adjust some of the settings. The following table summarizes the new GC conditions that were used for the remainder of the study:

GC Manufacturer ..... Hewlett-Packard  
Model No. .... 5890 Series

Detector Type ..... FID  
Detector Temperature ..... 175°C

Column Diameter X Length ..... 0.25 mm x 5 m  
Column Type ..... DB-WAX

Fuel Pressure ..... 15 psig  
Fuel Flowrate ..... 43 mL/min.

Air Pressure ..... 35 psig  
Air Flowrate ..... 311 mL/min.

Carrier Gas ..... Helium  
Carrier Gas Pressure ..... 34 psig  
Carrier Gas Flowrate ..... 7 mL/min

Injection Volume ..... 0.25 mL  
Retention Time ..... Approx. 1.6

Integrator Manufacturer: HP Model 3396A  
Chart Zero Offset ..... 0  
Chart Attenuation ..... 5  
Chart Speed ..... 1.0 cm/min  
Peak Area Rejection Value ..... 0  
Peak Threshold ..... 6  
Peak Width ..... 0.04

### **3.2.2. GAS CHROMATOGRAPH CALIBRATION**

The GC was standardized using 40-liter Tedlar<sup>®</sup> gas bags prepared to contain a known concentration of the test article. The standard bags were prepared by injecting a known volume of test article into a gas-sampling bulb (Ace Glass Inc., Vineland, New Jersey.) using Gastight<sup>®</sup> syringes (Hamilton Co., Reno, Nevada). Then, a known volume of air was metered into the bag through the gas-sampling bulb using a dry test meter (Model DTM-200A, American Meter Co., Nebraska City, Pennsylvania). Concentrations of the gas-phase standards were calculated as follows:

$$\text{Concentration} = \frac{\text{VOL} \cdot \text{R} \cdot \text{T} \cdot \text{D} \cdot 10^{-3} \cdot 10^6}{\text{L} \cdot \text{GMW} \cdot \text{P}}$$

Where:

Conc. is in ppm

- VOL = Volume of test article vaporized into bag in  $\mu\text{l}$
- R = Universal gas constant,  $\frac{62.36 \text{ L mmHg}}{\text{mole K}}$
- T = Nominal laboratory temperature in K (273 + 21°C = 294 K)
- D = Density of the test article
- L = Volume of air used to prepare bag, 30 liters
- GMW = Gram molecular weight, 74.12 g/mole
- P = Nominal laboratory barometric pressure, 730 mmHg
- $10^{-3}$  =  $\mu\text{L}$  to mL conversion factor
- $10^6$  = Conversion factor to ppm

The following table defines the standards prepared for this study:

Standard Concentration (ppm)	Volume of Test Article (µl)	Nominal Vaporization Temperature (° C)	Nominal Vaporization Flow Rate (LPM)	Total Dilution Air Volume (L)
Low Calibration Curve				
363	40	71	3	30
635	70	71	3	30
1088	120	71	3	30
1633	180	71	3	30

High Concentration Curve				
1633	180	71	3	30
2267	250	71	3	30
2721	300	71	3	30

Each standard was prepared in triplicate prior to the exposure period and analyzed with the GC. A least-squares line was fitted to the resulting peak areas for the formation of both low and high calibration curves. The low calibration curve was used for chambers 2 and 3, and the high calibration curve was used for chamber 4. Concentrations were then calculated using the slope and intercept from the least-squares lines.

On a daily basis, the integrity of the prime calibration curve was checked by analyzing one freshly prepared standard. On a rotational basis, a different one of the six standards was used each day, alternating between the standards for the low calibration curve, and those for the high calibration curve. If the analyzed concentration was within  $\pm 10\%$  of the known concentration, the GC was considered within calibration specifications.

On March 30, 2002, the gas chromatograph was re-calibrated, giving prime calibration curves 7a and 7b. However, it was not possible to enter these prime calibrations into the LabVIEW<sup>®</sup> software until April 1, 2002. For this reason, all sample rounds conducted by

LabVIEW<sup>®</sup> on March 30 were calculated manually, and these manual calculations were edited into the study data.

### **3.3. DETERMINATION OF HOMOGENEITY OF EXPOSURE ATMOSPHERES**

Evaluation of the homogeneity of exposure concentrations was accomplished during the method development phase of the study prior to animal exposures. Four test locations and a reference location were used for these determinations. The test locations were Right Upper Rear, Left Lower Rear, Right Lower Front and Left Upper Front identified as 1, 2, 3 and 4, respectively. Samples were collected as rapidly as possible always collecting a sample from the reference location and then from one of the four test locations. For each test location, the measured concentration was calculated as a percent difference from the reference location. The homogeneity determination was performed in triplicate for each test article exposure chamber. The results are presented in Table 4 of this appendix. The following table summarizes these data as the mean of the replicates for each chamber.

<u>Chamber Number</u>	<u>Test Location</u>	<u>Mean % From Reference</u>
2	1	-1.0
	2	-0.1
	3	-2.2
	4	-1.8
3	1	-2.9
	2	-1.9
	3	-3.6
	4	-2.6
4	1	-1.9
	2	-0.7
	3	-2.2
	4	-1.2

These data indicate that homogeneity of exposure atmospheres were adequate for the purpose of this study.

#### **4. RESULTS OF CHARACTERIZATION OF EXPOSURE ATMOSPHERES**

##### **4.1. NOMINAL EXPOSURE CONCENTRATIONS**

The overall mean nominal concentrations for the F<sub>0</sub> generation were 643 ppm, 1131 ppm and 2791 ppm for groups 2, 3 and 4, respectively. The overall mean nominal concentrations for the F<sub>1</sub> generation were 668 ppm, 1140 ppm and 2867 ppm for groups 2, 3 and 4, respectively. Daily mean nominal concentrations for each generation are presented in Tables 7 and 8 of this appendix.

##### **4.2. ANALYZED EXPOSURE CONCENTRATIONS**

The overall mean analyzed concentrations for the F<sub>0</sub> generation were 500 ppm, 1008 ppm and 2522 ppm for groups 2, 3 and 4, respectively. The overall mean analyzed concentrations for the F<sub>1</sub> generation were 494 ppm, 1012 ppm and 2521 ppm for groups 2, 3 and 4, respectively. Daily mean test atmosphere concentrations for each generation are presented in Tables 5 and 6 of this appendix.

## **APPENDIX F**

### Study Protocol

Study Number: WIL-186013

## PROTOCOL AMENDMENT VIII

Sponsor: Oxo Process Panel of the American Chemistry Council

A. Title of Study:

An Inhalation Two-Generation Reproductive Toxicity Study of Isobutanol in Rats

B. Protocol Modifications:

**VII. Experimental Design:**

1) **N. Selection of F<sub>1</sub> Generation:**

Beginning on January 5, 2002, and continuing until January 14, 2002, surplus pups attaining PND 28 were retained as possible replacement animals for the F<sub>1</sub> generation. Necropsy of the remaining surplus pups occurred on January 15, 2002. A copy of the Study Director notification is attached.

2) **T. General Observations During the Experimental Period:**

**4. Examination of Offspring:**

**a. Appearance and Behavior:**

Please replace the 2<sup>nd</sup> sentence in this section with the following:

A detailed physical examination was recorded for each pup on PND 1, 4, 7, 14 and 21 and for pups selected for the F<sub>1</sub> generation on PND 28, 32 and 35.

**b. Body Weights:**

Please replace the sentence in this section with the following:

Each pup was weighed on PND 1, 4, 7, 14 and 21 and pups selected for the F<sub>1</sub> generation were also weighed on PND 28, 32 and 35.

WIL RESEARCH LABORATORIES, INC. 1407 GEORGE ROAD ASHLAND, OH 44805-9281 (419) 289-8700 FAX (419) 289-3650

*Improving human health and protecting the environment through scientific research services.®*

3) **X. Statistical Methods:**

**A. Parental In-Life Data:**

Please replace the last sentence in this section with the following:

Male and female fertility indices of the control group will be compared to each treated group by the Chi-Square Test with Yates' Correction Factor.

**C. Reasons for Protocol Modifications:**

- 1) Due to mortalities observed in the F<sub>1</sub> weanlings, surplus pups were retained as possible replacements until January 15, 2002.
- 2) Additional timepoints were added for the collection of clinical observations and body weights for pups selected to comprise the F<sub>1</sub> generation.
- 3) To correct a typographical error in the protocol.

**PROTOCOL AMENDMENT VII**

Sponsor: Oxo Process Panel of the American Chemistry Council

A. Title of Study:

An Inhalation Two-Generation Reproductive Toxicity Study of Isobutanol in Rats

B. Protocol Modifications:

1) **X. Statistical Methods:**

**B. Litter Data:**

Pup weights will be analyzed by a nested analysis of covariance, ANCOVA, (pup weight nested within dams nested within groups with litter size as a covariant). Male and female pup weights will be analyzed separately.

C. Reason for Protocol Modification:

- 1) To modify the method for statistical analysis of pup weight.

**PROTOCOL AMENDMENT VI**

Sponsor: Oxo Process Panel of the American Chemistry Council

A. Title of Study:

An Inhalation Two-Generation Reproductive Toxicity Study of Isobutanol in Rats

B. Protocol Modifications:

1) **VIII. Anatomic Pathology:**

**C. Microscopic Examination:**

**1. F<sub>0</sub> and F<sub>1</sub> Animals Used for Breeding:**

The vaginas from 10 F<sub>0</sub> and F<sub>1</sub> females/group from the control and high exposure groups and from all F<sub>0</sub> and F<sub>1</sub> females dying spontaneously, euthanized *in extremis*, or that failed to breed, conceive or deliver offspring will be examined histopathologically.

C. Reasons for Protocol Modifications:

- 1) To correct the list of tissues to be examined histopathologically.

## PROTOCOL AMENDMENT V

Sponsor: Oxo Process Panel of the American Chemistry Council

A. Title of Study:

An Inhalation Two-Generation Reproductive Toxicity Study of Isobutanol in Rats

B. Protocol Modifications:

1) **VI. Specific (Non-Exposure Period) Maintenance Schedule:**

**B. Environmental Conditions:**

Controls will be set to maintain an average daily temperature of  $71 \pm 5^\circ\text{F}$  ( $22 \pm 3^\circ\text{C}$ ) and an average daily relative humidity of  $50 \pm 20\%$ . Temperature and relative humidity will be monitored continuously. Data for these two parameters will be scheduled for automatic collection on an hourly basis.

**VII. Experimental Design:**

Add the following, which is effective as of October 9, 2001:

2) **E. Generation of Exposure Atmospheres:**

The following table indicates the specific generation conditions for each exposure group.

<u>Chamber Number</u>	<u>Metering Device</u>	<u>Setting</u>	<u>Test Article Flow Rate (ml/min.)</u>	<u>Bead Column Temperature (<math>^\circ\text{C}</math>)</u>	<u>Internal Bead Column Temperature (<math>^\circ\text{C}</math>)</u>	<u>Flow Rate of Nitrogen for Vaporization (LPM)</u>	<u>Nominal Chamber Ventilation (LPM)</u>
1	NA	NA	NA	NA	NA	40.0	450
2	FMI	4.8	0.18-0.23	100	NA	20.0	450
3	FMI	3.8	0.50-0.72	100	NA	20.0	450
4	FMI	6.5	2.1	170	-70	40.0	450

WIL RESEARCH LABORATORIES, INC. 1407 GEORGE ROAD ASHLAND, OH 44805-9281 (419) 289-8700 FAX (419) 289-3650

*Improving human health and protecting the environment through scientific research services.*

**F. Characterization of Exposure Atmospheres:**

Should be changed as follows:

3) **2. Actual Exposure Concentrations:**

Actual exposure concentrations will be determined approximately every 35 minutes using a gas chromatographic method.

The following table summarizes the operational conditions of the gas chromatograph and signal integrator:

GC Manufacturer	Hewlett-Packard
Model No.	5890 Series
Detector Type	FID
Detector Temperature	250°C
Column Diameter X Length	0.25 mm x 5 m
Column Type	DB-WAX
Fuel Gas	Hydrogen
Fuel Pressure	15 psig
Fuel Flowrate	43 ml/min.
Air Pressure	35 psig
Air Flowrate	311 ml/min.
Carrier Gas	Helium
Carrier Gas Pressure	34 psig
Carrier Gas Flowrate	7 ml/min
Injection Volume	0.25 ml
Retention Time	Approx 0.16 min.
Integrator Manufacturer	Hewlett-Packard
Model Number	3396A
Chart Zero Offset	0
Chart Attenuation	4
Chart Speed	1.0 cm/min.
Peak Area Rejection Value	0
Peak Threshold	4
Peak Width	0.04

Any changes to these operational parameters will be authorized by the Inhalation Department Director, Study Director or appropriate designee and recorded in the study records.

Prior to initiation of animal exposures, the instrument will be calibrated with a low set of four standards and a set of three high standards prepared in triplicate. Two calibration curves will be prepared and defined by 363, 635, 1088 and 1633 ppm standards for the low curve and 1633, 2267 and 2721 ppm standards for the high curve. A least-squares line will be fitted to the data set for each set of standards to provide a prime standard curve. Thereafter, once each day and prior to initiation of exposures, a calibration check will be performed using a single freshly prepared standard. This standard will be one of the six levels used for prime calibration, and each day a different one will be used. If the daily calibration check is within  $\pm 10\%$  of the prime calibration curve, the instrument was considered to be within normal calibration limits. The following table summarizes the standard preparation procedures:

Standard Concentration (ppm)	Volume of Test Article ( $\mu$ L)	Nominal Vaporization Temperature ( $^{\circ}$ C)	Nominal Vaporization Flow Rate (LPM)	Total Dilution Air Volume (L)
363	40.0	~80	3.0	30
635	70.0	~80	3.0	30
1088	120	~80	3.0	30
1633	180	~80	3.0	30
1633	180	~80	3.0	30
2267	250	~80	3.0	30
2721	300	~80	3.0	30

C. Reasons for Protocol Modifications:

- 1) The Metasys<sup>®</sup> Network, a system of sensors, hardware and software, has been monitoring the temperature and humidity for the duration of the study. Effective March 1, 2002, recording of temperature and humidity will be entirely electronic, and reporting of temperature and humidity data will be as outlined according to SOP T1-258.

WIL-186013  
Protocol Amendment V  
Page Four

- 2) To clarify GC and generation system modifications following GC change and column repair.
- 3) To clarify exposure atmosphere characterization methods.

**PROTOCOL AMENDMENT IV**

Sponsor: Oxo Process Panel of the American Chemistry Council

A. Title of Study:

An Inhalation Two-Generation Reproductive Toxicity Study of Isobutanol in Rats

B. Protocol Modification:

1) **VIII. Anatomic Pathology:**

**C. Microscopic Examination:**

In addition to the tissue list specified in the original protocol, all gross lesions identified in the F<sub>0</sub> and F<sub>1</sub> generation animals (all groups, including the control group) will be evaluated by light microscopy.

C. Reason for Protocol Modification:

- 1) To provide provision for microscopic examination of macroscopic tissue lesions in first and second generation adults (F<sub>0</sub> and F<sub>1</sub>) as this was omitted from the original protocol.

WIL RESEARCH LABORATORIES, INC. 1407 GEORGE ROAD ASHLAND, OH 44805-9281 (419) 289-8700 FAX (419) 289-3650

*Improving human health and protecting the environment through scientific research services.®*

- I. Objective:** To determine the potential adverse effects of the test article on reproduction in a two-generation study. This will include determining the effects of the test article on male and female reproductive processes including gonadal function, estrous cyclicity, mating behavior, conception, gestation, parturition, lactation, weaning and on growth and development of the offspring. One litter will be produced in each generation. If effects are observed in the first mating of the generation, a second mating may be considered. One litter produced by each mating pair will be the objective of the F<sub>0</sub> and F<sub>1</sub> generations.

This study is subject to the United States Environmental Protection Agency (EPA) Health Effects Test Guidelines OPPTS 870.3800, Reproduction and Fertility Effects, August 1998.

**II. Personnel Involved in the Study:**

**A. Sponsor Representative:**

Barbara Francis  
Oxo Process Panel Manager

**B. WIL Study Director:**

Mark D. Nemecek, B.S., D.A.B.T.  
Director, Developmental and  
Reproductive Toxicology

**C. WIL Deputy Directors:**

Dan Kirkpatrick, Ph.D., D.A.B.T.  
Director, Inhalation Toxicology

Bennett J. Varsho, B.S., L.A.T.G.  
Staff Toxicologist, Developmental  
and Reproductive Toxicology

**D. WIL Departmental Responsibilities:**

Joseph F. Holson, Ph.D.  
President, Director

Donald G. Stump, Ph.D., D.A.B.T.  
Associate Director, Developmental  
and Reproductive Toxicology

Jeffrey A. Pitt, Ph.D.  
Staff Toxicologist, Developmental  
and Reproductive Toxicology

John F. Knapp, B.S.  
Senior Operations Director, Developmental,  
Reproductive and Neurotoxicology

Charlene A. Weygandt, B.S.  
Manager, Technical Report Writing

Ronald E. Wilson, B.S.  
Director, Informational Systems

Sally A. Keets, A.S.  
Manager II, Vivarium

Carol A. Kopp, B.S.  
Group Supervisor, Gross Pathology and  
Developmental Toxicology Laboratory

Daniel W. Sved, Ph.D.  
Director, Metabolism, Analytical Chemistry

Deborah L. Little, B.S., RQAP-GLP  
Manager II, Quality Assurance

Karen S. Regan, D.V.M., D.A.C.V.P., D.A.B.T.  
Director, Pathology and Veterinary Medicine

Barbara L. Smith, D.V.M., M.S., Ph.D.,  
D.A.C.V.S.  
Director, Laboratory and Animal Resources

### III. Study Schedule Data:

Proposed Animal Arrival Date: To be added by Protocol Amendment.

Proposed Experimental Start Date: To be added by Protocol Amendment.

Proposed Experimental Termination Date: To be added by Protocol Amendment.

Proposed Audited Report Date: To be added by Protocol Amendment.

**IV. Test Article Data:**

- A. Identification:** Isobutanol
- B. CAS Number:** 78-83-1
- C. Lot Number:** UCC Batch No.: 0000015867
- D. Purity:** 99.8%
- E. Stability:** The test article is considered to be stable under the storage conditions provided by the Sponsor. Stability data will be generated in the course of the study as per protocol section VII.G.2.
- F. Physical Description:** To be documented by WIL Research Laboratories, Inc.
- G. Storage Conditions:** Room temperature
- H. Reserve Samples:** A reserve sample of the test article will be taken in accordance with standard operating procedures and stored in the Archives at WIL Research Laboratories, Inc.
- I. Personnel Safety Data:** To be provided by the Sponsor. It is the responsibility of the Sponsor to notify the testing facility of any special handling requirements for the test article. A material safety data sheet (MSDS) should accompany the test article upon arrival at the laboratory.

**V. Test System:**

- A. Species:** Rat.
- B. Strain:** Sprague Dawley CrI:(SD)IGS BR

- C. Source:** Charles River Laboratories  
Raleigh, NC.
- D. Number on Study:** At randomization 120 Males and 120 Females  
(maximum of 135 Males and 135 Females  
purchased)
- E. Body Weight Range:** At start of in-life Phase: Males 200 - 300 g  
Females 150 - 250 g
- F. Approximate Age:** At start of in-life Phase: Males and Females  
42-63 days
- G. Identification System:** The F<sub>0</sub> animals will be uniquely identified by  
a Monel<sup>®</sup> metal eartag displaying the animal  
number. Individual cage cards will be affixed  
to each cage and will display the animal  
number, group number, study number,  
exposure level and sex. The F<sub>1</sub> pups selected  
to comprise the F<sub>1</sub> generation will be  
individually identified by an eartag following  
selection.
- H. Justification for Selection:** This species and strain of animal has been  
recognized as appropriate for reproduction  
studies. WIL Research Laboratories, Inc. has  
reproductive historical control data for the  
CrI:CD<sup>®</sup>(SD)IGS BR rat. The CrI:CD<sup>®</sup>  
(SD)IGS BR rat has been proven susceptible  
to the effects of reproductive toxicants.

#### **VI. Specific (Non-Exposure Period) Maintenance Schedule:**

##### **A. Animal Housing:**

F<sub>0</sub> animals will be housed three per cage by sex in clean suspended wire-mesh cages for a minimum of three days and a maximum of five days following receipt. Thereafter, all animals will be individually housed in clean suspended wire-mesh cages in an environmentally controlled room during the remainder of quarantine and continuing until mating. The cages will be elevated above cage-board or other suitable material, which will be changed at least three times each week. During cohabitation the females will be paired (1 male:1 female) with a male from the same exposure group in a suspended wire-mesh cage. Following successful mating the females will be housed individually in a plastic

cage containing ground corn cob nesting material (Bed-O'Cobs®) and will remain in these cages throughout lactation. After weaning, the females will be returned to suspended wire-mesh cages until euthanasia. The cages will be subject to routine cleaning at a frequency consistent with maintaining good animal health and Standard Operating Procedures. The facilities at WIL Research Laboratories, Inc. are fully accredited by the Association for Assessment and Accreditation of Laboratory Animal Care International (AAALAC International).

**B. Environmental Conditions:**

Controls will be set to maintain temperature at  $72^{\circ} \pm 5^{\circ}\text{F}$  and relative humidity at 30-70%. Air handling units will be set to provide approximately 10 fresh air changes per hour. Fluorescent lighting controlled by light timers will provide illumination for a 12-hour light (6:00 a.m. - 6:00 p.m.)/dark photoperiod. Temperature and relative humidity will be monitored continuously and recorded once daily.

**C. Drinking Water:**

Reverse osmosis-purified water will be available *ad libitum* except during the daily exposure period. Filters servicing the automatic watering system are changed regularly according to Standard Operating Procedures. The municipal water supplying the laboratory is analyzed according to WIL Standard Operating Procedure on a yearly basis for heavy metals and pesticides to assure that no contaminants are present in concentrations that would be expected to affect the outcome of the study.

**D. Basal Diet:**

PMI Nutrition International, Inc. Certified Rodent LabDiet® 5002 will be offered *ad libitum* during the study except during the daily exposure period. Periodic analyses of the certified feed are performed by the manufacturer to ensure that heavy metals and pesticides are not present at concentrations that would be expected to affect the outcome of the study; results of the analyses are provided to WIL Research Laboratories, Inc. by the manufacturer. Feeders will be changed and sanitized once per week.

**VII. Experimental Design:**

**A. Animal Receipt and Acclimation:**

Each animal will be inspected by a qualified technician upon receipt. Rats judged to be in good health and suitable as test animals will be immediately

placed in quarantine for a minimum of 10 days. All rats will be initially weighed and permanently identified with a metal eartag. During the quarantine period each rat will be observed twice daily for changes in general appearance and behavior. Prior to the start of the in-life phase, those animals judged to be suitable test subjects will be identified.

**B. Randomization:**

At the conclusion of the quarantine period, animals judged to be suitable test subjects and meeting acceptable body weight requirements, will be assigned at random using a computerized randomization procedure which ensures homogeneity of group means and variances for body weight. Weight variation of the animals will not exceed  $\pm 20\%$  of the overall mean for each sex. At this time, the animal numbers and corresponding body weights will be entered into the WIL Toxicology Data Management System (WTDMS™). A printout containing the animal numbers and individual group assignments will be generated based on body weight stratification into a block design. Animals will then be arranged into the groups according to the printout. The control group and three test article exposure groups will consist of 30 males and 30 females.

**C. Route and Rationale of Test Article Administration:**

The route of administration will be whole body inhalation exposure because the intended use of the test article indicated that this would be a likely route of human exposure.

**D. Exposure Methods:**

Exposures will be conducted in four 2-m<sup>3</sup> stainless steel and glass exposure chambers. These chambers will be located in chamber room 4. Three chambers will be dedicated for the test article exposure groups, while the fourth chamber will be dedicated for the controls. The chambers will be operated under dynamic conditions, at a slight negative pressure (ca. 0.5 inches of water) with at least 12 to 15 air changes per hour. Oxygen content of the exposure atmosphere will be at least 19% and will be documented during the pre-study methods development phase. Temperature and relative humidity during exposures will be measured at approximately 30-minute intervals for each chamber and the daily average will be between 18°C and 26°C, and 30% to 60%, respectively.

All animals will be housed in normal animal colony rooms during non-exposure hours. For each day's exposure, the animals will be transferred to exposure caging, transported to the exposure chamber room, exposed for the requisite duration and returned to their home cages.

Animal cage batteries will be rotated through the various possible chamber locations on a daily basis in order to reduce the potential differences in exposure due to any residual non-homogeneity in chamber concentrations. The rotation procedure will be described in the study records.

#### E. Generation of Exposure Atmospheres:

Vapors of the test article will be generated using a glass-bead vaporization system similar to that shown in Figure 1 (page 30). The vaporization column consists of a glass tube filled with glass beads. For Groups 2 and 3, the column will be 2.4 cm inner diameter (ID), 40 cm long filled with 4- and 8- mm beads. For Group 5, the column will be 5 cm ID, 68 cm long and filled with 3-, 6-, 8- and 12-mm beads. Calibrated FMI pumps (model QG-6 with a 1/4-inch piston for Group 2, model QG-6 with a 3/8-inch piston for Group 3 and model QG 20 with a 1/4-inch piston for Group 4) will be used to meter the test article to the column.

Nitrogen will be metered to the bottom of the column using calibrated flowmeters. Vaporization occurs as the test article flows down through the beads and the nitrogen flows up through the column. The concentrated vapors will be piped to the chamber inlet where the concentration will be reduced to the desired level by mixing with the chamber ventilation air. The vaporization columns will be heated by heating tapes operated from Omega CN370 temperature controllers.

The following table indicates the specific generation conditions for each exposure group.

Chamber Ventilation Number	Metering Device	Setting	Test Article Flow Rate (ml/min.)	Bead Column Temperature (°C)	Flow Rate of Nitrogen for Vaporization (LPM)	Nominal Chamber (LPM)
1	NA	NA	NA	100	20.0	450
2	FMI	a	a	100	20.0	450
3	FMI	a	a	100	20.0	450
4	FMI	a	a	145	36.0	450

a - To be determined by protocol amendment.

Chamber ventilation flow rate will vary  $\pm 15\%$  to maintain the desired exposure concentrations; any other changes to these operational parameters will be authorized by the Inhalation Department Director, Assistant Director, Study Director or appropriate designee and recorded in the study records.

**F. Characterization of Exposure Atmospheres:****1. Nominal Exposure Concentrations:**

Nominal exposure concentrations were determined by weighing the containers of test article prior to and again after each day's exposure, and calculating the concentration from the weight difference and the total volume of air passed through each chamber during that day's exposure.

$$\text{ppm Isobutanol} = \frac{\text{Wt. Isobutanol} \cdot \text{Mol. Vol.} \cdot 10^6}{\text{MW} \cdot \text{Ch. Flow} \cdot \text{Exp. Dur.}}$$

Where:

Wt. Isobutanol	=	the weight of Isobutanol used during a given day's exposure, grams
Mol. Vol.	=	Molar volume at 730 mmHg and 21°C, 25.11 L/mole
10 <sup>6</sup>	=	ppm conversion factor
MW	=	Isobutanol molecular weight, 74.12 g/mol
Ch. Flow	=	Daily average chamber flowrate for a given day, in LPM
Exp. Dur.	=	Duration of a given day's exposure, in minutes

**2. Actual Exposure Concentrations:**

Actual exposure concentrations will be determined approximately every 35 minutes using a gas chromatographic method.

The following table summarizes the operational conditions of the gas chromatograph and signal integrator:

GC Manufacturer	Hewlett-Packard
Model No.	5890 Series II
Detector Type FID	
Detector Temperature	250°C
Column Diameter X Length	0.25 mm x 30 m
Column Type DB-WAX	
Fuel Gas	Hydrogen
Fuel Pressure	To be determined by protocol amendment
Fuel Flowrate	To be determined by protocol amendment
Air Pressure	To be determined by protocol amendment
Air Flowrate	To be determined by protocol amendment
Carrier Gas	Helium

Carrier Gas Pressure	To be determined by protocol amendment
Carrier Gas Flowrate	To be determined by protocol amendment
Injection Volume	0.25 ml
Retention Time	Approx. 1.64 min.
Integrator Manufacturer	Hewlett-Packard
Model Number	3396A
Chart Zero Offset	To be determined by protocol amendment
Chart Attenuation	To be determined by protocol amendment
Chart Speed	To be determined by protocol amendment
Peak Area Rejection Value	To be determined by protocol amendment
Peak Threshold	To be determined by protocol amendment
Peak Width	To be determined by protocol amendment

Any changes to these operational parameters will be authorized by the Inhalation Department Director, Assistant Director, Study Director or appropriate designee and recorded in the study records.

Under the control of a LabVIEW® data acquisition virtual instrument device (DAVID), the integrator operates a gas-sampling valve with a 0.25-ml sample loop, displays the chromatogram, calculates the area under the sample peak, and sends the area data to DAVID. DAVID uses a slope and intercept, from dual GC calibration curves, to calculate the measured concentration in parts per million (ppm).

The GC will be calibrated using standards prepared in Tedlar® gas bags. The gas bag standards will be prepared as follows: A known volume of test article will be injected into a heated (71°C) glass vaporization bulb. Compressed air will be metered into the bulb to vaporize and dilute the test article. The total volume of compressed air used will be measured with a dry test meter. The resulting vapors will be collected in 40-liter gas bags.

Prior to initiation of animal exposures, the instrument will be calibrated with sets of five standards prepared in triplicate. One calibration curve will be prepared and defined by 363, 635, 1088, 1633 and 2721 ppm standards. A least-squares line will be fitted to the data set to provide a prime standard curve. Thereafter, once each day and prior to initiation of exposures, a calibration check will be performed using a single freshly prepared standard. This standard will be one of the five values used for prime calibration, and each day a different one will be used. If the daily calibration check is within  $\pm 10\%$  of the prime calibration curve, the instrument will be considered to be

within normal calibration limits. The following table summarizes the standard preparation procedures:

Standard Concentration (ppm)	Volume of Test Article (µL)	Nominal Vaporization Temperature (°C)	Nominal Vaporization Flow Rate (LPM)	Total Dilution Air Volume (L)
363	40	71	3.0	30
635	70	71	3.0	30
1088	120	71	3.0	30
1633	180	71	3.0	30
2721	300	71	3.0	30

### 3. Evaluation of Homogeneity of Exposure Atmospheres:

Evaluation of the homogeneity of exposure concentrations will be accomplished during the methods development phase of the study prior to animal exposures. Four test locations and a reference location will be used for these determinations. The test locations will be Right Upper Rear, Left Lower Rear, Right Lower Front, Left Upper Front, identified as 1, 2, 3 and 4, respectively. Samples will be collected as rapidly as possible in the following order: reference location, test location 1, reference location, test location 2, reference location, test location 3, reference location and test location 4. For each test location, the measured concentration will be calculated as a percent difference from the reference location. The homogeneity determination will be performed in triplicate for each test article exposure chamber. The spatial homogeneity for a chamber will be considered acceptable if the mean percent from reference (for triplicate determinations) for each test location is  $\leq 10\%$ .

### 4. Aerosol Monitoring:

The control and high-concentration chambers will be monitored for aerosol formation. During method development, a light-scattering aerosol photometer (MIE, Inc., Billerica, MA, or equivalent) will be used.

## G. Test Article Characterization:

### 1. Purity Analysis:

Prior to initiation of the previous range-finding study (WIL-186023) and after completion of this study, five-gram samples of the test article will be sent to:

Nancy Broyles  
 Union Carbide Corporation  
 Building 770  
 3200/330 Kanawha Turnpike  
 South Charleston, WV 25303

Duplicate 10-ml samples of the test article will be collected from each test article container prior to initial use. They will be sent to the Analytical Chemistry Department of WIL Research Laboratories, Inc., where the samples from each container will be analyzed by GC/FID. Purity of isobutanol will be expressed as area percent. The unused duplicate samples will be stored in reserve until no longer needed.

## 2. Stability Analysis:

Samples will be collected and analyzed at the end of use of each test article container following the same procedure used for the initial purity samples, i.e., duplicate 10 ml samples provided to the Analytical Chemistry Department for analysis and reserve; purity to be established by GC/FID and expressed as area percent. The resulting isobutanol concentrations will be compared to time zero values as and assessment of stability.

## H. Organization of Test Groups, Exposure Levels and Treatment Regimen:

### 1. Organization of Test Groups:

The exposure levels have been determined from the results of previous studies and were provided by the Sponsor Representative after consultation with the WIL Study Director. The following diagram presents the study group arrangement.

Group Number	Test Article	Exposure level (ppm)	Number of Animals	
			Male	Female
1	Filtered Air	0	30	30
2	Isobutanol	500	30	30
3	Isobutanol	1000	30	30
4	Isobutanol	2500	30	30

## 2. Treatment Regimen:

The test article will be administered as a daily six-hour exposure according to the following schedule. All animals will be exposed at approximately the same time each day. Exposures will be conducted seven days per week.

### a. F<sub>0</sub> Generation:

#### 1) Males:

Following randomization, F<sub>0</sub> male animals will be exposed for six hours per day for a minimum of 70 days prior to mating and continuing until euthanasia.

#### 2) Females:

Following randomization, the F<sub>0</sub> female animals will be exposed for six hours per day for a minimum of 70 days prior to mating and continuing throughout mating and gestation until gestation day 20. To avoid confounding effects on nesting and nursing behavior, exposure for the F<sub>0</sub> dams will be suspended from gestation day 21 through lactation day 4; exposures will be re-initiated on lactation day 5 and will continue until one day prior to euthanasia.

### b. F<sub>1</sub> Generation (F<sub>0</sub> offspring):

The F<sub>1</sub> generation will potentially be exposed to the test article *in utero*, through nursing during lactation and via inhalation following weaning (PND 28). Following selection, F<sub>1</sub> male and female weanlings will be exposed for a minimum of 70 days prior to mating and continuing throughout mating, gestation and lactation until euthanasia beginning after weaning of F<sub>2</sub> pups.

### I. F<sub>0</sub> Determination of Estrous Cycles:

Daily vaginal smears will be performed to determine the stage of estrous beginning 21 days prior to initiation of the mating period and until evidence of copulation is observed. Smearing will continue for those females with no evidence of copulation until termination of the mating period. On the day of necropsy, a vaginal smear will also be performed to determine stage of estrus.

**J. F<sub>0</sub> Breeding:**

After a minimum of 70 days of exposure, one female will be cohoused with one male rat, avoiding sibling mating, of the same treatment group (Charles River Laboratories will supply non-litter mates). In instances of mortality to F<sub>0</sub> males, the remaining males of the same treatment group will be randomly chosen to breed a second unpaired female of the same group. Detection of mating will be confirmed by evidence of sperm in the vaginal smear or by the appearance of the vaginal copulatory plug. After confirmation of mating, the female will be returned to an individual suspended plastic cage containing nesting material, and the day will be designated as day 0 of gestation.

A maximum of 14 days or approximately three estrous periods will be allowed for mating. If no evidence of copulation is obtained after 14 days the animals will be separated without further opportunity for mating, and the female will be placed in a plastic cage containing nesting material.

**K. F<sub>0</sub> Parturition and Lactation and F<sub>1</sub> Litters:**

The day parturition is first observed will be designated as day 0 of lactation. Any difficulties at the time of parturition will be recorded. When parturition is judged complete, litters will be sexed, examined for gross malformations and the number of stillbirths and live pups will be recorded. Any changes or abnormalities in nesting and nursing behavior will be recorded. The dam and litter will remain together until weaning on lactation day 28.

**L. Reduction of F<sub>1</sub> and F<sub>2</sub> Litter Size and Identification:**

Upon completion of delivery, all pups will be individually identified by tattoo markings applied to the digits. To reduce variability among the litters, eight pups from each litter will be randomly selected of equal sex distribution, if possible, on lactation day 4. The surplus pups will be euthanized and discarded after weighing on postnatal day (PND) 4. If any of the surplus pups are found to exhibit external abnormalities they will undergo an examination as specified in section VII.T.4.C.1.

**M. Euthanasia of F<sub>0</sub> Generation:**

If there is no evidence of impaired fertility, the F<sub>0</sub> rats will be euthanized following selection of the F<sub>1</sub> offspring and completion of a detailed clinical observation. All F<sub>0</sub> rats will be subjected to a gross necropsy and tissues saved as described in Section VIII. Detailed evaluation of the process of spermatogenesis will be performed as described in Section VII.U. If treatment-related alterations in litter size are seen, the F<sub>0</sub> animals may be remated

to produce a second litter (after the approval of the Sponsor, additional cost). On the day of necropsy, a vaginal smear will be performed to determine the stage of estrus.

#### **N. Selection of F<sub>1</sub> Generation:**

Since fertility rates are seldom equal between groups, the following procedure will be utilized for selection. A minimum of one male and one female per litter will be selected. Thirty F<sub>1</sub> male and 30 F<sub>1</sub> female weanlings from each group will be selected prior to PND 28 (beginning on PND 21 of the first litters) to become parents of the F<sub>2</sub> generation. Additional males or females may be selected from a litter if necessary to obtain 30 males and 30 females for each group. Both the litters (from which the additional pups will be selected) and the pups will be selected randomly. Only pups not expected to survive due to physical anomalies will not be available for selection. A detailed evaluation of each pup excluded from selection will be recorded. The remaining unselected F<sub>1</sub> pups will receive a gross necropsy on PND 28 with emphasis on developmental morphology and organs of the reproductive system. Organ weights will be collected on one F<sub>1</sub> pup from each sex and litter on PND 28 as described in Section VIII. The selections will be performed by computer randomization.

#### **O. F<sub>1</sub> Postweaning Developmental Landmarks:**

The selected pups will be evaluated for attainment of the following landmarks of sexual maturity.

##### **1. Balanopreputial Separation:**

Each male pup (30 rats/group) will be observed for balanopreputial separation on PND 35 as described by Korenbrot *et al.*<sup>1</sup> Examination of the males will continue daily until balanopreputial separation is present. Individual body weights will be recorded on the day of acquisition.

##### **2. Vaginal Perforation:**

Each female pup (30 rats/group) will be observed for vaginal perforation on PND 25 as described by Adams *et al.*<sup>2</sup> Examination of the females will continue daily until vaginal perforation is present. Individual body weights will be recorded on the day of acquisition.

#### **P. F<sub>1</sub> Breeding:**

A replication of the breeding procedure and estrous cycle determinations described for the F<sub>0</sub> rats will be conducted with the avoidance of sibling matings.

**Q. F<sub>1</sub> Parturition and Lactation, F<sub>2</sub> Litters:**

This phase of the study will be conducted as described for the F<sub>0</sub> generation. If a treatment-related effect is observed on F<sub>1</sub> sex ratio or in sexual maturation of the F<sub>1</sub> generation, then anogenital distance will be measured for all F<sub>2</sub> pups on PND 1.

**R. Euthanasia of F<sub>1</sub> Generation:**

Following weaning of the F<sub>2</sub> pups, all F<sub>1</sub> parental rats will be euthanized, necropsied and tissues saved for histopathologic examination as described in Section VIII. Detailed evaluation of the process of spermatogenesis will be performed as described in Section VII.U. If treatment-related alterations in litter size are seen, the F<sub>1</sub> animals may be remated to produce a second litter (after the approval of the Sponsor, additional cost). On the day of necropsy, a vaginal smear will also be performed to determine stage of estrus.

**S. Euthanasia of F<sub>2</sub> Weanlings:**

The F<sub>2</sub> pups will receive a gross necropsy on PND 21 with emphasis on developmental morphology and organs of the reproductive system. Organ weights will be collected from one F<sub>2</sub> pup from each sex and litter (selected by computer randomization) as described in Section VIII.

**T. General Observations During The Experimental Period:****1. Parental Appearance and Behavior:**

The parental rats will be observed twice daily for moribundity and mortality; in addition, the animals were observed for appearance, behavior and pharmacotoxic signs within approximately one hour after completion of exposure. A detailed physical examination will be conducted weekly. The observations shall include, but are not limited to, changes in the skin, fur, eyes, mucous membranes, respiratory, circulatory, autonomic and central nervous system function, somatomotor activity and behavior patterns. Special attention will be paid to the degree of salivation and lacrimation, presence or absence of urination and defecation (including polyuria and diarrhea), pupil size, degree of palpebral closure, presence of convulsions, tremors or abnormal movements, presence of posture and gait abnormalities, the presence of any unusual or abnormal behaviors and any repetitive actions (stereotypies). During exposure, special attention will be given to the state of arousal and response to novel stimuli. During the period of expected parturition, the dams will be observed twice daily for dystocia, prolonged labor, delayed labor or other difficulties at parturition.

**2. Parental Body Weights:****a. Males:**

Recorded individually on days 0, 1, 4, 7 and on a weekly basis until euthanasia.

**b. Females:**

Recorded individually on days 0, 1, 4, 7 and on a weekly basis until evidence of copulation is observed.

Gestation days: 0, 4, 7, 11, 14 and 20.

Lactation days: 1, 4, 7, 14, 21 and 28.

Body weights will be recorded individually at weekly intervals following the conclusion of the lactation period until euthanasia.

**3. Parental Food Consumption\*:****a. Males:**

Recorded individually on days 0, 1, 4, 7 and on a weekly basis thereafter.

**b. Females:**

Recorded individually on days 0, 1, 4, 7 and on a weekly basis until evidence of copulation is observed.

Gestation days: 0, 4, 7, 11, 14 and 20.

Reported for intervals of: 0-4, 4-7, 7-11, 11-14 and 14-20.

Lactation days: 1, 4, 7, 14, 21 and 28.

Reported for intervals of: 1-4, 4-7, 7-14, 14-21 and 21-28.

Body weights will be recorded individually at weekly intervals following the conclusion of the lactation period until euthanasia.

\*Individual food consumption measurement will be suspended during periods of mating, as the animals are cohabitated at that time.

#### 4. Examination of Offspring:

##### a. Appearance and Behavior:

All pups will be observed daily for general appearance and behavior and survival during lactation. A detailed physical examination will be recorded for each pup on PND 1, 4, 7, 14, 21 and 28 (F<sub>1</sub> only). Any abnormalities in nesting and nursing behavior will be recorded. The pups will be sexed on PND 0, 4, 7, 14, 21 and 28 (F<sub>1</sub> only). If a treatment-related effect is observed on F<sub>1</sub> sex ratio or in sexual maturation of the F<sub>1</sub> generation, then anogenital distance will be measured for all F<sub>2</sub> pups on PND 1.

##### b. Body Weights:

Each pup will be weighed on PND 1, 4, 7, 14, 21 and 28 (F<sub>1</sub> only).

##### c. Pup Deaths:

###### 1) Pups - 0 to 4 Days of Age:

Stillborn pups and pups dying between birth and PND 4 will be dissected (including the heart and the brain examined by a mid-coronal slice) by a technique described by Stuckhardt and Poppe.<sup>3</sup> If a skeletal anomaly is suspected the pups will be eviscerated, cleared and stained with Alizarin Red S as described by Dawson<sup>4</sup> and examined.

###### 2) Pups - 5 Days of Age to Weaning:

A complete necropsy will be performed and gross lesions will be saved for possible future histopathological examination. Necropsy will include the examination of the external surface, all orifices and the cranial, thoracic, abdominal and pelvic cavities including viscera.

#### U. Spermatogenesis Evaluation:

The following quantitative assessment of the process of spermatogenesis will be performed on all F<sub>0</sub> males (at F<sub>1</sub> weaning) and F<sub>1</sub> males (at study termination).

**1. Motility/Viability Assessment:**

Immediately after euthanasia, the reproductive tract of the male will be exposed via a ventral mid-line incision. The right epididymis will be excised and weighed separately. An incision will be made in the distal region of the right cauda epididymis, and the cauda will be placed in a beaker containing Dulbecco's phosphate buffered saline (maintained at approximately 37°C) with 10 mg/ml Bovine Serum Albumin (BSA). A small sample of the diluted sperm will be loaded into a 100- $\mu$ m chamber for determination of motility. Because sperm motility can be affected by temperature shock, all slides and diluents will be pre-warmed in an incubator, and motility determinations will be performed under constant temperature (approximately 37°C) using the Hamilton-Thorne HTM-IVOS Version 10 computer-assisted sperm analysis (CASA) system. Analysis of at least 200 motile and nonmotile spermatozoa per animal in all exposure groups will be performed by the analyzer. The motility score will be reported.

The right epididymis will then be preserved in accordance with Section VIII.A.

**2. Morphology Assessment:**

Sperm morphology will be evaluated by a modification of the wet-mount evaluation technique described by Linder *et al.*<sup>5</sup> Abnormal forms of sperm from a differential count of 200 spermatozoa per animal in all groups will be recorded.

**3. Enumeration of Epididymal and Testicular Sperm Numbers and Sperm Production Rate (SPR):**

The left testis and epididymis will be weighed, homogenized and evaluated for sperm numbers and the sperm production rate will be calculated utilizing the method described by Blazak *et al.*<sup>6</sup> and the Hamilton-Thorne CASA system. The homogenized sample will be mixed with a DNA-specific fluorescent dye to allow identification of the sperm under fluorescent illumination. The right testis and epididymis will be preserved in Bouin's fixative for subsequent microscopic examination as described in Section VIII.C.

**VIII. Anatomic Pathology:****A. Macroscopic Examination:**

A complete necropsy examination will be conducted on all F<sub>0</sub> and F<sub>1</sub> animals used for breeding dying spontaneously, euthanized *in extremis* or at termination (weaning of offspring). The method of euthanasia for F<sub>0</sub> and F<sub>1</sub> animals used for breeding will be by isoflurane inhalation. Prior to PND 4, the method of euthanasia for F<sub>1</sub> and F<sub>2</sub> neonates (except on PND 4) will be via inhalation of carbon dioxide. PND 4 pups, which are culled, will be euthanized by intraperitoneal injection of sodium pentobarbital. (A gross necropsy will also be performed on all unselected F<sub>1</sub> weanlings on PND 28, as described in protocol section VII.N. and all F<sub>2</sub> weanlings on PND 21.) This will include examination of the external surface, all orifices, the cranial cavity, the external surface of the brain and spinal cord and the thoracic, abdominal and pelvic cavities including viscera. At the time of necropsy the following tissues and organs will be collected and placed in 10% neutral-buffered formalin (except as noted):

**1. F<sub>0</sub> and F<sub>1</sub> Animals Used for Breeding:**

Adrenals (2)	Lymph node (mesenteric)
Aorta	Ovaries with oviducts (2)
Bone with marrow (sternbrae)	Pancreas
Brain (forebrain, midbrain, hindbrain)	Peripheral nerve (sciatic)
Coagulating gland	Pituitary
Eyes with optic nerve (2)	Prostate
Gastrointestinal tract	Salivary glands [submaxillary (2)]
Esophagus	Seminal vesicles (2)
Stomach	Skeletal muscle (vastus medialis)
Duodenum	Skin with mammary gland
Jejunum	Spinal cord (cervical)
Ileum	Spleen
Cecum	Testes with epididymides (1) <sup>a</sup> and vas deferens
Colon	Thymus
Rectum	Thyroids [with parathyroids if present (2)]
Heart	Trachea
Kidneys (2)	Urinary bladder
Liver (sections of two lobes)	Uterus with vagina
Lungs (including bronchi, fixed by inflation with fixative)	All gross lesions

<sup>a</sup> Testis and epididymis (right only) will be fixed in Bouin's solution.

**2. F<sub>1</sub> and F<sub>2</sub> Weanlings:**

All gross lesions will be preserved.

**B. Organ Weights:****1. F<sub>0</sub> and F<sub>1</sub> Animals Used for Breeding:**

The following organs from all parental animals euthanized at scheduled termination will be weighed:

Adrenals	Seminal vesicles with
Brain	coagulating glands (with
Kidneys	accessory fluids)
Liver	Testes*
Ovaries	Spleen
Pituitary	Thymus
Prostate	Epididymis* (total and
	cauda)
	Uterus (with oviducts and cervix)

\* These paired organs will be weighed separately.

**2. F<sub>1</sub> and F<sub>2</sub> Weanlings:**

The following organs from 1 pup/sex/litter from the F<sub>1</sub> and F<sub>2</sub> weanlings euthanized at scheduled termination (PND 28 and 21, respectively) will be weighed.

Brain	Spleen
	Thymus

**C. Microscopic Examination:**

Microscopic examination of hematoxylin-eosin stained paraffin sections will be performed on the following tissues from 10 F<sub>0</sub> and F<sub>1</sub> parental animals/sex/group from the control and high exposure groups and from all parental animals dying spontaneously or euthanized *in extremis*, or that failed to breed, conceive, or deliver offspring. If a target organ is identified in the high exposure group, this organ will be examined from all animals in the intermediate exposure groups (at additional cost).

**1. F<sub>0</sub> and F<sub>1</sub> Animals Used for Breeding:**

Adrenals	Prostate
Brain	Seminal vesicles with
Cervix	coagulating glands (with
Epididymis <sup>a</sup> (right)	accessory fluids)
Kidneys	Spleen
Liver	Testis <sup>a</sup> (right)
Ovaries <sup>b</sup>	Thymus
Pituitary	Uterus (with oviducts)

<sup>a</sup> Transverse sections of 2-4 microns will be made for the testis and longitudinal sections for the epididymis. PAS and hematoxylin staining will be used for the right testis and epididymis. The following regions of the epididymis will be embedded: caput, corpus and cauda.

<sup>b</sup> Bilateral evaluation of one section of each ovary will be performed for F<sub>0</sub> females. If qualitative differences are observed or adverse reproductive effects are noted bilateral evaluation of multiple sections of each ovary will be performed (after approval of the Sponsor, additional cost). A quantitative histopathologic evaluation of five sections (at least 100 µm apart) from the inner third of each ovary will be conducted on all F<sub>1</sub> females from the control and high dose groups. This examination will include enumeration of the total number of primordial follicles and corpora lutea according to the methods of Bolon *et al*<sup>7</sup> and Bucci *et al*.<sup>8</sup>

**IX. Duration of Study:**

The two generations to be studied (parental animals and first generation offspring) will be termed F<sub>0</sub> and F<sub>1</sub>, respectively. The conduct of this study will require approximately nine months for acclimation, mating, gestation and lactation of the F<sub>0</sub> generation, growth, mating, gestation and lactation of the F<sub>1</sub> generation and growth of the F<sub>2</sub> generation until euthanasia.

**X. Statistical Methods:**

All analyses will be two-tailed for a minimum significance level of 5%. All means will be presented with standard deviations. All statistical tests will be performed by a computer with appropriate programming as referenced below. The litter, rather than the neonate, will be considered as the experimental unit.

**A. Parental In-Life Data:**

Continuous data variables [mean  $F_0$  and  $F_1$  parental body weights (premating, gestation and lactation), body weight gains and food consumption at each interval], estrous cyclicity, follicular counts (ovary), gestation length and mean day of acquisition of vaginal patency and balanopreputial separation will be analyzed by a parametric one-way analysis of variance (ANOVA)<sup>9</sup> to determine intergroup difference. If the results of the ANOVA are significant ( $p < 0.05$ ), Dunnett's test<sup>10</sup> will be applied to the data to obtain the following comparisons: Vehicle control group versus all treatment groups.

Male and fertility indices of the control group will be compared to each treated group by the Chi-square test with Yates' correction factor.<sup>11</sup>

**B. Litter Data:**

The mean litter proportions (% per litter) of pup viability during the postnatal period will be analyzed by the Kruskal-Wallis nonparametric ANOVA test<sup>12</sup> to determine intergroup difference. If the results of the ANOVA are significant ( $p < 0.05$ ), the Mann-Whitney U-Test<sup>12</sup> will be applied to the data to obtain the following comparisons: vehicle control versus all treatment groups. Mean pup weights will be analyzed by the parametric ANOVA test<sup>9</sup> and Dunnett's test<sup>10</sup> as described above.

**C. Histopathologic and Organ Weight Data:**

Histopathologic findings of the control group will be compared to each treated group by Fisher's Exact Test.<sup>13</sup> Organ weights (absolute and relative to body weights) will be analyzed by a parametric ANOVA test<sup>9</sup> and Dunnett's test<sup>10</sup> as described above.

**D. Spermatogenic Endpoint Evaluations:**

The percentage of motile spermatozoa and percentage of sperm with normal morphology will be analyzed by the Kruskal-Wallis<sup>12</sup> nonparametric ANOVA test<sup>12</sup> followed by the Mann-Whitney U-Test<sup>12</sup> as described above. Epididymal and testicular sperm numbers and sperm production rates will be analyzed by a parametric ANOVA test<sup>9</sup> and Dunnett's test<sup>10</sup> as described above.

**XI. Quality Assurance:**

The study will be audited by the WIL Quality Assurance Unit while in progress to assure compliance with the study protocol and protocol amendments, WIL Standard Operating Procedures and the appropriate provisions of EPA/TSCA and FIFRA

Good Laboratory Practice Standards published in the Federal Register (40 CFR Part 792 and 40 CFR Part 160). The raw data and draft report will be audited by the WIL Quality Assurance Unit prior to submission to the Sponsor Representative to assure that the final report accurately describes the conduct and the findings of the study. This study will be included on the WIL master list of regulated studies.

#### **XII. Records to be Maintained:**

All original raw data records, as defined by WIL SOPs and the applicable GLPs, will be stored as described in Section XIII. in the Archives at WIL Research Laboratories, Inc.

#### **XIII. Work Product:**

Sponsor will have title to all documentation records, raw data, slides, specimens and other work product generated during the performance of the study. All work product including raw paper data, magnetically encoded records and specimens will be retained for a period of ten years following issuance of the final report in the Archives at WIL Research Laboratories, Inc. All work product will be stored in compliance with regulatory requirements.

Any work product, including documents, specimens, and samples, that are required by this protocol, its amendments, or other written instructions of the Sponsor, to be shipped by WIL Research laboratories, Inc. to another location will be appropriately packaged and labeled as defined by WIL's SOPs and delivered to a common carrier for shipment. WIL Research Laboratories, Inc. will not be responsible for shipment following delivery to the common carrier.

#### **XIV. Reports:**

The final report will contain a summary, test article data, methods and procedures, maternal and pup data and an interpretation and discussion of the study results. The final report will be comprehensive and shall define level(s) inducing toxic effects as well as "no-effect" level(s) under the conditions of this investigation. The report will contain all information necessary to conform with current EPA OPPTS and OECD specifications.

WIL Research Laboratories will provide one copy of an Audited Draft Report, submitted in a timely manner upon completion of the study prior to issuance of the final report. One revision will be permitted as part of the cost of the study, from which the Sponsor's reasonable revisions and suggestions will be incorporated into the Final Report, as appropriate. Additional changes or revisions may be made, at extra cost. It is expected that the Sponsor will review the draft report and provide comments to WIL within a two-month time frame following submission. WIL will

submit the Final Report within one month following receipt of comments. Two copies of the Final Report (1 bound, 1 unbound) will be provided; requests for additional copies of the Final Report may result in additional charges.

**XV. Animal Welfare Act Compliance:**

This study will comply with all applicable sections of the Final Rules of the Animal Welfare Act regulations (9 CFR Parts 1, 2 and 3). The Sponsor should make particular note of the following:

- The Sponsor signature on this protocol documents for the Study Director the Sponsor's assurance that the study described in this protocol does not unnecessarily duplicate previous experiments.
- Whenever possible, procedures used in this study have been designed to avoid or minimize discomfort, distress or pain to animals. All methods are described in this study protocol or in written laboratory SOPs.
- Animals that experience severe or chronic pain or distress that cannot be relieved will be painlessly euthanized as deemed appropriate by the veterinary staff and Study Director. The Sponsor will be advised by the Study Director of all circumstances which could lead to this action in as timely a manner as possible.
- Methods of euthanasia used during this study are in conformance with the above-referenced regulation. The method of euthanasia for F<sub>0</sub> and F<sub>1</sub> parental animals will be by isoflurane inhalation. The method of euthanasia for F<sub>1</sub> and F<sub>2</sub> neonates (except on PND 4) will be via inhalation of carbon dioxide. PND 4 pups, which are culled, will be euthanized by intraperitoneal injection of sodium pentobarbital.

**XVI. Protocol Modification:**

Modification of the protocol may be accomplished during the course of this investigation. However, no changes will be made in the study design without the verbal or written permission of the Sponsor. In the event that the Sponsor verbally requests or approves a change in the protocol, such changes will be made by appropriate documentation in the form of a protocol amendment. All alterations of the protocol and reasons for the modification(s) will be signed by the Study Director and the Sponsor Representative.
