LIST OF APPENDICES¹

Appendix B. WR-123 Schnitzer International Slip Site-Specific Sampling Report

¹ The naming and ordering of Appendices A to W has been kept consistent with the Round 3A FSR so that sampling sites can easily be referenced. Consequently, there are gaps in the appendix lettering that represent locations that were not sampled in Round 3B. Thus, Appendices A, C, D, M, P, Q, R, S, U, and W are not included in this document since no sampling occurred at these stations during Round 3B Sampling.

- Appendix E. WR-96 Arkema Site-Specific Sampling Report
- Appendix F. WR-14 Chevron - Transportation Site-Specific Sampling Report
- Appendix G. WR-161 Portland Shipyard Site-Specific Sampling Report
- Appendix H. WR-4 Sulzer Pump Site-Specific Sampling Report
- Appendix I. WR-145/142 Gunderson Site-Specific Sampling Report
- Appendix J. WR-147 Gunderson (former Schnitzer) Site-Specific Sampling Report
- Appendix K. Yeon Mixed Use² Site-Specific Sampling Report
- Appendix L. OF-49 City Site-Specific Sampling Report
- Appendix N. OF-22C City Site-Specific Sampling Report
- Appendix O. OF-22B City Site-Specific Sampling Report
- Appendix T. WR-218 UPRR Albina Site-Specific Sampling Report
- Appendix V. OF-18 City Site-Specific Sampling Report
- Appendix X. Hwy 30A Site-Specific Sampling Report
- Appendix Y. Hwy 30B Site-Specific Sampling Report
- Appendix Z. Field Chain of Custody/Compositing Forms
- Appendix AA. EPA-LWG Communications
- Appendix BB. Flowlink Data Output

² This site was originally intended to be a Hwy 30 sample but it was sampled in the wrong location during Round 3A sampling and so has been renamed from Hwy 30 to Yeon Mixed Use to better reflect its mixed land use. See Section 8 for more information.

1.0 Introduction

This Round 3B Field Sampling Report (FSR) summarizes the second round of upland stormwater field sampling activities (Round 3B sampling) conducted from November 2007 through February 2008 for the Remedial Investigation and Feasibility Study (RI/FS) of the Portland Harbor Superfund Site (Site). The first round of upland stormwater field sampling activities took place from February 2007 through July 2007 (Round 3A sampling). The Round 3A sampling resulted in less than the total number of desired samples, as described in the *Round 3A Stormwater Sampling – Field Sampling Report* (Anchor and Integral 2007d), being collected at some sites. The Stormwater Technical Team³ reviewed the completeness information and determined that there were several substantial data needs required to ensure that the stormwater data set was sufficient to meet the original Round 3A FSP objectives. This Round 3B FSR describes the methods for collection of those additional data needs in late 2007 and early 2008.

The planned sampling activities for the Round 3B stormwater sampling are described in detail in the *Round 3A Stormwater Sampling – Field Sampling Plan Addendum* (FSP Addendum; Anchor and Integral 2007c), the *Round 3A Stormwater Sampling – Field Sampling Plan* (FSP; Anchor and Integral 2007a) and the *Round 2 Quality Assurance Project Plan Addendum 8* (QAPP; Integral 2007)⁴. This Round 3B FSR and the FSP, FSP Addendum, and QAPP are companion documents to the *Round 3A Stormwater Sampling Rationale* (SSR) (Anchor and Integral 2007b), which describes the reasoning behind the overall sampling approach. This Round 3B FSR cites sections of the FSP and Round 3A FSR, rather than repeating sampling method details here.

This Round 3B FSR includes information on the field methods and sampling procedures as implemented for the project, but does not include the analytical results of any of the samples collected. It also does not include field-collected analytical data, such as pH and temperature. All analytical data will be presented and discussed in the *Comprehensive Data Summary Report* to be published at a later date.

The contents of the FSP and SSR were written by the Stormwater Technical Team for the project, comprised of Oregon Department of Environmental Quality (DEQ), U.S. Environmental Protection Agency (EPA), and Lower Willamette Group (LWG) member representatives. Although the SSR was never submitted formally to EPA for official review, comment, and approval, it was the intent of the Stormwater Technical Team (which includes EPA) that the SSR serve as a record of the rationale for the sampling methods described in the FSP. During the course of the Round 3A sampling activities, the Stormwater Technical Team, with EPA approval, provided additional instructions on sampling and analysis procedures that were documented in meeting

³ The Stormwater Technical Team included representatives from EPA, DEQ and LWG and was convened in order to develop the framework for a sampling plan.

⁴ It was recognized after the FSP Addendum was published that the next round of stormwater sampling should be identified as Round 3B, which is used in the remainder of this report to describe the late 2007 and early 2008 stormwater sampling.

highlight emails, which are contained in the Round 3A FSR. Any changes in the sampling and analysis procedures documented in the Round 3A FSR were also included in the FSP Addendum.

Sampling at one station near Terminal 4 (WR-169) is also described in the FSP Addendum. As agreed to by the Stormwater Technical Team field sampling procedures for this location are not reported here because this sampling was conducted by the Port of Portland. The field and analytical data for this station will be provided in the future for data analysis and stormwater loading estimates and will be discussed in the *Comprehensive Data Summary Report*. Sampling at this station is briefly summarized in Section 2.0.

1.1 OBJECTIVES OF ROUND 3A/3B UPLAND STORMWATER SAMPLING

The objectives of the Round 3A/3B upland stormwater sampling program are to provide data for evaluating the potential risk related to in-river fish tissue chemical burdens and sediment recontamination from stormwater discharges to the river. These data will be used for understanding the relative magnitude of stormwater impacts to the harbor, developing the draft Site RI, identifying remaining stormwater data gaps, and eventually evaluating remedial alternatives in the Site FS (see SSR for details).

1.2 DOCUMENT ORGANIZATION

The remaining sections of this document describe the sampling field and analytical procedures that were used to collect stormwater and sediment samples:

- Section 2 provides an overview of the field sampling approach.
- Section 3 provides a chronology of the field sampling operations.
- Section 4 provides a summary of the stormwater composite sample field sampling procedures.
- Section 5 provides a summary of the stormwater grab sample field sampling procedures.
- Section 6 provides a summary of the sediment field sampling procedures.
- Section 7 provides a summary of the laboratory analyses.
- Section 8 provides a summary of Round 3A and 3B sampling conducted by LWG.
- Section 9 provides references.

Appendices A through Y present Site-Specific Sampling Reports, each dedicated to a single sampling location. The naming and ordering of Appendices A to W is kept consistent with the Round 3A FSR so that sampling sites can easily be referenced. Consequently, there are gaps in the appendix lettering that represent locations that were not sampled in Round 3B. Appendices X and Y provide sampling information for two sites that were not sampled during Round 3A sampling. Each appendix contains sampling and equipment specifics for that location. Appendix Z contains the field chain-of-custody forms and compositing instructions. Appendix AA contains communications with EPA describing Stormwater Technical Team decisions subsequent to submittal of the FSP Addendum regarding sampling and analysis procedures. Appendix BB contains data output from the Flowlink database from the ISCO samplers.

2.0 Overview of Field Sampling Approach

Sampling objectives are briefly described in Section 1.1 and detailed in the SSR. The FSP Addendum details 15 locations, including one new location, where Round 3B stormwater and sediment trap sampling took place during late 2007 and early 2008. Figure 2-1a-c shows all locations where stormwater samples were collected during Round 3B sampling.

The FSP Addendum addresses only locations identified as having additional data needs after the first round (Round 3A) of sampling. As discussed in Section 1.0, Figure 2-1 shows one additional station (WR-169/Basin D) discussed in the FSP Addendum but not included in this FSR. This station was sampled by the Port of Portland and is not discussed further in this document. Consequently, 14 stations are described in this document.

The planned sampling approach described by FSP Addendum included:

1. Flow-weighted composite stormwater samples – Composite stormwater samples at nine locations (plus one Terminal 4 location).
2. Sediment trap deployment – Sediment traps at 13 sites (plus one Terminal 4 location)

In some cases, not all of these data were actually collected due to logistical, weather, and other issues. These cases are described in Section 3.3.

3.0 Chronology of Field Operations

This section summarizes the chronology of the field sampling operations including initial installation of the equipment, sampling activities, and final removal of the equipment. In general, all procedures described followed those detailed in the FSP Addendum unless otherwise noted. Deviations from the FSP Addendum are discussed, if applicable, in Sections 4 and 6 for stormwater composite and sediment samples, respectively.

3.1 MOBILIZATION AND INITIAL PROGRAMMING

Mobilization for the field sampling program began in November 2007. Also beginning in November, reconnaissance teams began contacting LWG members and non-members regarding access to their sites and any special requirements that needed to be met to facilitate sampling. In most cases the sites were the same as the Round 3A sampling so this mainly consisted of renewing access agreements.

Preliminary site reconnaissance visits and review of stormwater system information was conducted while relevant site-specific training and access agreements were obtained and site-specific sampling procedures were developed. These preliminary visits were made to characterize the drainage basins and outfall locations to allow fabrication or ordering of equipment that would be needed to mount the automated water samplers and sediment traps at each site. The specific mounting hardware for each site is shown on a figure and in photographs in their respective Site-Specific Sampling Reports (Figures 2 and 3 of Appendices A-Y). Drainage basin characteristics such as size and percent impervious area were collected for use in estimating flow volumes for sampler programming and are included in the Site-Specific Sampling Reports.

The ISCO samplers had been stored at the LWG Field Laboratory since the first round of sampling was completed in July 2007. Prior to the initiation of Round 3b, the ISCO samplers were decontaminated, the ISCO sample jars were sent to the analytical laboratory for decontamination, and initial programming was completed.

The initial programming consisted of entering site identification, alarm dial out numbers, data collection frequency, and a series of programs to cover the range of potential runoff volumes at each site in response to a precipitation event. The specific programming strategies are described in Section 4 of the Round 3A FSR. As the samplers were installed, additional entries were made to the programs. These entries included the measured pipe diameter, the offset of the flow meter (if not installed in the bottom of the pipe), and the length of the sample pickup tube. Additionally, the water depth measured by the sampler was verified and adjusted if needed. The entries critical to sample collection details for each site are included in the Site-Specific Sampling Reports (Appendices A to Y).

3.2 INSTALLATION OF SEDIMENT TRAPS AND ISCO SAMPLERS

Due to a range of logistical issues, such as obtaining access agreements and fabricating installation equipment, the dates of ISCO sampler and sediment trap samplers ranged from November 12, 2007 to December 19, 2007. The installation dates for ISCO samplers and sediment traps are summarized in Table 3-1.

Note that no sediment traps were installed at the WR-4 location. The FSP Addendum stated that, "Sediment traps will be installed at WR-4 if field reconnaissance shows that it is feasible." Field reconnaissance determined that the outfall was submerged and the only access to the outfall pipe was through a catch basin with a 3.5-inch pipe in the bottom that connected into the main outfall pipe. Due to this limited access space, the installation of the sediment traps was not feasible. This was discussed at the November 27, 2007 Stormwater Technical Team meeting, with EPA (see Appendix AA). This is further discussed in Section 6.8.

During installation, the preliminary programming was completed for each sampler as noted above. The installation details for each site are included in their respective Site-Specific Sampling Report (Appendices A to Y). These Site-Specific Sampling Reports include diagrams of the installation, photographs of the installation, and programming information.

3.3 STORM EVENT SUMMARY

This section contains a summary of the response to each storm event sampled. Note that the "sample date" is the date the whole water samples were retrieved from the field and the sample was prepared from the aliquots collected by the ISCO automated samplers. These are the dates that this report references when discussing particular samples and the dates referenced by the lab for each sample. Dates of rainfall and automated sample collection are summarized by storm sample date in Tables 3-3a to h. Generally, the sampling activities, such as activating the ISCO automated samplers, began several days before the samples were prepared.

The storm conditions targeted for sampling, as described in the FSP, were to meet both of the following criteria:

- Storms predicted to produce more than 0.2 inches of rainfall over a minimum of a 3-hour period, not to exceed approximately 2.25 inches in a 24-hour period (equivalent to the 2-year event)
- Storms preceded by at least a 24-hour dry period (less than 0.1 inches rainfall).

As discussed below, the storms sampled during Round 3B sampling, as discussed more below, had average rainfall amounts ranging between 0.29 and 0.89 inches, average

durations between 0.13 days to 1.13 days, and antecedent dry periods of a minimum of 24 hours and a maximum of more than 11 days. As discussed in Section 4.4 of the Round 3A FSR, the precipitation was found to be variable in the Portland metropolitan area, with the project site frequently in the rain shadow of the Tualatin Mountains, so the closest rain gage to each location's basin was used.

Table 3-2 provides a summary of samplers successfully collecting samples for each storm event. The table identifies a successful event by detailing the type of sampling program activated. The table also shows which samplers were installed for a particular event, and if no samples were collected because adequate samples had already been collected from the site. The general approach was to attempt to collect samples at as many installed stations as possible. As samples were successfully collected, some prioritization of collection occurred to attempt to obtain samples at those stations where samples were not obtained in previous storms.

A discussion of flow-based sampling versus time-based sampling is provided in Section 3.2 of the FSP Addendum. In summary, time-based sampling was used at all sites sampled during Round 3B sampling except OF-22B. Flow-based sampling was used for the second sampling event for OF-22B because adequate flow data was available and reliable.

The following subsections summarize sampling for each storm event. The preparation of the laboratory samples for specific water quality analyses by site and storm is further described in Section 4.5 of this document.

3.3.1 Response to Storm 1: Sample Date – November 16, 2007

On the evening of November 14, 2007, all of the seven ISCO automated samplers installed by that time were activated via cell phone modem in anticipation of a storm that was forecasted to deliver between 0.75 and 1.50 inches of rain beginning early November 15. These seven samplers are referred to as the activated samplers in this section. (Samplers at WR-218 and WR-4 were not installed at this time due to site access issues.) Detailed programming information is shown in the Site-Specific Sampling Reports (Appendices A to Y). Figure 3-1 shows a plot of the measured precipitation at rain gages operated in the project area for Storm 1.

The first measurable rainfall was recorded on November 15 at 5:00 p.m. Depending on the rain gage, the total rainfall for the storm ranged between 0.78 and 0.80 inches and lasted about one day. The antecedent dry period was approximately 3 days, with between 0 and 0.04 inches of rain in the 24 hours preceding the storm. Complete storm statistics by sampling location including dates of rainfall and automated sample collection are summarized for this storm in Table 3-3a.

Four of the seven activated samplers provided adequate sample volume collected during the targeted period of the hydrograph meeting FSP storm flow sampling requirements

(Table 3-2). The three samplers that failed to collect samples were examined to determine why they did not function properly and to make adjustments to improve performance. This evaluation revealed the following:

- At OF-22C, the sampler had a low battery. The battery was replaced.
- At Hwy 30B the hose disconnected from the sampler, so no samples could be collected. The hose was resecured.
- At WR-96, flow was collected over the wrong storm interval. It was reprogrammed.

3.3.2 Response to Storm 2: Sample Date November 27, 2007

By Storm 2, eight ISCO automated samplers had been installed. On the morning of November 26, 2007, seven ISCO automated samplers were activated via cell phone modem in anticipation of a storm that was forecasted to provide between 0.20 and 0.35 inches of precipitation starting later that night. The sampler was not installed at WR-4 due to site access issues. The sampler at OF-49 was not activated because an adequate number (per the FSP Addendum) of samples had already been collected from this station. Detailed programming information is shown in the Site-Specific Sampling Reports (Appendices A to Y). Figure 3-2 shows a plot of the measured precipitation at rain gages operated in the project area for Storm 2.

The first measurable rainfall was recorded at 4:00 p.m. on November 26. Depending on the rain gage, the total rainfall for the storm ranged between 0.29 and 0.35 inches and lasted 3 hours. The antecedent dry period was approximately 6½ days, with no rain in the 24 hours preceding the storm. Complete storm statistics by sampling location, including dates of rainfall and automated sample collection are summarized for this storm in Table 3-3b. This storm was in accordance with the storm criteria set forth in the FSP, summarized in Section 4.1 of the Round 3A FSR.

As shown in Table 3-2, six of the activated samplers provided adequate sample volume collected during the targeted period of the hydrograph meeting FSP storm flow sampling requirements (Table 3-2).

The sampler at the OF-22C station that failed to collect samples was examined to determine, if possible, why it did not function properly and to make adjustments to improve performance. This evaluation revealed that the flow meter failed. The flow meter was replaced and remounted.

3.3.3 Response to Storm 3: Sample Date November 29, 2007

On the morning of November 28, 2007, five out of eight ISCO automated samplers installed at the time were activated via cell phone modem in anticipation of a storm that

was forecasted to provide between 0.35 and 0.50 inches of precipitation starting later that afternoon. The sampler was not installed at WR-4 due to site access issues. The samplers at OF-49, OF-22B, and WR-96 were not activated because an adequate number (per the FSP Addendum) of samples had already been collected from these stations. Detailed programming information is shown in Table 3-2 and in the Site-Specific Sampling Reports (Appendices A to Y). Figure 3-3 shows a plot of the measured precipitation at rain gages operated in the project area for Storm 3.

The first measurable rainfall was recorded at 1:00 p.m. on November 28th. Depending on the rain gage, the total rainfall for the storm ranged between 0.42 and 0.43 inches and lasted between 7 and 8 hours. The antecedent dry period was approximately 2 days, with 0.6 inches of rain in the 24 hours preceding the storm. Complete storm statistics by sampling location including dates of rainfall and automated sample collection are summarized for this storm in Table 3-3c. This storm was in accordance with criteria set forth in the FSP, as summarized in Section 4.1 of the Round 3A FSR.

During this storm, two of the five activated samplers provided adequate sample volume collected during the targeted period of the hydrograph meeting FSP storm flow sampling requirements (Table 3-2). Samples were not successfully collected at other stations for the following reasons:

- At two sites (Hwy 30A and OF-22C), the flow meter did not function correctly. It was removed and replaced in both cases.
- The sampler pump ran continuously at Hwy 30B and all of the bottles were overfilled. The sampler was reprogrammed to stop after the bottles were filled with the correct volume.

3.3.4 Response to Storm 4: Sample Date January 9, 2008

On the morning of January 7, five out of nine ISCO automated samplers installed at the time were activated via cell phone modem in anticipation of a storm that was forecasted to provide between 0.75 and 1.25 inches of precipitation starting later that afternoon. The samplers at OF-49, OF-22B, WR-96, and WR-218 were not activated because an adequate number (per the FSP Addendum) of samples had already been collected from these stations. Detailed programming information is shown in Table 3-2 and in the Site-Specific Sampling Reports (Appendices A to Y). Figure 3-4 shows a plot of the measured precipitation at rain gages operated in the project area for Storm 4.

The first measurable rainfall was recorded at 9:00 p.m. on January 7. The total rainfall for the storm was 0.89 inches and lasted approximately 18 hours. The antecedent dry period was 24 hours with 0.05 inches of rain in the 24 hours preceding the storm. Complete storm statistics by sampling location including dates of rainfall and automated sample collection are summarized for this storm in Table 3-3d. This storm was in accordance with criteria set forth in the FSP, as summarized in Section 4.1 of the Round 3A FSR.

During this storm, two of the five activated samplers provided adequate sample volume collected during the targeted period of the hydrograph meeting FSP storm flow sampling requirements (Table 3-2). Samples were not successfully collected at other stations for the following reasons:

- Samples from two stations (Hwy 30A, and Hwy 30B) were discarded because insufficient sampling volume was collected over the storm interval to meet the FSP criteria or less than half of the storm hydrograph was sampled.
- The sample pickup tube was damaged by a forklift at the WR-4 sampling location and no sample was collected.

3.3.5 Response to Storm 5: Sample Date January 11, 2008

On the morning of January 9, 2008, three ISCO automated samplers were activated via cell phone modem in anticipation of a storm that was forecasted to provide between 0.35 and 0.50 inches of precipitation starting later that day. The samplers at OF-49, OF-22B, WR-96, WR-218, WR-142, and OF-22C were not activated because an adequate number (per the FSP Addendum) of samples had already been collected from these stations. Detailed programming information is shown in the Site-Specific Sampling Reports (Appendices A to Y). Figure 3-5 shows a plot of the measured precipitation at rain gages operated in the project area for Storm 5.

The first measurable rainfall was recorded at 4:00 p.m. on January 9. The total rainfall for the storm ranged between 0.39 and 0.45 inches and lasted less than 24 hours. The antecedent dry period was 24 hours with 0.07 inches of rain in the 24 hours preceding the storm. Complete storm statistics by sampling location including dates of rainfall and automated sample collection are summarized for this storm in Table 3-3e. This storm was in accordance with the storm criteria set forth in the FSP, as summarized in Section 4.1 of the Round 3A FSR.

Two of the activated samplers provided adequate sample volume collected during the targeted period of the hydrograph meeting FSP storm flow sampling requirements (Table 3-2).

Samples were not collected during this storm event at Hwy 30A because the battery died before samples could be collected.

3.3.6 Response to Storm 6: Sample Date January 15, 2008

On the morning of January 14, 2008, two ISCO automated samplers were activated via cell phone modem in anticipation of a storm that was forecasted to provide between 0.2 and 0.35 inches of precipitation starting later that day. The sampler at Hwy 30A could not be contacted via cell phone to activate it. The samplers at OF-49, OF-22B, WR-96, WR-218, WR-142, and OF-22C were not activated because an adequate number (per

the FSP Addendum) of samples had already been collected from these stations. Detailed programming information is shown in the Site-Specific Sampling Reports (Appendices A to Y). Figure 3-6 shows a plot of the measured precipitation at rain gages operated in the project area for Storm 6.

The first measurable rainfall was recorded at 2:00 p.m. on January 14, 2008. The total rainfall for the storm was 0.34 inches and lasted 6 hours. The antecedent dry period was almost 2 days, with no rain in the 24 hours preceding the storm. Complete storm statistics by sampling location including dates of rainfall and automated sample collection are summarized for this storm in Table 3-3f. This storm was in accordance with the storm criteria set forth in the FSP, as summarized in Section 4.1 of the Round 3A FSR.

Both of the activated samplers provided adequate sample volume collected during the targeted period of the hydrograph meeting FSP storm flow sampling requirements (Table 3-2).

3.3.7 Response to Storm 7: Sample Date January 28, 2008

On the evening of January 25, 2008, two ISCO automated samplers were activated via cell phone modem and one ISCO (Hwy 30A) was activated manually by the field team in anticipation of a storm that was forecasted to provide between 0.75 and 1.25 inches of precipitation starting later that day. The samplers at OF-49, OF-22B, WR-96, WR-218, WR-142, and OF-22C were not activated because an adequate number (per the FSP Addendum) of samples had already been collected from these stations. Detailed programming information is shown in the Site-Specific Sampling Reports (Appendices A to Y). Figure 3-7 shows a plot of the measured precipitation at rain gages operated in the project area for Storm 7.

The first measurable rainfall was recorded at 9:00 a.m. on January 26, 2008. The total rainfall for the storm was 0.83 inches and lasted 21 hours. The antecedent dry period was almost 12 days, with no rain in the 24 hours preceding the storm. Complete storm statistics by sampling location including dates of rainfall and automated sample collection are summarized for this storm in Table 3-3g. This storm was in accordance with the storm criteria set forth in the FSP, as summarized in Section 4.1 of the Round 3A FSR.

Two of the activated samplers provided adequate sample volume collected during the targeted period of the hydrograph meeting FSP storm flow sampling requirements (Table 3-2). The sample collected from WR-4 was discarded because insufficient sampling volume was collected over the storm interval to meet the FSP criteria, or less than half of the storm hydrograph was sampled.

3.3.8 Response to Storm 8: Sample Date January 30, 2008

On the morning of January 28, 2008, three ISCO automated samplers were activated via cell phone modem in anticipation of a storm that was forecasted to provide between 0.35 and 0.50 inches of precipitation starting later that day. The samplers at OF-49, OF-22B, WR-96, WR-218, WR-142, and OF-22C were not activated because an adequate number (per the FSP Addendum) of samples had already been collected from these stations. Detailed programming information is shown in the Site-Specific Sampling Reports (Appendices A to Y). Figure 3-8 shows a plot of the measured precipitation at rain gages operated in the project area for Storm 8.

The first measurable rainfall was recorded at 10:00 p.m. on January 28, 2008. The total rainfall for the storm was 0.34 inches and lasted 21 hours. The antecedent dry period was almost 2 days, with 0.03 inches of rain in the 24 hours preceding the storm. Complete storm statistics by sampling location including dates of rainfall and automated sample collection are summarized for this storm in Table 3-3h. Note that for one sample location, WR-4, a longer duration storm with 0.79 inches of rain was sampled. This was due to the fact that the time of runoff for this site was overestimated, so it took longer for all of the bottles to be filled. However, this larger duration storm was still in accordance with the storm criteria set forth in the FSP summarized in Section 4.1 of the Round 3A FSR.

All three of the activated samplers provided adequate sample volume collected during the targeted period of the hydrograph meeting FSP storm flow sampling requirements (Table 3-2).

3.4 **SEDIMENT TRAP INSPECTIONS**

After sediment traps were installed as described in Section 3.2, they were inspected approximately once a month during the sampling period. The inspection dates and observations/actions from each inspection are summarized in Table 3-4, as well as in the Site-Specific Sampling Reports (Appendices A to Y). At each inspection, the sediment traps were removed, the amount of sediment was recorded, and the sediment traps were reinstalled. Also noted in Table 3-4 and the Site-Specific Sampling Reports are instances where samples were removed and archived.

Of particular note were the following actions that were not specifically anticipated by the FSP:

- Per recommendation of the Stormwater Technical Team with agreement by EPA (see emails in Appendix AA), the 1,000-mL narrow mouth sediment trap bottles at two sites (Hwy 30A and Hwy 30B) were replaced with 500-mL narrow mouth bottles. These smaller bottles had the same size mouth opening but were shorter and therefore allowed stormwater runoff to overtop the bottles at sites with low water levels. Both short and regular

DO NOT QUOTE OR CITE

This document is currently under review by U.S. EPA and its federal, state and tribal partners and is subject to change, in whole or in part.

sized bottles (two each) were redeployed at OF-18 and each bottle type analyzed for total organic carbon (TOC) to help check whether the shorter bottles collected sediments differently from the standard bottles. Bottle openings were installed at the same elevation to ensure both sets were subject to the same flows and scouring effects in the pipe.

3.5 REMOVAL OF THE SAMPLING NETWORK

Anchor and Integral staff began removing the ISCO automated samplers and the sediment trap hardware on February 11, 2008. The final pieces of equipment were removed on February 14, 2008.

Upon removal from the field, the final data were downloaded from each ISCO sampler and added to the Flowlink database. The samplers were decontaminated and stored at the LWG Field Laboratory for potential future use. Worn items, such as the peristaltic pump tubes and transfer arm tubes, were discarded, as were the sample pickup tubes.

Installation hardware such as slip rings, stainless steel catch basins, and sediment trap mounting hardware were also removed, decontaminated, and stored at the LWG Field Laboratory. Batteries were recharged to prevent deterioration and also stored at the lab.

4.0 Stormwater Composite Sample Field Sampling Procedures

As described in Section 2.1.1 of the FSP, flow-weighted composite samples were collected to obtain Event Mean Concentrations (EMCs) of chemicals found in the stormwater. The following sections describe the general field sampling procedures as they applied to all stations. Site-specific details are provided in the Site-Specific Sampling Reports (Appendices A to Y).

4.1 WEATHER TRACKING

Information on weather tracking is discussed in Section 4.1 of the Round 3A FSR.

4.2 PROGRAM SELECTION AND ENABLING OF ISCO SAMPLERS

Detailed information on program selection and enabling of ISCO samplers is discussed in Section 4.2 of the Round 3A FSR. The runoff calculations for each sampling site can be found in their respective Site-Specific Sampling Reports (Appendices A to Y).

The programs selected for each event are identified in Section 3.3. A discussion of flow-based sampling versus time-based sampling is provided in Section 3.2 of the FSP Addendum. In summary, time-based sampling was used at all sites sampled during Round 3B sampling, except OF-22B. Flow-based programming was used during the second sampling event at OF-22B because adequate flow data was available.

The Site-Specific Sampling Reports (Appendices A to Y) describe the type and value for the triggers for each site and sampling event. Compositing information is also included in the Site-Specific Sampling Reports.

4.3 SAMPLE RETRIVAL AND DATA DOWNLOADING

As soon as practicable after a storm, sampling teams were deployed to recover the samples. Samples were recovered and data downloaded consistent with the procedures in the FSP.

In some cases, the time to retrieve samples was increased due to site access issues (e.g., over the weekend or the need to have traffic flaggers deployed to the site). The FSP required samples be retrieved within 24 hours after the end of sampling event and then processed within 12 hours after retrieval. Due to these issues, in some cases the target for sample retrieval was not met. The specific instances are shown in Table 4-1 and discussed more in Section 4.9. In all cases, the samples were processed within 12 hours after retrieval.

Early in the storm event response process, it was recognized that weekend site access could not easily be attained for the majority of sampling stations. Consequently, any storm events ending on Saturday or Sunday morning could not be retrieved within 24 hours with available Monday morning access. This created the potential to miss a number of storms and thereby cause substantial data gaps given the limited timeframe available for sampling. This issue was discussed with the Stormwater Technical Team on April 9, 2007. It was recommended and EPA agreed that the 24-hour retrieval time should be maintained whenever possible, but that if this was not possible for a weekend storm, the samples would be retrieved as soon as possible. Samples obtained after 24 hours would not be analyzed for filtered (dissolved) metals or dissolved organic carbon (DOC), but would be analyzed for total metals and TOC, as well as all other conventional and organic parameters. After the April 9, 2007 event, the Stormwater Technical Team recommended and EPA agreed that DOC could still be analyzed for samples retrieved after 24 hours. This deviation should have been included in the FSP Addendum as accepted standard practice for the project, but was inadvertently omitted. Therefore, this information (contained in the Round 3A FSR) is repeated here for clarity.

4.4 STORMWATER FLOW/RAINFALL EVALUATION AND COMPOSITING

Stormwater flow and rainfall evaluation and compositing is discussed in Section 4.4 of the Round 3A FSR. Rain gage information is presented in the Site-Specific Sampling Reports (Appendices A to Y), as well as Figures 3-1 through 3-8. Although City of Portland rain gage data is kept in Pacific Standard Time year-round, the data was adjusted to Daylight Savings Time before adding to the database. All rain gage information is the same as for Round 3A sampling, except the Swan Island rain gage was replaced with a new gage.

A summary of compositing for each site during each event is included in the Site-Specific Sampling Reports (Appendices A to Y) attached to this report. The chain-of-custody form for each sampling event is provided in Appendix Z.

4.5 SAMPLE PROCESSING AND HANDLING

Once the stormwater composite scheme was determined, as discussed above, the composite stormwater processing procedures generally followed those detailed in the FSP (Anchor and Integral 2007a) and FSP Addendum (Anchor and Integral 2007c). Table 4-2 summarizes composite stormwater collection by site, event, and analyte group. Deviations from the FSP are discussed in Section 4.9. As shown in Table 4-2, in a number of instances particular analytes were not collected at certain stations. In most cases, there was insufficient sample volume available at that station and, in these cases, the priority order of analyses required by the FSP was followed. Also, in some cases, retrieval target times were not met (as discussed previously), and consequently

dissolved metals analyses were not performed. In all cases, the samples were processed within 12 hours after retrieval.

4.6 FIELD PARAMETER MEASUREMENTS

As discussed in the FSP, individual stormwater sample containers were brought back from the field, composited in 20 L glass carboys and the water quality parameters were measured from the sample composites. Depending on the final composite volume, an aliquot of sample (approximately 100 to 200 mL) was either:

- Removed immediately for measurements of water quality parameters, or
- In cases of very limited composite volume, the aliquot was collected immediately after filling the priority sample containers for chemical analyses.

For Round 3B sampling, field water quality parameters were only collected during the November 16, 2007 composite water processing event due to available water volumes for testing. Water quality measurements were not taken during subsequent composite events because there was not enough sample volume left to conduct water quality measurements after analyte volumes for chemical analyses had been collected. This modification to the FSP procedures is included under deviations in Section 4.9.

4.7 FIELD QUALITY ASSURANCE/QUALITY CONTROL

Field quality control samples are used to assess sample method variability (e.g., matrix spike duplicates) and sample variability (e.g., field duplicates), evaluate potential sources of contamination (e.g., equipment rinsate and trip blanks), or confirm proper storage conditions (e.g., temperature blanks). Additional details on field duplicate samples and field QC samples are described in the QAPP Addendum 8 (Integral 2007). Field QC samples were collected for each sampling event in accordance with the FSP and FSP Addendum.

4.7.1 Field Duplicates

Field duplicate samples were collected during Storm 2 and 3 events (November 27 and November 29, 2007, respectively). In order to generate sufficient additional volume (6.2 L as per FSP Table 2-3) to analyze for the full suite of analytical parameters in the field duplicate sample, and because of limitations on the maximum sample volume that could be collected in each ISCO sampler, water for field duplicates was collected from multiple sample locations during the Storm 2 event. For this storm event, additional volume from one station was used to create field duplicates for total metals analysis,

DO NOT QUOTE OR CITE

This document is currently under review by U.S. EPA and its federal, state and tribal partners and is subject to change, in whole or in part.

additional volume from another station was used to create field duplicates for polycyclic aromatic hydrocarbon (PAH) analysis and other parameters as shown in Table 4-3.

Due to variations in actual runoff versus that predicted by the ISCO program or sampling approach used, it could not be determined in advance which stations would have sufficient volume for field duplicates. Consequently, the locations of field duplicates were determined based on the sample volumes available during each storm event. Any additional volume from a given station was aliquoted for field duplicate analysis in accordance with the analytical priorities established in the FSP (Table 2-4a). Once sufficient volume had been collected to create all field duplicate analyses, any additional sample volume from a given station was then used in the same manner to create laboratory quality control samples (i.e., matrix spike or laboratory duplicates following the analysis priority established in the FSP). Field duplicates are summarized for the stormwater composite samples in Table 4-3. Field duplicates were collected at the 5 percent frequency listed in the FSP (one per 20 samples). The following constituents did not meet the field replicate collection criteria; all other constituents met the collection criteria frequency:

- Total suspended solids (TSS) – one field duplicate collected out of 23 total samples
- TOC – one field duplicate collected out of 22 total samples
- Phthalates – field duplicate not collected due to limited stations slated for phthalate analysis and limited sample volume
- Pesticides – field duplicate not collected due to limited stations slated for pesticide analysis and limited sample volume.

Note that the TSS and TOC duplication frequency is very close to 5 percent and is not expected to measurably impact quality control assessment. As shown Table 4-3, duplicate samples were collected for Storm 2 and 3 events (four samples) Duplicate samples were not collected for Storm 1, 4, 5, 6, or 7 events because the total number of duplicate samples already available was sufficient to meet FSP requirements.

4.7.2 Equipment Rinsates and Temperature Blanks

The FSP requires one equipment rinsate blank prior to deployment of the ISCO samplers. The equipment blank on the ISCO setup collected for the Round 3A sampling event was utilized for this Round 3B FSR.

To provide additional information about the decontamination procedures and identify possible contamination sources throughout the sample compositing sequence, the following additional equipment and/or rinsate blanks were created and analyzed as discussed in Section 4.9:

- Stormwater composite equipment rinsate blank

In each case, all rinsate blank samples were treated identically to any other water samples described in the FSP and QAPP Addendum in terms of storage, transport, analyses, and laboratory quality assurance/quality control (QA/QC) procedures.

Per the FSP, temperature blanks are used to measure the temperature inside the cooler upon receipt to the laboratory. One temperature blank was prepared and submitted with each cooler shipped to the analytical laboratory. The temperature blank consisted of a sample jar containing deionized water and labeled “temp blank” and packed into the cooler in the same manner as the rest of the samples.

4.7.3 Field Blanks

As described previously in Section 4.2, a select number of ISCO samplers contained a collection vessel designated as a field blank. The field blank simply consisted of a blank bottle programmed to not collect a stormwater sample. Upon arriving at the lab, the field retrieval team determined if the field blank bottles were valid samples (i.e., no water was collected in container and jar intake). The field blank bottles were given to the composite team and processed. Columbia Analytical Service (CAS) deionized water was poured into each of the three (at a minimum) field blank bottles. Blank bottles were collected from several stations and used in the development of one blank sample as noted in Table 4-3. The water was then transferred to a carboy designated for a field blank and processed following the same procedures as completed for the composite samples. The locations from which field blanks were prepared for each sample event are shown in Table 4-3. Field blanks were collected at the 5 percent frequency listed in the FSP (one per 20 samples) for all sampling events with the exception of the January 30, 2008 event.

4.7.4 Laboratory QC Samples

Additional volume for laboratory quality control samples was not available for collection during any Round 3B stormwater sampling events.

4.8 FIELD DOCUMENTATION

All field activities and observations were noted in a field notebook. These notes included measurements taken when setting up the sampling equipment and during maintenance activities such as changing batteries or peristaltic pump tubes. Additional notes were taken on the chain-of-custody form regarding the time of retrieval and the appearance of the samples. Copies of key information can be found for each sampling site in their respective Site-Specific Sampling Reports (Appendices A to Y). The original field notebooks have been retained by Anchor in LWG project files.

4.9 DEVIATIONS FROM THE ROUND 3A FSP AND FSP ADDENDUM REGARDING STORMWATER COMPOSITE SAMPLINE

Several deviations have been made from the Round 3A (Anchor and Integral 2007a) and the Round 3A FSP Addendum (Anchor and Integral 2007c) during the course of the sampling activities. Some “deviations” reflect contingencies that were contemplated in the FSP and/or FSP Addendum. Many of these deviations were intended to improve data quality and are the same as those made during the Round 3A sampling event. As a result, they are not re-evaluated here in detail. Major deviations have been described in previous sections to provide context and rationale for the deviations. Deviations specifically associated with stormwater composite sampling during Round 3B are summarized in Table 4-4.

As detailed in Table 4-4 the following types of deviations from the Round 3A FSP Addendum (Anchor and Integral 2007c) occurred:

Minor Deviations:

- Field parameters were only measured during the November 16, 2007 sampling event due to limited volume and equipment availability.
- Additional volume for laboratory QC samples was not available for collection during any Round 3B stormwater sampling events.
- An equipment rinsate blank on the ISCO tubing, sampling arm, and collection bottle was not collected during the Round 3B sampling event as detailed in Table 4-4.
- Hwy 30 sample station was renamed Hwy 30A to distinguish it from the previous sampling very near the same location.

Overall, these changes did not substantially impact the quality of the study. Rinsate information from Round 3A provides a reasonable assessment of the decontamination procedures consistently used in both events. In many other cases (such as sampling station changes), the changes were made specifically to improve the quality of the study.

5.0 Stormwater Grab Sample Field Sampling Procedures

No additional grab samples were called for in the FSP Addendum and none were collected during Round 3B sampling. All grab samples required by the FSP were collected during Round 3A sampling. See the Round 3A FSP for more information.

6.0 Sediment Field Sampling Procedures

As described in Section 2.1.3 of the FSP, sediment traps are useful monitoring tools to help identify chemical concentrations in stormwater sediments. The sediment traps consist of a stainless steel bracket holding high density polyethylene (HDPE) bottles. Sediment traps were installed by bolting the bracket directly to the location junction, pipe, or catch basin.

6.1 WEATHER TRACKING

No specific weather monitoring was conducted for the sediment sampling. Precipitation records were gathered from the local precipitation gages operated by the City of Portland. All rain gage information is the same as Round 3A, except the Swan Island Rain Gage was replaced with a new gage. The precipitation data is contained in the project Flowlink database and may be used in the future when the chemical analyses of the samples are completed and the *Comprehensive Data Summary Report* is prepared.

6.2 ANCILLARY FLOW INFORMATION

Per the FSP, the ISCO samplers were set up to record depth, velocity, and flow at 5-minute increments throughout the sediment trap sampling period. Due to high variability in portable flow meters and the short deployment period that makes flow data review and refinement difficult, the technical team decided and EPA agreed that flow data was not intended for use beyond composite sample collection. This data is contained in the project Flowlink database and may be used in the future when the chemical analyses of the samples are completed and the *Comprehensive Data Summary Report* is prepared. During the October 10, 2007 Technical Team meeting (Appendix AA), the Stormwater Technical Team determined that flow meters were not needed at sites where only sediment trap sampling was proposed.

6.3 SAMPLE RETRIEVAL

The sediment traps were deployed from between 85 and 93 days depending on the particular location (Table 6-1). All traps were deployed for at least two months as required by the FSP Addendum. The sediment collection vessels were inspected monthly during the sampling period. At some stations, the observed level of sediment was slightly reduced from one month to the next, but this is most likely attributed to settling of the sediment.

The FSP called for retrieval of sediments in the traps if the bottles were half or over half full, archiving of those sediments, and continued deployment with new bottles. In all cases except one (OF-18 on December 10, 2007), the accumulations in the sediment

trap bottles were much less than one half (Table 3-4), and this procedure was not needed. However, the Stormwater Technical Team recommended during a January 10, 2008 meeting (see Appendix AA) and EPA agreed to employ the following additional procedure:

- At the end of January (approximately two months after sediment trap installation), remove existing bottles from any sediment trap with more than trace amounts of sediment, replace with clean bottles, and sample and analyze available sediments for total solids. Table 3-4 notes the locations where this was conducted during the “3rd inspection.”
- It was agreed that sediment traps would be removed near the end of January. After discussing the results of the total solids analysis in early February, it was agreed that all sediment traps would be removed shortly thereafter. The sediment trap volumes from this final deployment period were combined with the initial volumes from each site.

All field activities and observations were noted in a field notebook during field work. No specific flow or precipitation data was downloaded for sediment sampling.

6.4 STORMWATER FLOW, RAINFALL, AND RIVER HEIGHT EVALUATION

No analysis of the stormwater flow has been completed for the sediment sampling. As previously mentioned, due to high variability in portable flow meters and the short deployment period that makes flow data review and scrubbing difficult, the technical team decided and EPA agreed that flow data was not intended for use beyond composite sample collection. The total rainfall during sediment trap deployment is summarized by site in Table 6-1.

Per the FSP, sample locations were chosen at elevations relative to the river water levels such that the risk of river water backing up into stormwater pipes at the sampling location was minimized. River height information was checked routinely as shown in real time by U.S. Geologic Service (USGS) Morrison Bridge River Gage (#14211720) and near term predictions of river height as provided by National Oceanic and Atmospheric Administration’s (NOAA’s) Advanced Hydrologic Prediction Service. The station at OF-18 had the lowest elevation of any location at an elevation of 13.4 feet (City of Portland datum). During the Round 3A, the river height data were compared to visual observations of water heights within the pipe at OF-18 and to flow sensor water level data on a routine basis, particularly as river water levels rose. The peak river water level observed during the Round 3A sampling period was 12.22 feet (City of Portland Datum, measured at 1.55 feet above National Geodetic Vertical

Datum [NGVD] of 1929) on March 21 and in-pipe water levels at OF-18 were checked both in the field and via the installed flow sensor. No reaction in standing water height in the pipe at station OF-18 was noted through this peak river level period during Round 3A. River levels returned to 9.28 feet on March 27, and the same checks again indicated no coincident changes in the water level in the OF-18 pipe. During Round 3B, the maximum river elevation was 8.37 feet (City of Portland Datum, measured at 1.55 feet above NGVD of 1929) on December 5, 2007, which is below the 12.22-foot water level established in Round 3A. Given that OF-18 was at the lowest elevation for Round 3B, it is concluded that there was no influence of river water on either sediment trap samples or stormwater samples, which were all collected at times of lower river height, at any sampling location for Round 3B.

6.5 **SAMPLE PROCESSING AND COMPOSITING**

Sediment trap samples were retrieved (as noted above) and archived at the field laboratory for compositing.

Per the FSP, sample processing was conducted at the field laboratory by filtering the entire contents of the sediment trap bottles and transferring the filter and/or solid residue into an 8- or 16-ounce glass sample jar. At each location there were, at a minimum, four sediment trap bottles to composite. In some cases, some traps had four 1L bottles and at three locations (OF-18, Hwy 30A and Hwy 30B) there were short bottles (500 ml) in addition to tall bottles (1 L). The short/smaller bottles were added to try to collect more sediment because the smaller bottles allowed more flow to be directed over the sediment bottles. This is discussed further in Section 6.8.

Samples from the short and tall bottles were processed in the following manner, which differed slightly from the Round 3A FSP (Anchor and Integral 2007a) and FSP Addendum (Anchor and Integral 2007c) description:

- For each station, an 8- or 16-ounce glass jar was labeled with the appropriate sample identification information.
- Using a decontaminated acrylic filter stand apparatus, glass flask, peristaltic pump and tubing, stainless steel spatula, and 6-micron cellulose filters, the contents of each of the sediment bottles were filtered.
- Once most of the water was decanted from the sediment trap bottle, the remaining sediment was then transferred directly to the sample jar.
- A stainless-steel spatula was used to scrape the remaining material off the filter and into the sample jar.
- The filtrate was discarded.

DO NOT QUOTE OR CITE

This document is currently under review by U.S. EPA and its federal, state and tribal partners and is subject to change, in whole or in part.

6.5.1 Special Compositing Situations

6.5.1.1 Collection of Inline Sediments

Due to insufficient volume collected in sediment traps through the third inspection at WR-96, the Stormwater Technical Team suggested the use of sediment collected from within the outfall structure at this location for sediment sample analysis because there was a large amount of sediment accumulated around the bottles (see Appendix AA). This was recognized by the team as a deviation from the FSP, but was judged to be preferable to no sediment sample at all at this location. The sediment results from this location will need to be flagged during data analysis as representing a different collection procedure and assessed for anomalies to the extent possible.

Sediment was collected using a stainless steel spoon and transferred into a glass jar from the outfall near where the sediment traps were installed at WR-96.

Samples were collected in the following manner:

- Water was siphoned from the catch basin.
- Stainless steel spoons and mixing bowls were used to collect and homogenize sediment from the bottom of catch basin.
- The sediment was transferred to multiple pre-labeled sampler jars and stored on ice for transfer to the field laboratory.
- Samples were stored in refrigerators at $4^{\circ}\text{C} \pm 2^{\circ}\text{C}$ in the field laboratory and then shipped to CAS (Kelso, Washington) within 48 hours of retrieval.

The two jars of sediment collected were submitted as one sample. Due to the amount of sediment collected, the sediment was not processed in the field laboratory and rather was sent directly to the lab in the collection vessels on March 18, 2008. The lab was instructed to archive the sample at $4 \pm 2^{\circ}\text{C}$ until further instructions were received. In follow-up correspondence with the lab, it was requested that the catch basin sediment sample be analyzed for the following constituents: TSS, TOC, total metals, polychlorinated biphenyl (PCB) congeners, pesticides, PAHs/phthalates, and herbicides (consistent with the FSP Addendum analyte list for sediment trap samples).

6.5.1.2 Processing of Short Bottles

As discussed in Section 6.8, per recommendation of the Stormwater Technical Team and agreement by EPA (see emails in Appendix AA), the 1,000-mL narrow mouth sediment trap bottles at two sites (Hwy 30A and Hwy 30B) were replaced with 500-mL narrow mouth bottles on January 11, 2008. These smaller bottles had the same size mouth opening, but were shorter and therefore allowed stormwater runoff to overtop the bottles at sites with low water levels. Table 3-4 shows the sediment heights in the short bottles, which were able to collect between trace and ½ inch of sediment during the approximately 1-month long period they were installed.

Also on January 11, 2007, both short and regular sized bottles (two each) were redeployed at OF-18 to help determine whether shorter bottles collected sediments differently from standard bottles. Table 3-4 shows the sediment heights observed by field crew in the tall versus short bottles on January 28, 2008, and February 11, 2008. In general, there was no visible difference between the sediment heights.

Also, per the recommendation of the Stormwater Technical Team and agreement by EPA, during the February 7th Technical Team Meeting (Appendix AA), the bottles from OF-18 were proposed to be processed in the following way:

- The sediment from OF-18 short bottles deployed from January 11, 2008 to February 11, 2008 would be analyzed for total solids (TS), TOC, and PCBs.
- The sediment from OF-18 tall bottles deployed from January 11, 2008, to February 11, 2008 would be analyzed for TS, TOC, and PCBs, and the remaining sediment would be saved.
- The sediment from the OF-18 tall bottles deployed from November 12, 2007, to December 10, 2007, and December 10, 2007, to January 11, 2008 would be combined with the remaining sediment from the tall bottles deployed from January 11, 2008, to February 11, 2008.

However, during sediment trap processing, the sediment from tall bottles deployed from December 10, 2007, to January 11, 2008, was combined with the sediment from the tall bottles deployed from January 11, 2008, to February 11, 2008. Therefore, sediment chemistry data for short and tall bottles will not be available for identical deployment periods. However, the deployment period for the tall bottles (December 10, 2007, through February 11, 2008) includes the period the short bottles were deployed (January 11, 2008, through February 11, 2008), so comparisons can still be made.

6.5.2 Prioritization of Sediment Trap Analysis

Table 6-1 summarizes sediment trap and catch basin sediments collected by site.

As noted previously, insufficient sample volume was available to conduct all FSP-required analyses from all stations. Thus, once the samples were processed and composited, they were initially frozen to provide additional time for the Stormwater Technical Team to discuss the best use of the limited sample volumes available. To assist in these assessments, some sample volume was utilized to conduct a total solids analysis for each sample. This allowed the dry weight mass of each sample to be estimated, which in turn was used to estimate the number of analyses that could be conducted for each sample.

It was recommended by the Stormwater Technical Team and agreed by EPA on February 26 (Appendix AA) that, in general, the samples should be analyzed for chemical categories in the priority order described by the FSP. The exceptions to this rule are as follows:

- Gunderson WR-147 and Cascade General WR-161 – Use the mass proposed for PCBs to measure organochlorine pesticides (PCBs were measured during Round 3A sampling)
- OF-22B – Use the mass proposed for PCBs to measure pesticides at the detection limit and use the remaining mass to measure PAH/phthalates (PCBs were measured during Round 3A sampling)
- Hwy 30B – Take enough mass from the amount proposed for PAH/phthalates to measure metals at twice the detection limit. (This would increase the PAH/phthalate detection limit to about 2 times.)
- OF-49 and OF-22C – Take a small amount of mass from the PAH/phthalates analysis and use it to analyze metals.

Table 6-2 shows the analyses that are being conducted for each sediment sample location and where detection limits will likely be elevated above the FSP targets due to limited sample volumes.

6.6 FIELD QUALITY ASSURANCE/QUALITY CONTROL

Field QC information for the sediment trap samples is summarized in Table 6-3. Preliminary estimates of sediment volume collected for the sediment trap samples indicated that there was sufficient sediment volume available to fulfill all field QC sampling needs.

6.6.1 Field Duplicates

A field duplicate for sediment trap samples was created at CAS laboratory from sample LW3-STW2-S10-OF18T07. This duplicate was analyzed for the following constituents: TOC, total metals, PAHs/phthalates, PCB congeners, herbicides, and organochlorine pesticides.

The total number of original sediment samples submitted to the laboratory was 14 (not including the catch basin sample from WR-96). One field duplicate and one laboratory QC sample were submitted, which meets the requirements stated in the FSP.

6.6.2 Equipment Rinsates and Temperature Blanks

One equipment rinsate blank, as shown in Table 6-3, was collected from the sample processing setup described previously. Deionized water from CAS was passed through the filter setup using a peristaltic pump. Water was sampled from the setup directly into sample bottles and submitted for the analysis discussed in Section 7.

Temperature blanks were used to measure the temperature inside the cooler upon receipt to the laboratory as described in previous sections. Each sample cooler submitted to the lab contained a temperature blank.

6.6.3 Laboratory QC Samples

One laboratory QC sample, as shown in Table 6-3, was collected for sediment samples. The FSP calls for one QC sample per 20 normal samples. During Round 3B, 14 normal samples were collected for analysis. Because one laboratory QC sample was collected and submitted for each analyte, the FSP requirement was met.

6.7 FIELD DOCUMENTATION

Field documentation was collected in the same manner as described for stormwater composite sampling (Section 4.8).

6.8 DEVIATIONS FROM THE ROUND 3A FSP AND FSP ADDENDUM REGARDING SEDIMENT TRAP SAMPLING

Deviations that were recommended by the Stormwater Technical Team and agreed upon by EPA, as documented in Table 4-4 and Appendix AA, include:

- Note that no sediment traps were installed at the WR-4 location. The FSP Addendum stated that, "Sediment traps will be installed at WR-4 if field reconnaissance shows that it is feasible." Field reconnaissance determined that the outfall was submerged and the only access to the outfall pipe was through a catch basin with a 3.5-inch pipe in the bottom that connected into the main outfall pipe. Due to this limited access space, the installation of the sediment traps was not feasible. This was discussed at the November 27 Stormwater Technical Team meeting with EPA (see Appendix AA)
- As noted above, per the recommendation of the Stormwater Technical Team and agreement by EPA, catch basin sediments were collected from WR-96 due to insufficient volume in sediment traps, recognizing that this represents a different

sediment collection technique than all other sediments. Sediment was collected using a stainless steel spoon and transferred into a glass jar from the outfall near where the sediment traps were installed at WR-96.

- Per recommendation of the Stormwater Technical Team and agreement by EPA (see emails in Appendix AA), the 1,000-mL narrow mouth sediment trap bottles at two sites (Hwy 30A and Hwy 30B) were replaced by 500-mL narrow mouth bottles on January 11, 2008. These smaller bottles had the same size mouth opening but were shorter and therefore allowed stormwater runoff to overtop the bottles at sites with low water levels. Also on January 11, 2007, both short and regular sized bottles (two each) were redeployed at OF-18 to help check whether shorter bottles collected sediments differently from standard bottles.
- Sediments were frozen during analysis discussions to prolong the holding time (which was a carryover procedure from Round 3A)

In addition, the following minor deviations occurred:

- A sediment trap bottle rinsate was not collected during Round 3B sampling.
- Sediment was collected in either 8- or 16-ounce jars depending on volume.
- The sediment processing procedure was refined in the laboratory and differs slightly from the one described in the FSP Addendum as discussed above in Section 6.5, but follows that performed during Round 3A sampling.

These deviations are not expected to measurably impact the quality of the data collection and, in some cases, were specifically intended to increase sample completeness and/or improve data quality. Collection of in-line sediments at one location represents a different sediment collection procedure from all other sites, and therefore, these results will need to be examined carefully during data analysis.

7.0 Laboratory Analyses and Data Management

This section summarizes the chemical analyses that were and are being performed for the characterization of water and sediment samples from the Round 3B stormwater sampling event. Tables 4-2 and 6-3 summarize the analyses conducted on each sample. The analytical methods described in the FSP and QAPP are shown in Table 7-1 for water samples and Table 7-2 for sediment samples.

7.1 CHEMICAL ANALYSES

7.1.1 Stormwater Samples

CAS (Kelso, Washington) conducted the chemical analyses of all stormwater samples collected, except for the analysis of PCB congeners by EPA method 1668. All PCB congener analyses were performed by Vista Analytical Laboratory (El Dorado Hills, California). The *Comprehensive Data Summary Report* will describe the results of these analyses and related QC procedures.

7.1.2 Sediment Samples

CAS (Kelso, Washington) performed all chemical analyses for sediment samples, except for analysis of PCB congeners by EPA method 1668. All PCB congener analyses were performed by Vista Analytical Laboratory (El Dorado Hills, California). The *Comprehensive Data Summary Report* will describe the results of these analyses and related QC procedures.

7.2 FIELD LABORATORY ANALYSES

As noted in Section 4.6, water quality parameters (temperature, dissolved oxygen [DO], specific conductance, pH, turbidity, and oxidation/redox potential [ORP]) were measured in the field laboratory once during the November 16, 2007, sampling event. For other events, these measurements were not made due to insufficient volumes and equipment availability. The data for measured water quality parameters will be included along with the associated chemistry data in the *Comprehensive Data Summary Report* for this program.

8.0 Summary of Round 3A and Round 3B Stormwater Sampling Activities

This section summarizes the Round 3A and Round 3B Stormwater Sampling Activities conducted by LWG.

The first round of upland stormwater field sampling activities took place from February 2007 through July 2007 (Round 3A sampling). The second round of upland stormwater field sampling activities (Round 3B sampling) was conducted from November 2007 through February 2008.

The FSP Standard Operating Procedures (SOPs) describe the sampling procedures in detail. In summary, the planned sampling approach described by the FSP and FSP Addendum includes:

1. Flow-weighted composite stormwater samples – Per the FSP, composite samples were proposed for Round 3A sampling at 23 locations plus seven Terminal 4 locations and the GE Decommissioning Facility, for a total of 31 sites. Per the FSP Addendum, during the Round 3B sampling composite samples were proposed at nine locations (plus one Terminal 4 location).
2. One additional set of grab stormwater samples at 10 of the 23 planned sampling locations – This was completed during the first round (Round 3A) of sampling and no further grab samples were collected during Round 3B sampling.
3. Sediment trap deployment – Per the FSP, sediment trap samples were proposed for Round 3A sampling at 23 locations plus seven Terminal 4 locations and the GE Decommissioning Facility for a total of 31 sites. Per the FSP Addendum, during the Round 3B sampling, sediment traps were proposed at 13 sites (plus one Terminal 4 location).

8.1 STATION NAME CHANGES

During the course of the sampling activities, it was necessary to rename some sampling locations for clarity. These name changes are discussed here and will also be reiterated in the *Comprehensive Data Summary Report*. The following station names were changed:

- **Hwy 30 location sampling in Round 3A is renamed Yeon–NW35** – The station was renamed to avoid confusion. During Round 3A sampling, the station at Highway 30 was intended to be representative of runoff primarily from a major transportation corridor. The actual sampling location was in a manhole that had input from both the highway and from a side branch draining an

industrial area. The intended location of sampling was just upstream of this side branch, when inadvertently the actual sampling location was placed just downstream of this same branch. Thus, the samples collected were influenced by both the highway runoff (5 acres) and industrial land use runoff (13 acres).

- **Hwy 30 location sampled in Round 3B is renamed Hwy 30A** – The station was renamed to avoid confusion, since two stations with the same name but representing different drainage basins and land uses were sampled in Round 3A and 3B sampling.
- **WR-4* is renamed WR-3** - During Round 3A, the WR-4 sampling location was sampled at the wrong outfall due to multiple conflicting storm drainage and outfall maps. At the publication date of the Round 3A FSR, it was not known what outfall was sampled, so samples from the location sampled during Round 3A sampling were referred to at WR-4*. It has since be determined that outfall WR-3 was sampled in Round 3A, so WR-4* is renamed WR-3.

8.2 SUMMARY OF ROUND 3A AND 3B FLOW-WEIGHTED COMPOSITE STORMWATER SAMPLE

Table 8-1 summarizes all composite sampling activities conducted by LWG by site and storm event during Round 3A and 3B sampling.

8.3 SUMMARY OF ROUND 3A AND 3B GRAB STORMWATER SAMPLES

No additional grab samples were collected during Round 3B sampling. All grab samples required by the FSP were collected during Round 3A sampling. Table 8-2 shows a summary of all samples collected by site and storm event.

8.4 SUMMARY OF ROUND 3A AND 3B SEDIMENT TRAP SAMPLE

Table 8-3 shows the analyses that are being conducted for each sediment sample location collected by LWG and where detection limits will likely be elevated above the FSP targets due to limited sample volumes. In cases where sediment samples were collected during both Round 3A and 3B, the analyses are combined.

Table 3-4. Summary of Sediment Trap Inspections and Removals

Appendix	Outfall(s)	Facility or Location	Installation Date	1st Inspection			2nd Inspection			3rd Inspection ¹			Final Collection		
				Date	% Full	Notes	Date	% Full	Notes	Date	% Full	Notes	Date	% Full	Notes
O	OF-22B	City - Doane Lake Industrial Area	11/15/2007	12/11/2007	1/8"	Dark, flocculent material	1/3/2008	1/4"-1/2"	Loose flocculent sediment, bottles opaque and hard to see through. Terra Hydr modified wier to raise bottles 2.5". Bottle tops level with lip of wier	1/29/2008	?	Bottles were too opaque to determine sediment volume. Dark, stringy material was found on the outside of bottles. Everything had a strong sulfuric smell. Collected four bottles and replaced them with four new ones.	2/12/2008	1/8"-1/4"	Dark, stringy, flocculent sediment. Bottles were slightly opaque. Strong sulfur smell in bottles as well as coming out of the manhole. Collected four bottles.
T	WR-218	UPRR Albina	11/21/2007	12/11/2007	1/8"-3/4"	Very loose flocculent sediment	1/10/2008	Trace - 1/2"	Loose flocculent rust colored sediment.	1/30/2008	3/4"- 1"	Loose flocculent rusty material. Collected four bottles and replaced them with 4 new ones.	2/12/2008	1/8"	Loose, rusty flocculent material. Collected four bottles.
Multiple Land Use Locations (1)															
V	OF 18 ²	City - Multiple Land Uses	11/12/2007	12/10/2007	1/2-7/8 full	Consolidated, stratified layers of sandy sediment, organic material, and loose flocculent sediment BOTTLES ARCHIVED IN FIELD LAB	1/10/2008	3/4"-1.5"	Sandy sediment with some organic material. Top layer consisted of loose flocculent sediment. Removed all bottles to be archived, replaced with two tall and two short bottles.	1/28/2008	1/4"-1/2"	Dark, flocculent material. Collected four bottles and replaced them with two short bottles and two tall bottles.	2/11/2008	Tall - 1/4"-3/4" Short - 1/4"-3/4"	Loose, dark, flocculent material. Collected four bottles.

Notes:

¹ As discussed in Section 6.3, sediment trap bottles with more than trace sediment were removed at the end of January and replaced with new bottles.

² At Hwy 30A, Hwy 30B, and OF-18, some or all of the 1000-mL narrow mouth sediment trap bottles were replaced 500-mL narrow mouth bottles. These smaller bottles had the same size mouth opening but were shorter and therefore allowed stormwater runoff to overtop the bottles at sites with low water levels.

Table 4-4. Summary of Deviations/Anticipated Contingencies for Round 3B Stormwater Sampling Program.
(From Round 3A FSP and Round 3B FSP Addendum - deviations that carried through are noted, but not reiterated, here)

Sampling Activity	Deviations	Samples Affected	Impact of Deviation or Modification	Date of Stormwater Technical Meeting or Email where discussed.*
Collection of Field Blanks				
Collection of composite stormwater equipment rinsate blank.	A composite stormwater equipment rinsate blank was not collected on the ISCO tubing, sampling arm, and collection bottle during the Round 3B sampling event.	Composite samples at all locations.	An equipment blank was collected on the ISCO setup during the Round 3A event. The results were mostly non-detect with some analytes detected between the MDL and MRL; therefore this deviation is not expected to substantially impact the investigation.	Not discussed
Collection of sediment trap rinsate blank	A sediment trap rinsate blank was not collected during the Round 3B sampling events.	All sediment trap locations	A sediment trap rinsate blank was collected during the Round 3A event. The results were mostly non-detect with some analytes detected between the MDL and MRL; therefore this deviation is not expected to substantially impact the investigation.	Not discussed
Collection of sediment trap bottle blank	A sediment trap bottle blank was not collected during the Round 3B sampling events.	All sediment trap locations	A sediment trap rinsate blank was collected during the Round 3A event. The results were mostly non-detect with some analytes detected between the MDL and MRL; therefore this deviation is not expected to substantially impact the investigation.	Not discussed
Lab QC				
Collection of Lab Replicates	Additional volume for laboratory QC samples was not available for collection during any Round 3B stormwater sampling events.	Composite samples at all locations.	Reproducibility will not be able to be assessed, but this deviation should not substantially impact the investigation.	Not discussed
Stormwater Sample Collection/Processing				
Measurement of field water quality parameters	Field water quality parameters (i.e., temperature, pH, conductivity, turbidity and oxidation/reduction potential [ORP]) were not measured in the field for any stormwater samples. Water quality measurements were performed at the field lab from the composited sample if sufficient volume was collected. Other deviations included selected incidences when the field water quality parameters could not be collected due to limited sample volumes. Field water quality parameters were only collected during the November 16, 2007 sampling event.	Composite stormwater samples at all locations.	Field water quality parameters are not <i>in-situ</i> measurements. However, measurement in the field may not have been representative of the actual water used in the composite sample. All field parameters except turbidity and conductivity would be expected to be impacted by the compositing process. Additional discussion on impact of this change will be included in the associated data quality report.	Not discussed

Table 4-4. Summary of Deviations/Anticipated Contingencies for Round 3B Stormwater Sampling Program.
(From Round 3A FSP and Round 3B FSP Addendum - deviations that carried through are noted, but not reiterated, here)

Sampling Activity	Deviations	Samples Affected	Impact of Deviation or Modification	Date of Stormwater Technical Meeting or Email where discussed.*
Sediment Sample Processing				
Sediment samples frozen for holding	The FSP specifies holding samples at 4 degrees C and analysis within certain holding times. Due to ongoing discussions with the Stormwater Technical Team regarding how to best utilize limited sample volumes. It was discussed and agreed that the samples should be frozen so that the holding times in the FSP would no longer apply and the samples would be acceptable for analyses	All sediment trap locations	These change did not impact the investigation.	May 18, 2007 -- Notes from May 18 call and June 4 Stormwater Technical Team Conf. Call
Quality Assurance/Quality Control				
	Collection of QA/QC sediment trap samples followed FSP.			
Sample Storage				
Storage temperature quality control	Refrigeration units were not monitored daily. All refrigerator temperatures were verified prior to storage of any samples collected during a particular storm event. Refrigerators were generally monitored at least once per week during the stormwater sampling events.	Composite and sediment trap samples at all locations.	These changes did not impact the investigation. Monitoring that was conducted did not indicate any abnormalities with the refrigeration units.	Not discussed
Sampling Locations				
	Not all stations with less than the target three storm events were collected for analysis during Round 3B.			
Installation of the sampling location at actual WR-4 on the Sulzer site.	The actual location of WR-4 was determined during outfall verification and was sampled during the Round 3B sampling events.	WR-4	This location was needed in the calculation of unique pollutant loads from the Sulzer site.	November 30, 2007 regarding Sulzer sampling approach, Hwy 30B, Port of Portland Field Sampling Report, and Loading Methods.
No sediment traps were installed at WR-4	The FSP Addendum stated that, "Sediment traps will be installed at WR-4 if field reconnaissance shows that it is feasible." Filed reconnaissance determined that the outfall was submerged and the only access to the outfall pipe was through a catch basin with a 3.5-inch pipe in the bottom that connected into the main outfall pipe. This made installation of the sediment traps unfeasible.	WR-4	This change will impact the investigation because there will be no sediment data available for WR-4, which is in the unique site category.	November 30, 2007 regarding Sulzer sampling approach, Hwy 30B, Port of Portland Field Sampling Report, and Loading Methods.
Hwy 30 name change	Hwy 30 name change to Hwy 30A. Station name change to distinctly identify Hwy 30A location from the Hwy 30 station collected during the previous mobilization.	Hwy 30	This change helped clarify station location sampled.	February 26, 2008 regarding LWG Stormwater - REVISED Sediment Trap Prioritization.

Note:

* Minor or uncontrollable deviations typical of any sampling program were not necessarily discussed with the Stormwater Technical Team in advance.

MRL = method reporting limit

MDL = method detection limit

Notes:

¹ Detection limit factor shows how the target detection limit (DL) will be exceeded with the sample mass remaining. A factor of 1 means the target detection limit will be achieved. A factor of 2 means the actual DL will be two times higher than the target DL.

² No sediment was accumulated in the sediment traps at Arkema, so inline catch basin solids were collected.

³ Hwy 30B is described in the FSP Addendum (Anchor and Integral 2007c) as Hwy 30 at Reed Street.

Blank cells indicate that there was insufficient sample volume to conduct these analyses or for grain size the sample preservation requirements were not met because samples were frozen prior to analysis.

Shaded cell = no sediment trap samples collected during Round 3B sampling

Notes:

¹ During Round 3A sampling, WR-3 was sampled instead of WR-4.

² Station WR-145 moved WR-142 after first storm event.

³ Yeon-NW35 was referred to as Hwy 30 in the Round 3A FSP and FSR. The wrong location was sampled and it was changed to Yeon-Mixed Use.

-- = The FSP does not require analysis of this parameter for this station.

NC = Parameter not collected due logistical issues or because the sampling for this parameter was complete.

NA= Samples collected but not analyzed.

V	OF-18	City - Multiple Land Uses	1	1	1	1	1	1	1	
W	OF-19 (combined)	City - Multiple Land Uses	1	1	1	1	1	1	1	
K	Yeon NW35 ⁴	Hwy 30	1.8	1	1					

Notes:

¹ Detection limit factor shows how the target detection limit (DL) will be exceeded with the sample mass remaining. A factor of 1 means the target detection limit will be achieved. A factor of 2 means the actual DL will be two times higher than the target DL. These target detection limits are based on estimated mass of sediment, and actual detection limits will be determined at the laboratory. Actual detection limits may be higher or lower, or there may be insufficient sediment to measure an analyte.

² No sediment was accumulated in the sediment traps at Arkema, so inline catch basin solids were collected.

³ During Round 3A sampling, WR-3 was sampled instead of WR-4.

⁴ Yeon-NW35 was referred to as Hwy 30 in the Round 3A FSP and FSR. The wrong location was sampled and it was changed to Yeon-Mixed Use.

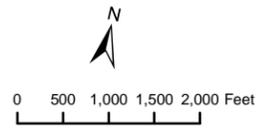

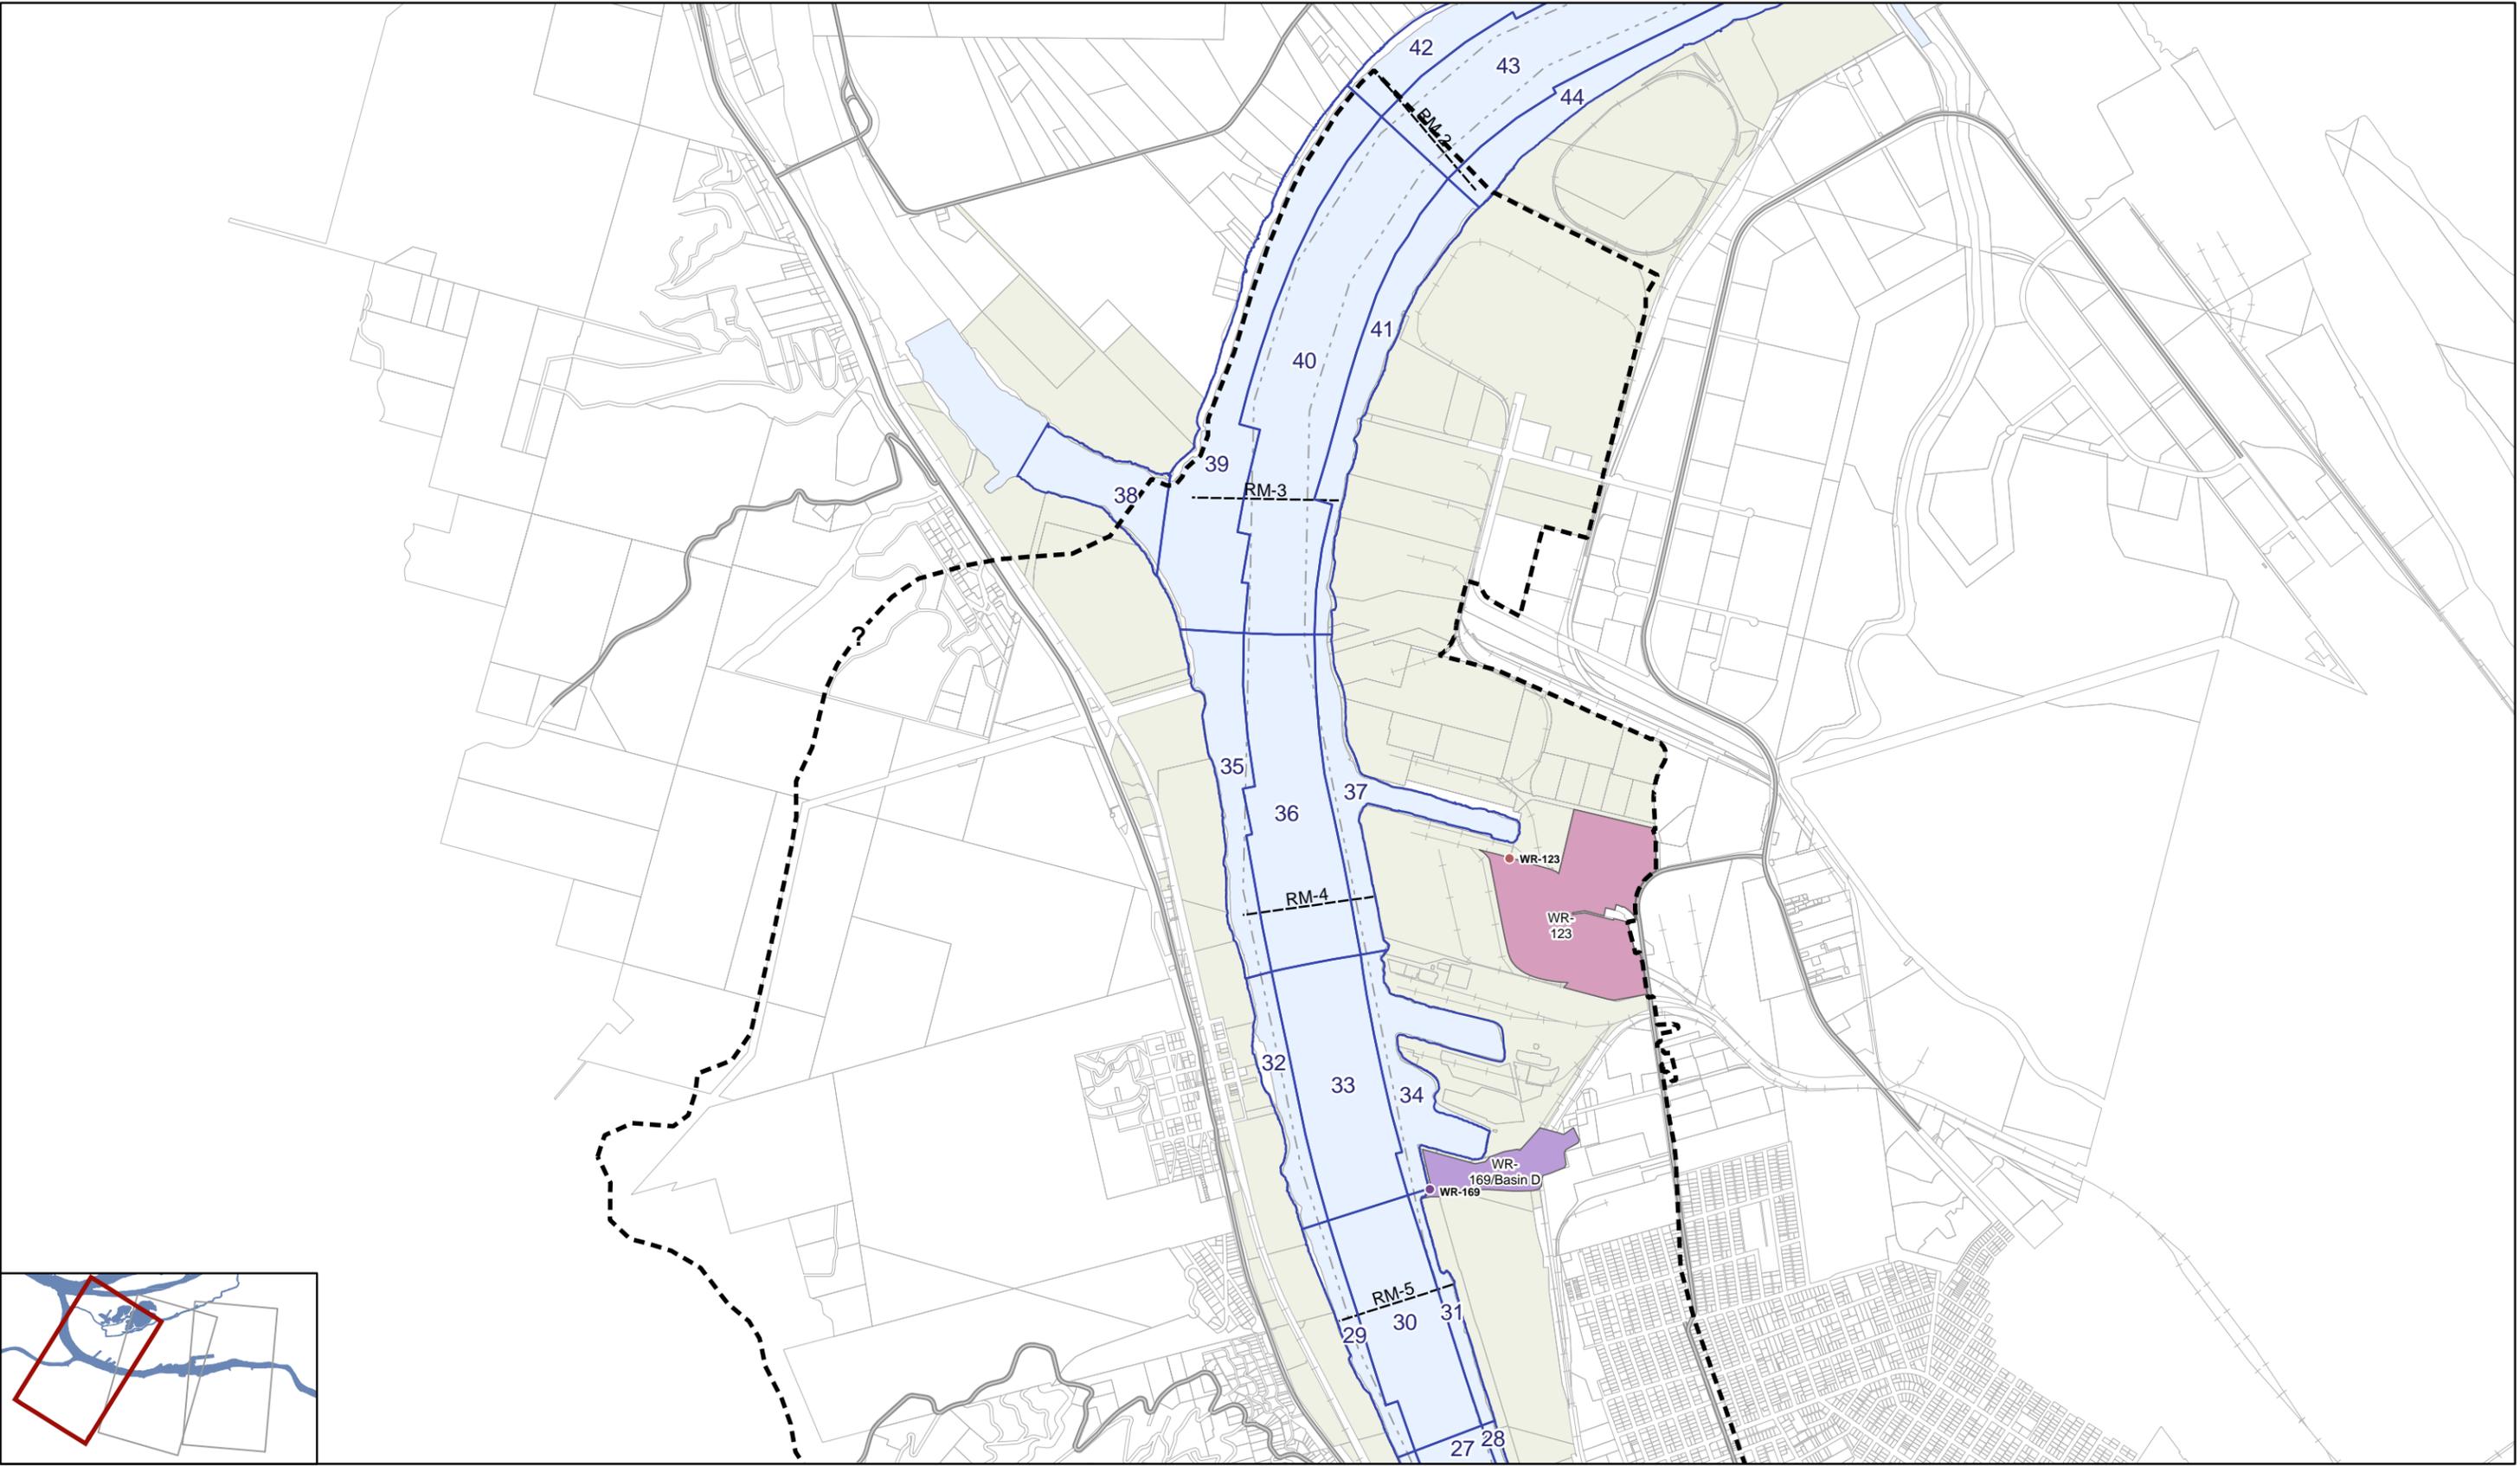

Blank cells indicate that there was insufficient sample volume to conduct these analyses.

Appendix B	WR-123 Schnitzer International Slip Site-Specific Sampling Report – Second Round Sampling
Appendix E	WR-96 Arkema Site-Specific Sampling Report – Second Round Sampling
Appendix F	WR-14 Chevron – Transportation Site-Specific Sampling Report – Second Round Sampling
Appendix G	WR-161 Portland Shipyard Site-Specific Sampling Report – Second Round Sampling
Appendix H	WR-4 Sulzer Pump Site-Specific Sampling Report – Second Round Sampling
Appendix I	WR-145/142 Gunderson Site-Specific Sampling Report – Second Round Sampling
Appendix J	WR-147 Gunderson (former Schnitzer) Site-Specific Sampling Report – Second Round Sampling
Appendix K	Yeon-Mixed Use Site-Specific Sampling Report – Second Round Sampling
Appendix L	OF-49 City Site-Specific Sampling Report – Second Round Sampling
Appendix N	OF-22C City Site-Specific Sampling Report – Second Round Sampling
Appendix O	OF-22B City Site-Specific Sampling Report – Second Round Sampling
Appendix T	WR-218 Albina - UPRR Site-Specific Sampling Report – Second Round Sampling
Appendix V	OF-18 City Site-Specific Sampling Report – Second Round Sampling
Appendix X	Highway 30 A Site-Specific Sampling Report – Second Round Sampling
Appendix Y	Highway 30 B Site-Specific Sampling Report – Second Round Sampling
Appendix Z	Field Chain of Custody/Compositing Forms
Appendix AA	EPA-LWG Communications
Appendix BB	Flowlink Data Output

Note: The naming and ordering of Appendices A to W has been kept consistent with the Round 3A FSR so that sampling sites can easily be referenced. Consequently, there are gaps in the appendix lettering that represent locations that were not sampled in Round 3B. Thus, Appendices A, C, D, M, P, Q, R, S, U, and W are not included in this document since no sampling occurred at these stations during Round 3B Sampling. In the Round 3A FSR, these appendices presented Site-Specific Sampling Reports for the following sites:

- APPENDIX A - WR-22 OSM Site-Specific Sampling Report
- APPENDIX C – WR-384 Schnitzer - Riverside Site-Specific Sampling Report

Appendix B – WR-123 Schnitzer International Slip Site-Specific Sampling Report – Second Round Sampling

This site specific sampling report describes the specific details for implementation of the FSP Addendum for the WR-123 outfall sampling location conducted in November 2007 through February 2008 (second round sampling). This report is based on field reconnaissance surveys and decisions made in the coordination with the Stormwater Technical Team. Refer to Round 3A Upland Stormwater Sampling Field Sampling Report Appendix B for information about additional sampling conducted during the first round of sampling in February through July of 2007 (first round sampling).

The following sampling activities were conducted at the WR-123 outfall sampling location, located at the manhole just upstream of the outfall on the Schnitzer site:

- Flow weighted composite sampling (first round only)
- Grab water sampling (first round only)
- Sampling of stormwater suspended sediments using sediment traps (first/second rounds)

This report contains the following information:

- Table B-1 – Key Parameters for Sampling Programming
- Table B-2 – Sediment Trap Sampling – Summary of Second Round Sampling Activities
- Figure B-1 – Drainage Basin and Sampling Location
- Figure B-2 – Diagram of Sample Equipment Setup
- Figure B-3 – Photographs of Installation
- Attachment B-1 – Reconnaissance Survey Data Sheet

Flowlink graphs show the rainfall, runoff data, and sample information for each storm. Runoff data includes level, velocity, and flow when available. For sample information, a red dot represents each time one aliquot of sample was taken. The bottles are represented by sample number. For example, the first 10 aliquots are taken in bottle 1, and then the graphs jumps up to represent filling bottle 2.

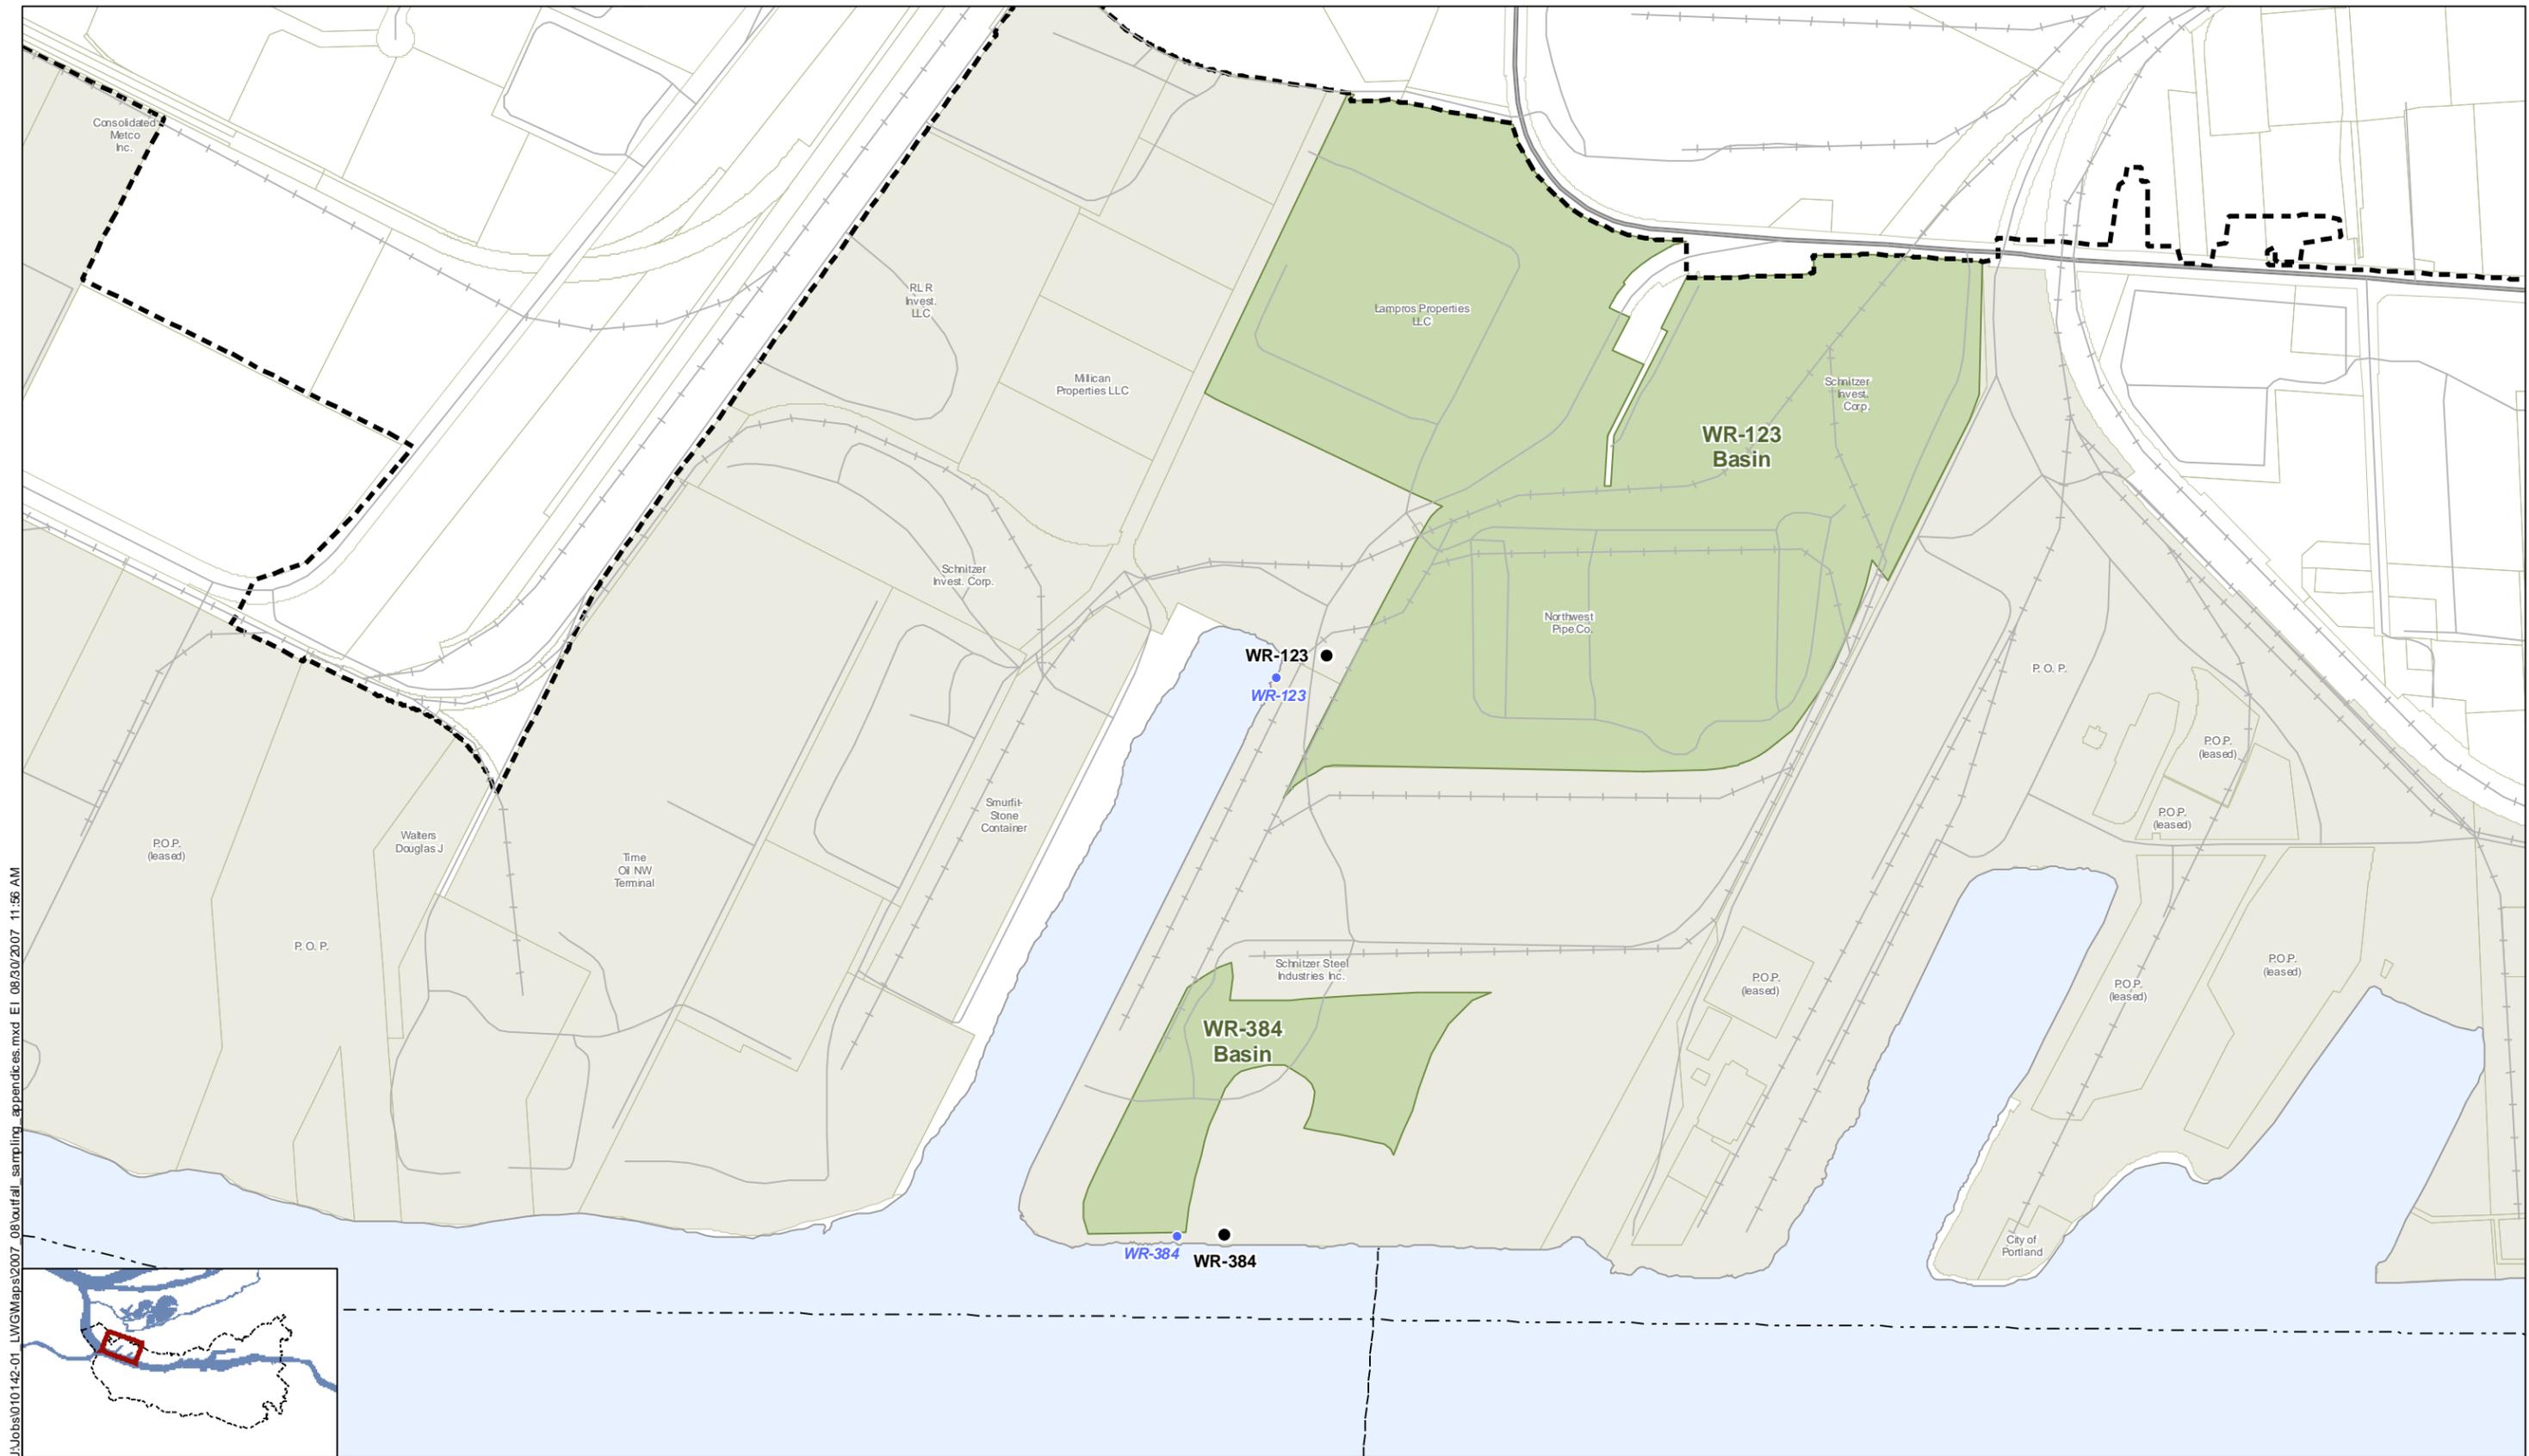

Table B-1. Key Parameters for Sampling Programming.

Parameter	
Site	WR-123: Schnitzer International Slip
Sampler Phone Number	206-450-8431
Outfall Pipe Size	48 in
Number of Bottles	8
Size of Bottles	1.8 L
Length of Pickup Tube	25 ft

Table B-2. Sediment Trap Sampling – Summary of Second Round Sampling Activities.

Action	Date	Depth of Sediment (in)	Observation/Notes
Installation	11/15/2007		
Interim Inspection 1	12/11/2007	1/8-3/4	Rusty loose flocculent sediment, very difficult to see through bottles and determine exact volume of sediment.
Interim Inspection 2	1/11/2008	Unknown	Bottles were so opaque and rust colored that it was impossible to determine the amount or type of sediment.
Interim Inspection 3	1/30/2008	Unknown	Bottles were stained a rusty color. Water inside was rusty and opaque and sediment volume was undeterminable. Collected four bottles and replaced with new ones.
Final Removal	2/13/2008	Unknown	Loose, rusty flocculent material. Collected four bottles.

APPENDIX E

WR-96
Arkema
Site-Specific Sampling Report

Appendix E – WR-96 Arkema Site-Specific Sampling Report – Second Round Sampling

This site specific sampling report describes the specific details for implementation of the FSP Addendum for the WR-96 outfall sampling location conducted in November 2007 through February 2008 (second round sampling). This report is based on field reconnaissance surveys and decisions made in the coordination with the Stormwater Technical Team. Refer to Round 3A Upland Stormwater Sampling Field Sampling Report Appendix E for information about additional sampling conducted during the first round of sampling in February through July of 2007 (first round sampling).

The following sampling activities were conducted at the WR-96 outfall sampling location, located at the outfall on the bank of the LWR:

- Flow weighted composite sampling (first/second rounds)
- Grab water sampling (first round only)
- Sampling of stormwater suspended sediments using sediment traps (first/second rounds)

This report contains the following information:

- Table E-1 – Key Parameters for Sampling Programming
- Table E-2 – Composite Sampling – Sampling Details for Each Second Round Event
- Table E-3 – Composite Sampling – Estimated Runoff Quantity Calculations
- Table E-4 – Composite Sampling – Summary and Compositing of Second Round Sampling Activities

Site-Specific Sampling Report

Appendix H – WR-4 Sulzer Pump Site-Specific Sampling Report – Second Round Sampling

This site specific sampling report describes the specific details for implementation of the FSP Addendum for the WR-4 outfall sampling location conducted in November 2007 through February 2008 (second round sampling). This report is based on field reconnaissance surveys and decisions made in the coordination with the Stormwater Technical Team. Refer to Round 3A Upland Stormwater Sampling Field Sampling Report Appendix H for information about additional sampling conducted during the first round of sampling in February through July of 2007 (first round sampling).

The following sampling activities were conducted at the WR-4 outfall sampling location, located at the outfall on the bank of the LWR:

- Flow weighted composite sampling (first/second rounds)
- Sampling of stormwater suspended sediments using sediment traps (first round only)

This report contains the following information:

- Table H-1 – Key Parameters for Sampling Programming
- Table H-2 – Composite Sampling – Sampling Details for Each Second Round Event
- Table H-3 – Composite Sampling – Estimated Runoff Quantity Calculations
- Table H-4 – Composite Sampling – Summary and Compositing of Second Round Sampling Activities
- Table H-5 – Composite Sampling – Second Round Compositing Calculations
- Table H-6 – Sediment Trap Sampling – Summary of Second Round Sampling Activities
- Figure H-1 – Drainage Basin and Sampling Location
- Figure H-2 – Diagram of Sample Equipment Setup
- Figure H-3 – Photographs of Installation
- Figure H-4 – Flowlink Graph (01/11/08)
- Figure H-5 – Flowlink Graph (01/15/08)
- Figure H-6 – Flowlink Graph (01/30/08)

Flowlink graphs show the rainfall, runoff data, and sample information for each storm. Runoff data includes level, velocity, and flow when available. For sample information, a red dot represents each time one aliquot of sample was taken. The bottles are represented

DO NOT QUOTE OR CITE

**This document is currently under review by U.S. EPA and its federal, state and tribal partners and is
subject to change in whole or in part**

by sample number. For example, the first 10 aliquots are taken in bottle 1, and then the graphs jumps up to represent filling bottle 2.

Table H-4. Composite Sampling – Summary and Compositing of Second Round Sampling Activities.

Sample Event ID	Date Collected	Retrieval Time	Composite Instructions	Notes
LW3-STW2-CW10-WR4	1/11/2008	830	A - 1226 ml	A,B - 110% full, clear.
			B - 1741 ml	
			C - 80 ml	C - 5% full, clear.
			D - 1132 ml	D - 70% full, clear.
			E, F, G, H – discard*	E - 10% full, clear. F - 5% full, clear. G -20% full, clear. H - 2% full, clear.
LW3-STW2-CW20-WR4	1/15/2008	1320	A - collect sample for TSS and TOC	A - 80% full, clear with dusting of sediment. B-H - 0% full.
No sample	1/28/2007	920	A, B-discard	A - 100% full, clear. B - 10% full, clear. C, D, E, F, G, H - 0% full.
LW3-STW2-CW30-WR4	1/30/2008	1200	A - 834 ml	A, B, C - 100% full, clear with trace sediment.
			B - 1233 ml	
			C - 1950 ml	
			D - 928 ml	D - 110% full, clear with less sediment.
			E - 315 ml	E - 30% full, clear.
F, G, H - blank	F, G, H - 0% full.			

*Bottles E, F, G, H were discarded because due to very low liquid levels, the sampler failed to collect water each time it sampled...therefore it would be difficult to composite correctly. By using the samples from bottles A, B, C, and D, FSP requirements were still met because more than 50% of the storm was sampled, and portions of both the rising and falling limbs of the hydrograph were sampled. The sampled portion of the storm (collected in bottles A, B, C, and D) is approximately 20,000 gallons out of a total storm volume of 26,000 gallons, which is 75% of the storm. Additionally, bottle C had limited volume, so could only contribute 3% instead of 20%. However, overall over 50% of storm was sampled so it should still be considered a representative sample.

Table H-5. Composite Sampling – Second Round Compositing Calculations.

Date	Bottle	Total Flow in Time Period (gal) ¹ ; Total Level During Time Period (ft in 5 minute increments) ²	Volume of Sample in Jar (mL)	Jar Contribution to Sample	Volume from Jar (mL)	Normalized to Largest Bottle Volume (mL)
1/11/2008 ¹	A	962	1900	0.24	1226	1226
	B	1366	1910	0.34	1741	1741
	C	786	80	0.20	1002	80
	D	888	1210	0.22	1132	1132
	Total	4002	5100	1	5100	2952
1/30/2008 ²	A	0.80	1945	0.16	1336	834
	B	1.19	1950	0.23	1975	1233
	C	1.88	1950	0.37	3123	1950
	D	0.89	1930	0.18	1486	928
	E	0.30	650	0.06	504	315
	Total	5.06	8425.00	1.00	8425.00	5259.91

Note: 1. Indicates that for the dates denoted the compositing calculations were based on the total flow in gallons during the time period

2. Indicates that for the dates denoted the compositing calculations were based on the total level in feet (in 5 minute increments) during the time period

Appendix J – WR-147 Gunderson (former Schnitzer) Site-Specific Sampling Report – Second Round Sampling

This site specific sampling report describes the specific details for implementation of the FSP Addendum for the WR-147 outfall sampling location conducted in November 2007 through February 2008 (second round sampling). This report is based on field reconnaissance surveys and decisions made in the coordination with the Stormwater Technical Team. Refer to Round 3A Upland Stormwater Sampling Field Sampling Report Appendix J for information about additional sampling conducted during the first round of sampling in February through July of 2007 (first round sampling).

The following sampling activities were conducted at the WR-147 outfall sampling location, located in a catch basin directly upstream of the outfall on the Gunderson site:

- Flow weighted composite sampling (first round only)
- Sampling of stormwater suspended sediments using sediment traps (first/second rounds)

This report contains the following information:

- Table J-1 – Key Parameters for Sampling Programming
- Table J-2 – Sediment Trap Sampling – Summary of Second Round Sampling Activities
- Figure J-1 – Drainage Basin and Sampling Location
- Figure J-2 – Diagram of Sample Equipment Setup
- Figure J-3 – Photographs of Installation
- Attachment J-1 – Reconnaissance Survey Data Sheet

Flowlink graphs show the rainfall, runoff data, and sample information for each storm. Runoff data includes level, velocity, and flow when available. For sample information, a red dot represents each time one aliquot of sample was taken. The bottles are represented by sample number. For example, the first 10 aliquots are taken in bottle 1, and then the graphs jumps up to represent filling bottle 2.

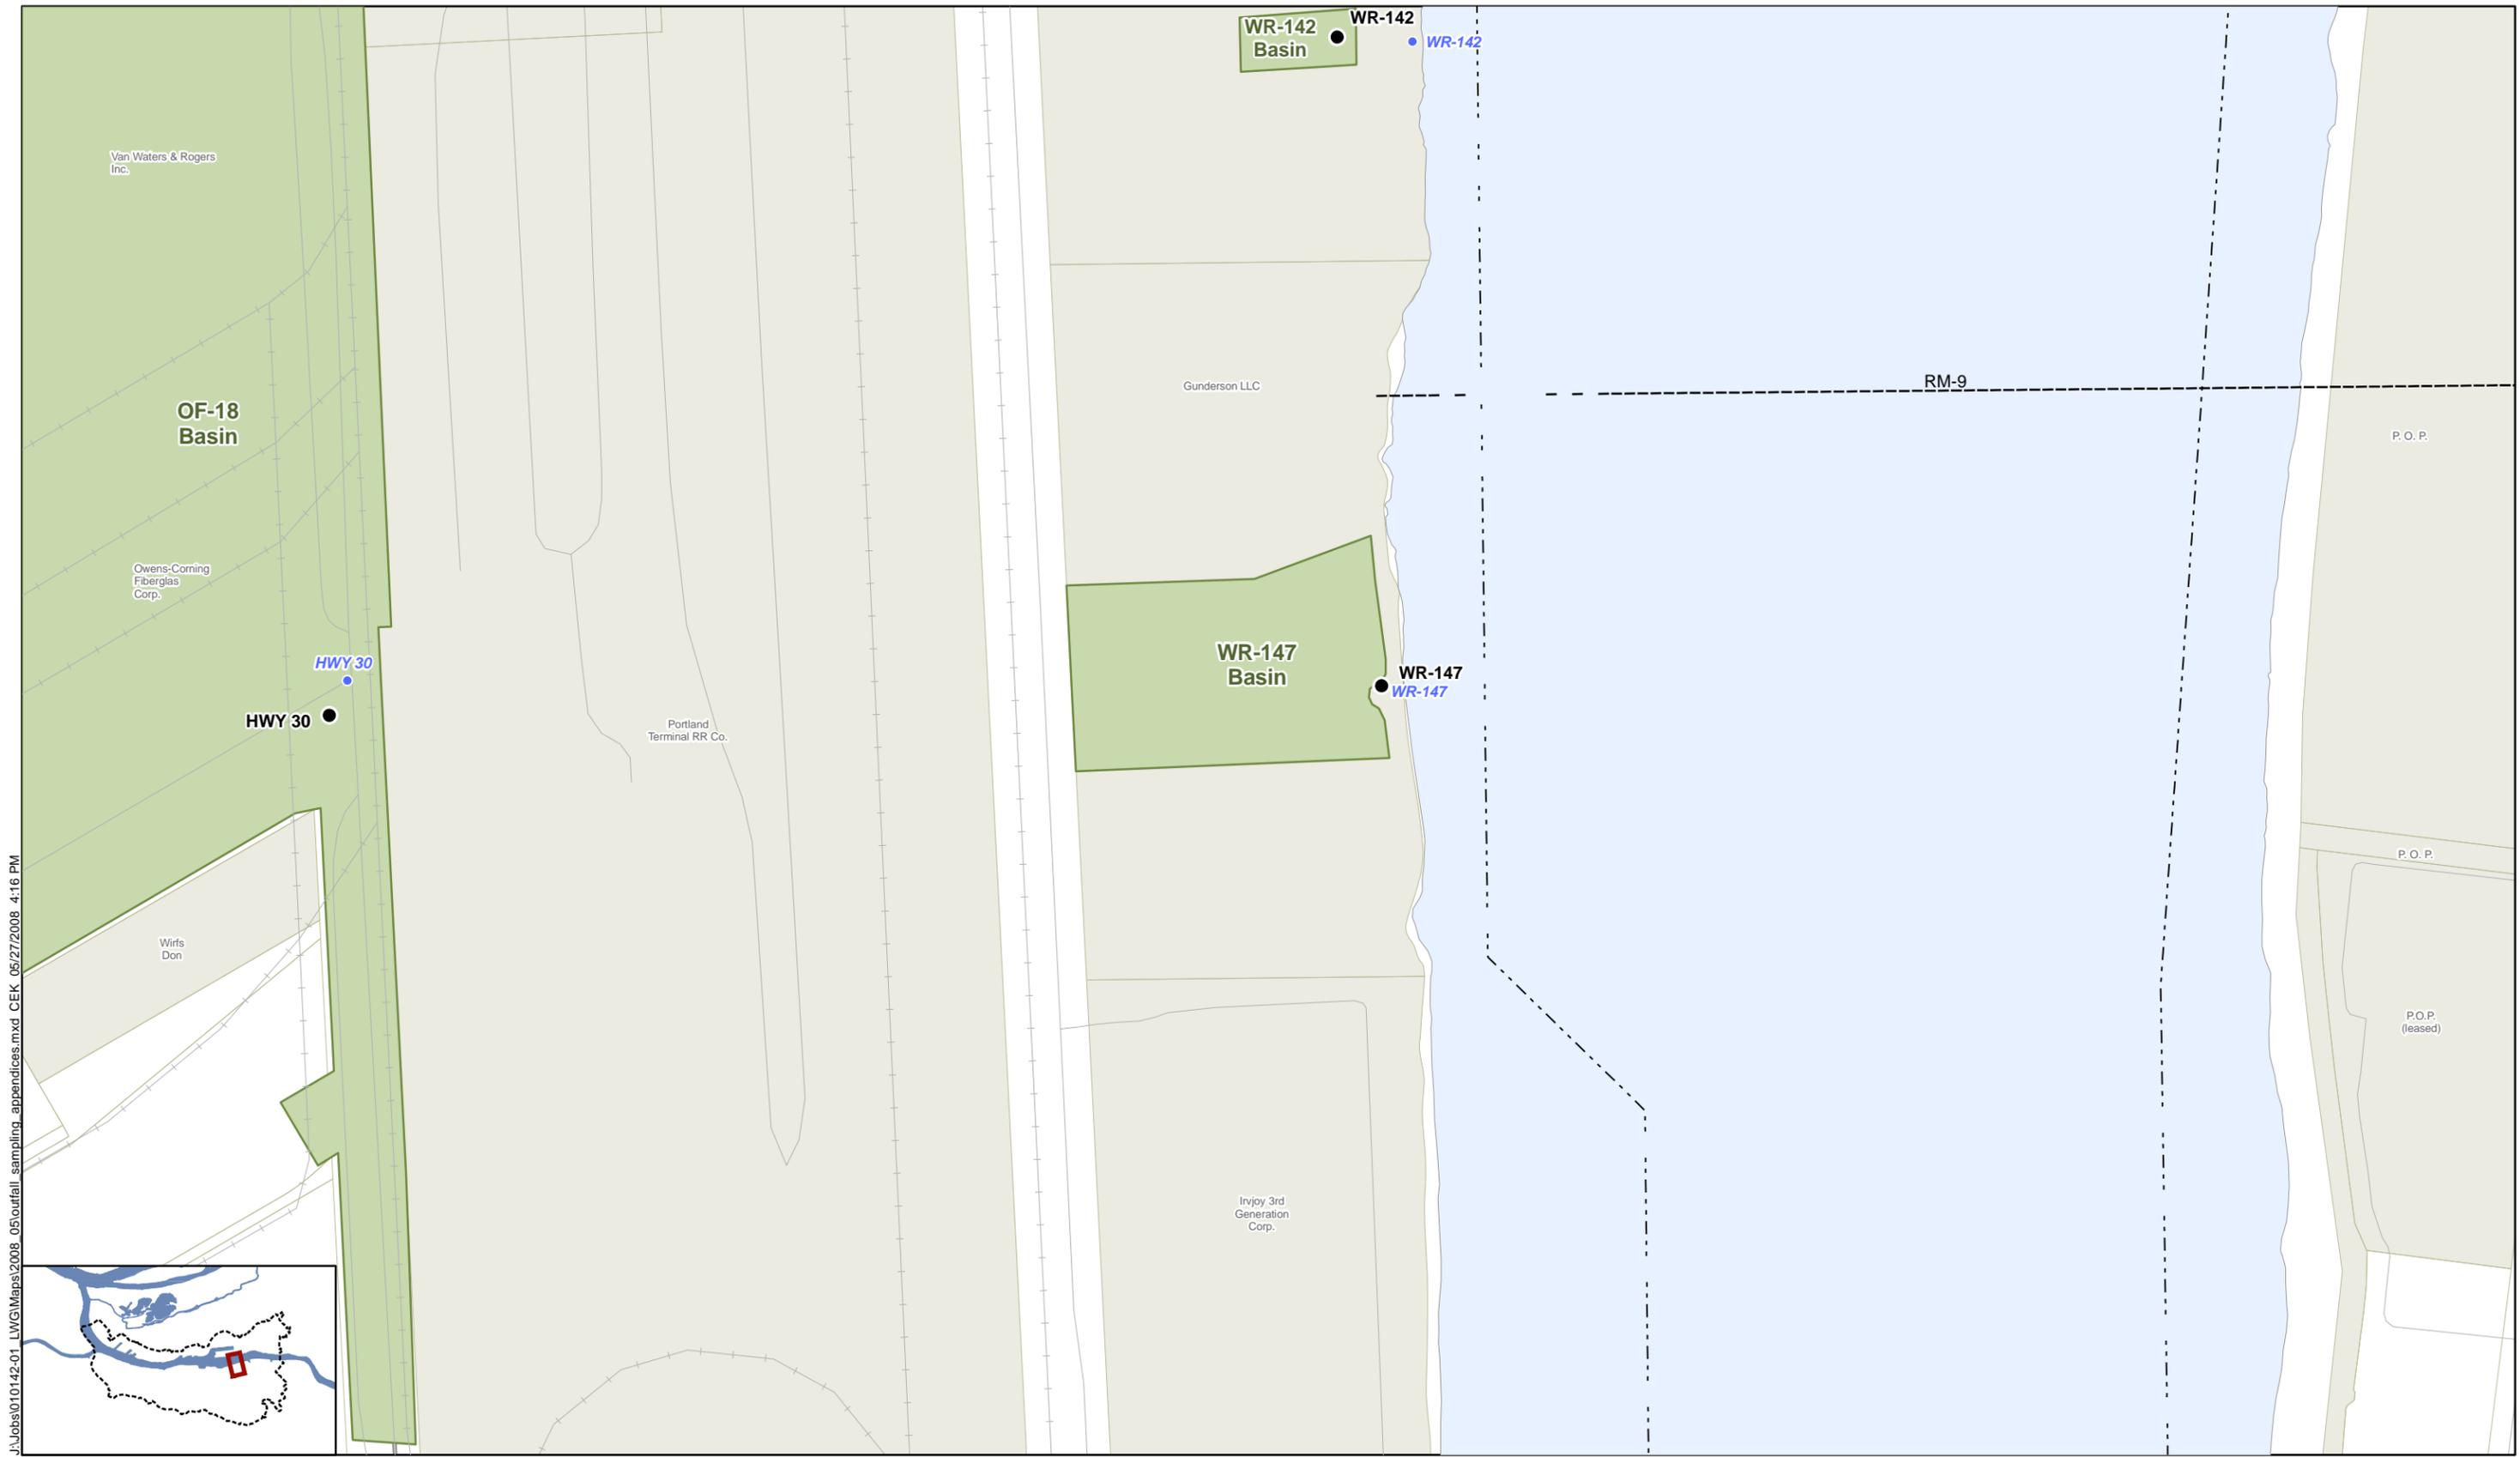

Table J-1. Key Parameters for Sampling Programming.

Parameter	
Site	WR-147: Gunderson (former Schnitzer)
Sampler Phone Number	206-450-0653
Outfall Pipe Size	5.5 in
Number of Bottles	8
Size of Bottles	1.8 L
Length of Pickup Tube	25 ft

Table J-2. Sediment Trap Sampling – Summary of Second Round Sampling Activities.

Action	Date	Depth of Sediment (in)	Observation/Notes
Installation	11/14/2007		
Interim Inspection 1	12/10/2007	1/8-1/4	Dark flocculent sediment.
Interim Inspection 2	1/9/2008	1/8-1/2	Dark flocculent sediment. Bottles opaque and hard to see through.
Interim Inspection 3	1/29/2008	1/4	Dark, flocculent material. Collected four bottles and replaced them with four new bottles.
Final Removal	2/11/2008	Trace-1/4	Dark, loose flocculent material. Collected four bottles.

APPENDIX L

OF-49
City
Site-Specific Sampling Report

Appendix L – OF-49 City Site-Specific Sampling Report – Second Round Sampling

This site specific sampling report describes the specific details for implementation of the FSP Addendum for the OF-49 outfall sampling location conducted in November 2007 through February 2008 (second round sampling). This report is based on field reconnaissance surveys and decisions made in the coordination with the Stormwater Technical Team. Refer to Round 3A Upland Stormwater Sampling Field Sampling Report Appendix L for information about additional sampling conducted during the first round of sampling in February through July of 2007 (first round sampling).

The following sampling activities were conducted at the OF-49 outfall sampling location, located in the City of Portland manhole AAG-669 upstream of the outfall:

- Flow weighted composite sampling (first/second rounds)
- Sampling of stormwater suspended sediments using sediment traps (first/second rounds)

This report contains the following information:

- Table L-1 – Key Parameters for Sampling Programming
- Table L-2 – Composite Sampling – Sampling Details for Each Second Round Event
- Table L-3 – Composite Sampling – Estimated Runoff Quantity Calculations
- Table L-4 – Composite Sampling – Summary and Compositing of Second Round Sampling Activities

APPENDIX N

OF-22C
City
Site-Specific Sampling Report

Appendix N – OF-22C City Site-Specific Sampling Report – Second Round Sampling

This site specific sampling report describes the specific details for implementation of the FSP Addendum for the OF-22C outfall sampling location conducted in November 2007 through February 2008 (second round sampling). This report is based on field reconnaissance surveys and decisions made in the coordination with the Stormwater Technical Team. Refer to Round 3A Upland Stormwater Sampling Field Sampling Report Appendix N for information about additional sampling conducted during the first round of sampling in February through July of 2007 (first round sampling).

The following sampling activities were conducted at the OF-22C outfall sampling location, located upstream of the outfall in City of Portland manhole AAJ 602:

- Flow weighted composite sampling (first/second rounds)
- Sampling of stormwater suspended sediments using sediment traps (first round only)

This report contains the following information:

- Table N-1 – Key Parameters for Sampling Programming
- Table N-2 – Composite Sampling – Sampling Details for Each Second Round Event
- Table N-3 – Composite Sampling – Estimated Runoff Quantity Calculations
- Table N-4 – Composite Sampling – Summary and Compositing of Second Round Sampling Activities

Site-Specific Sampling Report

Appendix O – OF-22B City Site-Specific Sampling Report – Second Round Sampling

This site specific sampling report describes the specific details for implementation of the FSP Addendum for the OF-22B outfall sampling location conducted in November 2007 through February 2008 (second round sampling). This report is based on field reconnaissance surveys and decisions made in the coordination with the Stormwater Technical Team. Refer to Round 3A Upland Stormwater Sampling Field Sampling Report Appendix O for information about additional sampling conducted during the first round of sampling in February through July of 2007 (first round sampling).

The following sampling activities were conducted at the OF-22B outfall sampling location, located upstream of the outfall in City of Portland manhole AAJ 650:

- Flow weighted composite sampling (first/second rounds)
- Grab water sampling (first round only)
- Sampling of stormwater suspended sediments using sediment traps (first/second rounds)

This report contains the following information:

- Table O-1 – Key Parameters for Sampling Programming
- Table O-2 – Composite Sampling – Sampling Details for Each Second Round Event
- Table O-3 – Composite Sampling – Estimated Runoff Quantity Calculations
- Table O-4 – Composite Sampling – Summary and Compositing of Second Round Sampling Activities
- Table O-5 – Composite Sampling – Second Round Compositing Calculations
- Table O-6 – Sediment Trap Sampling – Summary of Second Round Sampling Activities
- Figure O-1 – Drainage Basin and Sampling Location

This document is currently under review by U.S. EPA and its federal, state and tribal partners and is subject to change in whole or in part

Flowlink graphs show the rainfall, runoff data, and sample information for each storm. Runoff data includes level, velocity, and flow when available. For sample information, a red dot represents each time one aliquot of sample was taken. The bottles are represented by sample number. For example, the first 10 aliquots are taken in bottle 1, and then the graphs jumps up to represent filling bottle 2.

Table O-6. Sediment Trap Sampling – Summary of Second Round Sampling Activities.

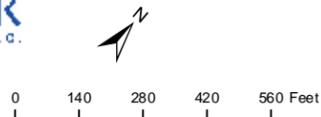

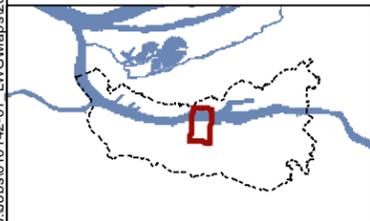

Action	Date	Depth of Sediment (in)	Observation/Notes
Installation	11/15/2007		
Interim Inspection 1	12/11/2007	1/8"	Dark, flocculent material
Interim Inspection 2	1/3/2008	1/4-1/2"	Loose flocculent sediment, bottles opaque and hard to see through. Terra Hydr modified weir to raise bottles 2.5". Bottle tops level with lip of weir.
Interim Inspection 3	1/29/2008	Unknown	Bottles were too opaque to determine sediment volume. Dark, stringy material was found on the outside of bottles. Everything had a strong sulfuric smell. Collected four bottles and replaced them with four new ones.
Final Removal	2/12/2008	1/8-1/4	Dark, stringy, flocculent sediment. Bottles were slightly opaque. Strong sulfur smell in bottles as well as coming out of the manhole. Collected four bottles.

APPENDIX T

WR-218

Albina - UPRR

Site-Specific Sampling Report

Appendix T – WR-218 Albina - UPRR Site-Specific Sampling Report – Second Round Sampling

This site specific sampling report describes the specific details for implementation of the FSP Addendum for the WR-218 outfall sampling location conducted in November 2007 through February 2008 (second round sampling). This report is based on field reconnaissance surveys and decisions made in the coordination with the Stormwater Technical Team. Refer to Round 3A Upland Stormwater Sampling Field Sampling Report Appendix T for information about additional sampling conducted during the first round of sampling in February through July of 2007 (first round sampling).

The following sampling activities were conducted at the WR-218 outfall sampling location, located in a manhole upstream of the outfall on the UPRR site:

- Flow weighted composite sampling (first/second rounds)
- Sampling of stormwater suspended sediments using sediment traps (first/second rounds)

This report contains the following information:

- Table T-1 – Key Parameters for Sampling Programming
- Table T-2 – Composite Sampling – Sampling Details for Each Second Round Event
- Table T-3 – Composite Sampling – Estimated Runoff Quantity Calculations
- Table T-4 – Composite Sampling – Summary and Compositing of Second Round Sampling Activities
- Table T-5 – Composite Sampling – Second Round Compositing Calculations
- Table T-6 – Sediment Trap Sampling – Summary of Second Round Sampling Activities

Flowlink graphs show the rainfall, runoff data, and sample information for each storm. Runoff data includes level, velocity, and flow when available. For sample information, a red dot represents each time one aliquot of sample was taken. The bottles are represented by sample number. For example, the first 10 aliquots are taken in bottle 1, and then the graphs jumps up to represent filling bottle 2.

APPENDIX Y

Hwy 30 B
Highway 30 B
Site-Specific Sampling Report

Appendix Y – Highway 30 B Site-Specific Sampling Report – Second Round Sampling

This site specific sampling report describes the specific details for implementation of the FSP Addendum for the Hwy 30 B outfall sampling location conducted in November 2007 through February 2008 (second round sampling). This report is based on field reconnaissance surveys and decisions made in the coordination with the Stormwater Technical Team. The following sampling activities were conducted at the Hwy 30 B outfall sampling location, located in a manhole at Highway 30 at Reed Street:

- Flow weighted composite sampling (second round only)
- Sampling of stormwater suspended sediments using sediment traps (second round only)

This report contains the following information:

- Table Y-1 – Key Parameters for Sampling Programming
- Table Y-2 – Composite Sampling – Sampling Details for Each Second Round Event
- Table Y-3 – Composite Sampling – Estimated Runoff Quantity Calculations
- Table Y-4 – Composite Sampling – Summary and Compositing of Second Round Sampling Activities
- Table Y-5 – Composite Sampling – Second Round Compositing Calculations
- Table Y-6 – Sediment Trap Sampling – Summary of Second Round Sampling Activities
- Figure Y-1 – Drainage Basin and Sampling Location
- Figure Y-2 – Diagram of Sample Equipment Setup
- Figure Y-3 – Photographs of Installation
- Figure Y-4 – Flowlink Graph (11/27/07)
- Figure Y-5 – Flowlink Graph (01/11/08)
- Figure Y-6 – Flowlink Graph (01/15/08)
- Figure Y-7 – Flowlink Graph (01/28/08)
- Figure Y-8 – Flowlink Graph (01/30/08)

Flowlink graphs show the rainfall, runoff data, and sample information for each storm. Runoff data includes level, velocity, and flow when available. For sample information, a red dot represents each time one aliquot of sample was taken. The bottles are represented

Subject: Next Call Sept 14th at 1:15pm

Stormwater Technical Team

The next call will be on September 14th starting at 1:15 pm with the same call in number: 1-866-866-2244
6761834#

At the last meeting we previously discussed having some different formats of summary completeness data that focused more on categories of land uses that will be relevant to loading calculations. Anchor and Integral worked with the City to develop the attached tables. My apologies for not getting this out sooner.

Data Complete
Summary3.xls (10...

The tables include three types of summaries: one for stormwater, one for sediments, and one for a summary of both. There are some nuances for all tables that I will need to go over during the start of the call. However, one thing that may stand out for you is the stormwater table, which looks at the number of completed samples in two ways. The first way is looking at the sites on an individual basis such that actual samples over the planned number of samples (usually 3) for that site are not calculated to contribute to the total for that land use category. The second way is to look at land use groups as a group and just tally the total number of samples across all groups. The City suggested that this differentiation may be important, and they can explain more about why during the call.

I suggest our agenda for this call is similar to the last one, but with the benefit of having these additional tables. Therefore, the agenda is still:

1. Discuss data adequacy as it relates to FSP Rationale Objectives.
2. If the objectives are not adequately met, discuss if there is a need for more sampling in the fall to better meet these objectives.

Talk to you soon.

Carl

Subject: Highlights Stormwater Technical Team Call Thursday Aug. 23rd at 1 pm

Stormwater Technical Team –

As promised here are highlights from the last call. As always, please let me know if I missed something important.

The next call will be on September 14th starting at 1:15 pm with the same call in number: 1-866-866-2244
6761834#

The three agenda items noted in the email below were discussed.

The first agenda item was to resolve the sediment trap sample handling approach. It was agreed that the approach reflected in the sediment trap summary table provided for the call would be used. LWG members noted that this approach would have to undergo formal LWG Exec approval before the samples would be released for lab analysis. We expect that approval to be discussed on by LWG Exec on August 29th.

The second and third agenda items (regarding data adequacy to meet FSP objectives and any additional sampling needs) was discussed pretty much as a one topic and a variety of concepts were raised and discussed. It was agreed that further data analysis and summarization was needed in order for the group to reach an opinion(s) on the adequacy of the data set. The LWG consultants (Anchor and Integral) with assistance from the City agreed to work on some additional data summarization approaches for presentation to the team. The primary items discussed were:

- In general, organize the completeness data (samples/analytes collected by station) by land use type and site specific (for some industrial sites) categories
- This would be organized separately for stormwater composite samples and sediment trap samples. Then a combined analysis—looking at completeness across these sample types—would also be prepared.
- This would include also reviewing how some specific industrial sites might be used as representative of the heavy industry category in general for some chemicals. For example, pesticides from the Gasco site, which is primarily a PAH site.

It was also discussed that the above analysis could move into examining the actual data (e.g., amounts of detects, magnitude of detects, incidence of blank contamination or other sampling artifacts, variability seen within field replicates etc.) and this might provide additional insight into data adequacy for FSP objectives. However, it was generally agreed that such an analysis would take longer and would not be included in the above initial tasks.

The LWG consultants will work on this with the City such that it can be issued about a week prior to the next call (targeting September 7).

DO NOT QUOTE OR CITE

This document is currently under review by U.S. EPA and its federal, state and tribal partners and is subject to change in whole or in part.

After the call Kristine Koch provided some additional data analysis along the lines of that discussed during the call and summarized the following general concepts that should be examined:

- 1) The number of minimum samples needed for each land use.
- 2) A review of the data to see if the data gaps need to be filled. An example here is metals for mixed land use: There are 17 total water, 12 dissolved water, and 1 sediment trap. Do we need more solids samples or is this enough information?
- 3) A review of the actual analytical data to see if there are other data gaps.

As noted above, the LWG consultants expect to start by focusing on these first two items, at least for right now.

Thanks.

Carl

Subject: RE: Stormwater Technical Team Call Thursday Aug. 23rd at 1 pm

Stormwater Technical Team -

<< File: B010162_Blanks_Phathalates.xls >> << File: Storm Sample Matrix with T4 and GE.xls >> << File: Sediment Trap Summary Est.xls >>

We are having a call at 1 pm tomorrow (Aug. 23). Please use the following call in number:

1-866-866-2244
6761834#

DO NOT QUOTE OR CITE

This document is currently under review by U.S. EPA and its federal, state and tribal partners and is subject to change in whole or in part.

Items on the agenda are:

1. Resolve additional proposal for sediment trap sample handling per City emails since last call.
2. Discuss data adequacy as it relates to FSP Rationale Objectives. The objective are: (with some text explanation of how the data will be used excerpted from the rationale):
 - a. Stormwater contribution to fish tissue burdens: "Thus, it is necessary to determine the relative contribution of stormwater (as compared to other sources) to surface water concentrations of selected chemicals in the harbor. For stormwater, this would be done in terms of loading estimates."
 - b. Stormwater contribution to recontamination potential: "To predict whether sediments would recontaminate at levels above the PRGs that will eventually be set for the Site, estimates of stormwater loads are needed for input into estimation tools and models described in Section 1.3; these load estimates must be on a spatial scale consistent with those estimation tools and models. The load estimates should be accompanied by partitioning measurements to assist in the estimation of chemical mass associated with particulates (that may settle to the sediment bed) versus dissolved mass."Atja
3. If the objectives are not adequately met, discuss if there is a need for more sampling in the fall to better meet these objectives.

With regards to the first item, the group requested via email an analysis of whether the phthalates in stormwater were likely a result of blank contamination or similar sampling artifacts. Attached is a table that summarizes this data analysis. In summary, slightly over one-half (155 of 306 results) of the stormwater results from all sampling events were qualified as estimated or undetected because of detections of phthalates in laboratory and field blanks. The stormwater blank results are attached.

With regards to the second and third items, attached are two tables summarizing the number of samples collected (and analytes for those samples) for all sites including the seven T-4 sites and GE Decommissioning site.

Talk to you tomorrow.

Carl

NA - Indicates that samples for this analyte were not planned on being collected for this site. Zeros indicate that samples were planned but none were successfully completed.

*These samples were collected at a junction location that likely includes contributions from non-highway drainage area and may not be fully representative of exclusively major transportation runoff.

Indicates that less than planned number of samples were taken for this analyte, which is also an AOPC risk driver.

*Detection limit factor shows how the target detection limit (DL) will be exceeded with the sample mass remaining. A factor of 1 means the target detection limit will be achieved. A factor of 2 means the actual DL will be two times higher than the target DL.

NA - Indicates that samples for this analyte were not planned on being collected for this site. Blanks indicate that samples were planned but none were successfully completed.

**These samples were collected at a junction location that likely includes contributions from non-highway drainage area and may not be fully representative of exclusively major transportation runoff.

Subject: RE: Stormwater Technical Team Call October 16 at 1:00 pm

Stormwater Technical Team –

Elements of Loading 20071010_summar 20071011_figures_ 20071012_figures_
Analysis O... y_stats_tables_... by_outfall.pd... by_land_use.p...

Attached are some data summaries to facilitate our next call. In addition, there is a summary of loading estimate calculation method options that was also requested by the team. My suggestion for an agenda based email traffic since our last meeting is:

- Finalize recommendations for fall stormwater/sediment trap sampling
 - Review data summaries
 - Discuss work anticipated at GE and T4 sites and how that fits in
 - Decide on any changes to recommendations
- Discuss path forward to seek approvals and schedule for implementation
- Discuss stormwater loading calculation methods (if time allows)
- Determine next meeting time and content

Also, note that we are planning on providing one additional data table that may be helpful to the group, but that will likely not be available until late today or Monday.

Thanks.

Carl

Subject: Stormwater Technical Team Call October 16 at 1:00 pm

Stormwater Technical Team -

The next call is on October 16th at 1:00 pm as Amanda Shellenberger previously noted. The call in number will be 1-866-866-2244 passcode: 6761834#. (Jessica - Please confirm to me that this number is OK for this time.)

I also wanted to mention that the LWG has been discussing the scheduling of the additional stormwater work currently under consideration. Basically, the work would need to be completed by Dec. 31, 2007 in order for the overall RI/FS project to stay on schedule. Given Kristine's comments (copied below) regarding potential for more data needs based on review of the stormwater detect/concentration data, it is imperative that we make any final decisions on the complete set of data needs at this next call. From that point, I would envision the following schedule:

- Obtain official LWG approval/disapproval between Oct. 16 and October 31.
- Formalize proposal in a technical memo from Oct. 16 to October 31, with EPA approval to proceed on October 31. (Note that this memo would heavily reference the existing FSP and would only note those new items necessary to execute this additional proposed work.)
- Deploy sediment traps from Nov. 1 through Dec. 31
- Be on alert for storm events from Nov. 1 through Dec. 31 and collect storms as possible per the FSP requirements.

Note that LWG consultants are working on a stormwater data detect/concentration summary consistent with the last meetings discussion and plan to get that to the Stormwater Technical team by October 11th after LWG approval on October 10th. The field sampling report is also under preparation, and is due to EPA in mid-October. I think it is unlikely that EPA/DEQ would have this report in hand prior to the October 16th call. However, I don't think this report will have much direct impact on our decisions as compared to the stormwater data summaries.

In the meantime, please let me know if you have any other questions.

Thanks.

Carl

Subject: RE: Notes from Stormwater Tech Team Call Sept 14th at 1:15pm

Carl - First, I'm currently available that week, except 10/17 (9-11) and 10/18 (1:30-2).

Secondly, you did not provide a table or listing of the proposed sampling so that may be where Karen's comment came from. Your statement makes it appear that there are no data gaps and I think it would be helpful for others to see the initial list to grasp the magnitude of this. I really thought our last meeting was going to have more discussion involving the analyzed data. I had provided my list of data gaps earlier, and it seems that the last conference call didn't put us much further ahead. I had identified several data gaps just based on sampling, but agreed that if the data analysis could show that any of these data gaps were filled, then additional sampling would not be necessary. Additionally, the data analysis could show that more sampling is necessary in other areas. I think that it is imperative to look at the data soon and confirm the data gaps by the next meeting to ensure that there is time to get into the field and collect the information to fill the data gaps this fall.

Draft Elements of Loading Analysis – Portland Harbor Superfund Site

Stormwater Data Loading Calculation

- $C_w \times V_{yr} = L$
 - C_w - Measured Concentration (ug/L) for land use or site
 - V_{yr} - Volume of discharge from land use or site over a year (L/yr)
 - L - Load (ug/yr)
- Issues include storms or time of year sampled not representative of loading all year long. Also, determination of V_{yr} can be difficult (see below).

Sediment Trap Data Loading Calculation

- $C_s \times TSS \times V_{yr} = L$
 - C_s - Measured Concentration (ug/kg) for land use or site
 - TSS - Total Suspended Sediments (kg/L) in stormwater measured for land use or site
 - V_{yr} - Volume of discharge from land use or site over a year (L/yr)
- Issues include time of year sediment traps deployed (e.g., spring) or TSS from storms not representative of loading all year long. Also, determination of V_{yr} can be difficult (see below).

Variations of Inputs to Load Calculations

- Volume (V_{yr}) Variable
 - Model discharge for site or land use over a typical precipitation year or ranges of years (recommended by rationale)
 - Use City Grid Model
 - Use some other model(s)?
 - Use measured volumes for storms (calculate storm loads) and extrapolate to yearly loads based on storm data and/or modeling (not recommended by rationale)
 - Specifics of approach?
 - Others?
- TSS variable
 - Use synoptic TSS/chemical pairs to estimate water concentration prior load estimate
 - Develop TSS average or other statistics that are intended to represent range of TSS for that site or land use and apply to all chemical data
 - Use of historical TSS site data
 - QC screen this for appropriate quality
 - Use grabs or composites or both?
 - Others?

Variations for Concentration (C_w/C_s) Inputs

- Associating C_w/C_s results with land uses and sites
 - Agree on final categories that each site falls into (or use FSP categories)
 - Outlier site analysis to make sure site should be in land use category
 - Remove outliers (by chemical or by site?)

DO NOT QUOTE OR CITE

This document is currently under review by US EPA and its federal, state, and

tribal partners and is subject to change in whole or in part.

Draft for Discussion Purposes Only

- Remove *A priori* based on known site uses/sources
 - Remove using statistical outlier approach
 - Both?
- Use of site-specific industrial sites for non-unique chemicals (e.g., use Gasco for industrial land use category for PCBs)
- Determining Cw/Cs values for each land use or site
 - Group all samples within category
 - Adjust for number of samples from each site in category
 - Sample point outlier analysis?
 - Statistic(s) to use (average, min, max, confidence limits, percentiles, other)
 - Handling of non-detects
 - Don't use
 - Full or half DLs
 - More complex approaches
- Determine basins where land use based approach cannot be used (per rationale)
 - Basin too small?
 - Basin has too many unique sites?
 - Others?
 - Alternative approach for these areas?
- For basins sampled near outfalls
 - Determine which outfalls fall in this category
 - Use land use approach? (not recommended by rationale)
 - Use calculated loads (recommended by rationale)?
 - Use both approaches?

Evaluation of Loading Estimates

- Comparison of stormwater loads to sediment trap loads
 - Total (water) vs. particulate (sediment) issue
 - When to use only one
 - When to use both
 - How to combine into overall range of loads
- Comparison of measured loads to those calculated on land use basis for some outfalls (“cross check” recommended in rationale)

NOTE: For the calculation of summed Totals, individual component ND are set to 0.
^a When summed Total is ND (all component concentrations are ND), the value is substituted with 1/2 the DL.
^b When summed Total is ND (all component concentrations are ND) the value is substituted with 0.

Subject: Notes from Oct. 16 Stormwater Technical Team Meeting

Stormwater Technical Team –

Data Needs
Summary Oct 16.xls .

Here are the highlights and action items from today's call. We decided that the next meeting (in person for most folks) will be on November 13th from 12:30 to 3 pm. A meeting location will be confirmed in a later email. The primary topic of discussion for this meeting will be the methods for loading calculations and estimates.

The primary topic of conversation for the Oct. 16 meeting was to finalize the data needs proposal. The attached table shows the data needs developed by the group. Note that there was disagreement on the need for sampling the T-4 site (WR-169) per the attached table, but the group agreed that we are requesting LWG discuss their position on sampling at this location in light of the Port's objections to this data need.

Note that the group also agreed that in general flow meters do not need to be deployed at sites where only sediment traps are being proposed. One exception, for WR-4, is noted in the attached table.

Please let me know ASAP if you have any objections or changes to this table before we provide it to the LWG Exec. for requested approval. I would like to send this to the LWG tomorrow if at all possible. Remember that any changes at this point need to be clear omissions or clarification based on the meeting discussions. Otherwise we would have to reconvene to discuss, which the current timeline does not allow.

Per the group's request, we are also working on an additional table that shows the fall/winter data collection ongoing or proposed for the T-4 and GE sites. This will come out in a later email.

It was agreed that the general path forward would be:

- Obtain official LWG approval/disapproval between Oct. 16 and October 31. Target date October 24.
- Assuming approval is provided, formalize proposal in a technical memo from Oct. 16 to October 31, with EPA approval to proceed on or about October 31. (Note that this memo would heavily reference the existing FSP and would only note those new items necessary to execute this additional proposed work.) After the meeting, I thought about this a little more, and I think the earliest that this FSP addendum would come to EPA for approval is November 1. So, we will be seeking EPA approval essentially as fast as possible.
- Deploy sediment traps from approximately Nov. 1 (depending on date of EPA approval) through Dec. 31
- Be on alert for storm events from approximately Nov. 1 (depending on data of EPA approval) through Dec. 31 and collect storms as possible per the FSP requirements.

DO NOT QUOTE OR CITE

This document is currently under review by U.S. EPA and its federal, state and tribal partners and is subject to change in whole or in part.

Additional items and action items that were discussed:

- Per Merv's suggestion, Anchor will look into the ability to deploy twice the number (or possibly more) of sediment trap bottles at the fall sampling locations to improve sampling volumes.
- In addition to the general description of the fall sampling, the FSP addendum would describe only those items that differ from the existing FSP. Examples discussed include: prioritization changes of sediment trap analytes based on data available already as well as that flow meters will not be deployed at sediment trap only locations.
- Andy Koulermos will look into the status of the WR-169 sediment trap and stormwater sampling to see how this might impact the requested LWG discussion on potentially sampling for PCBs at this site.
- For the next meeting:
 - Anchor/Integral will assess the distributions of stormwater data (assess for normality) and will provide a summary of this to the team prior to the next meeting.
 - Anchor will sort through options provided in the previous stormwater loading options description and propose a reasonable specific approach to facilitate discussions next time.
 - Anchor/Integral will discuss what form we currently have T-4 data and determine whether we need it in some other form to start to integrate it into the overall stormwater database.
 - Anchor/Integral will also discuss a proposed path forward for integrating these data and will report back on a proposed plan at the next meeting.

Let me know if I missed anything. Thanks much.

Carl

No.	Station	Stormwater Events	Sediment Trap	Rationale	Other Notes
1	OF-22C	1		Only one open space station, and it is currently not complete for stormwater	
2	Hwy 30	3	1	Location inadvertently included industrial drainage--not applicable to transportation	
2a	Hwy 30"B"	3	1	St. Johns Bridge site was recently re-paved and painted and may not be representative of overall transportation type	Hwy 30 and Reed St. appears to be a reasonable site, but will require reconnaissance to confirm.
3	OF-22B	1	1	Could be unique site for pesticides or PCBs and missing a storm for both and pesticides in sediments	Prioritize sediment traps for missing analytes (starting with pesticides)
4	OF-49	1	1	Only two residential sites and this one missing a storm for some analytes and almost all sediment analytes	Need all analytes in sediments
5	OF-18		1	Only one of two multiple land use sites and missing metals in sediment	Prioritize sediment traps for missing analytes (starting with metals)
6	WR-145/142	2	1	Only 1 storm for PCBs and missing almost all sediment analytes	Need all analytes in sediments
7	WR-96	1	1	Missing one storm for PCBs and two for herbicides and sediment traps missing all analytes	
8	WR-14		1	Missing most analytes in sediment	Prioritize traps for missing analytes.
9	WR-4		1	Missing most analytes in sediment	Prioritize traps for missing analytes. Place flow meter at this site as well due to process water discharges present here.
10	WR-161		1	Missing most analytes in sediment	Prioritize traps for missing analytes.
11	WR-123		1	Missing most analytes in sediment	Prioritize traps for missing analytes.
12	WR-147		1	Missing most analytes in sediment	Prioritize traps for missing analytes.
13	WR-218	1	1	Could be unique site for some chemicals and missing a storm and most sediment analytes	Prioritize sediment traps for missing analytes
14	WR-169?	3	1	PCB congeners in stormwater and possibly also sediment traps missing for this site. Data needed to support light industrial land use loading estimates.	There is a gap between the expectations of the LWG FSP and the T-4 FSP. The Port expressed a general objection to the need for these data points. It was agreed the Port would discuss this potential data need with the wider LWG to see if any compromises could be reached. One potential way to resolve the sediment trap data need is if there is sufficient sample from the already deployed T-4 sediment trap, an aliquot for PCB congeners could be provided. Also, the Port's ability to do any stormwater sampling may be contingent upon whether the scheduled fall storm event

RE: Portland Harbor RI/FS Draft Round 3A Field Sampling Plan Addendum, Stormwater Sampling (Anchor Environmental, L.L.C.)

Dear Messrs. McKenna and Wyatt:

The U.S. Environmental Protection Agency, Region 10 ("EPA") has completed its review of the above referenced Field Sampling Plan (FSP) submitted on November 2, 2007, for the Portland Harbor Superfund Site located in Portland, Oregon. This document was based on the recommendations of the Stormwater Technical Team comprised of representatives of the Environmental Protection Agency, Oregon Department of Environmental Quality and the Lower Willamette Group. Pursuant to Section IX of the AOC, EPA is hereby approving the above referenced FSP for stormwater sampling and directs the Lower Willamette Group to implement it.

If you have any questions regarding this letter, please contact me at (206) 553-6705 or koch.kristine@epa.gov, or have your attorney contact Lori Cora, Assistant Regional Counsel, at (206) 553-1115.

Sincerely,

Kristine Koch
Remedial Project Manager

Subject: Notes from Stormwater Technical Team Meeting Nov. 27th at 12:30

Stormwater Technical Team –

As discussed at the last meeting, here is a high level summary of action items and highlights:

- We agreed the next meeting should be Dec. 19 from 11 to 1 pm. This would be in person, in Portland, since we will want to project the data on the wall. I will set up a WebEx meeting for those who may need to call in. I will confirm the location soon. **Kristine** – If this time does not work for you, we also set up an alternate time for Dec. 20 (same time of day). Let me know which one works best for you.
- Sulzer – The group agreed that we would proceed with stormwater sampling but NOT sediment traps at Sulzer, due to deployment logistics. Anchor will work on a more detailed description of how the stormwater will be collected and flow will be monitored.
- New Hwy 30 Sample – It was agreed that the sample taken on Oct. 16th at the new Hwy 30 site could be used as a sample, even though sample representing about 4% of the flow from the middle of the storm was not collected.
- Load Calculation Methods – Methods for handling replicates and non-detects were discussed and Integral/Anchor will prepare data following these methods for use at the next call. The next call will work on the next steps in the loading calculation based on these data. It was agreed that this data analysis would concentrate on 4 PCB congeners, As, Pb, 2 PAHs, and TSS for the purposes of deriving methods.
- The Port is going to prepare on a Field Sampling Report similar to the one being prepared by the LWG for the spring sampling at the non-Port stations.
- Anchor to look for a statistician to attend the next meeting.
- Carl was going to look into the groups pace relative to the overall project schedule to make sure we are moving fast enough.

Let me know if I missed anything critical.

Thanks.

Carl

Sulzer Stormwater Installation

Stormwater Technical Team -

Just a reminder that we cannot proceed with the installation of the stormwater sampling equipment at Sulzer until we get some feedback from the team that the approach described below by Amanda is acceptable. Our next meeting is on the 19th (although I still need a confirmation from Kristine on that), so I definitely don't want to wait until then to discuss this. So, unfortunately we will have to try to resolve this one via email if at all possible. Please respond, even if it is only to say you have no objections to the approach described below. That way, I can take a vote of sorts.

Thanks much for your prompt response.

Subject: RE: Notes from Stormwater Technical Team Meeting Nov. 27th at
12:30

Tech Team -

As requested in the last technical team conference call, here is more information on how we propose to collect composite water samples upstream of the WR-4 outfall.

We propose to install a flow meter and sample pickup tube into the main outfall pipe draining to WR-4. This pipe can be accessed through the 3.5 inch pipe protruding from the bottom of CB-17. By attaching the flow meter and sample pickup tube to a stainless steel rod, we will be able to mount them on the bottom of the outfall pipe. We anticipate using a spring-loaded mounting setup to insert the meter and pickup tube vertically through the small pipe into the outfall pipe, and then turning the meter and tube perpendicularly so that the meter and pickup tube will be on the bottom of the outfall pipe. We'll take pictures of the setup.

The flow meter will allow us to measure stormwater runoff and cooling water discharge. By measuring cooling water discharge during dry weather, we can determine the approximate flow volume relative to the stormwater runoff volume. It should be noted that these volumes will not be exact since the flow meter will not be calibrated. However, the flow meter will do a good job of showing what proportion of discharge from the outfall is cooling water versus stormwater.

We hope to install this sampling setup at Sulzer early next week if there are no objections. Let me know if you will have any questions.

Subject: Sample Equipment Orientation

Tech Team,

This morning I was looking at some photos that Amanda provided of the weir structure in basin M-2, as well as photos our crews collected of the weir at basin 22B. These flow restrictors were installed by Anchor to help increase the probability of capturing stormwater solids in the sediment traps at these locations. But given the dry-weather flows, the equipment orientations do raise a few questions in terms of data interpretation.

- If the tops of trap bottles are even with or below the level of the weir, then solids accumulation will be biased toward solids affiliated with dry-weather flow. In the case of basin 22B, where there is a known groundwater contaminant plume infiltrating the stormwater conveyance system, this sediment trap sample may not be as representative of stormwater loading as at other locations.
- At the M-2 location, it appears that the sample intake tubing is in front of the weir. Given the size of the pipe and volume of base flow, significant in-pipe storage of base flow could be occurring. The weir could cause increased dilution of the stormwater composite sample during the early portions of the storm.

Are there other locations with dry-weather flow and unique equipment orientations where we may want to view the data differently? Thanks.

Subject: Notes from Stormwater Technical Team Meeting Dec. 19th 11am to 2 pm

Stormwater Technical Team –

Here are the highlights from our last meeting. Note that any agreements noted need to be ratified by the LWG Exec. As always let me know if I missed something. The group agreed to meet again either Jan 9th or 10th from 11 am to 2 pm. **Kristine – please confirm a preferred date as soon as possible.**

- Fall sampling status – It was agreed that shorter sediment trap bottles should be deployed at those locations with only trace sediments after 1 month of deployment and that also have flow height issues. (For example, we would not use short bottles in catch basins, because even taller bottles are always inundated and short bottles would make no difference.) It was also agreed that both short and regular sized bottles (2 each) should be redeployed to OF-18 and each bottle type analyzed for Total Organic Carbon, to help check whether shorter bottles collect a sediments differently from standard bottles. The exact new size of short bottle was not determined, but Anchor was given leeway to decide on something with the goal of minimizing the number of variations from standard sized bottles.
 - Data reporting – Anchor requested that only one data report be prepared that encompassed both the spring and fall sampling results. The group agreed to this with the understanding that the actual data would be available through database postings as it becomes available post validation.
 - Schedule – Various potential pathways to loading estimates were discussed. All permutations discussed require that loading methods decisions be completed by mid-January and that loading estimates need to be available for Fate and Transport modeling by the start of June. Kristine indicated EPA was expecting an approval process similar to approval of the FSP as follows:
 - Group decides on general loading estimate methods by mid-January
 - Anchor/Integral prepare a draft loading methods plan
 - EPA/Stormwater Team review, discuss, and provide input iteratively in period between mid-January and mid-April including LWG Exec. approval step
 - Target EPA approval date of mid-April.
 - Anchor/Integral conduct loading calculations mid-April to mid-June[I'd like to add that obviously Anchor/Integral would need some time in this period to create the initial draft (late Jan./early Feb timeframe) and LWG and EPA will need some time to officially approve it (say late March and early April). Thus, the actual Stormwater Team iterative refinement process would need to occur from about mid-February through mid-March.]
- It was also agreed that Carl should work with the City simultaneously in early January determine the mechanics of using the City grid model.
- Loading Methods – The following general approaches were agreed to:
 - All lab and field duplicates will be kept separate in the SCRA database so that widely divergent duplicates can be identified and more closely assessed. Integral will repost the SCRA consistent with this agreement.

DO NOT QUOTE OR CITE

- In general, relatively consistent duplicates will be combined (e.g., averaged) before further interpretation of results. However, widely divergent duplicates will be examined to determine if an error or cause can be identified. Also, they will generally be assessed to see if a result is an outlier. Divergent results may be eliminated from further use based on these assessments.
- It was agreed that summing rules (e.g., for total PCBs) are not needed because only individual chemicals will be subject to loading estimates.
- It was agreed that treatment of non-detects for statistical calculations will be based on EPA's Pro UCL program, where sample numbers are sufficient. More simple methods will need to be used for smaller data sets. The critical concept in all cases is to look at the ratio and number of non-detects relative to detects to discern the importance of non-detect handling decisions. The percentage of data points coming from non-detects will always be clearly reported.
- Placement of stations within land use categories was discussed and the following was agreed to:
 - The St. John's Bridge results will be compared to the two fall highway site results to determine whether the bridge is similar to these other sites and should be included in the transportation land use category.
 - OF-22B should be considered a unique site for pesticides
 - An outlier analysis should be done for heavy industrial category sites to see if any of these sites should be considered unique heavy industrial sites for any chemicals.
 - The distributions of heavy industrial category sites and unique heavy industrial sites should be compared. Where two groups have similar distributions, some unique sites for some chemicals might be included in the heavy industrial land use category.
- Note that there was concern that perhaps individual points from unique heavy industrial sites should not given equal weight if they are used in the heavy industrial land use category. It was agreed that more discussion was needed next time on use of individual data points within each category and whether they can be all considered equivalent or not, for a number of reasons.

Thanks.

Carl

Subject: Stormwater Technical Team Meeting Dec. 19th 11am to 2 pm

Stormwater Technical Team –

We will be meeting on Dec. 19th from 11 am to 2 pm at Schwabe (1211 SW Fifth Avenue) to discuss the next parts of the loading calculations.

I urge everyone to attend in person if possible. If not, please use the following conference call number:

1-866-866-2244
6761834#

Also, I have set up a WebEx meeting, which you can access as follows:

You have been invited to join a meeting on the Web, using WebEx MeetMeNow.

Please click the following link to join the meeting:

< <https://mwmus.webex.com/mwmus/jm.php?PWD=&MK=942000850> >

MEETING PASSWORD: No password

Date: December 19, 2007

Time: 11:00 am, Pacific Standard Time (GMT -08:00, San Francisco)

Teleconference: No teleconference

Meeting Number: 942 000 850

<http://meetmenow.webex.com>

We've got to start meeting like this(TM)

Subject: Notes from Jan. 10th meeting

Stormwater Technical Team –

We agreed to have our next call on February 7th starting at noon. This will be a conf. call and not an in person meeting. I will send out a call number when we are closer to the date. The purpose of the next meeting will be to make final decisions on the sediment trap samples, which will be collected at the end of the month. Anchor/Integral will send out the most recent information on sediment trap accumulations and total solids content prior to the meeting. Note that the total solids information will be sent out just before the call because that is when it will be available.

It was also agreed that LWG consultants would work on writing up a Loading Calculation Method Plan based on agreements from the last two meetings. Attached are my notes on our agreed to approaches from this meeting. Please let me know if I missed something. Other ideas relevant to the plan that were discussed include:

- Development of a summary diagram or table on study approach and ultimate objectives for the loading rates (this would probably go in the plan).
- Table matrix of supporting data available to understand stormwater concentration data distributions (again would probably be presented in the plan)
- Development of an example GRID model output for runoff volumes needed for the calculations. This will be discussed with the City to refine the output requirements as necessary to fit with the capabilities of the GRID model.

I currently anticipate that a draft of the plan will be available in late February. We discussed mid-February previously, but given all of the data/statistical analyses that will be conducted to understand the data distributions, I am now thinking this could take a little longer.

Thanks.

Carl

Agreed To Methods or Evaluation Processes for Stormwater Load Calculations

- Agreed that large end of pipe basins are for cross check with land use extrapolated loads only (this includes OF-18, OF-19, and old HWY30)
- Regarding population determination within land use categories:
 - Conduct an outlier analysis first, based on the categorizations agreed to last time
 - Evaluate overlap by chemical between heavy and light industrial categories (potential combining of categories if indicated)
 - Look at variables that might impact data distributions observed to identify reasons for outliers that may indicate a need for removal (or other use) of outliers including:
 - Site drainage size
 - Antecedent storm conditions
 - Impervious surface area
 - Storm sampling coverage
 - Sampling artifacts
 - Groupings of data by site that are unique or different
 - No. of samples in the category
 - Rainfall amount of sampled storm
 - Relationship of TOC to chemical concentrations
 - Relationship of TSS/Rainfall to chemical concentrations
 - Non-stormwater discharges present in sample
 - Amount of baseflow present in sample
- Calculate central tendency for each chemical within each category (or site for unique sites) plus a range of statistics so they are available for future F&T model runs
- Do not use the Spring Sulzer data for anything unless we find out what this outfall drains
- Use study TSS data only for sediment trap loading calculations
 - Use other TSS data from site only as comparison to understand how unusual study TSS data may be
 - Similarly, compare land use City MS4 TSS data to study land use category TSS data
- Pool sediment trap and TSS data within each land use category and calculate loads:
 - Based on a straight TSS values
 - Based on TOC normalized values
 - Using spring data for fall traps where no fall TSS data are available
- Compare average of measured stormwater concentrations to calculated stormwater concentrations from sediment trap/TSS data
 - Are trap calculated concentrations very different from measured stormwater concentrations?
 - If so, use sediment trap loads in F&T model as well as part of sensitivity analysis
 - If not, pick load statistic from stormwater loads per above

DO NOT QUOTE OR CITE

- Agreed to monthly runoff calculations of volume for each of F&T model years.

DO NOT QUOTE OR CITE

Subject: [Email allowed by Allow List] RE: Feb 7 call Starting at Noon - Stormwater Tech. Team

Stormwater Technical Team -

The Stormwater Technical Team (EPA/DEQ/LWG) discussed the proposed approach for handling stormwater sediment trap samples during our February 7 conference call. Here are the meeting highlights and action items. As always, please let me know if I missed something.

The technical team agreed to the following changes in the LWG proposed analysis prioritization approach:

- Gunderson WR-147 and Cascade General WR-161 - Use the mass proposed for PCB's to measure organochlorine pesticides (PCB's were measured last spring)
- OF-22B - Use the mass proposed for PCB's to measure pesticides at the detection limit and use the remaining mass to measure PAH/phthalates (PCB's were measured last spring)
- Hwy 30 "B" - Take enough mass from the amount proposed for PAH/phthalates to measure metals at twice the detection limit. (This would increase the PAH/phthalate detection limit to about 2 times)

The revised prioritization table is attached, with changes shown in yellow.

Other items discussed included:

- Conduct phthalates analysis in stormwater at highway sites if stormwater volume is archived. It was confirmed during the call that there is no archived stormwater available.
- Collect in-line sediments from Arkema.
- Process the OF-18 samples in the following way: (2 Short and 2 Tall bottles were installed in January for comparison purposes)
 - Short January bottles -
 - Measure TS, TOC, and PCB's
 - Tall January bottles -
 - Take aliquot for TS, TOC, and PCB's
 - Composite remainder of sediment with December tall bottles
 - Tall December bottles

DO NOT QUOTE OR CITE

This document is currently under review by U.S. EPA and its federal, state and tribal partners and is subject to change in whole or in part.

- Composite with remainder of January tall bottles and analyze for everything
- Only do grain size after QC samples are obtained
- At other sites where there is extra sediment, use sediment for QC first, then conduct grain size analyses if any sediment remains.

Note that the LWG needs to obtain formal Exec. committee approval for these changes. We will notify the stormwater tech. team if LWG Exec. cannot approve these changes for some reason.

Please let me know if you have any questions, comments, or anything to add. I'd like to send this on to Exec next week for approval if there are no changes.

Subject: LWG Stormwater - REVISED Sediment Trap Prioritization

Stormwater Tech Team –

I have attached the revised sediment trap prioritization (Revised Table 2 and 3 from our last tech team call) including the sediment collected during the final deployment period. Please reply to all with your agreement or comments within three days. We would like to get this sent to the lab this week if possible.

I added an extra column in Table 2 that explains what changed since last time. In most cases the extra mass just lowered the detection limit of a particular analyte but in some cases we got a bit more sediment and were able to analyze a few more things. Changes are shown in red text. I followed the priorities we discussed in the last call.

There are two instances where we decided to take a small amount of mass from the phthalate/PAH analysis and use it to analyze metals.

- At OF-49, this increases the detection limit factor for phthalates/PAH's to 1.8. If we don't analyze metals, we would have a detection limit factor of 1.5 for phthalates/PAH's
- At OF-22C, this increases the detection limit factor for phthalates/PAH's to 1.5. If we don't analyze metals, we would have a detection limit factor of 1.4 for phthalates/PAH's

Also, as discussed last time, we will process the OF-18 samples in the following way: (2 Short and 2 Tall bottles were installed in January for comparison purposes)

- Short January bottles –
 - Measure all analytes (this is different from last time because we now have enough sediment to analyze everything)
- Tall January bottles –
 - Take aliquot for all analytes to compare with short January bottles
 - Composite remainder of sediment with December tall bottles
- Tall December bottles
 - Composite with remainder of January tall bottles and analyze for everything
 - Only do grain size after QC samples are obtained

Table 2. Sediment Trap Sample Prioritization Summary - Showing Target Detection Limit Factors for LWG Sites and Estimated for T4 Sites*

Outfall(s)	Facility or Location	PCB Congeners	TOC	Percent Solids	Organochlorine pesticides	PAHs and Phthalates	Metals	Herbicides	Grain size	Change since last time
Industrial Locations (6)										
WR-123	Schnitzer International Slip	1	1	1	1	1	1	1		NO CHANGE, already analyzing full suite
WR-96	Arkema									Collected in-line solids, need exec approval to analyze
WR-14	Chevron - Transportation	1	1	1	1	1	1	1		NO CHANGE, already analyzing full suite
WR-161	Portland Shipyard	0	1	1	1	1	1	1.4		Decrease DLF to 1 from 1.6 for PAH/Phthalates, enough mass to measure metals, and herbicides at DLF
WR-142	Gunderson	1.1	1	1						Decrease DLF to 1.1 from 1.7 for PCB's
WR-147/148	Gunderson (former Schnitzer)	0	1	1	1	2				Decrease DLF from 4.1 to 2 for PAH/phthalates
Land Use Locations (5)										
Hwy 30	Hwy 30	1.4	1	1						Decrease DLF from 2.4 to 1.4 for PCB's
Hwy30 "B"	Hwy 30	1	1	1	1	1	1	1		Decrease DLF to 1 for PAH/Phthalates and Metals and enough mass to analyze herbicides
OF-49	City - St. Johns Area	1	1	1	1	1.8	1			Decrease DLF to 1.8 from 4.3 or PAHs/Phthalates, and analyze metals
OF-22B	City - Doane Lake Industrial Area	0	1	1	1	1.5	1			Decrease DLF to 1.5 from 4.2 or PAHs/Phthalates and analyze metals
WR-218	UPRR Albina	1	1	1	1	1	1	1		NO CHANGE, already analyzing full suite
Multiple Land Use Locations (2)										
OF-18	City - Multiple Land Uses	1	1	1	1	1	1	1		NO CHANGE, already analyzing full suite
WR-169	Light Industrial									

*Detection limit factor shows how the target detection limit (DL) will be exceeded with the sample mass remaining. A factor of 1 means the target detection limit will be achieved. A factor of 2 means the actual DL will be two times higher than the target DL.

Chemical detected more than 81% of the time in Batch 1 stormwater samples

Chemical detected 61-80% of the time in Batch 1 stormwater samples

Chemical detected 41-60% of the time in Batch 1 stormwater samples

Chemical detected 21-40% of the time in Batch 1 stormwater samples

Chemical detected 0-20% of the time in Batch 1 stormwater samples or not sampled

						Dry		3 PAHs/Phthalates	20	20	1754.7	
						Wet		4 Metals	7	7	1747.7	
					Dry		5 Herbicides	20	20	1727.7		

Notes:

¹ The absolute minimum amount of sample needed for TOC analysis is 100mg (0.1g); this sample amount will lead to elevated detection limits, but we are expecting detected levels in each sample, therefore elevated DLs will not affect the quality of the data.

² 10g dry weight is the minimum amount needed for pesticide analysis. If needed, the final extract volume will be reduced to approximately 1/2 the initial volume to meet project MRLs.

³ 10g dry weight is the minimum amount needed for PCB congener analysis. It is possible to use less sample mass for this analysis, but the results on reporting limits and quality of results is unknown at this time due to possibility of surrogate crystallization.

⁴ 20g dry weight is the minimum amount needed for a co-extraction for PAHs and phthalates. If needed, the final extract volume will be reduced to approximately 1/2 the initial volume to meet project MRLs.

⁵ 20g dry weight is the minimum amount needed for herbicide analysis. If needed, the final extract volume will be reduced to approximately 1/3 the initial volume to meet project MRLs.

-- Only percent solids analyses have been conducted to date. Sediment trap samples are currently being archived (frozen) pending further instruction for analysis.

Subject: RE: LWG Stormwater - REVISED Sediment Trap Prioritization

Hi – The revised prioritization table is fine with me. I agree with taking a small aliquot from the PAH/phthalate aliquot for metals analysis in outfalls 49 and 22C. Please also note that we will be asking the lab to “create” a field duplicate and will also need 2 additional aliquots for laboratory QC. We will ask the lab to create the field and lab QC samples from the OF-18 T07 sample, since we have abundant sample mass remaining. Please let me know if you have any questions about the field or lab QC samples.

Subject: RE: LWG Stormwater - REVISED Sediment Trap Prioritization

Follow Up Flag: Follow up

Flag Status: Red

No comments from the City on the changes, other than needing to clarify the location name for Hwy 30. As the first data set collected as Hwy 30 represented a combination of Hwy 30 and the adjacent industrial area, and all field notes etc. likely refer to it as "Hwy 30", this location should be renamed to distinguish it from the earlier data. "Hwy 30 A"?

Good to see that you got a little more volume to work with. Thanks.

Subject: FW: Stormwater Items - Exec Approval

Chip, Eric, Kristine - See below and attached for three items for your review and approval

Item 1 - Stormwater Sediment Trap Sample Analyses

The EPA/DEQ/LWG Stormwater Technical Team agreed today, with LWG approval, to proceed with the stormwater sediment trap sample analyses as summarized in the attached Table 1. We are seeking EPA approval to proceed with this sample handling approach and instruct the laboratories to proceed with these analyses.

Similar to the spring approach, where a number is indicated in a particular cell of this table, sediment volume will be devoted to the analyte category noted for that station. Where there is no number in a cell of the table, there will be insufficient sample to conduct an analyses for that analyte category for that station. The number value indicates the expected detection limit for that sample above the target detection limit. Thus, a value of "1" indicates the target detection limit will be achieved and a value of "2" indicates a detection limit twice the target detection limit will be achieved. The value zero, indicates the analyte in question will be skipped over for a lower priority analyte, due to the fact that data on that analyte was obtained in the Spring 07 event.

Item 2 - Use of sediment from WR-96 Arkema Outfall

The EPA/DEQ/LWG Stormwater Technical team suggested the use of sediment collected from within the outfall structure at Arkema WR-96 for sediment sample analysis since the sediment trap bottles had no measurable sediment but there was a large amount of sediment accumulated around the bottles. Sediment was collected using a stainless steel spoon and transferred into a glass jar from the outfall near where the sediment traps were installed at WR-96. This sediment is currently archived in the field lab pending EPA approval to send it to the laboratory for analysis.

Item 3 - Completion of Stormwater Sampling

After the completion of Round 3A Upland Stormwater Sampling in spring of

DO NOT QUOTE OR CITE

This document is currently under review by U.S. EPA and its federal, state and tribal partners and is subject to change in whole or in part.

2007, the stormwater technical team discussed data gaps and proposed additional sampling starting in Fall 2007 to fill final important data gaps in composite water samples and sediment traps. The sampling effort for this second round of sampling was detailed in the Round 3A FSP Addendum Stormwater Sampling. The second round of stormwater sampling was completed at the end of January.

FSP Addendum requirements for composite stormwater sampling were met at nine of the ten sites, including one Port of Portland site. At one site, Sulzer WR-4, only two composite sample events were collected, with all required analytes measured twice except for herbicides which was measured once.

FSP Addendum requirements for sediment trap samples called for collecting sediment at 14 sites, and sediment was collected at eleven of these sites. No information was available for the Port of Portland site WR-169. At one site, Sulzer WR-4, it was not feasible to collect sediment. At another site, Arkema WR-96, no sediment was collected in the jars, so sediment was collected from within the catch basin and archived for possible analysis. At the 11 successful sites, sufficient sediment was collected to conduct all analyses at 5 sites. For the remaining six sites, in most cases the majority of the analyses will be conducted using the priority analysis order discussed in the FSP.

On this basis, it is the opinion of the LWG that the objectives of the stormwater sampling program as outlined by the original Spring FSP and Fall FSP addendum have been met and no further stormwater or inline sediment trap sampling needs to be conducted.

Thanks.

Re: Portland Harbor Superfund Site; Administrative Order on Consent for Remedial Investigation and Feasibility Study; Docket No. CERCLA-10-2001-0240
Status of Round 3 Sampling Activities

Dear Messrs. Wyatt and McKenna:

The Lower Willamette Group (LWG) has requested documentation from EPA that Round 3B data collection activities at the Portland Harbor site have been completed. EPA concurs that all Round 3B data collection activities associated with the following approved Field Sampling Plans (FSPs) have been completed:

- Round 3B Comprehensive Sediment and Bioassay FSP (conditionally approved on November 9, 2007);
- The Round 3B FSP for Fish and Invertebrate Tissue and Collocated Surface Sediment (approved on December 3, 2007);
- The Round 3 Groundwater Pathway Assessment, FSP for Stratigraphic Assessment and Transition Zone Water Sampling – Gunderson (approved on October 11, 2007);
- The Round 3A Stormwater FSP Addendum (approved November 6, 2007);
- The Round 3 Lamprey Toxicity FSP Addendum (approved August 17, 2007);

The attached Table 1 summarizes the status of all Round 3A and 3B data collection activities. As indicated in the table, there are three outstanding data collection efforts:

The Round 3B Side Scan Sonar Field Sampling Plan: The side-scan sonar data collection effort is primarily for the purpose of debris identification to support the Portland Harbor feasibility

DO NOT QUOTE OR CITE

study. The Side-Scan Sonar FSP was submitted to EPA on January 18, 2008. EPA provided comments on this document on March 13, 2008.

The Round 3B Sediment Mobility Study: A proposal for performing sediment mobility testing was submitted on December 11, 2007. EPA provided comments on this proposal on January 24, 2008. A Sediment Mobility FSP is expected on March 24, 2008.

The Collection of Bird Eggs: EPA believes that osprey eggs may serve as a useful long-term monitoring tool following cleanup activities at the Portland Harbor site. EPA also believes that a unique opportunity exists to partner with work being proposed by the Portland Harbor Natural Resource Trustee Council, the United States Geological Survey (USGS) and the U.S. Fish and Wildlife Service. Egg collection and processing will be coordinated with USGS and USFW and will take advantage of existing permits held by USGS for the collection of eggs. Approximately ten bird eggs will be targeted for collection (six to eight nest sites within Portland Harbor with the remainder reference sites located upstream from Portland Harbor but below Willamette Falls). The work to be performed by the LWG would include egg collection and processing support and chemical analysis of the eggs. Egg tissues would be analyzed for selected chemicals including organochlorine pesticides, polychlorinated biphenyls (PCBs), chlorinated dibenzodioxins and furans, mercury and polybrominated diphenyl ethers (PBDEs).

In addition to the above items, EPA and the LWG have not resolved whether lamprey ammocoete tissue analysis is required as part of the water toxicity testing completed in January 2008. Discussion between the EPA and the LWG on this topic is ongoing.

As stated previously by EPA, the data collection needed to support the RI and risk assessment phase of the Portland Harbor RI/FS is essentially complete. Data needs currently being pursued are related to the Portland Harbor FS and the establishment of baseline conditions to support future long-term monitoring efforts. Although EPA does not anticipate any additional data collection to support the RI and baseline risk assessment at this time, the draft RI, baseline risk assessment and/or FS reports may identify additional data requirements that must be addressed to support remedial action decisions at the Portland Harbor site.

If you have any questions, please contact Chip Humphrey at (503) 326-2678 or Eric Blischke (503) 326-4006. All legal inquiries should be directed to Lori Cora at (206) 553-1115.

Sincerely,

Chip Humphrey
Eric Blischke

Table 1
Round 3 Data Gap Summary Table
March 24,2008

Data Needs	Round	LWG Proposed Samples	Additional 3B Data Needs Proposed by EPA	Notes and Current Status
Site Wide Data Needs				
Upstream Site Boundary	3A	8 sediment cores and 3 radioisotope cores	Contingent on results of Round 3A.	Sediment samples collected between RM 11 and 12.2 during Round 3B. No additional sampling anticipated.
Downstream Site Boundary	3A	12 grab samples and 7 sediment cores	Additional data collection unlikely.	Sediment samples collected between RM 1 and 2 during Round 3A. No additional sampling anticipated.
Riparian Soil	NA	None proposed	None - upland data gap.	No additional sampling anticipated.
Multnomah Channel	3B	10 sediment samples based on bathymetric survey results	General scope and scale of LWG proposal is acceptable.	Sediment samples collected during Round 3B; no additional sampling anticipated.
Non-AOPC Subsurface Sediments	3B	Contingent on additional data evaluation	10 - 12 sediment cores.	Sediment samples collected throughout study area during round 3B; no additional sampling anticipated.
Upstream - Background	3B	Approximately 20 sediment samples	General scope and scale is acceptable. Finalize sample numbers based on statistical analysis. Supplement with pulp mill site investigation data.	Sediment samples collected during Round 3B; no additional sampling anticipated.
Upstream Surface Water	3A	Transects at RM 16 and 11	Contingent on results of Round 3A and results of fate and transport modeling effort.	Surface water data collected during Round 3A; no additional sampling anticipated.
Upstream Biota	NA	None proposed	Upstream biota not required at this time.	No additional sampling anticipated.
HHRA				
Tissue chemistry	NA	None proposed	Biota tissue required to ensure adequate spatial coverage and full range of contaminant concentrations.	Tissue samples collected throughout study area during round 3B; no additional sampling anticipated.
