U.S. Environmental Protection Agency, ICC Building
1201 Constitution Ave., NW
Washington, DC 20004

Dear 8(e) Coordinator:

1,3,5-Triazin-2-amine, 4-methoxy-6-methyl-
CAS # 1668-54-8

This letter is to inform you of the results of a non-DuPont acute inhalation toxicity test in rats, that we recently became aware of with the above referenced test substance.

An acute inhalation study was conducted in male and female rats in accordance with OECDTG 403. Rats were exposed to the test substance for a single, 4-hour, nose-only exposure, at a concentration of 5,224 mg/m³ (0.9 – 2.4µm MMAD). Animals were observed for 14 days post exposure.

The animals of both sexes exposed to the test substance experienced symptoms which included piloerection, hunched posture, dyspnea, and reduced spontaneous activity to a similar extent. Recovery from these effects was complete by day 9. In addition, ataxia and tremors were observed in all animals on the day of exposure to day-1 post exposure and were recovered by day-2. At autopsy, spotted lungs were found in one male rat. No other deviations from normal morphology were detected.

This information is submitted in accordance with current guidance issued by EPA indicating EPA's interpretation of Section 8(e) of the Toxic Substances Control Act or, where it is not clear that reporting criteria have been met, it is submitted as a precautionary measure and because it is information in which EPA may have an interest.

Sincerely,

A. Michael Kaplan, Ph.D.
Director - Regulatory Affairs
