401 M Street., S.W.
Washington, D.C. 20460
Attn: Section 8(e) Coordinator (CAP Agreement)

Dear Coordinator:

8ECAP-0025

On behalf of the Regulatee and pursuant to Unit II B.1.b. and Unit II C of the 6/28/91CAP Agreement, E.I. Du Pont de Nemours and Co. hereby submits (*in triplicate*) the attached studies. Submission of this information is voluntary and is occasioned by unilateral changes in EPA's standard as to what EPA now considers as reportable information. Regulatee's submission of information is made solely in response to the new EPA §8(e) reporting standards and is not an admission: (1) of TSCA violation or liability; (2) that Regulatee's activities with the study compounds reasonably support a conclusion of substantial health or environmental risk or (3) that the studies themselves reasonably support a conclusion of substantial health or environmental risk.

The "Reporting Guide" creates new TSCA 8(e) reporting criteria which were not previously announced by EPA in its 1978 Statement of Interpretation and Enforcement Policy, 43 Fed Reg 11110 (March 16, 1978). The "Reporting Guide states criteria which expands upon and conflicts with the 1978 Statement of Interpretation. Absent amendment of the Statement of Interpretation, the informal issuance of the "Reporting Guide" raises significant due processes issues and clouds the appropriate reporting standard by which regulated persons can assure TSCA Section 8(e) compliance.

For Regulatee,

Mark H. Christman
Counsel
Legal D-7158
1007 Market Street
Wilmington, DE 19898
(302) 774-6443

ATTACHMENT 1

Submission of information is made under the 6/28/91 CAP Agreement, Unit II. This submission is made voluntarily and is occasioned by recent changes in EPA's TSCA §8(e) reporting standard; such changes made, for the first time in 1991 and 1992 without prior notice and in violation of Regulatee's constitutional due process rights. Regulatee's submission of information under this changed standard is not a waiver of its due process rights; an admission of TSCA violation or liability, or an admission that Regulatee's activities with the study compounds reasonably support a conclusion of substantial risk to health or to the environment. Regulatee has historically relied in good faith upon the 1978 Statement of Interpretation and Enforcement Policy criteria for determining whether study information is reportable under TSCA §8(e), 43 Fed Reg 11110 (March 16, 1978). EPA has not, to date, amended this Statement of Interpretation.

After CAP registration, EPA provided the Regulatee the June 1, 1991 "TSCA Section 8(e) Reporting Guide". This "Guide" has been further amended by EPA, EPA letter, April 10, 1992. EPA has not indicated that the "Reporting Guide" or the April 1992 amendment supersedes the 1978 Statement of Interpretation. The "Reporting Guide" and April 1992 amendment substantively lowers the Statement of Interpretation's TSCA §8(e) reporting standard². This is particularly troublesome as the "Reporting Guide" states criteria, applied retroactively, which expands upon and conflicts with the Statement of Interpretation.³ Absent amendment of the Statement of Interpretation, the informal issuance of the "Reporting Guide" and the April 1992 amendment clouds the appropriate standard by which regulated persons must assess information for purposes of TSCA §8(e).

²In sharp contrast to the Agency's 1977 and 1978 actions to soliciting public comment on the proposed and final §8(e) Policy, EPA has unilaterally pronounced §8(e) substantive reporting criteria in the 1991 Section 8(e) Guide without public notice and comment, See 42 Fed Reg 45362 (9/9/77), "Notification of Substantial Risk under Section 8(e): Proposed Guidance".

³A comparison of the 1978 Statement of Interpretation and the 1992 "Reporting Guide" is appended.

Throughout the CAP, EPA has mischaracterized the 1991 guidance as reflecting "longstanding" EPA policy concerning the standards by which toxicity information should be reviewed for purposes of §8(e) compliance. Regulatee recognizes that experience with the 1978 Statement of Interpretation may cause a review of its criteri. Regulatee supports and has no objection to the Agency's amending reporting criteria *provided that* such amendment is not applied to the regulated community in an unfair way. However, with the unilateral announcement of the CAP under the auspices of an OCM enforcement proceeding, EPA has wrought a terrific unfairness since much of the criteria EPA has espoused in the June 1991 Reporting Guide and in the Agency's April 2, 1992 amendment is new criteria which does not exist in the 1978 Statement of Interpretation and Enforcement Policy.

The following examples of new criteria contained in the "Reporting Guide" that is not contained in the Statement of Interpretation follow:

- o even though EPA expressly disclaims each "status report" as being preliminary evaluations that should not be regarded as final EPA policy or intent⁴, the "Reporting Guide" gives the "status reports" great weight as "sound and adequate basis" from which to determine mandatory reporting obligations. ("Guide" at page 20).
- o the "Reporting Guide" contains a matrix that establishes new numerical reporting "cutoff" concentrations for acute lethality information ("Guide" at p. 31). Neither this matrix nor the cutoff values therein are contained in the Statement of Interpretation. The regulated community was not made aware of these cutoff values prior to issuance of the "Reporting Guide" in June, 1991.
- o the "Reporting Guide" states new specific definitional criteria with which the Agency, for the first time, defines as 'distinguishable neurotoxicological effects'; such criteria/guidance not expressed in the 1978 Statement of Interpretation.⁵
- o the "Reporting Guide" provides new review/ reporting criteria for irritation and sensitization studies; such criteria not previously found in the 1978 Statement of Interpretation/Enforcement Policy.
- o the "Reporting Guide" publicizes certain EPA Q/A criteria issued to the Monsanto Co. in 1989 which are not in the Statement of Interpretation; have never been published in the Federal Register or distributed by the EPA to the Regulatee. Such Q/A establishes new reporting criteria not previously found in the 1978 Statement of Interpretation/Enforcement Policy.

⁴The 'status reports' address the significance, if any, of particular information reported to the Agency, rather than stating EPA's interpretation of §8(e) reporting criteria. In the infrequent instances in which the status reports contain discussion of reportability, the analysis is invariably quite limited, without substantial supporting scientific or legal rationale.

⁵ See, e.g., 10/2/91 letter from Du Pont to EPA regarding the definition of 'serious and prolonged effects' as this term may relate to transient anesthetic effects observed at lethal levels; 10/1/91 letter from the American Petroleum Institute to EPA regarding clarification of the Reporting Guide criteria.

In discharging its responsibilities, an administrative agency must give the regulated community fair and adequate warning to as what constitutes noncompliance for which penalties may be assessed.

Among the myriad applications of the due process clause is the fundamental principle that statutes and regulations which purport to govern conduct must give an adequate warning of what they command or forbid.... Even a regulation which governs purely economic or commercial activities, if its violation can engender penalties, must be so framed as to provide a constitutionally adequate warning to those whose activities are governed.

Diebold, Inc. v. Marshall, 585 F.2d 1327, 1335-36 (D.C. Cir. 1978). See also, Rollins Environmental Services (NJ) Inc. v. U.S. Environmental Protection Agency, 937 F. 2d 649 (D.C. Cir. 1991).

While neither the are rules, This principle has been applied to hold that agency 'clarification', such as the Statement of Interpretation, the "Reporting Guide" nor the April 1992 amendments will not applied retroactively.

...a federal court will not retroactively apply an unforeseeable interpretation of an administrative regulation to the detriment of a regulated party on the theory that the post hoc interpretation asserted by the Agency is generally consistent with the policies underlying the Agency's regulatory program, when the semantic meaning of the regulations, as previously drafted and construed by the appropriate agency, does not support the interpretation which that agency urges upon the court.

Standard Oil Co. v. Federal Energy Administration, 453 F. Supp. 203, 240 (N.D. Ohio 1978), aff'd sub nom. Standard Oil Co. v. Department of Energy, 596 F.2d 1029 (Em. App. 1978):

The 1978 Statement of Interpretation does not provide adequate notice of, and indeed conflicts with, the Agency's current position at §8(e) requires reporting of all 'positive' toxicological findings without regard to an assessment of their relevance to human health. In accordance with the statute, EPA's 1978 Statement of Interpretation requires the regulated community to use scientific judgment to evaluate the significance of toxicological findings and to determining whether they reasonably support a conclusion of a substantial risk. Part V of the Statement of Interpretation urges persons to consider "the fact or probability" of an effect's occurrence. Similarly, the 1978 Statement of Interpretation stresses that an animal study is reportable only when "it contains reliable evidence ascribing the effect to the chemical." 43 Fed Reg. at 11112. Moreover, EPA's Statement of Interpretation defines the substantiality of risk as a function of both the seriousness of the effect and the probability of its occurrence. 43 Fed Reg 11110 (1978). Earlier Agency interpretation also emphasized the "substantial" nature of a §8(e) determination. See 42 Fed Reg 45362, 45363

(1977). [Section 8(e) findings require "extraordinary exposure to a chemical substance...which critically imperil human health or the environment"].

The recently issued "Reporting Guide" and April 1992 Amendment guidance requires reporting beyond and inconsistent with that required by the Statement of Interpretation. Given the statute and the Statement of Interpretation's explicit focus on substantial human or environmental risk, whether a substance poses a "substantial risk" of injury requires the application of scientific judgment to the available data on a case-by-case basis.

If an overall weight-of-evidence analysis indicates that this classification is unwarranted, reporting should be unnecessary under §8(e) because the available data will not "reasonably support the conclusion" that the chemical presents a substantial risk of serious adverse consequences to human health.

Neither the legislative history of §8(e) nor the plain meaning of the statute support EPA's recent lowering of the reporting threshold that TSCA §8(e) was intended to be a sweeping information gathering mechanism. In introducing the new version of the toxic substances legislation, Representative Eckhart included for the record discussion of the specific changes from the version of H. R. 10318 reported by the Consumer Protection and Finance Subcommittee in December 1975. One of these changes was to modify the standard for reporting under §8(e). The standard in the House version was changed from "causes or contributes to an unreasonable risk" to "causes or significantly contributes to a substantial risk". This particular change was one of several made in TSCA §8 to avoid placing an undue burden on the regulated community. The final changes to focus the scope of Section 8(e) were made in the version reported by the Conference Committee.

The word "substantial" means "considerable in importance, value, degree, amount or extent". Therefore, as generally understood, a "substantial risk" is one which will affect a considerable number of people or portion of the environment, will cause serious injury and is based on reasonably sound scientific analysis or data. Support for the interpretation can be found in a similar provision in the Consumer Product Safety Act. Section 15 of the CPSA defines a "substantial product hazard" to be:

"a product defect which because of the pattern of defect, the number of defective products distributed in commerce, the severity of the risk, or otherwise, creates a substantial risk of injury to the public."

Similarly, EPA has interpreted the word 'substantial' as a quantitative measurement. Thus, a 'substantial risk' is a risk that can be quantified, *See*, 56 Fed Reg 32292, 32297 (7/15/91). Finally, since information pertinent to the exposure of humans or the environment to chemical substances or mixtures may be obtained by EPA through Sections 8(a) and 8(d) regardless of the degree of potential risk, §8(e) has specialized function. Consequently, information subject to §8(e) reporting should be of a type which would lead a reasonable man to conclude that some type action was required immediately to prevent injury to health or the environment.

INHALATION TOXICITY

Summary & Conclusions:

The Approximate Lethal Concentration (ALC) of tetramethylsuccinonitrile (TMSN) and the effect of repeated exposures of TMSN at one-fifth the ALC have been determined by routine procedures. The ALC of this compound for rats is 16 ppm and it should be placed in the category of highly toxic compounds. Behavior of the animals during the ALC exposures and pathological findings indicate that the compound affects primarily the respiratory and possibly the central nervous system. There is some indication of an intestinal effect. Ten sequential exposures of six hours each at 3 ppm ($\frac{ALC}{5}$) did not produce any permanent effects in the tissues examined that could be attributed to the compound.

Based on these studies, concentrations of TMSN in working areas should be kept < 3 ppm. Definite establishment of a threshold limit would require more animals and additional exposures.

Observations:

Lethal Concentrations:

During exposure the rats showed rapid respiration followed by labored respiration, incoordinate movement of limbs (1/4 at 14 ppm), red ears and inactivity. Following exposures they were inactive, showing ruffled fur, mild sensitivity to handling and had a mild bloody discharge around the nose. One animal at the concentration of 16 ppm was observed to have a terminal convulsion shortly after the end of the exposure. All rats (except one at 8 ppm) showed severe to moderate initial weight losses, but appeared normal thereafter.

Sublethal Concentrations:

During exposure the rats exhibited deep respiration and red ears, following exposure they showed mildly rapid respiration and mild redness of ears.

Repeated Exposures:

The clinical signs of toxicity during exposure were deep respiration and/or labored respiration, following exposure the rats appeared normal.

At the conclusion of the test period, the average body weight of the test group was 95% of the average control group body weight.

Pathological Findings:

Gross examination of the lungs of rats that died during exposure or within 24 hours following exposure to 14 ppm for six hours and/or 16 ppm (4 hours) showed evidence of hyperinflation, edema and hemorrhage. One animal, in addition to the lung injury, had blood in the intestinal contents. Microscopic examination of these lungs revealed a marked diffuse congestion, a moderate alveolar edema and moderate focal hemorrhage. The intestinal tract of one rat was markedly congested. Rats surviving lethal concentrations and rats exposed to nonlethal concentrations killed 14 days after exposure showed normal lung weights and various changes of the lungs that are consistent with the chronic murine pneumonitis usually observed in rats and mice. Microscopically, six of the ten examined showed, in addition, a variable number of neutrophils in the bronchiolar lumen, as well as in the alveolar walls. This neutrophilic infiltration is not commonly found in conjunction with the chronic murine pneumonitis in our stock rats. This may be a direct effect of the exposure or the influence of the exposure in changing the course of chronic murine pneumonitis. No lesions attributable to the exposure were observed in other organs.

Microscopic examination of the lungs of rats repeatedly exposed to TMSN and their controls showed changes that are consistent with a moderate chronic murine pneumonitis. The neutrophilic infiltration into the lungs, as described in the single exposures, was found in two exposed rats, as well as a control rat. No lesions attributable to single and repeated exposures were observed in the liver, kidney, brain and spinal cord.

Procedure:

A dry air stream was passed through the test compound in a metal U-tube and the resulting vapor was carried by a copper tube to an 8-liter bell jar containing four CHR-CD male rats of initial body weight 247-307 grams. During repeated exposures, four rats were exposed to dry air for a control group. Concentrations of the test material were determined analytically by gas chromatography.

Results:

Type of Exposure	Analytical Concentration	Exposure Time	Air Flow (via material)	Air Flow (Diluting)	Mortality Ratio	Fate
Single	14 ppm	6:00 hrs	1.83 lit/min	-	2/4	One died during exposure (5:55 hrs after start); one died 1 day after exposure; survivors killed 14 days after exposure
Single	16	4:00	1.83	-	1/4	One died 1 day after exposure; rest killed 14 days later

Results (Cont'd):

<u>Type of Exposure</u>	<u>Analytical Concentration</u>	<u>Exposure Time</u>	<u>Air Flow (via material)</u>	<u>Air Flow (Diluting)</u>	<u>Mortality Ratio</u>	<u>Fate</u>
Single	8 ppm	4:00 hrs	1.00 lit/min	1.00 lit/min	0/4	Killed 14 days after exposure
Single	2	4:00	0.20	1.80	0/4	Killed 14 days after exposure
Repeated	Avg. 3.4 Range 2.6-3.8	6:00 x 10 exposures	0.25-0.30	1.70-1.75	0/4	Two killed after last exposure, rest killed 14 days later

EPA acknowledges the receipt of information submitted by your organization under Section 8(e) of the Toxic Substances Control Act (TSCA). For your reference, copies of the first page(s) of your submission(s) are enclosed and display the TSCA §8(e) Document Control Number (e.g., 8EHQ-00-0000) assigned by EPA to your submission(s). Please cite the assigned 8(e) number when submitting follow-up or supplemental information and refer to the reverse side of this page for "EPA Information Requests".

All TSCA 8(e) submissions are placed in the public files unless confidentiality is claimed according to the procedures outlined in Part X of EPA's TSCA §8(e) policy statement (43 FR 11110, March 16, 1978). Confidential submissions received pursuant to the TSCA §8(e) Compliance Audit Program (CAP) should already contain information supporting confidentiality claims. This information is required and should be submitted if not done so previously. To substantiate claims, submit responses to the questions in the enclosure "Support Information for Confidentiality Claims". This same enclosure is used to support confidentiality claims for non-CAP submissions.

Please address any further correspondence with the Agency related to this TSCA 8(e) submission to:

Document Processing Center (7407)
Attn: TSCA Section 8(e) Coordinator

COMMENTS:

8(E) -12227A

H

ACUTE INHALATION TOXICITY IN MALE CD RATS IS OF HIGH CONCERN BASED ON AN LC50 OF APPROXIMATELY 14 PPM. DOSAGE AND MORTALITY DATA ARE AS FOLLOWS: 2 PPM, 4 HOURS (0/4); 8 PPM, 4 HOURS (0/4); 14 PPM, 6 HOURS (2/4); AND 16 PPM, 4 HOURS (1/4). DURING EXPOSURE TOXIC SIGNS INCLUDED LABORED RESPIRATION, INCOORDINATION AND INACTIVITY AT LETHAL DOSAGE LEVELS AND DEEP RESPIRATION AT NONLETHAL LEVELS. AT 14 PPM AND 16 PPM, PATHOLOGICAL SIGNS INCLUDED BLOOD IN THE INTESTINES, AND HEMORRHAGE AND EDEMA OF THE LUNGS. NO LESIONS ATTRIBUTABLE TO SINGLE AND REPEATED EXPOSURES WERE OBSERVED IN THE BRAIN OR SPINAL CHORD.
