A/N 498039: Zink Oxidizer

There are 2 fabrication areas (Fab 1 and Fab 2) in the facility. McGill oxidizer (existing permit G1981, A/N 492807) controls VOC emissions from equipment in Fab 1, and Zink oxidizer (Current A/N 498039) controls VOC emissions from Fab 2. To save fuel, the applicant proposes to also connect Fab 1 to Zink oxidizer in addition to the existing McGill oxidizer so that VOC emissions from Fab 1can also be vented to Zink oxidizer for control.

A/N 498037: Srubbers 1 & 2

The venting removal: Except for the wafer etching and stripping line (Current A/N 498032) which was listed as a venting point of this APC system by mistake (it was supposed to be listed under the APC system A/N 498038 Scrubbers 101 & 102, it is now listed with the correct APC system), the removal of other venting points is due to the removal of those tools.

The removal of two burn boxes: These burn boxes are removed along with the removal of the tools it vents.

PROCESS DESCRIPTION

The equipment is for semiconductor device manufacturing. Oxidizers or carbon adsorbers are used for VOC control and wet scrubbers are used for PM control. In addition, resin adsorbers are used to control arsine emissions from ion implanters that use arsine.

CALCULATIONS

Storage tanks:

TANK 4.0.9d is used to calculate emissions from storage tanks. The vapor pressures are calculated by adding all individual vapor pressure of each component in the mixture.

Emissions from wet chemicals are calculated using Preferred and Alternate Methods for Estimating Air Emissions from Semiconductor Manufacturing, Volume II: Chapter 6 (Prepared by Eastern Research Group, Inc. for Point Sources Committee of the Emission Inventory Improvement Program and EPA's Emission Factor and Inventory Group).

Emissions from IC manufacturing are based on material balances.

All calculations are in attachments to this evaluation. Below is a summary of calculated emissions.

Note 1: Previous PM10 emissions were overestimated by assuming that all HNO_3 in the tank would be evaporated and become PM emissions. If previous emissions were calculated using the same method as for the current emissions, there would be no change in the PM10 emission for this permit unit.

Note 2: There is no actual PM10 emission decrease. Previous emissions were calculated using Raoult's Law to estimate the partial vapor pressures. That resulted in higher PM10 but lower VOC (acetic acid) emissions. Vapor pressure of each component is used for the current calculations which give lower PM10 but higher VOC (acetic acid) emissions.

RULE EVALUATION

Rule 212:

(c) (1): Emissions near a school

The equipment is not located within 1000 feet from the outer boundary of a school. (The nearest school, Mountain View Christian School, is 3168 feet from the facility). The equipment is not subject to the public notice requirements of subdivision (c).

River Springs Charter School, located at 43466 Business Park Dr., CA 92590, is listed 0.1 mile from the facility. However, a check on the maps shows that the distance is actually more than 0.3 mile. Also, further investigation reveals that River Springs Charter School, located at 43466 Business Park Dr., CA 92590 is only an administration building, and there is no class held at the location.

(c) (2): On-site emission increases exceeding the daily maximums

The emission increases do not exceed any of the daily maximums specified in subdivision (g) of this rule. The equipment is not subject to the public notice requirements of subdivision (c).

(c) (3): Emissions of toxic air contaminants

Results of Tier 1 analysis show that MICR is less 1 in a million and HIs are less than 1. The equipment is not subject to the public notice requirements of subdivision (c).

(g) Emission increases exceeding the daily maximums

The emission increases do not exceed any of the daily maximums specified in subdivision (g) of this rule. The equipment is not subject to the public notice requirements specified in subdivision (g).

Rule 401 - Visible Emissions:

Based on experience with this type of equipment, compliance with this rule is expected.

Rule 402 - Nuisances:

Nuisance problems due to the equipment operation are unlikely.

Rules 407/409:

This equipment is fired with natural gas. Compliance is expected.

Rule 1164 - Semiconductor Manufacturing:

VOC emissions from solvent benches and photoresist operations are controlled by over 90%. Complies. Isopropyl alcohol is used in Rinsing Tank No. 6 of the wafer etching and stripping lines 1 and 2. A small amount of alcohol is added to the tank (0.11 g/L) to reduce the surface tension of water to prevent it from adhering to the wafer surface. The operation is not a solvent cleaning, and therefore, is not subject to the requirements of Rule 1164.

Regulation XIII:

BACT:

A/N 498041: Tank T-411

The maximum daily emissions are less than 1 lb. No BACT analysis is required.

A/Ns 498033:

There is no emission increase because of the change of conditions. No BACT analysis is required. Previous PM10 emissions were overestimated by assuming that all HNO_3 in the tank would be evaporated and become PM emissions. If previous emissions were calculated using the same method as for the current emissions, there would be no change in the PM10 emission for this permit unit.

A/Ns 491984-5, 498032, 498034-6, 498040-1, 498761:

Scrubbers for PM control and afterburners for VOC control are BACT for the equipment.

Modeling:
Currently, no modeling is required for VOC. The PM10 emissions are lower than the limit in Table A-1 of Rule 1303. No further evaluation is necessary.

Offsets:

CO:
CO is in attainment. See Rule 1703 evaluation.

VOC:
The facility has a VOC facility limit of 1,830 pounds in one calendar month. This limit is not expected to be exceeded with the modification and change of conditions. Reported VOC emissions from July 07 to August 08 show that VOC emissions from this facility were less than 1,400 lbs/month.
Per AQMD's January 9, 2009 Permit Moratorium Fact Sheet, since the facility has an NSR cap on VOC and the modification and change of conditions will not increase emissions beyond the cap, the permit can be issued without requiring VOC ERCs to offset the VOC emission increase due to the modification or change of conditions.

NOx/SOx
There is no emission increase from the project. No external offsets are required.

PM10
Project maximum emission increase is less than 0.5 pound per day. Per AQMD's January 9, 2009 Permit Moratorium Fact Sheet, no PM10 ERCs are required.

DISCUSSIONS

Zink oxidizer load: The company's analysis on the oxidizer load shows that Zink oxidizer has enough capacity for both Fab 1 and Fab 2 equipment (See Ignacio Verzuco's email to Kien Huynh dated May 15, 2009).

Wafer Etching and Stripping line A/N 498033: With the use of method described in Preferred and Alternate Methods for Estimating Air Emissions from Semiconductor Manufacturing, Volume II: Chapter 6 (Prepared by Eastern Research Group, Inc. for Point Sources Committee of the Emission Inventory Improvement Program and EPA's Emission Factor and Inventory Group) for process tanks, no BOE etchant limit is necessary and it will be removed.

Based on information submitted with the applications and the above evaluation, it is determined/expected that the equipment operates/will operate in compliance with all the applicable rules and regulations of the District.

RECOMMENDATIONS:

Issue permits subject to the permit conditions as stated in Section D.

If molecular weight of H_2SO_4 is used: 18.35

Desired throughput 1,839,600 gals/month

22,075,200 gals/yr

Assumption: Effects of interactions between acids are minimum.

*Vapor pressure of each component in aqueous solution (as if it is the only component in water) is used.

For water, vapor pressure of pure water is used.

For HF, the vapor pressure is vapor pressure of 5% HF solution

The tank contains HCl, HNO_3, H_3PO_4, HF, H_2SO_4, and NH_4OH. For vapor pressure calculations, we use HF, since it has higher vapor pressure than other acids.

Notes:

- At a low pH level, NH_4OH is neutralized by the acids in the waste water. Therefore, NH_3 emission is minimal, if any.
- To be conservative, we will use MW = 18.35
