

QUESTION: Although K001 lists “bottom sediment from the treatment of wastewaters from wood preserving processes that use creosote and/or pentachlorophenol,” the background document also includes the wastewater. Is the wastewater included in the K001 listing as described in the background document?

ANSWER: K001 covers the bottom sediment sludge and not the wastewater. The wastewater from this process was proposed as a listed hazardous waste in the May 19, 1980 Federal Register (45 FR 33136). This proposed rule is under consideration and has not been finalized.
