1

Introduction

The U.S. Environmental Protection Agency (EPA) directed Ecology and Environment, Inc.'s (E & E) Superfund Technical Assessment and Response Team (START) to support EPA's environmental data collection activities and an EPA-funded engineering evaluation and cost analysis (EE/CA) for a planned remediation of contaminated sediment in Yosemite Creek in San Francisco, San Francisco County, California. The Yosemite Creek Superfund site (the site) is an approximately 1,600-foot channel that receives sewage and storm water system overflows and storm water runoff and leads to the South Basin of the San Francisco Bay. Previous investigations of the site indicate creek sediments are contaminated with polychlorinated biphenyls (PCBs); metals, including chromium, lead, mercury, nickel, and zinc; total petroleum hydrocarbons as diesel (TPH-d); TPH as motor oil (TPH-mo) and the pesticides chlordane, dieldrin, and dichloro-diphenyl-trichloroethane (DDT). The waste characterization study was conducted in February 2012 and focused on generating data on concentrations of total and leachable metals, including mercury and hexavalent chromium, PCBs, and asbestos in the slough sediments. The data were generated to support estimates of volumes that could require different types of hazardous or nonhazardous disposal if the waste were to be removed from the slough.

Field work described in this Waste Characterization Report was conducted in accordance with the *Sampling and Analysis Plan (SAP), Yosemite Creek Sediment Waste Characterization Study, February 2012*, prepared by E & E.

The waste characterization results for PCBs, metals, and asbestos were compared to toxicity characteristic leaching procedure (TCLP) thresholds outlined in Title 40: Protection of Environment of the U.S. Code of Federal Regulations (CFR) Part 261, Toxic Substances Control Act Title 1, and the soluble threshold limit concentrations (STLC) and total threshold limit concentrations (TTLC) from Title 26 of the California Code of Regulations (CCR) in order to assess federal and state waste classification of the sediments. This report was prepared to describe the scope of work, objectives, methodology, analytical testing procedures, results, conclusions, and recommendations for the site.

1.1 Site Location

The Yosemite Creek site is a 1,600-foot long channel that leads to the South Basin of the San Francisco Bay in the southeastern portion of San Francisco, San Francisco County, California (Figures 1 and 2). The approximate location of the site is 37° 43' 25" N, 122° 23' 07" W. The site is located west of and adjacent to the Hunters Point Naval Shipyard Superfund site and is situated within the Yosemite Basin.

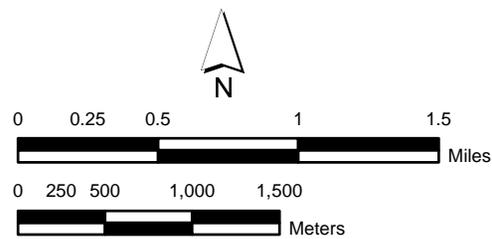

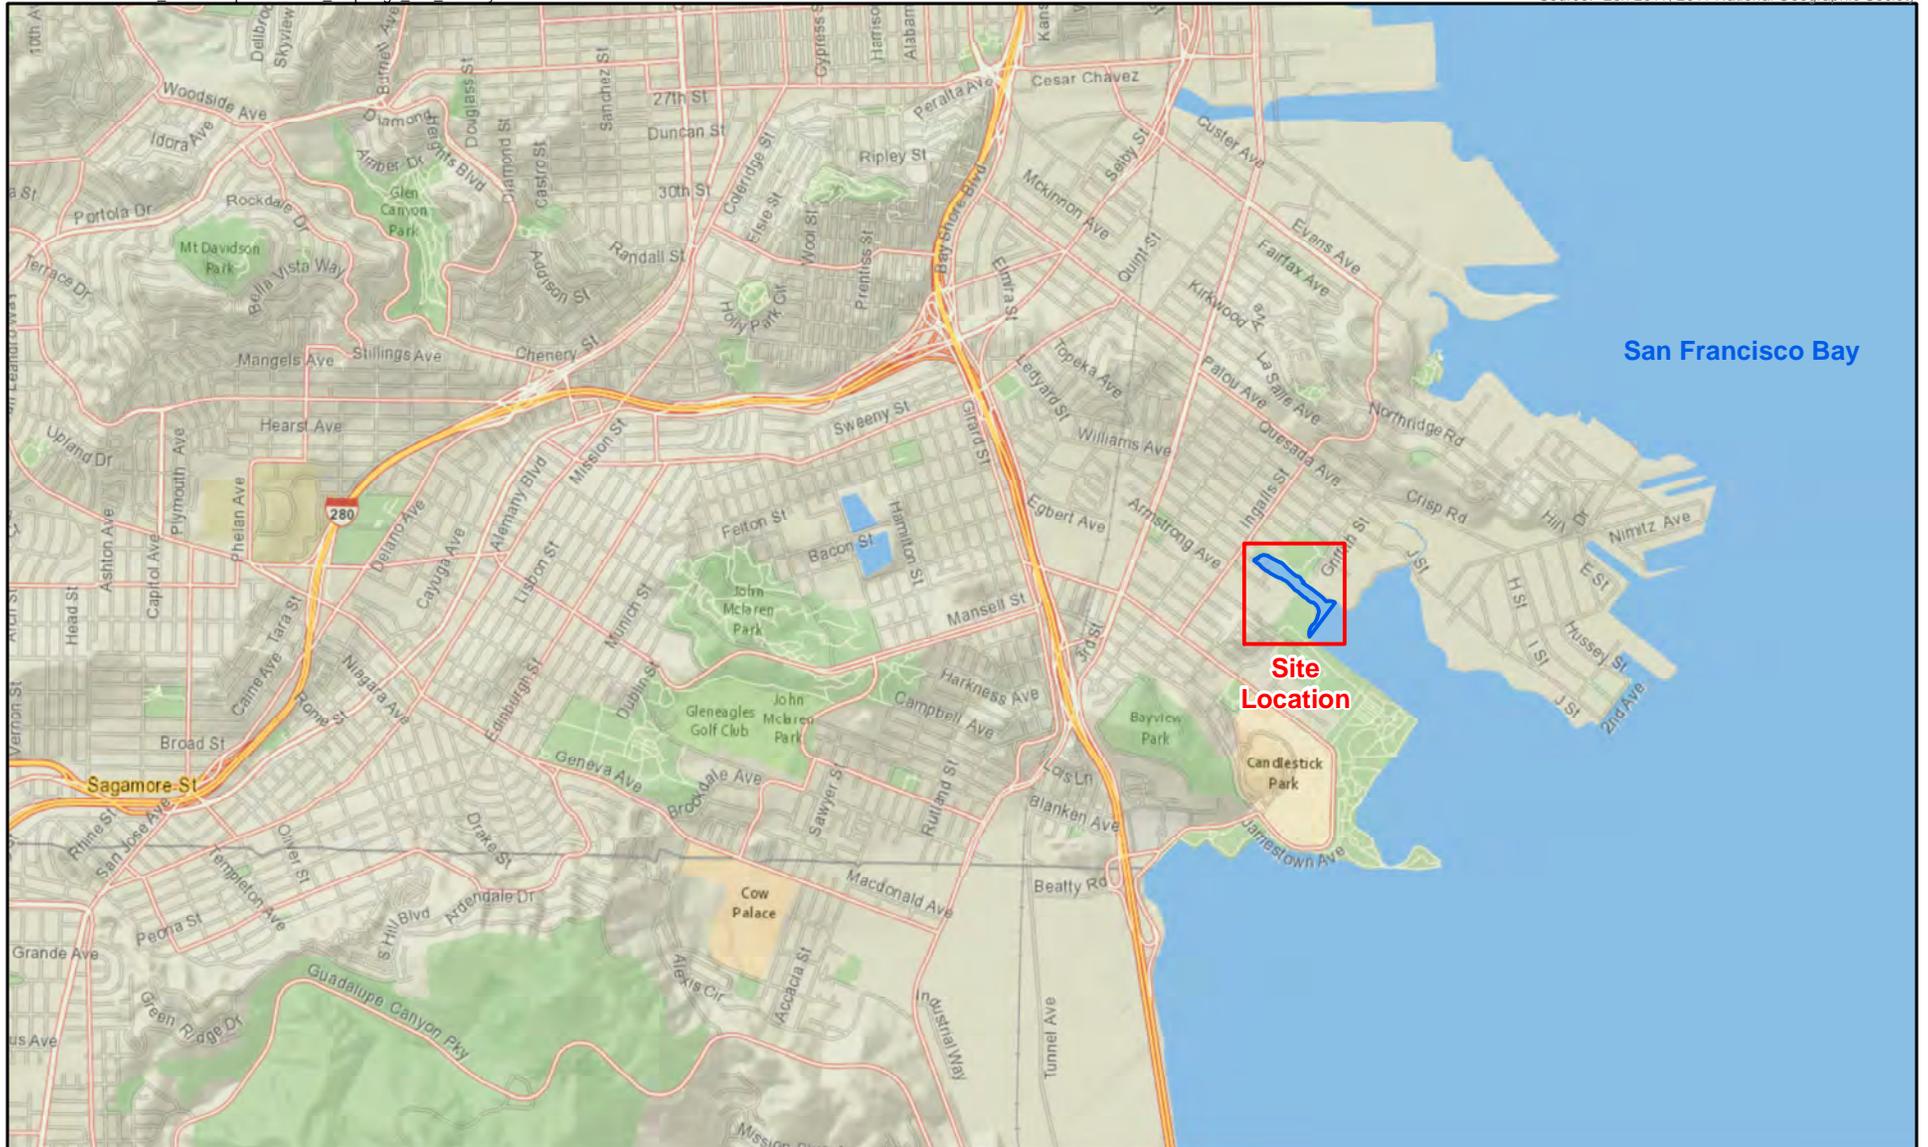

1.2 Site Description

The site is located in the Yosemite Creek drainage basin, which encompasses approximately 1,500 acres in southeastern San Francisco, California (Battelle 2004). The site historically received sewage and storm water overflows and storm water runoff. Discharges of treated sewage and storm water historically flowed to the southeast into the South Basin of the San Francisco Bay. At low tide, the sediments of the site are exposed as a tidal mudflat; this area (see Figure 2) was the study area investigated for this assessment. The study area is approximately 1,800 feet long and varies from approximately 200 feet to 800 feet wide, with an area of 408,200 square feet.

1.3 Site History

Before 1900, the site and the immediate area around the site consisted primarily of wetlands, marshland, or land submerged below mean tide level (intertidal and subtidal habitat). Between 1940 and 1970, much of the surrounding area was filled. The area surrounding the site was characterized by mixed residential, commercial, and industrial use beginning in the 1940s. Previous investigations have shown site sediments to be impacted with PCBs; metals, including chromium, lead, mercury, nickel, and zinc; TPH; and the pesticides chlordane, dieldrin, and total DDT (Battelle 2004).

Additional information on site history is available in *Sediment Investigation at Yosemite Creek*, prepared by Battelle in May 2004, and *Sediment Investigation at Yosemite Creek, Fall 1998*, prepared by Arthur D. Little in May 1999.

2

Setting and Previous Investigation

A discussion of the site's geology, hydrogeology, and ecology and a summary of previous investigation results are provided below.

2.1 Geology, Hydrology, and Hydrogeology

Information presented in the Battelle report (Battelle 2004) and documents from the nearby Bay Area Drum site indicates that artificial fill, younger bay mud, bay side sand, and/or Franciscan formation rock (sandstone, graywacke, shale, and chert) lie beneath the site (Harding Lawson Associates 1999). The closest area to the site for which geologic information is available is the Hunters Point Shipyard site. Geology beneath the adjacent Hunters Point Shipyard reportedly includes artificial fill, which can contain serpentinite bedrock, excavated bay mud, sands, gravels, and construction and industrial debris. The fill generally overlies bay mud deposits and occasionally undifferentiated sedimentary deposits (Barajas & Associates, Inc. 2008).

Groundwater flow in the region is towards the site as a groundwater-to-surface water discharge into the South Basin (Harding Lawson Associates 1999). The Yosemite Basin is located between two hills: to the north lies Hunters Point and to the south lies Bayview Hill. The original Yosemite Creek originated from a spring in what is now McLaren Park and flowed into San Francisco Bay. Yosemite Basin is approximately 3 square miles and is bounded by McLaren Park to the west and the Hunters Point Naval shipyard and San Francisco Bay to the east and northeast. Lands to the south and north of the site are owned by the California State Park system and managed as part of Candlestick Point State Recreation Area. This includes a recently constructed tidal wetlands project located on the north side of Yosemite Slough.

2.2 Storm Water and Sewer System Drainage

The San Francisco Public Utilities Commission (SFPUC) owned and operated the sewer system that has historically discharged to the site under various configurations. Between 1959 and 1991, SFPUC's combined sewer system operated with three overflow structures (outfalls 40, 41, and 42) that discharged to the site in rainy weather, which occurred 82 times per year, on average. Outfall 41, which drained much of the area east of Highway 101, was located at the mouth of the site. Outfall 42 discharged at Fitch Street near the southern

2. Setting and Previous Investigation

shoreline of the creek, draining areas that included industrial properties on the southern side of the site and Candlestick Park. Outfall 40 discharged near Griffith Street on the north side of the site and drained an area of approximately 200 acres, including the Bay Area Drum site.

In 1990 and 1991, SFPUC completed construction of overflow retention and storage basins for its combined sewer system. This upgrade reduced the number of system overflows to the site to a long-term average of one per year (Battelle 2004).

2.3 Previous Investigations and Regulatory Involvement

The EPA, the U.S. Department of the Navy, and a significant number of other responsible parties have been working toward the selection of an appropriate remedial option for the site, which has been determined to be affected by several source areas.

The South Basin area of the San Francisco Bay, which includes the site, has been the subject of numerous environmental investigations (Battelle 2004). Remedial investigations, feasibility studies, and remedial actions are ongoing at the Hunters Point Shipyard Superfund Site, which includes the South Basin, under the U.S. Navy's Base Realignment and Closure Program. Additionally, the California State Parks Foundation sampled soil, groundwater, and sediment in a 35-acre area where wetland creation had been proposed, including the site. Sediments at the site were investigated in December 1995 under the Bay Protection and Toxic Cleanup Program. Samples contained concentrations of mercury and PCBs exceeding the screening criteria (Battelle 2004).

As a part of ongoing Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) remedial activities at Hunters Point Shipyard (see Figure 1), a remedial investigation and feasibility study was performed at Parcel F, the portion of Hunters Point Shipyard that includes the South Basin shoreline and adjacent sediments, by PRC Environmental Management, Inc. under the direction of the Navy in 1996. Sediment sample results in the South Basin and the site indicated elevated levels of mercury, PCBs, DDT, and chlordane. This investigation was conducted to evaluate contamination of the South Basin from Hunters Point Shipyard but also presented the potential for additional sources of contamination to the South Basin, including discharges to the site (Battelle 2004).

Based on the evidence of contaminated sediments at the site, the regional water quality control board (RWQCB) required further investigation to delineate the nature and extent of the contamination. Additional investigation and sampling of the site was performed under the direction of the SFPUC in October 1998, October 1999, and April 2000. The SFPUC investigation included collecting surface and subsurface sediment samples up to 4 feet below ground surface (bgs) and bioassays and bioaccumulation in clam tissue. The investigation and its

2. Setting and Previous Investigation

results are discussed in the Battelle *Sediment Investigation at Yosemite Creek* report (Battelle 2004).

According to the Battelle report, the following contaminants of potential concern (COPCs) are present at the site at concentrations that exceeded their screening levels: lead, mercury, nickel, zinc, total PCBs, total DDT, total chlordane, and dieldrin. The maximum concentrations reported in surface sediments were chromium at 202 parts per million (ppm), mercury at 1.21 ppm, nickel at 152 ppm, lead at 197 ppm, zinc at 316 ppm, PCBs at 1317 parts per billion (ppb), total DDT at 142 ppb, total chlordane at 88 ppb, and dieldrin at 110 ppb. A total of 32 surface locations have been sampled by the SFPUC and the Navy in the vicinity of the site.

Subsurface samples were collected at five locations during the 2004 Battelle investigation. Subsurface samples were collected to total depths of 4 feet bgs in two locations, 3 feet bgs at one location, and 2 feet bgs at two locations. The maximum concentrations reported in subsurface sediments were chromium at 368 ppm, lead at 811 ppm, mercury at 1.49 ppm, zinc at 830 ppm, dieldrin at 370 ppb, total chlordane at 208 ppb, total DDT at 1,430 ppb, and total PCBs at 2,356 ppb. These COPC concentrations exceeded their respective screening criteria, with the exception of chromium, and generally appeared to decrease with depth.

In addition to studies in the South Basin area discussed above, several environmental investigations have occurred at the former Bay Area drum facility, a former drum recycling and reconditioning facility located north of the site at 1212 Thomas Avenue in San Francisco, California.

Remediation of soil and groundwater at the former Bay Area drum site was completed in July 2003 under the direction of the California Department of Toxic Substances Control. The sewer and storm water system draining the Bay Area drum site and its vicinity emptied into Yosemite Slough (Battelle 2004).

Between June 17 and July 9, 2009, START assisted the EPA in collecting a total of 191 sediment samples from 36 sampling locations at the site. The results of this investigation were presented in a document entitled *Yosemite Creek Sediment Removal Assessment Report* (Ecology and Environment 2011). Based on the results of the sediment sampling, PCBs (Aroclor-1254 and 1260 and PCB Congeners), metals (chromium, lead, mercury, and zinc), and TPH-d and motor oil were confirmed to be present in Yosemite Slough sediments at concentrations that exceeded their respective environmental screening levels (ESLs). Elevated COPCs were predominantly located in the upper 3 feet of sediment at Yosemite Slough, although contaminant concentrations exceeding site screening levels did occur in the 3- to 5-foot interval. PCBs, lead, mercury, zinc, and TPH-d contamination boundaries above site screening levels were not completely defined during the 2009 assessment, including in the downstream direction towards the entrance to San Francisco Bay.

3

Field Activities

A site-specific sampling and analysis plan (SAP) was completed before initiating field work. All work was conducted under E & E's standard operating procedures, a health and safety plan, and the site-specific sampling plan.

The objectives of the site investigation were as follows:

- **Document the concentrations of PCBs, asbestos, and metals** (chromium, lead, mercury, and zinc) in sediment at the site and determine where these concentrations exceed state and federal waste disposal criteria.
- **Evaluate the potential for extrapolations regarding volumes and area** based on previous sampling results if the waste characterization data indicate good correlation between existing TTLC and STLC data sets. These volume extrapolations will be completed as part of the EE/CA.

START's selection of eight sample boring locations (YC-038 through YC-045), based on previous site data, focused on providing adequate coverage across the 1,600 foot long and 200 foot wide Yosemite Creek channel while targeting areas with the highest documented concentrations of COPCs. Some sample locations were adjusted in the field based on accessibility, field conditions, and professional judgment. A total of 32 samples, not including duplicates, were collected from the eight sample locations during the waste characterization study. Sample locations are noted on Figure 3 and a summary of sample location information is presented in Table 3-1.

Photographic documentation collected by the START during site activities is presented in Appendix A. A description of sampling methodologies can be found in the SAP.

3.1 Sediment Sampling

As noted above, START collected 32 sediment samples from eight sampling locations at Yosemite Creek on February 21, 2012. Personnel present during the field activities included EPA Region 9 Laboratory personnel Andy Lincoff; START members Sara Dwight, Brian Milton, and Kate Villars, and U.S. Coast

- MS/MSD PCB = Matrix Spike/Matrix Spike Duplicate sample for PCBs by 8082

Since the Yosemite Creek site is a tidally influenced area, largely exposed during low tide and completely submerged during high tide, sample locations were accessed by an EPA-owned pontoon boat with a Vibracore unit mounted to the front. The vibracore sampling device consists of a hollow casing attached to a vibrating motor, and a tripod and hoist are generally required for operation. The 3-inch sampling core was advanced through the sediment using high-frequency vibrations. The sediments were collected in pre-cleaned acrylic sampling cores.

After collecting sample core, the tube was retrieved, capped with Teflon caps, and the ends were labeled. Sample tubes were transported to the sample staging area for processing. The sediment core was extruded from the tube and divided into 1-foot intervals. Four samples per location (0 to 1 foot bgs, 1 to 2 feet bgs, 2 to 3 feet bgs, 3 to ≤4 feet bgs) were prepared from the sediment cores. In cases of refusal or poor recovery, at least three attempts were made at a sampling location to obtain a full 4-foot core. If refusal or recovery issues continued, samples were collected to the farthest depth achievable.

3. Sampling Plan and Fieldwork Activities

For each 1-foot interval, samples were homogenized in a glass bowl and placed into two 8-ounce glass sample jars and two 4-ounce sample jars. Handlers used nitrile gloves. All samples were placed in coolers and chilled with ice to 4° C for storage and transport to the analytical laboratory.

Sample locations were recorded in the field logbook and the geographic coordinates were obtained and documented using a Trimble GeoXH global positioning device.

3.2 Laboratory Analysis

All sediment samples were split and sent to EPA Region 9 laboratory in Richmond, California, for analysis for metals, including lead and zinc (EPA Method 6010B); mercury (EPA Method 7471A); and PCBs (EPA Method 8082), and to Test America Laboratories in West Sacramento, California for analysis of hexavalent chromium (EPA Method 7196) and asbestos by polarized light microscopy (EPA Method 600/R-93/116).

3.3 Radiation Screening

Due to the proximity of the Yosemite Creek site to the Hunters Point Shipyard Superfund site, which has documented radiation contamination, sediment sampling cores were screened for gamma radiation using a Ludlum 192 meter before being extruded from the sampling tube. No sediment cores contained gamma concentrations that exceeded background radiation levels.

3.4 Investigation-Derived Waste

In the process of conducting field activities at the Yosemite Creek site, several different types of investigation-derived waste (IDW) were generated, including the following:

- Residual soil from acetate soil sampling vibrocore tubes
- Decontamination fluids and solids (e.g., towels)
- Disposable sampling equipment
- Used personal protective equipment.

At the conclusion of field activities, one 55-gallon drum containing decontamination rinse water, one 55-gallon drum containing soil cuttings and used personal protective equipment had been collected. START coordinated the characterization and disposal of this IDW as well as an additional 14 drums of drill cuttings, decontamination rinsewater, and personal protective equipment generated in a related geotechnical investigation conducted on the site by Arcadis, a contractor representing the responsible parties.

Figure 3
2009 and 2012 Sampling
Event Boring Locations

Yosemite Creek
Sediment Removal
Assessment

San Francisco, California

3. Sampling Plan and Fieldwork Activities

Two composited samples from the eight soil-containing drums and two composited samples from the eight water drums were collected by START on April 3, 2012 for waste profiling purposes. These samples were sent to the EPA Region 9 laboratory for analysis of organochlorine pesticides and PCBs by EPA Method 8081A/8082; CAM 17 metals by EPA Methods 6010B and 7471A/7470A; and petroleum hydrocarbons (gasoline, diesel, and motor oil by EPA Method 8015B) Environmental Logistics of Bloomington, California, was contracted to profile the waste and transport it to an appropriate disposal facility.

On May 23, 2012 Environmental Logistics removed the drums from the site and delivered them to Filter Recycling Services in Rialto, California for disposal. START retained copies of all disposal manifests (see Appendix F).

3.5 Deviations from the SAP

All work was conducted in accordance with the SAP with the following exceptions:

Refusal in the subsurface limited the vertical extent of sampling at three locations, YC-038-3.6, YC-040-3.6, and YC-039-3.3. Three repeated sampling attempts were made at these locations down to refusal depth, and proposed samples deeper than the refusal depth were not collected.

4

Results and Interpretations

The analytical testing results for sediment are discussed in the following sections.

4.1 Sediment Sample Analytical Results

As noted above, a total of 32 soil samples were collected at eight locations from target depths ranging from 1 to 4 feet bgs and analyzed for PCBs as Aroclors, metals, hexavalent chromium, and asbestos. Analytical results are presented in Appendix B. Detected compounds are discussed in more detail below. Complete analytical data packages are presented in Appendix C.

A qualified chemist performed a Tier 2 data validation in accordance with the SAP. Except for the qualification discussed in Section 5, all data were considered acceptable for their intended use. Copies of the data validation reports are included as Appendix D.

Figure 3 shows the locations of samples collected as part of this waste characterization study. Attempts were made to co-locate sample locations YC-038 with YC-005, YC-039 with YC-012, YC-40 with YC-15, and YC-41 with YC-34.

4.1.1 PCBs as Aroclors

Analytical results for PCBs are summarized in Appendix B, Table B1. Aroclor 1254 and Aroclor 1260 were the only analytes detected above laboratory method detection limits (MDLs). For each sample the sum of total Aroclors was calculated. Where an Aroclor species was not detected above the laboratory MDL its value for purposes of calculating total PCBs was assumed to be zero.

PCBs were not observed at concentrations exceeding the Toxic Substances Control Act (TSCA) regulatory limit of 50 milligrams per kilogram (mg/kg) for total PCBs as a sum of Aroclors in any sample from this study. No sample exceeded the soluble threshold limit concentrations (STLC) threshold value of 50 mg/kg, which is ten times the STLC regulatory limit of 5 milligrams per liter (mg/L); therefore no additional analysis of the samples for soluble PCBs by the California waste extraction test (WET) was required. Fifteen samples in this study exceeded the TTLC regulatory value of 5 mg/kg; however this regulatory limit only applies to PCB contamination from a known source. Of the 32 samples

analyzed, 25 exceeded the proposed PCB removal action level of 1,240 µg/kg. The average concentration of the 25 samples that exceeded the removal level was 11,209 µg/kg. Using ProUCL Version 3.0 statistical software and assuming a Chebyshev distribution, the upper confidence limit (UCL) of the mean at the 95 percent confidence level was 22,334 µg/kg. These results indicate that the sediments would be classified as non-TSCA for PCBs for the purposes of disposal. Appendix B, Table B5 shows the disposal classification for each sediment sample. A summary of the statistical evaluation is included in Appendix E.

Appendix B, Table B5, also presents the total PCBs as a sum of Aroclors for samples collected during E & E's 2009 remedial assessment study. Four samples collected in this remedial assessment study exceeded the TSCA regulatory limit. The estimated disposal volume of sediments exceeding TSCA regulatory values for PCBs are estimated as part of the EC/CA. However unless these areas are specifically segregated, it is unlikely that PCB concentrations in sediment removed from the slough will be greater than the 50 mg/kg TSCA limit once they are homogenized during the removal process.

4.1.2 Hexavalent Chromium

Analytical results for hexavalent chromium are summarized in Appendix B, Table B1. Hexavalent chromium was detected above the laboratory MDL in two samples in this study. Both of these samples were at levels less than the laboratory reporting limit (RL). Based on these results, the sediments can be considered non-hazardous with respect to hexavalent chromium for purposes of disposal.

4.1.3 Asbestos

Analytical results for asbestos are summarized in Appendix B, Table B1. Asbestos was detected above the laboratory MDL in two samples in this study, both of which were below 1% chrysotile. Based on the State of California's regulatory limit of 1% friable asbestos, the results indicate that the sediments can be considered non-hazardous for asbestos for purposes of disposal.

4.1.4 Metals

Sediment samples were first analyzed for total solid CAM-17 metals by EPA Method 6010B. The results for each sample were then compared with the threshold values for TCLP and STLC. If the STLC threshold value (10 x STLC regulatory limit) for any analyte was met, then the sample was analyzed for soluble metals via the California WET method. If the TCLP threshold value (20 x TCLP regulatory limit) for any analyte was met, then the sample was analyzed for soluble metals via the TCLP method. The regulatory limits for total threshold limit concentrations (TTLC), STLC, and TCLP are shown in Appendix B, Table B2.

4.1.4.1 TTLC Metals

Analytical results for total solid metals are summarized in Appendix B, Table B2. All analytes were detected above the laboratory MDL except for thallium. Molybdenum and selenium were detected in only one sample. TTLC regulatory limits were exceeded in one sample, YC-041-3, which exceeded the 1,000 mg/kg limit for lead. These results indicate that sediments removed from Yosemite Slough are unlikely to be classified by the State of California as hazardous for total metals for purposes of disposal. This conclusion is supported by the calculated value of the 95%UCL about the mean of the TTLC (total) lead concentrations for the 25 waste characterization samples that exceeded the PCB removal action level (i.e. the 95% UCL for lead for samples collocated with PCBs above the action level). Using ProUCL Version 3.0, the calculated 95% UCL for total lead in those samples (using the Chebyshev distribution) was 851.4 mg/kg. Appendix B, Table B5 shows the disposal classification for each sediment sample. A summary of the statistical evaluation for total lead is included in Appendix E.

4.1.4.2 STLC Metals

All sediment samples except for YC-038-3 and YC-038-3.6 exceeded the TTLC threshold value of 50 mg/kg for lead and chromium, indicating STLC analyses were necessary. One sample, YC-041-3, also exceeded the TTLC threshold value of 250 mg/kg for copper. Because samples YC-038-3 and YC-038-3.6 were within 2 mg/kg of the TTLC threshold value for chromium, all samples were analyzed for soluble metals via the California WET method (STLC).

The analytical results for soluble metals via the California WET method are summarized in Appendix B, Table B3. Three samples, YC-038-2, YC-041-4, and YC-039-2, exceeded the STLC regulatory limit of 5 mg/L for soluble chromium. Eighteen samples exceeded the STLC regulatory limit of 5 mg/L for soluble lead. Because removal actions are expected to be based on PCB concentrations, the 95% UCL for soluble lead was calculated using the STLC values for those 25 samples that exceeded the 1,240 µg/kg limit for PCBs. Using ProUCL Version 3.0, the calculated mean was 12.7 mg/L and the 95% UCL about the mean was 27.6 mg/L. These results indicate that sediment removed due to elevated PCB concentrations will likely be classified by the State of California as hazardous for soluble lead for purposes of disposal. Appendix B, Table B5 shows the disposal classification for each sediment sample. A summary of the statistics generated using ProUCL 3.0 is included in Appendix E.

4.1.4.3 TCLP Metals

All sediment samples except for YC-038-3, YC-038-3.6, and YC-039-3.3 met the TTLC threshold value of 100 mg/kg for chromium, indicating TCLP extraction was warranted. Twenty-four samples, not including YC-038-3, YC-038-3.6, and YC-039-3.3, exceeded the TTLC threshold value of 100 mg/kg for lead, indicating TCLP extraction procedure was warranted. All samples except for YC-038-3, YC-038-3.6, and YC-039-3.3 were analyzed for soluble metals via the

TCLP method. The analytical results for soluble metals via the TCLP method are summarized in Appendix B, Table B4. No samples in this study exceeded the TCLP regulatory limits. These results indicate that the sediments may be considered as non-RCRA (Resource Conservation and Recovery Act) hazardous for purposes of disposal.

4.2 Waste Characterization

To ensure that the collected samples were at concentrations appropriate for establishing a correlation with historic data, the sampling locations were selected based on previous analytical results in areas where there are documented contamination “hot spots.” The sediments in these areas are the most likely to have the hazardous waste characteristics needed to determine the correlation to support the estimation of the sediment disposal volumes falling under the various disposal methods.

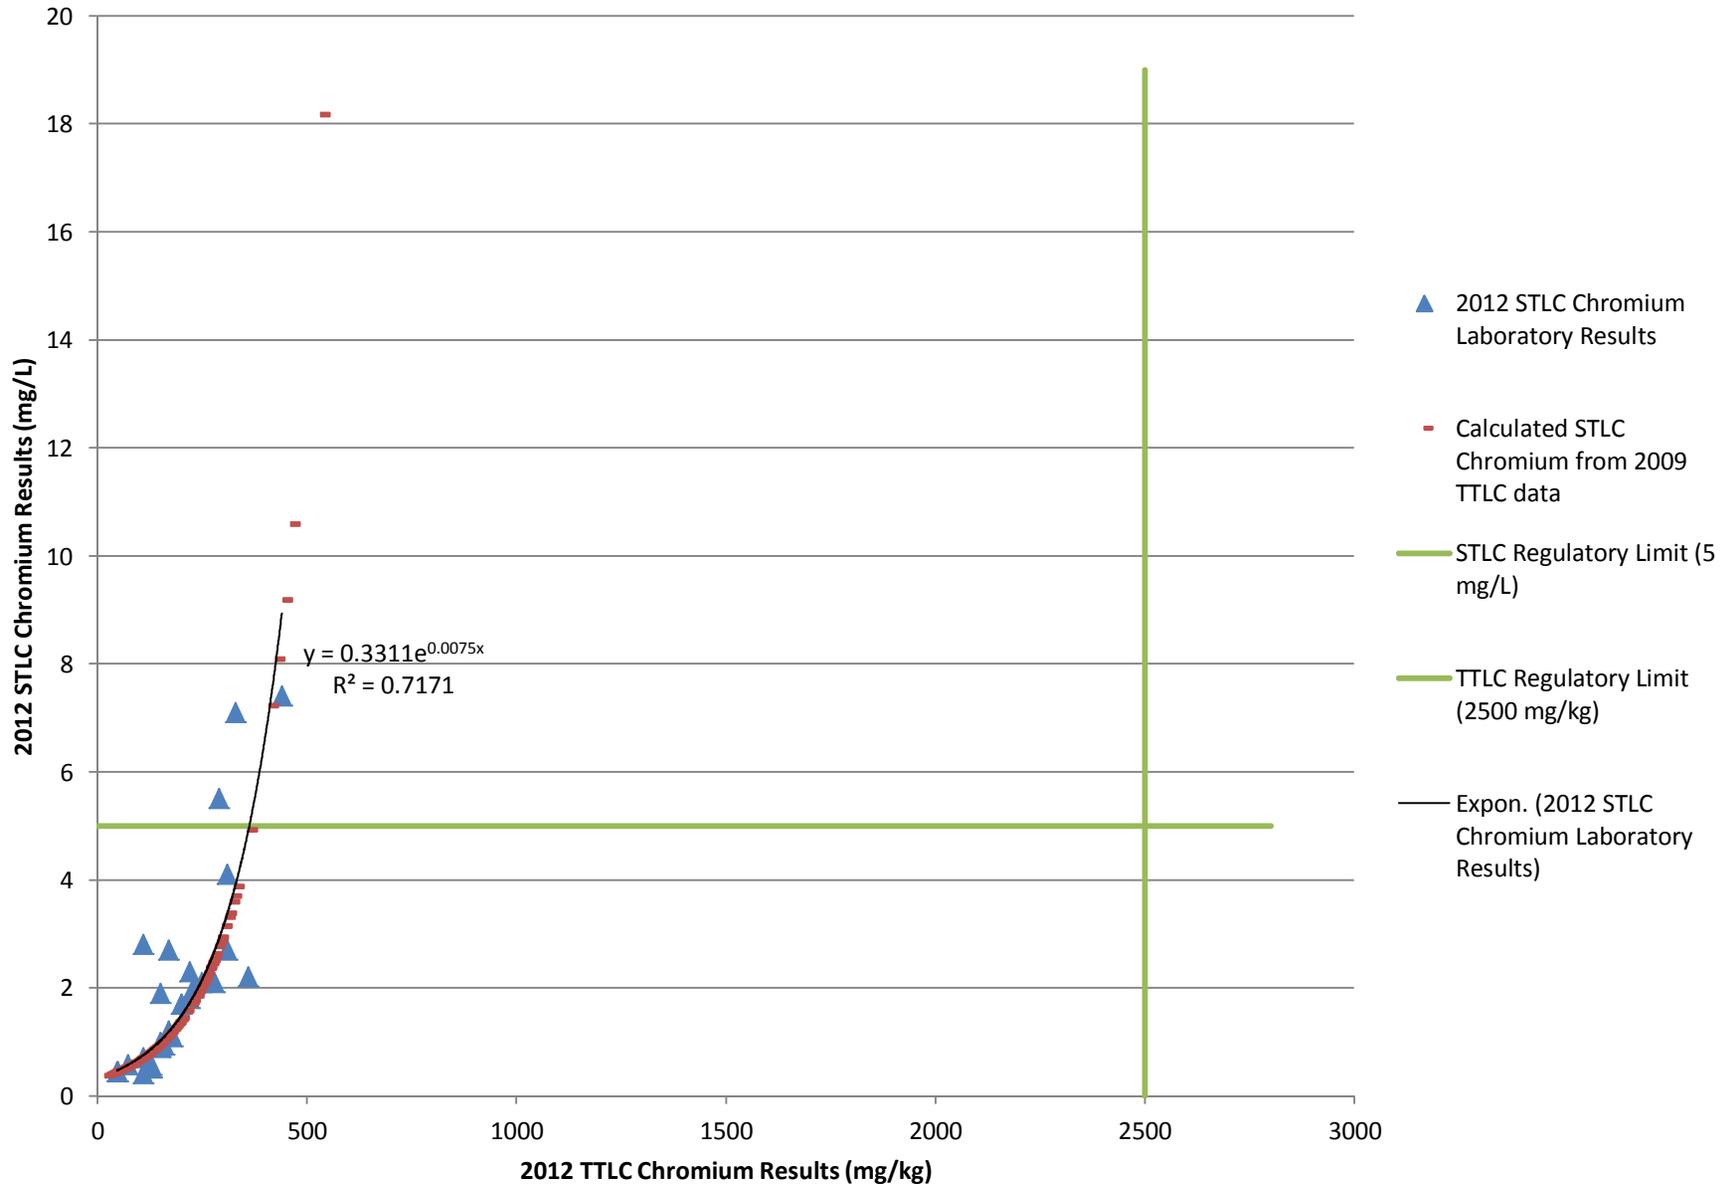

If the waste characterization data indicate good correlation between existing TTLC and STLC data sets, then extrapolations regarding volumes and area can be made using previous sampling results. For example, if the characterization data indicate that sediments are regulated hazardous waste under TSCA or California rules, and there is good correlation between TTLC, TCLP, and STLC data collected during the waste characterization study, then it will be assumed that material with similar TTLC characteristics (as sampled during the E & E 2009 remedial assessment work) will be disposed of as a regulated hazardous waste, and extrapolations regarding volumes and areas can be made using previous sampling results.

4.2.1 Correlation Study

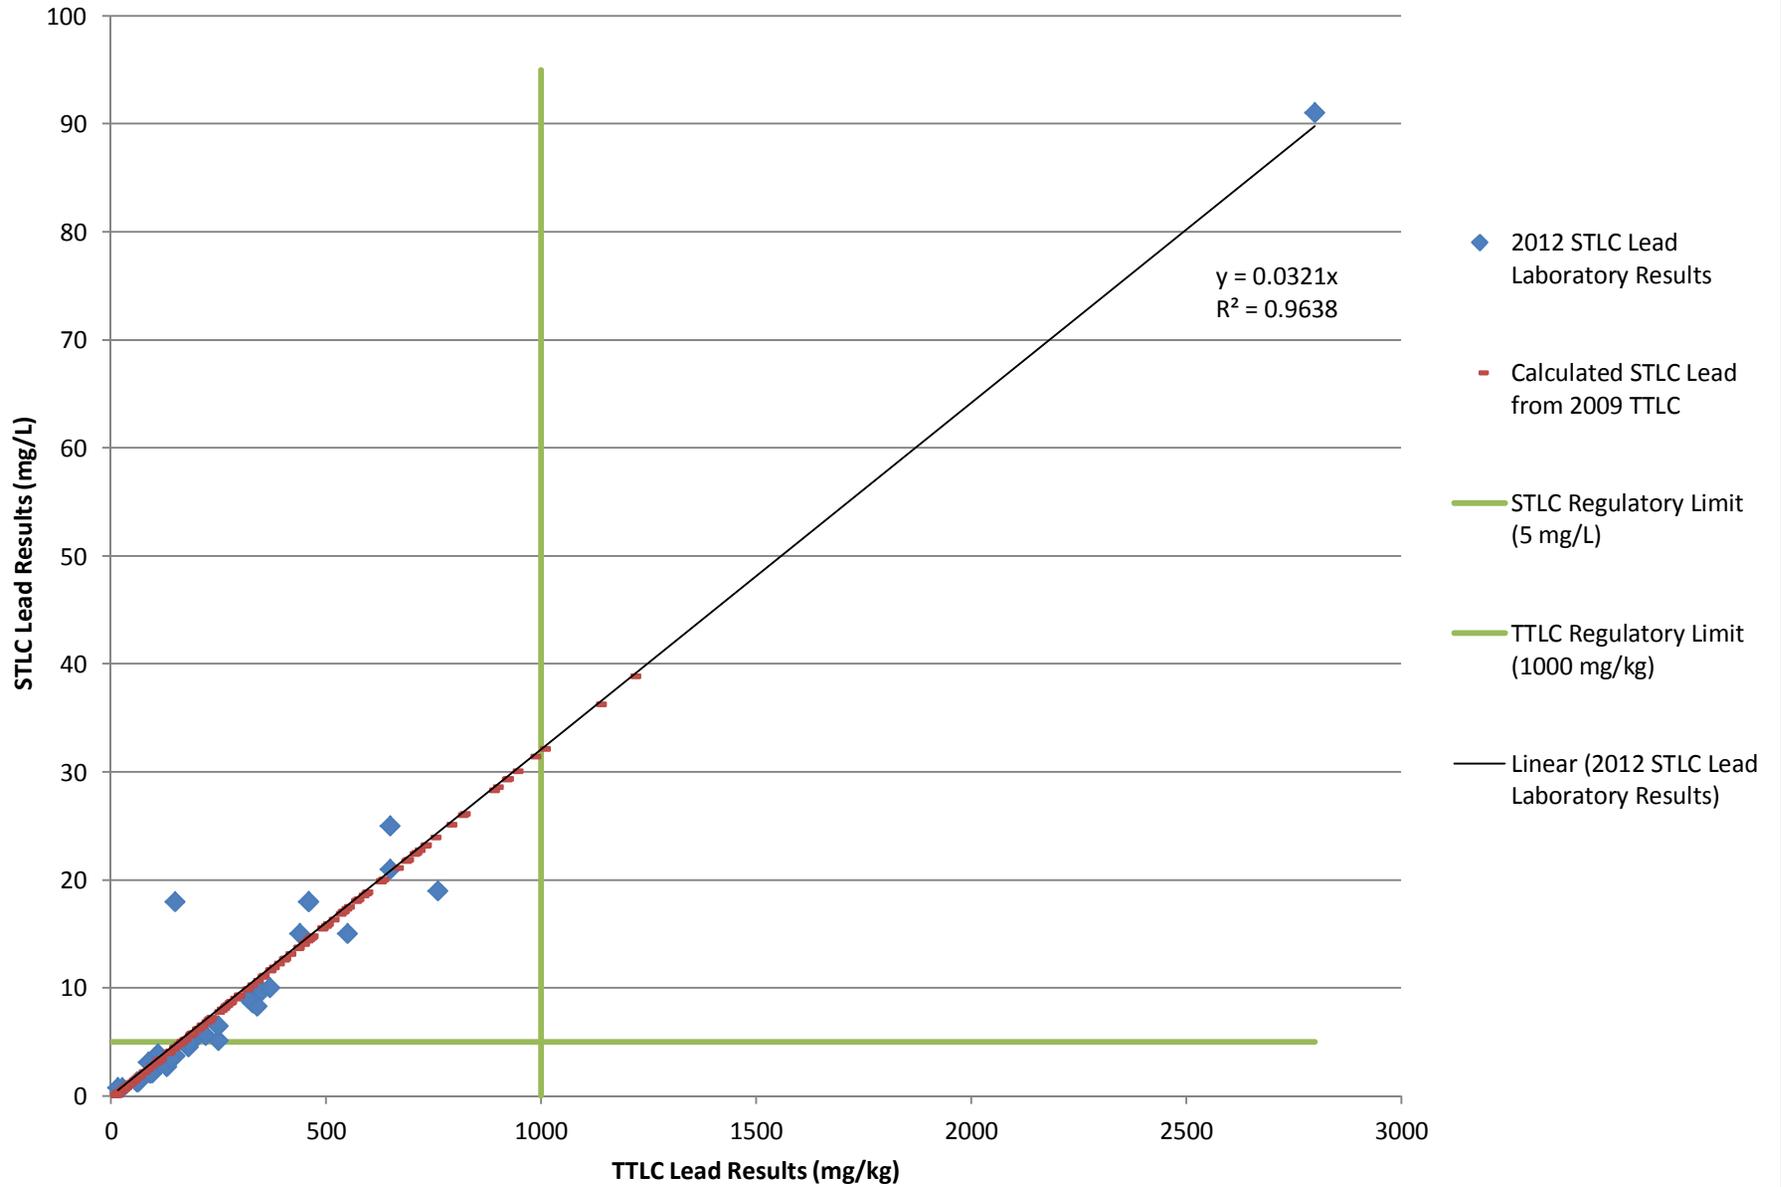

A correlation study was run to determine the relationship between TTLC and STLC sample results for chromium and lead for sediment samples collected in this waste characterization study. The correlation study was not run for PCB results because no samples collected during this study exceeded TSCA regulatory limits or met the STLC threshold value for PCBs. No correlation study was run for the relationship between TTLC and TCLP results because no sediment samples exceeded the TCLP regulatory thresholds.

According to the SAP, a correlation coefficient value of 0.70 or greater is considered as an acceptable correlation. Chromium TTLC and STLC sample results from this study have a correlation coefficient of 0.72 (see Figure 4). Lead TTLC and STLC sample results have a correlation coefficient of 0.96 (see Figure 5). However, if the outlier point that exceeds the TTLC regulatory limit of 1,000 mg/kg is removed, the correlation coefficient is reduced to 0.80. Because both of these correlation coefficients meet the acceptable criteria, the relationship between TTLC and STLC was used to calculate the STLC results for lead and chromium for the sediment samples collected by E & E during the 2009 removal assessment study. The results of this calculation are shown in Appendix B, Table B5. The relationship between TTLC and STLC for lead corresponding to the

Chromium TTLC to STLC Correlation

Lead TTLC to STLC Correlation

correlation coefficient of 0.9638 was used in the calculation of STLC results for sediment samples collected in 2009.

Although the correlation between chromium TTLC and STLC was less strong than the correlation between lead TTLC and STLC, all calculated chromium exceedances were co-located with lead exceedances, so any calculated chromium exceedances will not alter the disposal method. These results show a good correlation between existing TTLC and STLC datasets; therefore extrapolations regarding disposal volumes can be made using the 2009 removal assessment sampling results.

4.2.2 Waste Disposal Classification

Disposal volume estimates requiring different types of hazardous or nonhazardous disposal, if removed from the slough, will be estimated in the EC/CA using data generated from this waste characterization study. The sediment data for each sample collected by E & E during the 2009 and 2012 sampling events were compared with the regulatory disposal limits for TSCA, RCRA, or California rules as discussed above. Total Aroclor data for PCBs was used in comparison with TSCA and California rules for both the 2009 and 2012 sample results. Because of the positive correlation between TTLC and STLC data (discussed in Section 4.2.1), calculated STLC data were used in the comparison with California rules for the 2009 samples.

Appendix B, Table B5, shows the disposal classification of each sample. Disposal types determined to exist for sediments removed from the Slough are shown in Table 4-1. For disposal purposes, sediment that is classified as non-hazardous by the State of California for metals is considered Class II Waste. Sediment that is classified as hazardous by the State of California for metals is considered as non-RCRA waste for disposal purposes.

Table 4-2 shows a summary of the number of samples found in each disposal classification.

Actual disposal classifications may vary depending on the results of characterization samples collected from dewatered sediment stockpiles.

4.2.3 Co-located Samples

Attempts were made to co-locate sample locations YC-038 with YC-005, YC-039 with YC-012, YC-40 with YC-15, and YC-41 with YC-34. The sample results did not always result in matching disposal classifications for these co-located samples (see Appendix B, Table B6). For example, YC-034-1 resulted in a classification of non-RCRA, PCB-containing waste, while the co-located sample YC-041-1 resulted in a classification of Class II waste, PCB-containing. It is assumed that this is the case because sample collection locations may not have matched perfectly due to the field limitations of sample collection from a boat;

and because of the inherent variability of contaminant concentrations in environmental samples.

4.2.4 Distribution of Disposal Classification Samples

Figures 6 through 10 present the spatial distribution of disposal classifications of existing sample locations where the disposal classifications were estimated through the correlation study described above. The five figures represent sample results for 1-foot depth intervals, starting at the sediment surface (0 to 1 foot) to the deepest samples collected (4 to 5 feet).

Table 4-1 Definition of Disposal Classifications, Yosemite Creek Waste Characterization Study, San Francisco, San Francisco County, California

| | | METALS CLASS | | |
|-----------|----------------------------------|--------------------------------------|--|---------------------------|
| | | No Exceedance of TTLC, STLC, or TCLP | Exceeds either TTLC or STLC for Pb or Cr | Exceeds TCLP for Pb or Cr |
| PCB CLASS | Sum of Aroclors = 0 | Class II Waste, non-PCB | Non-RCRA, non-PCB | RCRA |
| | Sum of Aroclors is >0 but <50ppm | Class II Waste, PCB-containing | Non-RCRA, PCB-containing | RCRA |
| | Sum of Aroclors is >50ppm | TSCA | | RCRA/TSCA |

Key:

- BCP = polychlorinated biphenyls
- Cr = chromium
- Pb = lead
- ppm = parts per million
- RCRA = Resource Conservation and Recovery Act
- STLC = soluble threshold limit concentrations
- TSCA = Toxic Substances and Control Act
- TTLC = total threshold limit concentrations

4. Results and Interpretations

Quality Assurance/Quality Control (QA/QC)

5.1 Analytical Data Usability Report

The quality of the analytical data was reviewed by a START project chemist and, except for the qualifications discussed herein, found to be acceptable for intended uses under this investigation. Data produced as a result of this Waste Characterization Study were found to be acceptable with qualification as definitive analytical data. Specific data validation or quality assurance/quality control (QA/QC) issues are discussed in the Data Validation Summary Reports presented in Appendix D.

5.2 QA/QC Samples

The following quality assurance and quality control (QA/QC) samples were collected and analyzed as part of the waste characterization study.

5.2.1 Duplicate Samples

Field duplicate split samples were collected to evaluate homogenization and field sampling procedures at a rate of approximately one duplicate sample for every ten samples. Based on the SAP and EPA guidance, samples in which duplicates exceeded 35% relative percent difference (RPD) were to be qualified with a J (estimated) data validation qualifier. However, results for all duplicate samples were within the 35% RPD limit.

5.2.2 Matrix Spike and Matrix Spike Duplicate Samples

Additional sample material was collected for samples YC-044-3 and YC-039-2 and these samples were designated for matrix spike (MS) and matrix spike duplicate (MSD) analyses for TLLC metals. Except for antimony, recoveries were within the specified control limits. Results for antimony were qualified as estimated (j-flagged).

5.2.3 Rinse Blank

A rinse blank sample (YC-022112-RB) was collected by pouring distilled water over a decontaminated sample collection device (sampling spoon or bowl) and capturing the water in the specified sampling containers. The rinse blank was submitted to EPA Region 9 laboratory in Richmond, California, for analysis of metals, including lead and zinc (EPA Method 6010B); mercury (EPA Method 7471A); and PCBs as Aroclors (EPA Method 8082). Analytical results for sample

YC-022112-RB indicated that no PCBs or metals were reported at levels exceeding MDLs. Based on these results, decontamination procedures for site activities were adequate and were unlikely to have resulted in any cross-contamination between samples.

6

Summary and Conclusions

On February 21, 2012, START assisted the EPA with the collection of a total of 32 sediment samples from 8 sampling locations at Yosemite Creek, San Francisco, San Francisco County, California. Based on the results of the sediment sampling, PCBs (as Total Aroclors), soluble metals (including chromium and lead), and total metals are present in Yosemite Creek sediments at concentrations that exceed an applicable disposal criteria. Based on the Waste Characterization Study results, a good correlation is present between existing TTLC and STLC data sets; therefore, extrapolations regarding disposal classification volumes and area can be made using the 2009 removal assessment sampling results and the 2012 Waste Characterization Study results.

Based on the results of this Waste Characterization Study, the removal of sediments from the Yosemite Creek will not result in sediments classified as TSCA Waste for PCBs. However, it is likely that sediments removed from Yosemite Slough will exceed California Hazardous Waste (non-RCRA waste) criteria for soluble lead. There were not any samples collected that resulted in the RCRA Waste disposal classification.

Notes:
 ug/kg - micrograms per kilogram
 <n - Not detected in samples above the stated reporting limit n
 NA- Not analyzed or not applicable
 ND - not detected
 U - Estimated result, result is less than reporting limit but greater than method detection limit
 Asbestos analyzed by EPA Method 600
 Hexavalent Chromium analyzed by SW846 7196A and ASTM D 2216-90
 PCBs - polychlorinated biphenyls analyzed by EPA Method 8082
 Bold - exceeds disposal criteria
 RSL - U.S. EPA Region 9 industrial regional screening levels (November 2010)

Service SOPs: Asbestos-EPA Method 600/R-93/116 (EPA-600/M4-82-020 (SOP 01264))

All samples were received in acceptable condition unless noted in the Report Comments portion in the body of the report. The results relate only to the items tested. The results include an inherent uncertainty of measurement associated with estimating percentages by polarized light microscopy. Measurement uncertainty data can be provided when requested.

EMLab P&K ("the Company") shall have no liability to the client or the client's customer with respect to decisions or recommendations made, actions taken or courses of conduct implemented by either the client or the client's customer as a result of or based upon the Test Results. In no event shall the Company be liable to the client with respect to the Test Results except for the Company's own willful misconduct or gross negligence nor shall the Company be liable for incidental or consequential damages or lost profits or revenues to the fullest extent such liability may be disclaimed by law, even if the Company has been advised of the possibility of such damages, lost profits or lost revenues. In no event shall the Company's liability with respect to the Test Results exceed the amount paid to the Company by the client therefor.

|--|------------------|
| Brown Soil | ND |
| Composite Non-Asbestos Fibrous Content: | < 1% Cellulose |
| Sample Composite Homogeneity: | Good |

The results relate only to the items tested. Interpretation is left to the company and/or persons who conducted the field work. The test report shall not be reproduced except in full, without written approval of the laboratory. The report must not be used by the client to claim product certification, approval, or endorsement by NVLAP, NIST, or any agency of the federal government.

All samples were received in acceptable condition unless otherwise noted. EMLab P&K reserves the right to dispose of all samples after a period of thirty (30) days, according to all state and federal guidelines, unless otherwise specified.

Inhomogeneous samples are separated into homogeneous subsamples and analyzed individually. ND means no fibers were detected. When detected, the minimum detection and reporting limit is less than 1% unless point counting is performed.

‡ A "Version" indicated by "-x" after the Lab ID# with a value greater than 1 indicates a sample with amended data. The revision number is reflected by the value of "x".

Lab ID-Version‡: 3963506-1

| Sample Layers | Asbestos Content |
|--|------------------|
| Brown Soil | ND |
| Composite Non-Asbestos Fibrous Content: | < 1% Cellulose |
| Sample Composite Homogeneity: | Good |

The results relate only to the items tested. Interpretation is left to the company and/or persons who conducted the field work. The test report shall not be reproduced except in full, without written approval of the laboratory. The report must not be used by the client to claim product certification, approval, or endorsement by NVLAP, NIST, or any agency of the federal government.

All samples were received in acceptable condition unless otherwise noted. EMLab P&K reserves the right to dispose of all samples after a period of thirty (30) days, according to all state and federal guidelines, unless otherwise specified.

Inhomogeneous samples are separated into homogeneous subsamples and analyzed individually. ND means no fibers were detected. When detected, the minimum detection and reporting limit is less than 1% unless point counting is performed.

‡ A "Version" indicated by "-x" after the Lab ID# with a value greater than 1 indicates a sample with amended data. The revision number is reflected by the value of "x".

Mindy Song
Ecology and Environment, Inc.
3700 Industry Avenue #102
Lakewood, CA 90712

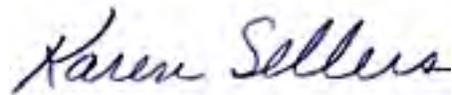

Dear Ms. Song,

This report contains the analytical results for the samples received under chain of custody by TestAmerica on February 22, 2012. These samples are associated with your Yosemite Creek project.

The test results in this report meet all NELAC requirements for parameters that accreditation is required or available. Any exceptions to NELAC requirements are noted in the case narrative. The case narrative is an integral part of this report.

If you have any questions, please feel free to call me at (916) 374-4442.

Sincerely,

Karen M. Sellers
Project Manager

General Comments

Please note that samples for asbestos via method E600/R-93/116 were forwarded to TestAmerica EMLab P&K. Please see attached report for any comments or anomalies pertinent to that analysis.

There were no anomalies associated with this project.

QC Parameter Definitions

QC Batch: The QC batch consists of a set of up to 20 field samples that behave similarly (i.e., same matrix) and are processed using the same procedures, reagents, and standards at the same time.

Method Blank: An analytical control consisting of all reagents, which may include internal standards and surrogates, and is carried through the entire analytical procedure. The method blank is used to define the level of laboratory background contamination.

Laboratory Control Sample and Laboratory Control Sample Duplicate (LCS/LCSD): An aliquot of blank matrix spiked with known amounts of representative target analytes. The LCS (and LCSD as required) is carried through the entire analytical process and is used to monitor the accuracy of the analytical process independent of potential matrix effects. If an LCSD is performed, it may also be used to evaluate the precision of the process.

Duplicate Sample (DU): Different aliquots of the same sample are analyzed to evaluate the precision of an analysis.

Surrogates: Organic compounds not expected to be detected in field samples, which behave similarly to target analytes. These are added to every sample within a batch at a known concentration to determine the efficiency of the sample preparation and analytical process.

Matrix Spike and Matrix Spike Duplicate (MS/MSD): An MS is an aliquot of a matrix fortified with known quantities of specific compounds and subjected to an entire analytical procedure in order to indicate the appropriateness of the method for a particular matrix. The percent recovery for the respective compound(s) is then calculated. The MSD is a second aliquot of the same matrix as the matrix spike, also spiked, in order to determine the precision of the method.

Isotope Dilution: For isotope dilution methods, isotopically labeled analogs (internal standards) of the native target analytes are spiked into the sample at time of extraction. These internal standards are used for quantitation, and monitor and correct for matrix effects. Since matrix effects on method performance can be judged by the recovery of these analogs, there is little added benefit of performing MS/MSD for these methods. MS/MSD are only performed for client or QAPP requirements.

Control Limits: The reported control limits are either based on laboratory historical data, method requirements, or project data quality objectives. The control limits represent the estimated uncertainty of the test results.

Notes(s):

- The analytical results of the samples listed above are presented on the following pages.
- All calculations are performed before rounding to avoid round-off errors in calculated results.
- Results noted as "ND" were not detected at or above the stated limit.
- This report must not be reproduced, except in full, without the written approval of the laboratory.
- Results for the following parameters are never reported on a dry weight basis: color, corrosivity, density, flashpoint, ignitability, layers, odor, paint filter test, pH, porosity, pressure, reactivity, redox potential, specific gravity, spot tests, solids, solubility, temperature, viscosity, and weight.

$$\% \text{ diff} = \frac{44.51 - 44.40}{\frac{44.51 + 44.40}{2}} \times 100 = \frac{0.11}{44.46} \times 100 = 0.25\%$$

All weights are in grams.
 Sample weights (wet & dry) include the weight (tare) of the sample pan.
 Wt. Diff. = sample wet weight (+ tare) - sample dry weight (+ tare).
 % Water = (Wt. Diff./sample wet weight - pan tare)*100
 % Solid = 100 - percent Water

From: Mindy Song
Through: Howard Edwards

Dear Karen Sellers,

This letter serves to inform you that your laboratory has been awarded the analytical laboratory work for:

Project Name: Yosemite Creek, EE/CA
TDD No.: 09-11-10-0001
Project Number: 002693.7008.01SO06

The work will be performed as per your Basic Ordering Agreement (BOA) environmental analysis subcontract with E&E and is anticipated to consist of the following analysis, matrices, number of samples, and deliverables as per the communication with you on: 12/14/2011

| Analytical Method | Sample Matrix | Contract Item # | Sample Qty | Data Summary TAT | Level 4 Package TAT | Unit Cost | TAT Cost | Total Cost |
|---|---------------|-----------------|------------|------------------|---------------------|-----------|----------|------------|
| Chromium VI by Coprecipitation/ Colorimetric (Digestion/Extraction Cost EPA 7195/7196 | soil | 17 | 30 | 2-wks - std. | 4 wks - Env lab | \$17.50 | \$0.00 | \$525.00 |

The Ecology & Environment project manager, Brian Milton (or designee) will contact you prior to shipment to discuss the actual matrices, analyses, quantities, and deliverables as these may differ from the included table.

Please read the following to reconfirm that:

1. Samples will be received starting approximately: ~~1/16/2012~~ ^{AMS} 1/20/2012
2. After receipt of samples a summary data package and electronic data will be received by Ecology & Environment as specified in the table above and should be emailed to Brian Milton at bmilton@ene.com.

3. After receipt of samples a Level IV Data Package will be received by Ecology & Environment as specified in the table above, and should be sent to: Mindy Song
3700 Industry Avenue, Suite 102
Lakewood, CA 90712

All billing/invoice statements must contain the following information:

Project Name: Yosemite Creek, EE/CA

TDD No.: 09-11-10-0001

Project Number: 002693.7008.01SO06

BOA Contract Item #

Unit Cost per Contract Item #

Total Cost per Contract Item #

All invoices must be sent to Anita Slater at Ecology & Environment, Inc., 1940 Webster Street, Suite 100, Oakland, CA 94612. The chain-of-custody sheets delivered with each sample shipment contain specific information regarding the number of samples and analyses required as well as the TDD and PAN numbers to reference when invoicing this project. If there are any questions regarding this project, please call me at (310) 947-2853.

Miguel Ines

Service SOPs: Asbestos-EPA Method 600/R-93/116 (EPA-600/M4-82-020 (SOP 01264))

All samples were received in acceptable condition unless noted in the Report Comments portion in the body of the report. The results relate only to the items tested. The results include an inherent uncertainty of measurement associated with estimating percentages by polarized light microscopy. Measurement uncertainty data can be provided when requested.

EMLab P&K ("the Company") shall have no liability to the client or the client's customer with respect to decisions or recommendations made, actions taken or courses of conduct implemented by either the client or the client's customer as a result of or based upon the Test Results. In no event shall the Company be liable to the client with respect to the Test Results except for the Company's own willful misconduct or gross negligence nor shall the Company be liable for incidental or consequential damages or lost profits or revenues to the fullest extent such liability may be disclaimed by law, even if the Company has been advised of the possibility of such damages, lost profits or lost revenues. In no event shall the Company's liability with respect to the Test Results exceed the amount paid to the Company by the client therefor.

| Sample Layers | Asbestos Content |
|--|------------------|
| Brown Soil | ND |
| Composite Non-Asbestos Fibrous Content: | < 1% Cellulose |
| Sample Composite Homogeneity: | Good |

The results relate only to the items tested. Interpretation is left to the company and/or persons who conducted the field work. The test report shall not be reproduced except in full, without written approval of the laboratory. The report must not be used by the client to claim product certification, approval, or endorsement by NVLAP, NIST, or any agency of the federal government.

All samples were received in acceptable condition unless otherwise noted. EMLab P&K reserves the right to dispose of all samples after a period of thirty (30) days, according to all state and federal guidelines, unless otherwise specified.

Inhomogeneous samples are separated into homogeneous subsamples and analyzed individually. ND means no fibers were detected. When detected, the minimum detection and reporting limit is less than 1% unless point counting is performed.

‡ A "Version" indicated by "-x" after the Lab ID# with a value greater than 1 indicates a sample with amended data. The revision number is reflected by the value of "x".

Mindy Song
Ecology and Environment, Inc.
3700 Industry Avenue #102
Lakewood, CA 90712

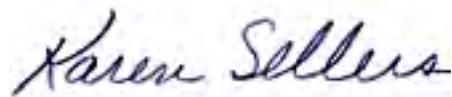

Dear Ms. Song,

This report contains the analytical results for the samples received under chain of custody by TestAmerica on February 22, 2012. These samples are associated with your Yosemite Creek project.

The test results in this report meet all NELAC requirements for parameters that accreditation is required or available. Any exceptions to NELAC requirements are noted in the case narrative. The case narrative is an integral part of this report.

If you have any questions, please feel free to call me at (916) 374-4442.

Sincerely,

Karen M. Sellers
Project Manager

General Comments

Please note that samples for asbestos via method E600/R-93/116 were forwarded to EMLab P&K. Please see attached report for any comments or anomalies pertinent to that analysis.

There were no anomalies associated with this project.

QC Parameter Definitions

QC Batch: The QC batch consists of a set of up to 20 field samples that behave similarly (i.e., same matrix) and are processed using the same procedures, reagents, and standards at the same time.

Method Blank: An analytical control consisting of all reagents, which may include internal standards and surrogates, and is carried through the entire analytical procedure. The method blank is used to define the level of laboratory background contamination.

Laboratory Control Sample and Laboratory Control Sample Duplicate (LCS/LCSD): An aliquot of blank matrix spiked with known amounts of representative target analytes. The LCS (and LCSD as required) is carried through the entire analytical process and is used to monitor the accuracy of the analytical process independent of potential matrix effects. If an LCSD is performed, it may also be used to evaluate the precision of the process.

Duplicate Sample (DU): Different aliquots of the same sample are analyzed to evaluate the precision of an analysis.

Surrogates: Organic compounds not expected to be detected in field samples, which behave similarly to target analytes. These are added to every sample within a batch at a known concentration to determine the efficiency of the sample preparation and analytical process.

Matrix Spike and Matrix Spike Duplicate (MS/MSD): An MS is an aliquot of a matrix fortified with known quantities of specific compounds and subjected to an entire analytical procedure in order to indicate the appropriateness of the method for a particular matrix. The percent recovery for the respective compound(s) is then calculated. The MSD is a second aliquot of the same matrix as the matrix spike, also spiked, in order to determine the precision of the method.

Isotope Dilution: For isotope dilution methods, isotopically labeled analogs (internal standards) of the native target analytes are spiked into the sample at time of extraction. These internal standards are used for quantitation, and monitor and correct for matrix effects. Since matrix effects on method performance can be judged by the recovery of these analogs, there is little added benefit of performing MS/MSD for these methods. MS/MSD are only performed for client or QAPP requirements.

Control Limits: The reported control limits are either based on laboratory historical data, method requirements, or project data quality objectives. The control limits represent the estimated uncertainty of the test results.

Notes(s):

- The analytical results of the samples listed above are presented on the following pages.
- All calculations are performed before rounding to avoid round-off errors in calculated results.
- Results noted as "ND" were not detected at or above the stated limit.
- This report must not be reproduced, except in full, without the written approval of the laboratory.
- Results for the following parameters are never reported on a dry weight basis: color, corrosivity, density, flashpoint, ignitability, layers, odor, paint filter test, pH, porosity, pressure, reactivity, redox potential, specific gravity, spot tests, solids, solubility, temperature, viscosity, and weight.

Example Calculation:
 $y = [m \cdot x + b]$ [extract volume / sample wt]
 $* 11MS = [(1.2078) \cdot (0.41 - 0.003) + 4.6619E-04] \cdot x$
 $= .225 \text{ mg/kg}$ 3/14/12

y = result
 x = absorbance - background absorbance
 b = intercept
 50/10.13

START AWARD OF ANALYTICAL WORK LETTER

Date: 12/15/2011
To: Karen Sellers
TestAmerica Laboratories, Inc.
880 Riverside Parkway, West Sacramento, CA 95605

Phone: (916) 373-5600
FAX: (916) 372-1059
Email: karen.sellers@testamericainc.com

From: Mindy Song
Through: Howard Edwards
Dear Karen Sellers,

This letter serves to inform you that your laboratory has been awarded the analytical laboratory work for:

Project Name: Yosemite Creek, EE/CA
TDD No.: 09-11-10-0001
Project Number: 002693.7008.01SO06

The work will be performed as per your Basic Ordering Agreement (BOA) environmental analysis subcontract with E&E and is anticipated to consist of the following analysis, matrices, number of samples, and deliverables as per the communication with you on: 12/14/2011

| Analytical Method | Sample Matrix | Contract Item # | Sample Qty | Data Summary TAT | Level 4 Package TAT | Unit Cost | TAT Cost | Total Cost |
|---|---------------|-----------------|------------|------------------|---------------------|-----------|----------|------------|
| Chromium VI by Coprecipitation/ Colorimetric (Digestion/Extraction Cost EPA 7195/7196 | soil | 17 | 30 | 2-wks - std. | 4 wks - Env lab | \$17.50 | \$0.00 | \$525.00 |

The Ecology & Environment project manager, Brian Milton (or designee) will contact you prior to shipment to discuss the actual matrices, analyses, quantities, and deliverables as these may differ from the included table.

Please read the following to reconfirm that:

1. Samples will be received starting approximately: ~~1/16/2012~~ ^{AMS} 1/20/2012
2. After receipt of samples a summary data package and electronic data will be received by Ecology & Environment as specified in the table above and should be emailed to Brian Milton at bmilton@enc.com.

3. After receipt of samples a Level IV Data Package will be received by Ecology && Environment as specified in the table above, and should be sent to: Mindy Song
3700 Industry Avenue, Suite 102
Lakewood, CA 90712

All billing/invoice statements must contain the following information:

Project Name: Yosemite Creek, EE/CA

TDD No.: 09-11-10-0001

Project Number: 002693.7008.01SO06

BOA Contract Item #

Unit Cost per Contract Item #

Total Cost per Contract Item #

All invoices must be sent to Anita Slater at Ecology && Environment, Inc., 1940 Webster Street, Suite 100, Oakland, CA 94612. The chain-of-custody sheets delivered with each sample shipment contain specific information regarding the number of samples and analyses required as well as the TDD and PAN numbers to reference when invoicing this project. If there are any questions regarding this project, please call me at (310) 947-2853.

Service SOPs: Asbestos-EPA Method 600/R-93/116 (EPA-600/M4-82-020 (SOP 01264))

All samples were received in acceptable condition unless noted in the Report Comments portion in the body of the report. The results relate only to the items tested. The results include an inherent uncertainty of measurement associated with estimating percentages by polarized light microscopy. Measurement uncertainty data can be provided when requested.

EMLab P&K ("the Company") shall have no liability to the client or the client's customer with respect to decisions or recommendations made, actions taken or courses of conduct implemented by either the client or the client's customer as a result of or based upon the Test Results. In no event shall the Company be liable to the client with respect to the Test Results except for the Company's own willful misconduct or gross negligence nor shall the Company be liable for incidental or consequential damages or lost profits or revenues to the fullest extent such liability may be disclaimed by law, even if the Company has been advised of the possibility of such damages, lost profits or lost revenues. In no event shall the Company's liability with respect to the Test Results exceed the amount paid to the Company by the client therefor.

| Project Number: 002693.7008.01SO | TDD No: 09-11-10-0001 |

1. HOLDING TIMES

- Acceptable
 Acceptable with qualification
 Unacceptable

Samples were extracted and analyzed within required holding times except as noted under Comments. In addition, no problems were identified with regard to sample preservation or custody unless specified. For those samples analyzed outside holding time requirements, the detected results have been qualified as estimated (J), and the nondetected results have been qualified either as estimated (UJ) or rejected (R) based on the reviewer's judgement.

Water Samples

Extractable analyses: 7 days (from collection) to extraction; 40 days (from extraction) to analysis.

Soil or Other Matrices:

Extractable analyses: 14 days (from collection) to extraction; 40 days (from extraction) to analysis.

Comments: The recently-updated holding time of soil samples for PCB analysis by EPA 8082 is none per USEPA SW-846, Table 4-1 in Chapter 4.

2. INSTRUMENT PERFORMANCE CRITERIA

- N/A Raw data has been checked to verify that the DDT retention time is greater than 12 minutes and that there is adequate resolution (>25%) between peaks of the other standard compounds.
- X Raw data has been checked to verify that retention time windows are reported and that all standard compounds are within the windows.
- N/A Raw data has been checked to verify that the percent breakdown for DDT and endrin does not exceed 20% in the degradation check standard.
- X Raw data has been checked to verify that the percent difference in retention time for the surrogate in all standards and samples does not exceed 0.3% (capillary columns) or 1.5% (wide-bore capillary columns).

Comments:

ANALYTICAL DATA REVIEW SUMMARY

| | |
|----------------------------------|-----------------------------|
| Site Name: Yosemite Creek, EE/CA | Location: San Francisco, CA |
| Project Number: 002693.7008.01SO | TDD No: 09-11-10-0001 |

3. INITIAL CALIBRATIONS

- Acceptable
 Acceptable with qualification
 Unacceptable

Unless flagged below, a 5-point initial calibration was run. In addition, average Relative Response Factor (RRF), and percent relative Standard Deviation (%RSD) values were within control limits (%RSD \leq 20). For analytes which exceeded these control limits, associated detected results are qualified as estimated (J). In cases where the low calibration level was not detected, the nondetected results are qualified (UJ).

Comments: PCB 1016/1260 was used for a 5-point initial calibration and percent relative standard deviation values were within the control limits.

4. CONTINUING CALIBRATIONS

- Acceptable
 Acceptable with qualification
 Unacceptable

Unless flagged below, continuing calibrations were performed at the beginning and at the end of any group of samples and at least every 12 hours. In addition, Relative Response Factors (RRF), and Percent Difference (%D) values were within control limits (%D \leq 15). For analytes which exceeded these control limits, associated detected results are qualified as estimated (J). In cases where the %D is very high and indicates a severe loss of instrument sensitivity, the associated nondetected results may be qualified as estimated (UJ) or rejected (R) based on the professional judgement of the reviewer.

Comments: Percent Difference (%D) values were within control limits.

ANALYTICAL DATA REVIEW SUMMARY

Tier 2 Validation

| | |
|----------------------------------|-----------------------------|
| Site Name: Yosemite Creek, EE/CA | Location: San Francisco, CA |
| Project Number: 002693.7008.01SO | TDD No: 09-11-10-0001 |

5. LABORATORY CONTROL SAMPLE

- Acceptable
 Acceptable with qualification
 Unacceptable
 No Laboratory Control Samples Analyzed

Laboratory control sample recoveries are used for a qualitative indication of accuracy (bias) independent of matrix effects. LCS recovery limits should either be specified in the Sampling and Analysis Plan or can be established by the laboratory. For analytes which exceeded these control limits, associated detected results are qualified as estimated (J).

Comments: LCS recoveries for PCB 1016 and PCB 1260 were within control limits.

6. MATRIX SPIKE/MATRIX SPIKE DUPLICATE

- Acceptable
 Acceptable with qualification
 Unacceptable
 No Matrix Spike/Matrix Spike Duplicates Analyzed

Matrix spike and matrix spike duplicate recoveries are used for a qualitative indication of accuracy (bias) due to matrix effects. The RPD between the recoveries is used for a qualitative indication of precision. Spike recovery limits of 80% to 120% are specified in EPA/540/G-90/004. For analytes which exceeded these control limits, associated detected results are qualified as estimated (J). At the discretion of the reviewer, other limits may be used only if justification can be provided.

Comments: Samples YC-038-3.6 and YC-039-3.3 were used for MS/MSD and the recoveries were within the control limits.

ANALYTICAL DATA REVIEW SUMMARY

Tier 2 Validation

| | |
|----------------------------------|-----------------------------|
| Site Name: Yosemite Creek, EE/CA | Location: San Francisco, CA |
| Project Number: 002693.7008.01SO | TDD No: 09-11-10-0001 |

7. BLANKS AND BACKGROUND SAMPLES

Acceptable
 Detection Limits Adjusted

The following blanks were analyzed:

Method (preparation) Blanks
 Field Blanks
 Instrument Blanks
 Rinsate Blanks
 Background Samples
 VOA Trip Blanks

Preparation (method) blanks were prepared for each batch of samples extracted. A preparation blank was analyzed after every continuing calibration standard, prior to sample analysis unless noted below. Any compound detected in the sample and also detected in any associated blank, must be qualified as non-detect (U) when the sample concentration is less than 5x the blank concentration.

Comments: No contamination was found in the method blank or rinsate blank at reporting limit level.

8. SURROGATE COMPOUNDS

Acceptable
 Acceptable with qualification
 Unacceptable
 No surrogates analyzed

Surrogate compound recoveries for samples analyzed within a sample group must be within the limits specified in the method. If the surrogate recovery is between 10% and the lower limit, the associated detected results are qualified as estimated (J) and the nondetected results are qualified as estimated (UJ). If the surrogate recovery is <10%, the associated detected results are qualified as estimated (J) and the nondetected results are rejected (R). If the surrogate recovery is above the upper limit, the associated detected results are qualified as estimated (J). Surrogate recoveries which exceeded these limits are noted below and the associated results are qualified on the attached sample report forms. If there are no limits specified in the method, laboratory limits based on historical performance may be used at the discretion of the reviewer.

Comments: Surrogate recoveries were within the control limits.

9. INTERNAL STANDARDS

- Acceptable
 Acceptable with qualification
 Unacceptable
 No internal standards analyzed

Internal Standard area counts for samples analyzed within a sample group must be within the range of 50% to 200% of the internal standard area for the continuing calibration. If the internal standard area is between 10% and 50% of this value, the associated detected results are qualified as estimated (J) and the non-detected results are qualified as estimated (UJ). If the internal standard area is <10% of the calibration area, both the detected and non-detected results are rejected (R). If the internal standard area is >200% of the calibration area, the associated detected results are qualified as estimated (J). Internal standards which exceeded these limits are noted below and the associated results are qualified on the attached sample report forms.

Comments: External standards were used.

10. DUPLICATE ANALYSES

- Acceptable
 Acceptable with qualification
 Unacceptable
 No Duplicates Analyzed

Type of duplicates analyzed:

- Field Duplicates
 Laboratory Duplicates

Calculate the relative Percent Difference (RPD) between the members of duplicate pairs using the equation indicated below. Qualify the results as estimated (J) for any analyte whose RPD exceeds that specified in the Sampling and Analysis Plan.

$$RPD = \frac{2(\text{Value 1} - \text{Value 2})}{\text{Value 1} + \text{Value 2}} \times 100\%$$

| Aroclor 1254 | 5100 | 3300 | 43* |
| Aroclor 1260 | 2700 | 2100 | 25 |

*: RPD>35%

Comments: Sample YC-841-2 was a field duplicate of YC-041-2 and the RPD of Aroclor 1254 was outside of control limit. The detected Aroclor 1254 results in YC-041-2 and YC-841-2 were qualified as estimated (J)

ANALYTICAL DATA REVIEW SUMMARY

Tier 2 Validation

| | |
|----------------------------------|-----------------------------|
| Site Name: Yosemite Creek, EE/CA | Location: San Francisco, CA |
| Project Number: 002693.7008.01SO | TDD No: 09-11-10-0001 |

11. ANALYTE IDENTIFICATION

Verify that positive results have been confirmed on a dissimilar second column, that the sample chromatograms agree with the correct daily standard chromatograms, and that the retention time windows match. When sample results are confirmed by a second column, the relative percent difference (RPD) between the two results is calculated. If the RPD is less than 40% and there is no evidence of chromatographic problems, the higher result is reported. If the RPD is greater than 40%, the chromatogram is checked for anomalies and results are selected based on the best professional judgment of the reviewer. If there is no evidence of any chromatographic problems, the higher result is reported.

Comments: Reported results were acceptable. Region 9 laboratory reports the lower results (this is the same as the Superfund CLP protocols) because the most common interferences are due to co-elution and these usually results in high bias.

12. ANALYTE QUANTITATION

Confirm that analyte quantitation was performed correctly using the following formulas:

Extractable analyses, water samples:

$$\text{ug/L} = \frac{(\text{analyte area})(\text{amount of external standard, ng})(\text{total volume of extract, uL})}{(\text{external standard area})(\text{volume of sample extracted, mL})(\text{injection volume, uL})}$$

Extractable analyses, soil samples:

$$\text{ug/kg} = \frac{(\text{analyte area})(\text{amount of external standard, ng})(\text{total volume of extract, uL})}{(\text{external standard area})(\text{weight of sample extracted, g})(\text{fraction solids})(\text{injection volume, uL})}$$

Comments: Analyte quantitation was acceptable.

For samples from this site were contaminated with both Aroclor 1254 and Aroclor 1260 therefore the common peaks used to quantitate Aroclors 1254 and 1260 may have resulted in a high bias. ESAT reviewed the data and the method and concluded that the two Aroclors do interfere with each other, resulting in a high bias for one or both Aroclors. Region 9 Laboratory SOP 330 R4 does not allow for the exclusion of interfering peaks except when one of the fives is a significant statistical outlier (using the Q test). The overlapping compounds from Aroclor 1260 and 1254 encompass more than one peak and were not all excluded after applying the outlier test. EPA SW-846 method 8280A allows for the quantitation of an aroclor by using 3 to 5 peaks. For four sediment samples, YC-038-2, YC-041-3, YC-041-4, and YC-039-2, the laboratory chose for quantitation 3 or 4 peaks that were deemed to be free of potential co-elutions. The re-calculated concentrations necessitated the use of an RF for each Aroclor peak, as per the method, as opposed to the R9 SOP which uses an RF for the total area of the five Aroclor peaks summed together. For this project, interfering peaks were dropped and the results recalculated, as follows:

|----------------------------------|-----------------------------|
| Site Name: Yosemite Creek, EE/CA | Location: San Francisco, CA |
| Project Number: 002693.7008.01SO | TDD No: 09-11-10-0001 |

| | <u>1254</u> | <u>1260</u> | <u>1254/1260</u> | <u>1254/1260</u> |
|----------|-------------|-------------|-------------------|--------------------------------------|
| | Peak # | dropped | using all 5 peaks | recalculated not using dropped peaks |
| YC-038-2 | 4, 5 | 1 | 29/20, mg/kg | 21/17, mg/kg |
| YC-041-3 | None | 1, 2 | 29/3.0, mg/kg | 29/2.7, mg/kg |
| YC-041-4 | 4, 5 | 1 | 35/34, mg/kg | 16/30, mg/kg |
| YC-039-2 | 4, 5 | 1 | 26/20, mg/kg | 15/ 17, mg/kg |

Sample YC-038-1

Aroclor 1260: 5 peaks used

$(128.7E6 + 42490434 + 29590693 + 82582206 + 45707612) / (453.050E3) = 726.346 \text{ ng/mL}$

$(726.346 \text{ ng/mL}) (5\text{mL}/2.97\text{g}) (100/52) = 2351.5 \text{ ng/g} = 2351.5 \text{ ug/kg}$

Lab reported 2400 ug/kg.

Aroclor 1254: 5 peaks used

$(4164700 + 7298771 + 5510175 + 8304759 + 9934399) / (159.509E3) = 220.757 \text{ ng/mL}$

$(220.757 \text{ ng/mL}) (5\text{mL}/2.97\text{g}) (100/52) (5) = 3573.5 \text{ ng/g} = 3573.5 \text{ ug/kg}$

Lab reported 3600 ug/kg.

13. OVERALL ASSESSMENT OF DATA

On the basis of this review, the following determination has been made with regard to the overall data usability for the specified level.

- Acceptable
- Acceptable with Qualification
- Rejected

Accepted data meet the minimum requirements for the following EPA data category:

- ERS Screening
- Non-definitive with 10 % Confirmation by Definitive Methodology
- Definitive, Comprehensive Statistical Error Determination was performed.
- Definitive, Comprehensive Statistical Error Determination was not performed.

Any qualifications to individual sample analysis results are detailed in the appropriate section above or appear under the comments section below. In cases where several QC criteria are out of specification, it may be appropriate to further qualify the data usability. The data reviewer must use professional judgment and express concerns and comments on the data validity for each specific data package.

Comments: Data as reported are valid.

14. USABILITY OF DATA

A. These data are considered usable for the data use objectives stated in the SAMPLING AND ANALYSIS PLAN YOSEMITE CREEK SEDIMENT WASTE CHARACTERIZATION STUDY, SAN FRANCISCO, CALIFORNIA, JANUARY 9, 2012 (SAP).

The following data use objective was indicated in the SAP:

TO DOCUMENT THE CONCENTRATION OF PCBs, ASBESTOS, AND METALS (CHROMIUM, LEAD, MERCURY, AND ZINC) IN SEDIMENT AT THE SITE AND DETERMINE WHERE THESE CONCENTRATIONS EXCEED STATE AND FEDERAL WASTE DISPOSAL CRITERIA.

USING THE WASTE CHARACTERIZATION STUDY DATA AND DATA SETS FROM PREVIOUS INVESTIGATIONS, ESTIMATE THE VOLUME OF SEDIMENT CONTAINING CONCENTRATIONS OF ASBESTOS, PCBs, AND METALS (CHROMIUM, LEAD, MERCURY, AND ZINC) THAT EXCEED STATE AND FEDERAL WASTE DISPOSAL CRITERIA.

THE DATA ARE USABLE FOR THE ABOVE OBJECTIVES.

B. These data meet quality objectives stated in the SAP.

AS INDICATED IN SECTION 3 OF THE SAP, THE INVESTIGATION WILL GENERATE DEFINITIVE DATA AND TABLE 3-1 OF THE SAP OUTLINES THE DATA QUALITY INDICATOR GOALS APPLICABLE TO THE DEFINITIVE DATA QUALITY LEVEL. THE DATA IN THIS PACKAGE MEET THESE REQUIREMENTS.

15. DOCUMENTATION OF LABORATORY CORRECTIVE ACTION

Problem: No problems requiring corrective action were found.

Resolution: Not required.

Attached are copies of all data summary sheets, with data (a qualifiers indicated, and a copy of the chain of custody for the samples.

DATA VALIDATION SUMMARY

The data were reviewed following procedures and limits specified in the EPA OSWER directive, *Quality Assurance/Quality Control Guidance for Removal Activities, Sampling QA/QC Plan and Data Validation Procedures* (EPA/540/G-90/004, OSWER Directive 9360.4-01, dated April 1990).

Indicate with a YES or NO whether each item is acceptable without qualification:

| | | |
|----|---|-----|
| 1 | Holding Times | YES |
| 2 | Initial and Continuing Calibrations | YES |
| 3 | Laboratory Control Sample | YES |
| 4 | Matrix Spike | NO |
| 5 | Blanks and Background Samples | YES |
| 6 | Duplicate Analyses | YES |
| 7 | Interference Check Samples and Serial Dilution Analysis | YES |
| 8 | Post Digestion Spike and Standard Addition Analysis | N/A |
| 9 | Analyte Quantitation | YES |
| 10 | Overall Assessment of Data | YES |
| 11 | Usability of Data | NO |

Comments: N/A: Not Applicable.

ANALYTICAL DATA REVIEW SUMMARY

Tier 2 Validation

| | |
|----------------------------------|----------------------------------|
| Site Name: Yosemite Creek, EE/CA | Location: San Francisco, CA |
| TDD Number: TO2-09-11-10-0001 | Project Number: 002693.7008.01SO |

1. HOLDING TIMES

- Acceptable
 Acceptable with qualification
 Unacceptable

Samples were extracted and analyzed within required holding times except as noted under Comments. In addition, no problems were identified with regard to sample preservation or custody unless specified. For those samples analyzed outside holding time requirements, the detected results have been qualified as estimated (J), and the nondetected results have been qualified either as estimated (UJ) or rejected (R) based on the reviewer's judgement.

All Sample Matrices:

Mercury: 28 days (from collection) for analysis.

Hexavalent chromium: 24 hours (from collection) for analysis.

All other metals: 180 days (from collection) for analysis.

Comments: All holding times were met.

2. INITIAL AND CONTINUING CALIBRATION VERIFICATION

- Acceptable
 Acceptable with qualification
 Unacceptable

Unless flagged below, an initial calibration verification (ICV) and a calibration blank were analyzed at the beginning of the run, and a continuing calibration verification (CCV) and a calibration blank were analyzed after every ten samples, and at the end of the run. ICV and CCV recoveries were within a range of 80-120% for mercury and tin, and 90-110% for all other metals. For analytes which exceeded these control limits, associated detected results are qualified as estimated (J). In cases where the recovery was below 65% or above 135% (for mercury and tin) or below 75% or above 125% (for all other metals), all associated data are rejected (R).

Comments: All recoveries of metals in initial and continuing calibration verifications were within the control limits.

ANALYTICAL DATA REVIEW SUMMARY

Tier 2 Validation

| | |
|----------------------------------|----------------------------------|
| Site Name: Yosemite Creek, EE/CA | Location: San Francisco, CA |
| TDD Number: TO2-09-11-10-0001 | Project Number: 002693.7008.01SO |

3. LABORATORY CONTROL SAMPLE

- Acceptable
 Acceptable with qualification
 Unacceptable
 No Laboratory Control Samples Analyzed

Laboratory control sample recoveries are used for a qualitative indication of accuracy (bias) independent of matrix effects. LCS recovery limits should either be specified in the Sampling and Analysis Plan or can be established by the laboratory. For analytes which exceeded these control limits, associated detected results are qualified as estimated (J).

In cases where the recovery was below 30%, all associated nondetected results are rejected (R) and detected results are qualified as estimated (J).

Comments: Percent recoveries of LCS were within the control limits.

4. MATRIX SPIKE

- Acceptable
 Acceptable with qualification
 Unacceptable
 No Matrix Spikes Analyzed

Matrix spike recoveries are used for a qualitative indication of accuracy (bias) due to matrix effects. Unless flagged below, one laboratory control sample was analyzed at a rate of one per batch or one per 20 samples. Recoveries were within a range of 75-125%.

For analytes which exceeded these control limits, associated detected results are qualified as estimated (J). In cases where the recovery was below 30%, all associated nondetected results are rejected (R) and detected results are qualified as estimated (J).

Comments: Samples YC-044-3 and YC-039-2 were designated for MS/MSD analysis and the recoveries except antimony were within the control limits. The detected antimony results were qualified as estimated (J).

ANALYTICAL DATA REVIEW SUMMARY

Tier 2 Validation

| | |
|----------------------------------|----------------------------------|
| Site Name: Yosemite Creek, EE/CA | Location: San Francisco, CA |
| TDD Number: TO2-09-11-10-0001 | Project Number: 002693.7008.01SO |

5. BLANKS AND BACKGROUND SAMPLES

- Acceptable
 Detection Limits Adjusted

The following blanks were analyzed:

- Method (preparation) Blanks
 Field Blanks
 Calibration Blanks
 Rinsate Blanks
 Background Samples

Preparation (method) blanks were prepared for each batch of samples extracted. A preparation blank was analyzed after every continuing calibration standard, prior to sample analysis unless noted below. Any compound detected in the sample and also detected in any associated blank, must be qualified as non-detect (U) when the sample concentration is less than 5x the blank concentration.

Comments: No contamination was detected in the method blank.

6. DUPLICATE ANALYSES

- Acceptable
 Acceptable with qualification
 Unacceptable
 No Duplicates Analyzed

Type of duplicates analyzed:

- Field Duplicates
 Laboratory Duplicates

Calculate the relative Percent Difference (RPD) between the members of duplicate pairs using the equation indicated below. Qualify the detected results as estimated (J) for any analyte whose RPD in a laboratory duplicate exceeds 20% for water samples or 35% for soil samples.

$$RPD = \frac{2(\text{Value 1} - \text{Value 2})}{\text{Value 1} + \text{Value 2}} \times 100\%$$

7. INTERFERENCE CHECK SAMPLES AND SERIAL DILUTION ANALYSIS

- Acceptable
 Acceptable with qualification
 Unacceptable
 Not required

Interference Check Samples (ICS) - Unless flagged below, an ICS was analyzed at the beginning and end of each run and at least twice every eight hours. Recoveries were within a range of 80-120%. For analytes which exceeded these control limits, associated detected results are qualified as estimated (J) if the concentrations of Al, Ca, Fe, or Mg are higher in the sample than in the ICS.

Serial Dilution Analysis - Unless flagged below, a serial dilution analysis was performed at a rate of one per 20 samples on a sample having analyte concentrations greater than 50 times the IDL. Percent differences were within a range of 0-10%. For analytes which exceeded these control limits, associated detected results are qualified as estimated (J).

Comments: ICS recoveries were within the control limit.
Serial Dilution: Not analyzed

8. POST DIGESTION SPIKE AND STANDARD ADDITIONS

- Acceptable
 Acceptable with qualification
 Unacceptable
 Not required

Post-digestion spikes - If a furnace AA result was flagged by the laboratory with an E to indicate interference, and the associated post-digestion spike recovery was less than 10%, the associated results are rejected (R).

Method of Standard Additions - If the method of standard additions was required and the correlation coefficient was less than 0.995, the associated results were qualified as estimated (J).

9. ANALYTE QUANTITATION

Confirm that analyte quantitation was performed correctly using the following formulas:

Water samples:

$$\text{ug/L} = \frac{(\text{Instrument printout concentration, mg/L})(1000 \text{ ug/mg})(\text{final volume of extract, mL})}{(\text{Initial volume of extract, mL})}$$

Soil samples:

$$\text{mg/kg} = \frac{(\text{Instrument printout concentration, mg/L})(\text{final volume of extract, mL})(0.001 \text{ L/mL})}{(\text{weight of sample extracted, g})(0.001 \text{ kg/g})(\text{fraction solids})}$$

Comments: Analyte quantitation is acceptable.

Sample YC-040-3.6

As: $(0.03096 \text{ mg/L}) (0.05 \text{ L}/1.0 \text{ g}) (100/61) (2) (1000 \text{ g}/1\text{kg}) = 5.0754 \text{ mg/kg}$.

Lab reported 5.1 mg/kg.

Cu: $(0.6797 \text{ mg/L}) (0.05 \text{ L}/1.0 \text{ g}) (100/61) (2) (1000 \text{ g}/1\text{kg}) = 111 \text{ mg/kg}$.

Lab reported 110 mg/kg.

Pb: $(2.840 \text{ mg/L}) (0.05 \text{ L}/1.0 \text{ g}) (100/61) (2) (1000 \text{ g}/1 \text{ kg}) = 465.57 \text{ mg/kg}$.

Lab reported 460 mg/kg.

Zn: $(2.553 \text{ mg/L}) (0.05 \text{ L}/1.0 \text{ g}) (100/61) (2) (1000 \text{ g}/1 \text{ kg}) = 418.52 \text{ mg/kg}$.

Lab reported 420 mg/kg.

Sample YC-039-3

As: $(0.08774 \text{ mg/L}) (0.05 \text{ L}/1.06 \text{ g}) (100/65) (2) (1000 \text{ g}/1\text{kg}) = 12.734 \text{ mg/kg}$.

Lab reported 13 mg/kg.

Cu: $(0.4798 \text{ mg/L}) (0.05 \text{ L}/1.06 \text{ g}) (100/65) (2) (1000 \text{ g}/1\text{kg}) = 69.637 \text{ mg/kg}$.

Lab reported 70 mg/kg.

Pb: $(3.192 \text{ mg/L}) (0.05 \text{ L}/1.06 \text{ g}) (100/65) (2) (1000 \text{ g}/1 \text{ kg}) = 463.28 \text{ mg/kg}$.

Lab reported 460 mg/kg.

Zn: $(3.217 \text{ mg/L}) (0.05 \text{ L}/1.06 \text{ g}) (100/65) (2) (1000 \text{ g}/1 \text{ kg}) = 466.91 \text{ mg/kg}$.

Lab reported 470 mg/kg.

ANALYTICAL DATA REVIEW SUMMARY

Tier 2 Validation

| | |
|----------------------------------|----------------------------------|
| Site Name: Yosemite Creek, EE/CA | Location: San Francisco, CA |
| TDD Number: TO2-09-11-10-0001 | Project Number: 002693.7008.01SO |

10. OVERALL ASSESSMENT OF DATA

On the basis of this review, the following determination has been made with regard to the overall data usability for the specified level.

- Acceptable
- Acceptable with Qualification
- Rejected

Accepted data meet the minimum requirements for the following EPA data category:

- ERS Screening
- Non-definitive with 10 % Conformation by Definitive Methodology
- Definitive, Comprehensive Statistical Error Determination was performed.
- Definitive, Comprehensive Statistical Error Determination was not performed.

Any qualifications to individual sample analysis results are detailed in the appropriate section above or appear under the comments section below. In cases where several QC criteria are out of specification, it may be appropriate to further qualify the data usability. The data reviewer must use professional judgment and express concerns and comments on the data validity for each specific data package.

Comments: Data as reported are valid.

ANALYTICAL DATA REVIEW SUMMARY

Tier 2 Validation

| | |
|----------------------------------|----------------------------------|
| Site Name: Yosemite Creek, EE/CA | Location: San Francisco, CA |
| TDD Number: TO2-09-11-10-0001 | Project Number: 002693.7008.01SO |

11. USABILITY OF DATA

A. These data are considered usable for the data use objectives stated in the SAMPLING AND ANALYSIS PLAN YOSEMITE CREEK SEDIMENT WASTE CHARACTERIZATION STUDY, SAN FRANCISCO, CALIFORNIA, JANUARY 9, 2012 (SAP).

The following data use objective was indicated in the SAP:

TO DOCUMENT THE CONCENTRATION OF PCBs, ASBESTOS, AND METALS (CHROMIUM, LEAD, MERCURY, AND ZINC) IN SEDIMENT AT THE SITE AND DETERMINE WHERE THESE CONCENTRATIONS EXCEED STATE AND FEDERAL WASTE DISPOSAL CRITERIA.

USING THE WASTE CHARACTERIZATION STUDY DATA AND DATA SETS FROM PREVIOUS INVESTIGATIONS, ESTIMATE THE VOLUME OF SEDIMENT CONTAINING CONCENTRATIONS OF ASBESTOS, PCBs, AND METALS (CHROMIUM, LEAD, MERCURY, AND ZINC) THAT EXCEED STATE AND FEDERAL WASTE DISPOSAL CRITERIA.

THE DATA ARE USABLE FOR THE ABOVE OBJECTIVES.

B. These data meet quality objectives stated in the SAP.

AS INDICATED IN SECTION 3 OF THE SAP, THE INVESTIGATION WILL GENERATE DEFINITIVE DATA AND TABLE 3-1 OF THE SAP OUTLINES THE DATA QUALITY INDICATOR GOALS APPLICABLE TO THE DEFINITIVE DATA QUALITY LEVEL. THE DATA IN THIS PACKAGE MEET THESE REQUIREMENTS.

12. DOCUMENTATION OF LABORATORY CORRECTIVE ACTION

Problem: No problems requiring corrective action were found.

Resolution: Not required.

Attached are copies of all data summary sheets, with data qualifiers indicated, and a copy of the chain of custody for the samples.

ANALYTICAL DATA REVIEW SUMMARY

Tier 2 Validation

| | |
|----------------------------------|-------------------------------------|
| Site Name: Yosemite Creek, EE/CA | Location: San Francisco, California |
| Project Number: 002693.7008.01SO | TDD NO: 02-09-11-10-0001 |

DATA VALIDATION SUMMARY

The data were reviewed following procedures and limits specified in the EPA OSWER directive, *Quality Assurance/Quality Control Guidance for Removal Activities, Sampling QA/QC Plan and Data Validation Procedures* (EPA/540/G-90/004, OSWER Directive 9360.4-01, dated April 1990).

Indicate with a YES or NO whether each item is acceptable without qualification:

| | | |
|---|-------------------------------------|-----|
| 1 | Holding Times | YES |
| 2 | Initial and Continuing Calibrations | YES |
| 3 | Laboratory Control Sample | YES |
| 4 | Matrix Spike | YES |
| 5 | Blanks and Background Samples | YES |
| 6 | Duplicate Analyses | YES |
| 7 | Analyte Quantitation | YES |
| 8 | Overall Assessment of Data | YES |
| 9 | Usability of Data | YES |

Comments:

ANALYTICAL DATA REVIEW SUMMARY

Tier 2 Validation

| | |
|----------------------------------|-------------------------------------|
| Site Name: Yosemite Creek, EE/CA | Location: San Francisco, California |
| Project Number: 002693.7008.01SO | TDD NO: 02-09-11-10-0001 |

1. HOLDING TIMES

- Acceptable
 Acceptable with qualification
 Unacceptable

Samples were extracted and analyzed within required holding times except as noted under Comments. In addition, no problems were identified with regard to sample preservation or custody unless specified. For those samples analyzed outside holding time requirements, the detected results have been qualified as estimated (J), and the non-detected results have been qualified either as estimated (UJ) or rejected (R) based on the reviewer's judgement.

All Sample Matrices:

Cyanide: 14 days (from collection) for analysis.

Nitrate (unpreserved water samples): 48 hours (from collection) for analysis.

All other anions: 28 days (from collection) for analysis.

Comments: Samples met the analytical holding times.

2. INITIAL AND CONTINUING CALIBRATION VERIFICATION

- Acceptable
 Acceptable with qualification
 Unacceptable

Unless flagged below, an initial calibration verification (ICV) and a calibration blank were analyzed at the beginning of the run, and a continuing calibration verification (CCV) and a calibration blank were analyzed after every ten samples, and at the end of the run. ICV and CCV recoveries were within a range of 90-110%. For analytes which exceeded these control limits, associated detected results are qualified as estimated (J). In cases where the recovery was below 75% or above 125%, all associated data are rejected (R).

Comments: ICV and CCV recoveries were within the control limits.

ANALYTICAL DATA REVIEW SUMMARY

Tier 2 Validation

| | |
|----------------------------------|-------------------------------------|
| Site Name: Yosemite Creek, EE/CA | Location: San Francisco, California |
| Project Number: 002693.7008.01SO | TDD NO: 02-09-11-10-0001 |

3. LABORATORY CONTROL SAMPLE

- Acceptable
 Acceptable with qualification
 Unacceptable
 No Laboratory Control Samples Analyzed

Laboratory control sample recoveries are used for a qualitative indication of accuracy (bias) independent of matrix effects. LCS recovery limits should either be specified in the Sampling and Analysis Plan or can be established by the laboratory. For analytes which exceeded these control limits, associated detected results are qualified as estimated (J).

In cases where the recovery was below 30%, all associated nondetected results are rejected (R) and detected results are qualified as estimated (J).

Comments: LCS recovery was within the control limit.

4. MATRIX SPIKE

- Acceptable
 Acceptable with qualification
 Unacceptable
 No Matrix Spikes Analyzed

Matrix spike recoveries are used for a qualitative indication of accuracy (bias) due to matrix effects. Unless flagged below, one laboratory control sample was analyzed at a rate of one per batch or one per 20 samples. Recoveries were within a range of 75-125%.

For analytes which exceeded these control limits, associated detected results are qualified as estimated (J). In cases where the recovery was below 30%, all associated nondetected results are rejected (R) and detected results are qualified as estimated (J).

Comments: Samples YC-038-1 and YC-004-1 were used for MS/MSD analysis and the recoveries were within the control limits.

ANALYTICAL DATA REVIEW SUMMARY

Tier 2 Validation

| | |
|----------------------------------|-------------------------------------|
| Site Name: Yosemite Creek, EE/CA | Location: San Francisco, California |
| Project Number: 002693.7008.01SO | TDD NO: 02-09-11-10-0001 |

5. BLANKS AND BACKGROUND SAMPLES

- Acceptable
- Detection Limits Adjusted

The following blanks were analyzed:

- Method (preparation) Blanks
- Field Blanks
- Calibration Blanks
- Rinsate Blanks
- Background Samples

Preparation (method) blanks were prepared for each batch of samples extracted. A preparation blank was analyzed after every continuing calibration standard, prior to sample analysis unless noted below. Any compound detected in the sample and also detected in any associated blank, must be qualified as non-detect (U) when the sample concentration is less than 5x the blank concentration.

Comments: No contamination was found in the method blank at reporting limit level.

6. DUPLICATE ANALYSES

- Acceptable
- Acceptable with qualification
- Unacceptable
- No Duplicates Analyzed

Type of duplicates analyzed:

- Field Duplicates
- Laboratory Duplicates

Calculate the relative Percent Difference (RPD) between the members of duplicate pairs using the equation indicated below. Qualify the detected results as estimated (J) for any analyte whose RPD in a laboratory duplicate exceeds 20% for water samples or 35% for soil samples.

$$RPD = \frac{2(\text{Value 1} - \text{Value 2})}{\text{Value 1} + \text{Value 2}} \times 100\%$$

| | | | |
|------------------|-----------------|-----------------|----------------|
| Comments: | <u>YC-040-2</u> | <u>YC-840-2</u> | <u>RPD (%)</u> |
| Cr+6, mg/kg | <0.082 | <0.082 | 0 |
| | <u>YC-042-2</u> | <u>YC-842-2</u> | <u>RPD (%)</u> |
| Cr+6, mg/kg | <0.10 | <0.11 | 0 |

ANALYTICAL DATA REVIEW SUMMARY

Tier 2 Validation

| | |
|----------------------------------|-------------------------------------|
| Site Name: Yosemite Creek, EE/CA | Location: San Francisco, California |
| Project Number: 002693.7008.01SO | TDD NO: 02-09-11-10-0001 |

7. ANALYTE QUANTITATION

Confirm that analyte quantitation was performed correctly using the following formulas:

Water samples:

$$\text{ug/L} = \frac{(\text{Instrument printout concentration, mg/L})(1000 \text{ ug/mg})(\text{final volume of extract, mL})}{(\text{Initial volume of extract, mL})}$$

Soil samples:

$$\text{mg/kg} = \frac{(\text{Instrument printout concentration, mg/L})(\text{final volume of extract, mL})(0.001 \text{ L/mL})}{(\text{weight of sample extracted, g})(0.001 \text{ kg/g})(\text{fraction solids})}$$

Comments: Analyte quantitation was acceptable.

Sample YC-042-1

Hexavalent Chromium:

$$Y = ((1.2078)(0.004 - 0.0003) + (4.6619E-4))(50\text{mL}/10.22 \text{ g}) = 0.0241 \text{ mg/kg.}$$

$$(0.0241 \text{ mg/kg})(100/52.6) = 0.0459 \text{ mg/kg.}$$

Lab reported 0.046 mg/kg.

8. OVERALL ASSESSMENT OF DATA

On the basis of this review, the following determination has been made with regard to the overall data usability for the specified level.

- Acceptable
 Acceptable with Qualification
 Rejected

Accepted data meet the minimum requirements for the following EPA data category:

- ERS Screening
 Non-definitive with 10 % Confirmation by Definitive Methodology
 Definitive, Comprehensive Statistical Error Determination was performed.
 Definitive, Comprehensive Statistical Error Determination was not performed.

Any qualifications to individual sample analysis results are detailed in the appropriate section above or appear under the comments section below. In cases where several QC criteria are out of specification, it may be appropriate to further qualify the data usability. The data reviewer must use professional judgment and express concerns and comments on the data validity for each specific data package.

Comments: Data as reported are valid.

ANALYTICAL DATA REVIEW SUMMARY

Tier 2 Validation

| | |
|----------------------------------|-------------------------------------|
| Site Name: Yosemite Creek, EE/CA | Location: San Francisco, California |
| Project Number: 002693.7008.01SO | TDD NO: 02-09-11-10-0001 |

9. USABILITY OF DATA

A. These data are considered usable for the data use objectives stated in the SAMPLING AND ANALYSIS PLAN YOSEMITE CREEK SEDIMENT WASTE CHARACTERIZATION STUDY, SAN FRANCISCO, CALIFORNIA, JANUARY 9, 2012 (SAP).

The following data use objective was indicated in the SAP:

TO DOCUMENT THE CONCENTRATION OF PCBs, ASBESTOS, AND METALS (CHROMIUM, LEAD, MERCURY, AND ZINC) IN SEDIMENT AT THE SITE AND DETERMINE WHERE THESE CONCENTRATIONS EXCEED STATE AND FEDERAL WASTE DISPOSAL CRITERIA.

USING THE WASTE CHARACTERIZATION STUDY DATA AND DATA SETS FROM PREVIOUS INVESTIGATIONS, ESTIMATE THE VOLUME OF SEDIMENT CONTAINING CONCENTRATIONS OF ASBESTOS, PCBs, AND METALS (CHROMIUM, LEAD, MERCURY, AND ZINC) THAT EXCEED STATE AND FEDERAL WASTE DISPOSAL CRITERIA.

THE DATA ARE USABLE FOR THE ABOVE OBJECTIVES.

B. These data meet quality objectives stated in the SAP.

AS INDICATED IN SECTION 3 OF THE SAP, THE INVESTIGATION WILL GENERATE DEFINITIVE DATA AND TABLE 3-1 OF THE SAP OUTLINES THE DATA QUALITY INDICATOR GOALS APPLICABLE TO THE DEFINITIVE DATA QUALITY LEVEL. THE DATA IN THIS PACKAGE MEET THESE REQUIREMENTS.

10. DOCUMENTATION OF LABORATORY CORRECTIVE ACTION

Problem: No problems requiring corrective action were found.

Resolution: Not required.

Attached are copies of all data summary sheets, with data qualifiers indicated, and a copy of the chain of custody for the samples.

DATA PACKAGE COMPLETENESS CHECKLIST:

Checklist Code:

- Included: no problems
- * Included: problems noted in review
- O Not Included and/or Not Available
- NR Not Required
- RS Provided As Re-submission

Case Narrative:

- Case Narrative present

Quality Control Summary Package:

- Data Summary sheets
- Initial and Continuing Calibration results
- NR CRDL Standard results
- Preparation Blank and Calibration Blank results
- ICP Interference Check Sample results
- Matrix Spike recoveries
- Matrix Duplicate results
- Laboratory Control Sample recoveries
- NR Method of Standard Additions results
- NR ICP Serial Dilution results
- NR Instrument Detection Limits
- NR ICP Interelement Correction Factors
- NR ICP Linear Ranges
- Preparation Log
- Analysis Run Log

Raw QC Data Package Section

- Chain-of-Custody Records
- Instrument Printouts
- Sample Preparation Notebook Pages
- Logbook and Worksheet Pages
- Percent Solids Determination

ANALYTICAL DATA REVIEW SUMMARY

| Site Name: Yosemite Creek, EE/CA | Location: San Francisco, CA |
| TDD Number: TO2-09-11-10-0001 | Project Number: 002693.7008.01SO |

DATA VALIDATION SUMMARY

The data were reviewed following procedures and limits specified in the EPA OSWER directive, *Quality Assurance/Quality Control Guidance for Removal Activities, Sampling QA/QC Plan and Data Validation Procedures* (EPA/540/G-90/004, OSWER Directive 9360.4-01, dated April 1990).

Indicate with a YES or NO whether each item is acceptable without qualification:

| | | |
|----|---|-----|
| 1 | Holding Times | YES |
| 2 | Initial and Continuing Calibrations | YES |
| 3 | Laboratory Control Sample | YES |
| 4 | Matrix Spike | YES |
| 5 | Blanks and Background Samples | YES |
| 6 | Duplicate Analyses | NO |
| 7 | Interference Check Samples and Serial Dilution Analysis | YES |
| 8 | Post Digestion Spike and Standard Addition Analysis | N/A |
| 9 | Analyte Quantitation | YES |
| 10 | Overall Assessment of Data | YES |
| 11 | Usability of Data | NO |

Comments: N/A: Not Applicable. No STLC Hg was analyzed for these samples.

ANALYTICAL DATA REVIEW SUMMARY

Tier 2 Validation

| | |
|----------------------------------|----------------------------------|
| Site Name: Yosemite Creek, EE/CA | Location: San Francisco, CA |
| TDD Number: TO2-09-11-10-0001 | Project Number: 002693.7008.01SO |

1. HOLDING TIMES

- Acceptable
 Acceptable with qualification
 Unacceptable

Samples were extracted and analyzed within required holding times except as noted under Comments. In addition, no problems were identified with regard to sample preservation or custody unless specified. For those samples analyzed outside holding time requirements, the detected results have been qualified as estimated (J), and the nondetected results have been qualified either as estimated (UJ) or rejected (R) based on the reviewer's judgement.

All Sample Matrices:

Mercury: 28 days (from collection) for analysis.

Hexavalent chromium: 24 hours (from collection) for analysis.

All other metals: 180 days (from collection) for analysis.

Comments: All holding times were met.

2. INITIAL AND CONTINUING CALIBRATION VERIFICATION

- Acceptable
 Acceptable with qualification
 Unacceptable

Unless flagged below, an initial calibration verification (ICV) and a calibration blank were analyzed at the beginning of the run, and a continuing calibration verification (CCV) and a calibration blank were analyzed after every ten samples, and at the end of the run. ICV and CCV recoveries were within a range of 80-120% for mercury and tin, and 90-110% for all other metals. For analytes which exceeded these control limits, associated detected results are qualified as estimated (J). In cases where the recovery was below 65% or above 135% (for mercury and tin) or below 75% or above 125% (for all other metals), all associated data are rejected (R).

Comments: All recoveries of metals in initial and continuing calibration verifications were within the control limits.

ANALYTICAL DATA REVIEW SUMMARY

Tier 2 Validation

| | |
|----------------------------------|----------------------------------|
| Site Name: Yosemite Creek, EE/CA | Location: San Francisco, CA |
| TDD Number: TO2-09-11-10-0001 | Project Number: 002693.7008.01SO |

3. LABORATORY CONTROL SAMPLE

- Acceptable
 Acceptable with qualification
 Unacceptable
 No Laboratory Control Samples Analyzed

Laboratory control sample recoveries are used for a qualitative indication of accuracy (bias) independent of matrix effects. LCS recovery limits should either be specified in the Sampling and Analysis Plan or can be established by the laboratory. For analytes which exceeded these control limits, associated detected results are qualified as estimated (J).

In cases where the recovery was below 30%, all associated nondetected results are rejected (R) and detected results are qualified as estimated (J).

Comments: Percent recoveries of LCS were within the control limits.

4. MATRIX SPIKE

- Acceptable
 Acceptable with qualification
 Unacceptable
 No Matrix Spikes Analyzed

Matrix spike recoveries are used for a qualitative indication of accuracy (bias) due to matrix effects. Unless flagged below, one laboratory control sample was analyzed at a rate of one per batch or one per 20 samples. Recoveries were within a range of 75-125%.

For analytes which exceeded these control limits, associated detected results are qualified as estimated (J). In cases where the recovery was below 30%, all associated nondetected results are rejected (R) and detected results are qualified as estimated (J).

Comments: Samples YC-044-1 and YC-043-2 were used for MS/MSD analysis and the recoveries were within the control limits.

ANALYTICAL DATA REVIEW SUMMARY

Tier 2 Validation

| | |
|----------------------------------|----------------------------------|
| Site Name: Yosemite Creek, EE/CA | Location: San Francisco, CA |
| TDD Number: TO2-09-11-10-0001 | Project Number: 002693.7008.01SO |

5. BLANKS AND BACKGROUND SAMPLES

- Acceptable
 Detection Limits Adjusted

The following blanks were analyzed:

- Method (preparation) Blanks
 Field Blanks
 Calibration Blanks
 Rinsate Blanks
 Background Samples

Preparation (method) blanks were prepared for each batch of samples extracted. A preparation blank was analyzed after every continuing calibration standard, prior to sample analysis unless noted below. Any compound detected in the sample and also detected in any associated blank, must be qualified as non-detect (U) when the sample concentration is less than 5x the blank concentration.

Comments: No contamination was detected in the method blank.

6. DUPLICATE ANALYSES

- Acceptable
 Acceptable with qualification
 Unacceptable
 No Duplicates Analyzed

Type of duplicates analyzed:

- Field Duplicates
 Laboratory Duplicates

Calculate the relative Percent Difference (RPD) between the members of duplicate pairs using the equation indicated below. Qualify the detected results as estimated (J) for any analyte whose RPD in a laboratory duplicate exceeds 20% for water samples or 35% for soil samples.

$$RPD = \frac{2(\text{Value 1} - \text{Value 2})}{\text{Value 1} + \text{Value 2}} \times 100\%$$

|----------------------------------|----------------------------------|
| Site Name: Yosemite Creek, EE/CA | Location: San Francisco, CA |
| TDD Number: TO2-09-11-10-0001 | Project Number: 002693.7008.01SO |

7. INTERFERENCE CHECK SAMPLES AND SERIAL DILUTION ANALYSIS

- Acceptable
 Acceptable with qualification
 Unacceptable
 Not required

Interference Check Samples (ICS) - Unless flagged below, an ICS was analyzed at the beginning and end of each run and at least twice every eight hours. Recoveries were within a range of 80-120%. For analytes which exceeded these control limits, associated detected results are qualified as estimated (J) if the concentrations of Al, Ca, Fe, or Mg are higher in the sample than in the ICS.

Serial Dilution Analysis - Unless flagged below, a serial dilution analysis was performed at a rate of one per 20 samples on a sample having analyte concentrations greater than 50 times the IDL. Percent differences were within a range of 0-10%. For analytes which exceeded these control limits, associated detected results are qualified as estimated (J).

Comments: ICS recoveries were within the control limit.
Serial Dilution: Not analyzed

8. POST DIGESTION SPIKE AND STANDARD ADDITIONS

- Acceptable
 Acceptable with qualification
 Unacceptable
 Not required

Post-digestion spikes - If a furnace AA result was flagged by the laboratory with an E to indicate interference, and the associated post-digestion spike recovery was less than 10%, the associated results are rejected (R).

Method of Standard Additions - If the method of standard additions was required and the correlation coefficient was less than 0.995, the associated results were qualified as estimated (J).

Comments:

| Site Name: Yosemite Creek, EE/CA | Location: San Francisco, CA |
| TDD Number: TO2-09-11-10-0001 | Project Number: 002693.7008.01SO |

9. ANALYTE QUANTITATION

Confirm that analyte quantitation was performed correctly using the following formulas:

| |
|--|
| Water samples: $\text{ug/L} = \frac{(\text{Instrument printout concentration, mg/L})(1000 \text{ ug/mg})(\text{final volume of extract, mL})}{(\text{Initial volume of extract, mL})}$ |
| Soil samples: $\text{mg/kg} = \frac{(\text{Instrument printout concentration, mg/L})(\text{final volume of extract, mL})(0.001 \text{ L/mL})}{(\text{weight of sample extracted, g})(0.001 \text{ kg/g})(\text{fraction solids})}$ |

Comments: Analyte quantitation is acceptable.

Sample YC-040-3.6

STLC Pb: (1.804 mg/L) (50 mL/5 mL) = 18.04 mg/L.

Lab reported 18 mg/L.

Sample YC-042-2

STLC Pb: (0.9010 mg/L) (50 mL/5 mL) = 9.01 mg/L.

Lab reported 9.0 mg/L.

10. OVERALL ASSESSMENT OF DATA

On the basis of this review, the following determination has been made with regard to the overall data usability for the specified level.

- Acceptable
- Acceptable with Qualification
- Rejected

Accepted data meet the minimum requirements for the following EPA data category:

- ERS Screening
- Non-definitive with 10 % Confirmation by Definitive Methodology
- Definitive, Comprehensive Statistical Error Determination was performed.
- Definitive, Comprehensive Statistical Error Determination was not performed.

Any qualifications to individual sample analysis results are detailed in the appropriate section above or appear under the comments section below. In cases where several QC criteria are out of specification, it may be appropriate to further qualify the data usability. The data reviewer must use professional judgment and express concerns and comments on the data validity for each specific data package.

Comments: Data as reported are valid.

11. USABILITY OF DATA

A. These data are considered usable for the data use objectives stated in the SAMPLING AND ANALYSIS PLAN YOSEMITE CREEK SEDIMENT WASTE CHARACTERIZATION STUDY, SAN FRANCISCO, CALIFORNIA, JANUARY 9, 2012 (SAP).

The following data use objective was indicated in the SAP:

TO DOCUMENT THE CONCENTRATION OF PCBs, ASBESTOS, AND METALS (CHROMIUM, LEAD, MERCURY, AND ZINC) IN SEDIMENT AT THE SITE AND DETERMINE WHERE THESE CONCENTRATIONS EXCEED STATE AND FEDERAL WASTE DISPOSAL CRITERIA.

USING THE WASTE CHARACTERIZATION STUDY DATA AND DATA SETS FROM PREVIOUS INVESTIGATIONS, ESTIMATE THE VOLUME OF SEDIMENT CONTAINING CONCENTRATIONS OF ASBESTOS, PCBs, AND METALS (CHROMIUM, LEAD, MERCURY, AND ZINC) THAT EXCEED STATE AND FEDERAL WASTE DISPOSAL CRITERIA.

THE DATA ARE USABLE FOR THE ABOVE OBJECTIVES.

B. These data meet quality objectives stated in the SAP.

AS INDICATED IN SECTION 3 OF THE SAP, THE INVESTIGATION WILL GENERATE DEFINITIVE DATA AND TABLE 3-1 OF THE SAP OUTLINES THE DATA QUALITY INDICATOR GOALS APPLICABLE TO THE DEFINITIVE DATA QUALITY LEVEL. THE DATA IN THIS PACKAGE MEET THESE REQUIREMENTS.

12. DOCUMENTATION OF LABORATORY CORRECTIVE ACTION

Problem: No problems requiring corrective action were found.

Resolution: Not required.

Attached are copies of all data summary sheets, with data qualifiers indicated, and a copy of the chain of custody for the samples.

| Site Name: Yosemite Creek, EE/CA | Location: San Francisco, CA |
| TDD Number: TO2-09-11-10-0001 | Project Number: 002693.7008.01SO |

DATA VALIDATION SUMMARY

The data were reviewed following procedures and limits specified in the EPA OSWER directive, *Quality Assurance/Quality Control Guidance for Removal Activities, Sampling QA/QC Plan and Data Validation Procedures* (EPA/540/G-90/004, OSWER Directive 9360.4-01, dated April 1990).

Indicate with a YES or NO whether each item is acceptable without qualification:

| | | |
|----|---|-----|
| 1 | Holding Times | YES |
| 2 | Initial and Continuing Calibrations | YES |
| 3 | Laboratory Control Sample | YES |
| 4 | Matrix Spike | YES |
| 5 | Blanks and Background Samples | YES |
| 6 | Duplicate Analyses | YES |
| 7 | Interference Check Samples and Serial Dilution Analysis | YES |
| 8 | Post Digestion Spike and Standard Addition Analysis | N/A |
| 9 | Analyte Quantitation | YES |
| 10 | Overall Assessment of Data | YES |
| 11 | Usability of Data | YES |

Comments: N/A: Not Applicable. No TCLP Hg was analyzed for these samples.

ANALYTICAL DATA REVIEW SUMMARY

Tier 2 Validation

| | |
|----------------------------------|----------------------------------|
| Site Name: Yosemite Creek, EE/CA | Location: San Francisco, CA |
| TDD Number: TO2-09-11-10-0001 | Project Number: 002693.7008.01SO |

1. HOLDING TIMES

- Acceptable
 Acceptable with qualification
 Unacceptable

Samples were extracted and analyzed within required holding times except as noted under Comments. In addition, no problems were identified with regard to sample preservation or custody unless specified. For those samples analyzed outside holding time requirements, the detected results have been qualified as estimated (J), and the nondetected results have been qualified either as estimated (UJ) or rejected (R) based on the reviewer's judgement.

All Sample Matrices:

Mercury: 28 days (from collection) for analysis.

Hexavalent chromium: 24 hours (from collection) for analysis.

All other metals: 180 days (from collection) for analysis.

Comments: All holding times were met.

2. INITIAL AND CONTINUING CALIBRATION VERIFICATION

- Acceptable
 Acceptable with qualification
 Unacceptable

Unless flagged below, an initial calibration verification (ICV) and a calibration blank were analyzed at the beginning of the run, and a continuing calibration verification (CCV) and a calibration blank were analyzed after every ten samples, and at the end of the run. ICV and CCV recoveries were within a range of 80-120% for mercury and tin, and 90-110% for all other metals. For analytes which exceeded these control limits, associated detected results are qualified as estimated (J). In cases where the recovery was below 65% or above 135% (for mercury and tin) or below 75% or above 125% (for all other metals), all associated data are rejected (R).

Comments: All recoveries of metals in initial and continuing calibration verifications were within the control limits.

ANALYTICAL DATA REVIEW SUMMARY

Tier 2 Validation

| | |
|----------------------------------|----------------------------------|
| Site Name: Yosemite Creek, EE/CA | Location: San Francisco, CA |
| TDD Number: TO2-09-11-10-0001 | Project Number: 002693.7008.01SO |

3. LABORATORY CONTROL SAMPLE

- Acceptable
 Acceptable with qualification
 Unacceptable
 No Laboratory Control Samples Analyzed

Laboratory control sample recoveries are used for a qualitative indication of accuracy (bias) independent of matrix effects. LCS recovery limits should either be specified in the Sampling and Analysis Plan or can be established by the laboratory. For analytes which exceeded these control limits, associated detected results are qualified as estimated (J).

In cases where the recovery was below 30%, all associated nondetected results are rejected (R) and detected results are qualified as estimated (J).

Comments: Percent recoveries of LCS were within the control limits.

4. MATRIX SPIKE

- Acceptable
 Acceptable with qualification
 Unacceptable
 No Matrix Spikes Analyzed

Matrix spike recoveries are used for a qualitative indication of accuracy (bias) due to matrix effects. Unless flagged below, one laboratory control sample was analyzed at a rate of one per batch or one per 20 samples. Recoveries were within a range of 75-125%.

For analytes which exceeded these control limits, associated detected results are qualified as estimated (J). In cases where the recovery was below 30%, all associated nondetected results are rejected (R) and detected results are qualified as estimated (J).

Comments: Samples YC-042-1 and YC-842-4 were used for MS/MSD analysis and the recoveries were within the control limits.

ANALYTICAL DATA REVIEW SUMMARY

Tier 2 Validation

| | |
|----------------------------------|----------------------------------|
| Site Name: Yosemite Creek, EE/CA | Location: San Francisco, CA |
| TDD Number: TO2-09-11-10-0001 | Project Number: 002693.7008.01SO |

5. BLANKS AND BACKGROUND SAMPLES

- Acceptable
 Detection Limits Adjusted

The following blanks were analyzed:

- Method (preparation) Blanks
 Field Blanks
 Calibration Blanks
 Rinsate Blanks
 Background Samples

Preparation (method) blanks were prepared for each batch of samples extracted. A preparation blank was analyzed after every continuing calibration standard, prior to sample analysis unless noted below. Any compound detected in the sample and also detected in any associated blank, must be qualified as non-detect (U) when the sample concentration is less than 5x the blank concentration.

Comments: No contamination was detected in the method blank at reporting limit levels.

6. DUPLICATE ANALYSES

- Acceptable
 Acceptable with qualification
 Unacceptable
 No Duplicates Analyzed

Type of duplicates analyzed:

- Field Duplicates
 Laboratory Duplicates

Calculate the relative Percent Difference (RPD) between the members of duplicate pairs using the equation indicated below. Qualify the detected results as estimated (J) for any analyte whose RPD in a laboratory duplicate exceeds 20% for water samples or 35% for soil samples.

$$RPD = \frac{2(\text{Value 1} - \text{Value 2})}{\text{Value 1} + \text{Value 2}} \times 100\%$$

7. INTERFERENCE CHECK SAMPLES AND SERIAL DILUTION ANALYSIS

- Acceptable
 Acceptable with qualification
 Unacceptable
 Not required

Interference Check Samples (ICS) - Unless flagged below, an ICS was analyzed at the beginning and end of each run and at least twice every eight hours. Recoveries were within a range of 80-120%. For analytes which exceeded these control limits, associated detected results are qualified as estimated (J) if the concentrations of Al, Ca, Fe, or Mg are higher in the sample than in the ICS.

Serial Dilution Analysis - Unless flagged below, a serial dilution analysis was performed at a rate of one per 20 samples on a sample having analyte concentrations greater than 50 times the IDL. Percent differences were within a range of 0-10%. For analytes which exceeded these control limits, associated detected results are qualified as estimated (J).

Comments: ICS recoveries were within the control limit.
Serial Dilution: Not analyzed

8. POST DIGESTION SPIKE AND STANDARD ADDITIONS

- Acceptable
 Acceptable with qualification
 Unacceptable
 Not required

Post-digestion spikes - If a furnace AA result was flagged by the laboratory with an E to indicate interference, and the associated post-digestion spike recovery was less than 10%, the associated results are rejected (R).

Method of Standard Additions - If the method of standard additions was required and the correlation coefficient was less than 0.995, the associated results were qualified as estimated (J).

Comments:

| TDD Number: TO2-09-11-10-0001 | Project Number: 002693.7008.01SO |

9. ANALYTE QUANTITATION

Confirm that analyte quantitation was performed correctly using the following formulas:

Water samples:

$$\text{ug/L} = \frac{(\text{Instrument printout concentration, mg/L})(1000 \text{ ug/mg})(\text{final volume of extract, mL})}{(\text{initial volume of extract, mL})}$$

Soil samples:

$$\text{mg/kg} = \frac{(\text{Instrument printout concentration, mg/L})(\text{final volume of extract, mL})(0.001 \text{ L/mL})}{(\text{weight of sample extracted, g})(0.001 \text{ kg/g})(\text{fraction solids})}$$

Comments: Analyte quantitation is acceptable.

Sample YC-041-3

TCLP Ba: (0.06209 mg/L (50 mL/5 mL) = 0.6209 mg/L

Lab reported 0.62 mg/L.

TCLP Pb: (0.1915 mg/L) (50 mL/5 mL) = 1.915 mg/L.

Lab reported 1.9 mg/L.

Sample YC-045-3

TCLP Pb: (0.03550 mg/L) (50 mL/5 mL) = 0.355 mg/L.

Lab reported 0.35 mg/L.

10. OVERALL ASSESSMENT OF DATA

On the basis of this review, the following determination has been made with regard to the overall data usability for the specified level.

- Acceptable
 Acceptable with Qualification
 Rejected

Accepted data meet the minimum requirements for the following EPA data category:

- ERS Screening
 Non-definitive with 10 % Confirmation by Definitive Methodology
 Definitive, Comprehensive Statistical Error Determination was performed.
 Definitive, Comprehensive Statistical Error Determination was not performed.

Any qualifications to individual sample analysis results are detailed in the appropriate section above or appear under the comments section below. In cases where several QC criteria are out of specification, it may be appropriate to further qualify the data usability. The data reviewer must use professional judgment and express concerns and comments on the data validity for each specific data package.

Comments: Data as reported are valid.

11. USABILITY OF DATA

A. These data are considered usable for the data use objectives stated in the SAMPLING AND ANALYSIS PLAN YOSEMITE CREEK SEDIMENT WASTE CHARACTERIZATION STUDY, SAN FRANCISCO, CALIFORNIA, JANUARY 9, 2012 (SAP).

The following data use objective was indicated in the SAP:

TO DOCUMENT THE CONCENTRATION OF PCBs, ASBESTOS, AND METALS (CHROMIUM, LEAD, MERCURY, AND ZINC) IN SEDIMENT AT THE SITE AND DETERMINE WHERE THESE CONCENTRATIONS EXCEED STATE AND FEDERAL WASTE DISPOSAL CRITERIA.

USING THE WASTE CHARACTERIZATION STUDY DATA AND DATA SETS FROM PREVIOUS INVESTIGATIONS, ESTIMATE THE VOLUME OF SEDIMENT CONTAINING CONCENTRATIONS OF ASBESTOS, PCBs, AND METALS (CHROMIUM, LEAD, MERCURY, AND ZINC) THAT EXCEED STATE AND FEDERAL WASTE DISPOSAL CRITERIA.

THE DATA ARE USABLE FOR THE ABOVE OBJECTIVES.

B. These data meet quality objectives stated in the SAP.

AS INDICATED IN SECTION 3 OF THE SAP, THE INVESTIGATION WILL GENERATE DEFINITIVE DATA AND TABLE 3-1 OF THE SAP OUTLINES THE DATA QUALITY INDICATOR GOALS APPLICABLE TO THE DEFINITIVE DATA QUALITY LEVEL. THE DATA IN THIS PACKAGE MEET THESE REQUIREMENTS.

12. DOCUMENTATION OF LABORATORY CORRECTIVE ACTION

Problem: No problems requiring corrective action were found.

Resolution: Not required.

Attached are copies of all data summary sheets, with data qualifiers indicated, and a copy of the chain of custody for the samples.

Ms. Karen Sellers
TestAmerica-West Sacramento
880 Riverside Parkway
West Sacramento, CA 95605

Regarding: Project: G2B220468; Ecology and Environment Yosemite Creek EE/CA
EML ID: 891768

Approved by:

Dates of Analysis:
Asbestos-EPA Method 600/R-93/116: 02-27-2012

Miguel Constantino Ines

Technical Manager
Miguel Ines

Service SOPs: Asbestos-EPA Method 600/R-93/116 (EPA-600/M4-82-020 (SOP 01264))

All samples were received in acceptable condition unless noted in the Report Comments portion in the body of the report. The results relate only to the items tested. The results include an inherent uncertainty of measurement associated with estimating percentages by polarized light microscopy. Measurement uncertainty data can be provided when requested.

EMLab P&K ("the Company") shall have no liability to the client or the client's customer with respect to decisions or recommendations made, actions taken or courses of conduct implemented by either the client or the client's customer as a result of or based upon the Test Results. In no event shall the Company be liable to the client with respect to the Test Results except for the Company's own willful misconduct or gross negligence nor shall the Company be liable for incidental or consequential damages or lost profits or revenues to the fullest extent such liability may be disclaimed by law, even if the Company has been advised of the possibility of such damages, lost profits or lost revenues. In no event shall the Company's liability with respect to the Test Results exceed the amount paid to the Company by the client therefor.

ASBESTOS PLM REPORT: EPA-600/M4-82-020 & EPA METHOD 600/R-93-116

Total Samples Submitted: 21

Total Samples Analysed: 21

Total Samples with Layer Asbestos Content > 1%: 0

Location: YC-038-1

Lab ID-Version‡: 3963482-1

| Sample Layers | Asbestos Content |
|---|------------------|
| Brown Soil | ND |
| Composite Non-Asbestos Fibrous Content: | < 1% Cellulose |
| Sample Composite Homogeneity: | Good |

Location: YC-038-2

Lab ID-Version‡: 3963483-1

| Sample Layers | Asbestos Content |
|---|------------------|
| Brown Soil | ND |
| Composite Non-Asbestos Fibrous Content: | < 1% Cellulose |
| Sample Composite Homogeneity: | Good |

Location: YC-038-3

Lab ID-Version‡: 3963484-1

| Sample Layers | Asbestos Content |
|---|------------------|
| Brown Soil | ND |
| Composite Non-Asbestos Fibrous Content: | < 1% Cellulose |
| Sample Composite Homogeneity: | Good |

Location: YC-038-3.6

Lab ID-Version‡: 3963485-1

| Sample Layers | Asbestos Content |
|---|------------------|
| Brown Soil | ND |
| Composite Non-Asbestos Fibrous Content: | < 1% Cellulose |
| Sample Composite Homogeneity: | Good |

The results relate only to the items tested. Interpretation is left to the company and/or persons who conducted the field work. The test report shall not be reproduced except in full, without written approval of the laboratory. The report must not be used by the client to claim product certification, approval, or endorsement by NVLAP, NIST, or any agency of the federal government.

All samples were received in acceptable condition unless otherwise noted. EMLab P&K reserves the right to dispose of all samples after a period of thirty (30) days, according to all state and federal guidelines, unless otherwise specified.

Inhomogeneous samples are separated into homogeneous subsamples and analyzed individually. ND means no fibers were detected. When detected, the minimum detection and reporting limit is less than 1% unless point counting is performed.

‡ A "Version" indicated by "-x" after the Lab ID# with a value greater than 1 indicates a sample with amended data. The revision number is reflected by the value of "x".

Technical Manager
Miguel Ines

Service SOPs: Asbestos-EPA Method 600/R-93/116 (EPA-600/M4-82-020 (SOP 01264))

All samples were received in acceptable condition unless noted in the Report Comments portion in the body of the report. The results relate only to the items tested. The results include an inherent uncertainty of measurement associated with estimating percentages by polarized light microscopy. Measurement uncertainty data can be provided when requested.

EMLab P&K ("the Company") shall have no liability to the client or the client's customer with respect to decisions or recommendations made, actions taken or courses of conduct implemented by either the client or the client's customer as a result of or based upon the Test Results. In no event shall the Company be liable to the client with respect to the Test Results except for the Company's own willful misconduct or gross negligence nor shall the Company be liable for incidental or consequential damages or lost profits or revenues to the fullest extent such liability may be disclaimed by law, even if the Company has been advised of the possibility of such damages, lost profits or lost revenues. In no event shall the Company's liability with respect to the Test Results exceed the amount paid to the Company by the client therefor.
