*Draft Report*

# **Human Health Risk Assessment**

## **AMCO Chemical Superfund Site**

Prepared for  
**United States Environmental Protection Agency,  
Region 9**

February 2008

**CH2MHILL**  
155 Grand Avenue, Suite 1000  
Oakland, CA 94612

# Executive Summary

---

This report presents the methodology, findings, and conclusions of a human health risk assessment (HHRA) prepared as part of the Remedial Investigation (RI) for the AMCO Chemical Superfund Site (the Site). This HHRA includes a quantitative evaluation of the potential adverse health effects to people resulting from exposure to hazardous chemicals in soil at the former AMCO facility and adjacent parcels (on- and off-facility locations) and in groundwater at the Site. In addition, a screening level evaluation of potential exposure to contaminated soil gas and air (ambient and crawlspace), was performed for on- and off-facility locations as well as residential parcels adjacent to the former AMCO facility and South Prescott Park. Screening level evaluations were also performed to assess potential exposure to residential contaminated soil, and homegrown produce. Results from this HHRA will be one of the factors that the EPA uses to determine if cleanup actions are warranted at the Site.

An ecological risk assessment (ERA) was not performed for the Site. Due to the residential and industrial land use in the vicinity of the former AMCO facility, there are no significant populations of ecological receptors or individuals of special status species on the Site. In addition, there are no reasonable and unambiguous pathways for contaminant transport from the Site to any wildlife or sensitive habitats, including Oakland harbor (EPA 2004d). Under current conditions, birds and small mammals may be exposed to site-related chemicals that have been taken up by homegrown produce. This pathway, while potentially complete, was not quantitatively evaluated in this HHRA and is considered to be insignificant compared to exposure by other receptors (humans) and pathways.

## ES.1 Study Area

Four separate industrial/commercial exposure areas within the AMCO study area are evaluated as part of this HHRA. These areas are referred to as follows: former AMCO facility, parking lot, small vacant lot, and large vacant lot. Each of these areas is currently paved. The concrete was encountered in solid thicknesses ranging from 0.5 foot to more than 3.7 feet. However, for this assessment it was assumed that no pavement would be present to preclude direct contact with soil.

The groundwater underneath the Site is not being used for drinking or other potable uses. It is extremely unlikely that residents would drink groundwater underneath the Site in the future; however, in accordance with input from the community and regulatory agencies, the potential risk of using groundwater underneath the Site as drinking water is evaluated.

Additionally, ambient air, soil gas, and crawlspace air samples were collected from eight separate nearby residential locations. Ambient air samples were collected to evaluate the vapor intrusion pathway. Soil gas and crawlspace air samples were collected to determine preferential migration pathways and the potential for vapor intrusion. Soil was sampled at six residential parcels in the immediate vicinity of the facility.

Produce samples were collected from four residences that have gardens and fruit trees to evaluate the potential for chemical exposure through ingestion of this produce.

## ES.2 Risk Assessment Methodology

This HHRA was prepared in a manner consistent with EPA's *Risk Assessment Guidance for Superfund, Part A* (EPA 1989), *Part B* (EPA 1991b) and *Part E* (EPA 2004b) and supporting documents and guidelines published by the California Environmental Protection Agency (CalEPA). The assumptions provided for the general public by EPA and incorporated into this HHRA are conservative (i.e., representative highest exposure that is reasonably expected to occur at a site) and thus, health-protective.

This HHRA including both the quantitative and screening level assessments is a baseline evaluation which assumes exposure to contaminated media under current conditions without consideration of future remediation or natural attenuation of chemicals.

### Data Collection and Data Evaluation

Data were evaluated separately for each of the different industrial and residential site locations. In addition to new data, data from previous investigations were reviewed to gain a better understanding of the site characteristics.

For the industrial areas, soil data collected from depths of 0 to 7 feet below the bottom of the concrete was evaluated. The groundwater evaluation was based on six quarters of groundwater monitoring data. Exposure point concentrations (EPCs) were calculated for soil and groundwater data. For soil and groundwater the EPC was either the 95 percent upper confidence limit on the mean (95 UCL) or the maximum detected concentration for chemicals with the 95 UCL exceeding the maximum concentration. For soil gas, ambient air, crawlspace air and produce data, the detected concentrations from each sample/media were compared to their appropriate screening levels.

All chemicals reported in at least one sample at concentrations greater than the sample detection limit were included as constituents of potential concern (COPCs). Chemicals were not excluded based on comparison to background concentrations. The approach used to evaluate COPCs is appropriate for a conservative baseline HHRA.

### Exposure Assessment

The objective of the exposure assessment is to estimate the type and magnitude of exposures to COPCs that are present at or migrating from a site. An exposure-based conceptual site model (CSM) was prepared to identify potential exposure media, exposed populations, and exposure pathways (Figure 1). The exposed populations included on-facility and off-facility adult and child residents, outdoor commercial/industrial workers, construction workers, and excavation/trench workers.

The exposure pathways evaluated included direct contact (incidental ingestion, dermal contact) with soil and groundwater, as well as inhalation of dusts and vapors in ambient air from soil and groundwater. In addition, direct contact with groundwater and outdoor inhalation of vapors from groundwater was evaluated for excavation/trench workers. For residents, ingestion of chemicals in homegrown produce was evaluated by comparing the concentrations detected in the produce collected from backyards occupying the same city

block as the former facility to background levels and soil screening levels. Residential soil gas, ambient air, and crawlspace air data were compared to risk-based screening levels as well as background concentrations.

## Toxicity Assessment

The objective of the toxicity assessment is to evaluate evidence regarding the potential for COPCs to cause adverse effects in exposed individuals. Toxicity values published in EPA's Integrated Risk Information System (IRIS) were used for the toxicity assessment. Other sources, including those provided in the EPA Region 9 Preliminary Remediation Goals (PRG) table were used for chemicals not found in IRIS.

Exposure to lead in soil for residents was evaluated using a site-specific screening level calculated using the California Department of Toxic Substances Control's (DTSC) Lead Risk Assessment Spreadsheet Version 7, LeadSpread 7 (CalEPA 1999). This model calculates a screening level that represents a concentration of lead in soil for children that is protective for a combined exposure to lead in air, drinking water, food, and soil. The most conservative (health-protective) screening level available from this model was selected (99th percentile) based on protection of children's health. Exposure to lead in soil for industrial workers was evaluated using the Region 9 PRG of 800 mg/kg for a commercial/industrial scenario.

EPA uses the Adult Lead Model to estimate PRGs for an industrial setting. This PRG is intended to protect a fetus that may be carried by a pregnant female worker. It is assumed that a cleanup goal that is protective of a fetus will also afford protection for male or female adult workers. The model equations were developed to calculate cleanup goals such that there would be no more than a 5 percent probability that fetuses exposed to lead would exceed a blood lead (PbB) of 10 µg/deciliter. The updated screening level for soil lead at commercial/industrial (i.e. nonresidential) sites of 800 mg/kg is based on an analysis of the combined phases of the third National Health and Nutrition Examination Survey (NHANES III) that chooses a cleanup goal protective of all subpopulations. NHANES III is one program within the National Center for Health Statistics (NCHS) which is part of the Center for Disease Control and Prevention (CDC). The survey was designed to obtain nationally representative information on the health and nutritional status of the population of the United States through interviews and direct physical examinations.

## Risk Characterization

Excess lifetime cancer risk (ELCR) and non-cancer hazard index (HI) were calculated for both residents and industrial/commercial workers for each exposure area in soil and site wide for groundwater. Human health risks are compared against EPA's target risk range of  $10^{-6}$  to  $10^{-4}$  for cancer risks and the HI benchmark of 1 for non-cancer hazards (EPA 1991b). Exposure areas with ELCRs less than  $10^{-6}$  or HI less than 1 are characterized as not posing a threat to human health for the evaluated exposed populations and pathways.

For the ambient air, soil gas, and crawlspace air samples, results are compared against screening levels. Screening levels used for comparison to the ambient air and crawlspace air sample results are the EPA Region 9 ambient air PRGs. Screening levels for soil gas sample results were developed based on an attenuation factor of ten which is the recommended attenuation factor for shallow soil gas in OSWER Draft Guidance for Evaluating the Vapor Intrusion to Indoor Air Pathway from Groundwater and Soils (Subsurface Vapor Intrusion

Guidance) (EPA 2002). The attenuation factor represents the ratio between indoor air concentration and soil gas concentration, as follows:

$$\alpha = \frac{C_{\text{indoor}}}{C_{\text{soil gas}}}$$

Where:

$C_{\text{indoor}}$  = Indoor air concentration (ug/m<sup>3</sup>)

$C_{\text{soil gas}}$  = Soil gas concentration (ug/m<sup>3</sup>)

In addition, ambient air and crawlspace air sample results were compared to acute reference exposure levels (RELs) developed by California EPA's Office of Environmental Health Hazard Assessment (OEHHA) and the Agency for Toxic Substances and Disease Registry's (ATSDR) acute minimal risk level (MRLs) for hazardous substances.

Data from residential soil were compared against background levels and Region 9 residential PRGs for soil. Results from the homegrown produce samples were compared against background levels based on an evaluation of relevant scientific literature.

## ES.3 Results of Quantitative Risk Evaluation

### Soil

The ELCRs and HIs for on- and off-facility soil exposure areas are calculated based on all detected compounds except lead. The risks from lead are evaluated by calculating a lead EPC and comparing it to the industrial PRG (industrial and commercial workers) or a site-specific screening level (residents). As a result, in the following sections, the risks associated with lead are discussed separately from the cancer risks and non-cancer hazards for all other contaminants.

#### Former AMCO Facility

The chemicals that contribute the most to the cancer risk and non-cancer hazards in this area are arsenic, vinyl chloride, TCE, cis-1,2-dichloroethene, naphthalene, aldrin and dieldrin.

For the industrial worker RME scenario, the ELCR is  $1 \times 10^{-4}$  for exposure to shallow soil and  $2 \times 10^{-4}$  for exposure to deep soil. HIs for exposure to both the shallow soil and deep soil are 2.

For the construction worker RME scenario, the ELCR is  $1 \times 10^{-5}$  for exposure to shallow soil and  $2 \times 10^{-5}$  for exposure to deep soil. The HI for exposure to shallow soil is 4 and the HI for exposure to deep soil is 5.

For the future on-site residential RME scenario, for both shallow and deep soil the ELCR is  $4 \times 10^{-4}$ . The HI for the child is 14 for exposure to shallow soil and 15 for exposure to deep soil. For the adult, the HIs for exposure to both the shallow and deep soil are 3.

The lead EPC for shallow soil is 640 mg/kg and for deep soil 605 mg/kg; both of these concentrations exceed the AMCO site-specific residential lead screening levels of 194 mg/kg including ingestion of homegrown produce and 340 mg/kg excluding ingestion of homegrown produce. However, these lead concentrations are below the PRG for an industrial scenario (800 mg/kg).

## Parking Lot

The chemicals that contribute the most to the risk in the parking lot are lead, arsenic, benzo(a)pyrene and antimony.

For the industrial worker RME scenario, the ELCR is  $1 \times 10^{-4}$  for exposure to shallow soil and  $2 \times 10^{-4}$  for exposure to deep soil. The HIs are 1 for exposure to both shallow and deep soil.

For the construction worker RME scenario, the ELCR is  $2 \times 10^{-5}$  for exposure to shallow soil and  $3 \times 10^{-5}$  for exposure to deep soil. HIs for exposure to both the shallow and deep soil HIs are 2.

For the future on-site residential RME scenario, the ELCR is  $4 \times 10^{-4}$  for exposure to shallow soil and  $5 \times 10^{-4}$  for exposure to deep soil. The HI for the child is 28 for exposure to shallow soil and 27 for exposure to deep soil. For the adult, HIs for exposure to both the shallow and deep soil are 4.

The lead EPC for shallow soil is 2,170 mg/kg and for deep soil 1,450 mg/kg; both of these concentrations exceed the AMCO site-specific screening levels for residential scenarios and the PRG for an industrial scenario.

## Large Vacant Lot

The chemicals that contribute the most to the risks and hazards at the large vacant lot are lead, arsenic, DDT and benzo(a)pyrene.

For the industrial worker RME scenario, the ELCR is  $2 \times 10^{-4}$  for exposure to shallow soil and  $1 \times 10^{-4}$  for exposure to deep soil. HIs for exposure to both the shallow and deep soil HIs are less than 1.

For the construction worker RME scenario, the ELCR is  $2 \times 10^{-5}$  for exposure to shallow soil and  $2 \times 10^{-5}$  for exposure to deep soil. The HI for exposure to shallow soil is 3, and the HI for exposure to deep soil HI is 2.

For the future on-site residential RME scenario, the ELCR is  $6 \times 10^{-4}$  for exposure to shallow soil and  $4 \times 10^{-4}$  for exposure to deep soil. The HI for the child is 11 for exposure to shallow soil and 8 for exposure to deep soil. For the adult, the HIs for exposure to both the shallow and deep soil are less than 1.

The lead EPC for shallow soil is 4,360 mg/kg and for deep soil 2,750 mg/kg; both of these concentrations exceed the AMCO site-specific screening levels for lead for residential scenarios and the PRG for an industrial scenario.

## Small Vacant Lot

Due to the shallow water table at this exposure area, only shallow soil samples were collected. The chemicals that contribute the most to the risks and hazards at the small vacant lot are arsenic, dieldrin, and DDT.

For the industrial worker RME scenario, the ELCR is  $1 \times 10^{-4}$  for exposure to shallow soil. The HI is less than 1.

For the construction worker RME scenario, the ELCR for exposure to shallow soil is  $1 \times 10^{-5}$ . The HI for exposure to shallow soil is 1.

For the potential on-site residential RME scenario, the ELCR for exposure to shallow soil is  $3 \times 10^{-4}$ . The HI for exposure to shallow soil for the child is 12. For the adult the HI is less than 1.

The lead EPC for shallow soil is 386 mg/kg, which exceeds the AMCO site-specific screening level of 194 mg/kg including ingestion of homegrown produce and slightly exceeds 340 mg/kg excluding ingestion of homegrown produce but is well below the PRG of 800 mg/kg for an industrial worker.

## Groundwater

The chemicals that contribute the most to the risk through exposure to groundwater are vinyl chloride, arsenic, cis-1, 2-dichloroethene, benzo(a)pyrene, and aroclor-1260.

For the potential residential RME scenario, the ELCR is  $1 \times 10^{-1}$  for exposure to groundwater. The HI for the child is 1153; and the HI for the adult is 484.

In addition, at the request of the community's technical advisor, a trench worker's risk from dermal contact with groundwater underneath the Site was evaluated. For the trench worker RME scenario, the ELCR is  $1 \times 10^{-4}$  for exposure to groundwater. The HI for the trench worker is 34.

## ES.4 Results for Screening Level Risk Evaluation

### Residential Soil Gas, Ambient Air, and Crawlspace Air

Several volatile organic compounds (VOCs) were detected above screening levels in the soil gas, ambient air, and crawlspace samples. Of the VOCs detected above screening levels, many are also detected at background locations, indicating that not all resident VOC exposure may be coming from the Site. None of the VOCs detected had concentrations above the OEHHA acute RELs and ATSDR acute MRLs indicating no immediate health threat to residents.

### Residential Soil

All residential soil borings were completed in areas where there was no concrete or asphalt surface cover. Shallow samples were collected from 0.5 to 1 foot bgs; deeper samples were generally collected from between 2.5 and 3 feet bgs, although one sample was collected from between 2 and 2.5 feet bgs due to obstructions. Subsequent to the collection of the residential soil samples, a soil removal action to address high concentrations of lead was performed at residential properties adjacent to and near the former AMCO facility. These properties include 1428, 1432, and 1436 3<sup>rd</sup> Street, and 320, 326, 356, 360, and 366/368 Center Street. The soil was excavated until the confirmation sampling indicated that the remaining soil was below the site-specific action level of 390 mg/kg, or to a 3-foot maximum depth. The excavation depth was generally between one and three feet. Small areas were excavated to a depth of less than 1 foot in locations where valuable trees or plants might have been damaged by deeper excavation. As a result, the samples collected during the RI are no longer representative of the soil conditions at these properties. The following discussion explains samples results **before** the removal action.

Before the removal action, several chemicals exceeded screening levels in residential soil samples. Lead exceeded the site-specific screening level for soil at each of the residential properties. Polynuclear aromatic hydrocarbons (PAHs), pesticides (DDT, DDE, dieldrin, and heptachlor epoxide), antimony, and iron also exceed soil screening levels in at least one property.

## Homegrown Produce

To evaluate the ingestion of homegrown produce pathway, 15 fruits and vegetables from four gardens were collected and analyzed for selected metals (arsenic, chromium, and lead) and VOCs. Analytical results may reflect soil and dust deposited on the plant surface and possible uptake from soil into the edible portions of the plants.

Of the 47 VOCs analyzed, only methyl acetate and styrene were detected. Methyl acetate was detected in figs, mint, and red chiles. Styrene was detected only in cactus. Both methyl acetate and styrene have been detected in ripening produce in concentrations ranging from 0.04 to 0.24 mg/kg (Heikes et al. 1995). Volatile organic compounds like methyl acetate are naturally produced by ripening fruits at less than 1 mg/kg (Fountain et al. 1984).

Produce was also analyzed for selected inorganic compounds of concern: arsenic, chromium, and lead. Concentrations of lead in produce range from 0.16 to 8.47 mg/kg. Lead naturally occurs in all plants at concentrations ranging from 0.1 to 10 mg/kg (Kabata-Pendias and Pendias 2001). The maximum arsenic concentration was detected in the pomegranate sample at 0.08 mg/kg and chromium concentrations in produce range from 0.39 to 1.07 mg/kg. Both arsenic and chromium are found in plants at concentrations ranging from 0.009 to 1.5 mg/kg and 0.02 to 1.5 mg/kg respectively (Kabata-Pendias and Pendias 2001).

## ES.8 Uncertainty Evaluation

Uncertainties, which arise at every step in the risk assessment process, are evaluated to provide an indication of the relative degree of conservatism associated with a risk estimate. The uncertainties in this risk assessment can be grouped into three main categories as listed below.

### Environmental Sampling and Analysis

Errors in sampling results can arise from the field sampling, laboratory analyses, and data analyses. Errors in laboratory analysis procedures are possible, although the impacts of these sorts of errors on the risk estimates are likely to be low. The environmental sampling at a site is one source of uncertainty in the evaluation. The number and location of samples at each exposure area are considered adequate for the calculation of EPCs at most of the industrial areas and for groundwater. However, the number of samples collected from shallow soil at the small vacant lot and the parking lot are less than what is generally needed to calculate a 95 UCL; therefore, the maximum concentration was used to represent the EPC in these areas. A larger sample size would allow for the calculation of a more representative EPC, and thus decrease uncertainty regarding chemical concentrations used for risk assessment at these locations.

Because of the long history of industrial use at the Site and the associated history of construction and filling, all primary sources may not have been identified. Hot spots and localized areas of contamination in soil or soil vapor that were not sampled may remain unknown in on-facility and off-facility areas. The existence of unknown contamination could lead to an increase in the health risks beyond what has been reported in this document. Data collected from known hot spots have been included in the risk assessment.

## Exposure Pathways and Assumptions

Uncertainties can arise from the types of exposures examined, the points of potential human exposure, the concentrations of COPCs at the points of human exposure, and the intake assumptions. For instance, exposure parameters (e.g., exposure frequency, exposure duration, soil ingestion rates, and skin surface areas) are selected as reasonable maximum exposure (RME) assumptions, resulting in the likely overestimation of risk for most potential exposed populations.

The exposure pathways selected are another source of uncertainty. Exposure routes which were not considered in this evaluation could exist for a particular activity. Such exposures, however, are expected to be lower than the risks associated with the pathways considered. Dermal exposure has greater uncertainty resulting from uncertainty in several of the inputs including the amount of skin surface area available for exposure and the degree to which soil adheres to skin. Uncertainty in the inhalation route results from the method used for estimating resuspended dust from soil concentrations.

The vapor intrusion pathway is complex and data are variable (i.e., volatile chemicals are detected in one crawlspace sampling event but not in others) causing uncertainty in the evaluation of this pathway.

Characteristics of the COPCs can also present a source of uncertainty. For instance, the amount that each of the COPCs might be absorbed into the body may be quite different from the amount of chemical that is actually contacted (i.e., bioavailability).

## Toxicity Criteria and Factors

The availability and quality of toxicological data is another source of uncertainty in the risk assessment. Uncertainties associated with animal and human studies could influence the toxicity criteria. Carcinogenic criteria are classified according to the amount of evidence available that suggests human carcinogenicity. In the establishment of the non-carcinogenic criteria, conservative multipliers, known as uncertainty and modifying factors, are used.

For a number of chemicals detected in the Site media, toxicity values have not been established by EPA or California EPA. Toxicity values based on surrogate chemicals with similar structural and behavioral properties were used where appropriate. If a surrogate chemical was not available, these chemicals were not evaluated quantitatively.

## ES.9 Summary and Conclusions

This HHRA evaluates potential health risks to workers, as well as future adult and child residents, from exposure to COPCs in soil and groundwater at the former AMCO facility. Because this is a baseline evaluation which assumes exposure to contaminated media under current conditions without consideration of future remediation or natural attenuation of

chemicals, estimated risks and hazards to current and future workers is the same. A screening level risk evaluation was conducted on the soil, soil gas, air, and homegrown produce in the surrounding residential neighborhood.

Consistent with the CSM, the predominant exposure pathways for workers at the Site are incidental ingestion of soil, inhalation of particulates and vapors, and dermal contact with soil. Current and future residents in the vicinity may be exposed to contaminants through the same pathways described for workers. Groundwater at the Site is not currently used as a potable water source, nor is it likely to be in the future. Oakland residents have their drinking water supplied by the East Bay Municipal Utility District. However, should groundwater be used as a potable water source, residents could be exposed to contaminants through ingestion of groundwater and dermal contact with groundwater while showering or bathing.

## Quantitative Risk Estimates

Soil samples were divided into the following four exposure areas: former AMCO facility, parking lot, large vacant lot, and small vacant lot. Risk and hazard estimates for each receptor and exposure area are discussed below.

**Industrial Worker:** Estimated cancer risks are at the upper end of the risk range for exposure to either shallow or deep soil at each of the four exposure areas. HIs exceed the non-cancer threshold of 1 only at the former AMCO facility.

**Construction Worker:** Estimated cancer risks are within the risk range of  $10^{-6}$  to  $10^{-4}$  for exposure to shallow or deep soil at each of the four exposure areas. HIs exceeds the non-cancer threshold of 1 at the former AMCO facility, parking lot, and large vacant lot.

**Future Residents:** Estimated cancer risks are within the risk range for exposure to shallow or deep soil at all four of the exposure areas. HIs also exceed the non-cancer threshold of 1 at all four exposure areas.

## Groundwater Risk Estimates

The cancer risks and non-cancer HIs exceed the risk range and noncancer threshold of 1 when residential use of groundwater is considered. However, it is unlikely that groundwater will be used as a source of drinking water in the future.

## Screening Level Evaluation

The screening level risk evaluation was performed for the current or future off-facility resident or park user. Potential pathways include:

- Soil (incidental ingestion, direct contact, outdoor dust and vapor inhalation, indoor vapor inhalation)
- Homegrown Produce (ingestion of homegrown produce)
- Ambient Air (vapor inhalation)
- Crawlspace Air (vapor inhalation)
- Soil Gas (vapor inhalation).

## Residential Soil Gas, Ambient Air and Crawlspace Air

Several VOCs, including PCE, TCE, vinyl chloride, carbon tetrachloride, chloroform, benzene, and naphthalene were detected above screening levels in the soil gas, ambient air, and crawlspace samples. Concentrations of these VOCs generally ranged from not detected to almost 10 times the screening level in ambient air and crawlspace air; however, the concentration of vinyl chloride in one crawlspace air sample collected in November 2006 was approximately 100 times the screening level. For both TCE and carbon tetrachloride, the concentrations detected in ambient and crawlspace air were within the range of concentrations detected in the background samples. None of the VOCs detected exceeds its acute reference concentration, indicating that there is no immediate health threat to residents. Of the VOCs detected above screening levels, many are also detected at background locations, indicating that not all resident VOC exposure may be coming from the Site.

## Residential Soil

At each of the residential properties, lead exceeds the site-specific screening level for soil based on residential exposure. PAHs, pesticides (DDT, DDE, dieldrin, and heptachlor epoxide), antimony, and iron also exceed soil screening levels in at least one property.

All residential soil borings were completed in areas where there was no concrete or asphalt surface cover. Shallow samples were collected from 0.5 to 1 foot bgs; deeper samples were generally collected from between 2.5 and 3 feet bgs, although one sample was collected from between 2 and 2.5 feet bgs due to obstructions. Subsequent to the collection of the residential soil samples, a soil removal action to address high concentrations of lead was performed at residential properties adjacent to and near the former AMCO facility. These properties include 1428, 1432, and 1436 3<sup>rd</sup> Street, and 320, 326, 356, 360, and 366/368 Center Street. The soil was excavated until the confirmation sampling indicated that the remaining soil was below the site-specific action level of 390 mg/kg, or to a 3-foot maximum depth. The excavation depth was generally between one and three feet. Small areas were excavated to a depth of less than 1 foot in locations where valuable trees or plants might have been damaged by deeper excavation. As a result, the samples collected during the RI are no longer representative of the soil conditions at these properties.

## Homegrown Produce

To evaluate the ingestion of homegrown produce pathway, 15 fruits and vegetables from four gardens were collected and analyzed for selected metals (arsenic, chromium, and lead) and VOCs. Analytical results may reflect soil and dust deposited on the plant surface and possible uptake from soil into the edible portions of the plants.

Of the 47 VOCs analyzed, only methyl acetate and styrene were detected. Methyl acetate was detected in figs, mint, and red chiles. Styrene was detected only in cactus. Both methyl acetate and styrene have been detected in ripening produce in concentrations ranging from 0.04 to 0.24 mg/kg (Heikes et al. 1995). Volatile organic compounds like methyl acetate are naturally produced by ripening fruits at less than 1 mg/kg (Fountain et al. 1984).

Produce was also analyzed for selected inorganic compounds of concern: arsenic, chromium, and lead. Concentrations of lead in produce range from 0.16 to 8.47 mg/kg. Lead naturally occurs in all plants at concentrations ranging from 0.1 to 10 mg/kg (Kabata-

Pendias and Pendias 2001). The maximum arsenic concentration was detected in the pomegranate sample at 0.08 mg/kg and chromium concentrations in produce range from 0.39 to 1.07 mg/kg. Both arsenic and chromium are found in plants at concentrations ranging from 0.009 to 1.5 mg/kg and 0.02 to 1.5 mg/kg respectively (Kabata-Pendias and Pendias 2001).

Because produce samples were analyzed for VOCs as well as metals, none of the produce samples were rinsed or washed before analysis. As a result, the metals concentrations could reflect dust or soil deposited on the plant surfaces in addition to metals that were taken up through the root system.

# 1.0 Introduction

---

The Human Health Risk Assessment (HHRA) described in this appendix was prepared as part of the Remedial Investigation (RI) for the AMCO Chemical Superfund Site (the Site). This HHRA includes a quantitative evaluation of the potential adverse health effects to people from exposure to hazardous chemicals in soil at the former AMCO facility and adjacent parcels and in groundwater at the Site. In addition, a screening level evaluation of potential exposure to contaminated soil gas and air (ambient and crawlspace), was performed for on- and off-facility locations as well as residential parcels adjacent to the former AMCO facility and South Prescott Park. Screening level evaluations were also performed to assess potential exposure to contaminated soil and homegrown produce at the residential properties. Results from the HHRA will be one of the factors that EPA uses to determine if cleanup actions are warranted at the Site.

This HHRA was prepared in a manner consistent with EPA's *Risk Assessment Guidance for Superfund, Part A* (EPA 1989), *Part B* (EPA 1991b) and *Part E* (EPA 2004b) and supporting documents and guidelines published by the California Environmental Protection Agency (CalEPA). The assumptions provided for the general public by EPA and incorporated into this HHRA are conservative (i.e., representative highest exposure that is reasonably expected to occur at a site) and thus, health-protective.

As part of this HHRA, a conceptual site model (CSM) a schematic diagram that identifies the primary source of contamination in the environment (e.g. releases from leaking storage tank or waste material poured onto the ground) and shows how chemicals at the original point of release move in the environment (e.g. a chemical in soil might percolate into groundwater or might volatilize into air) and identifies the different types of human populations (e.g., residents and workers) who might come in contact with contaminated media. The models also lists the potential exposure pathways (e.g., ingestion of contaminated water) The CSM for the former AMCO facility is presented in Figure 1. The risk assessment will assist EPA in the following areas

- Evaluating the need for a comprehensive remedial action to address contaminated groundwater and soil.
- Provide a basis for performing a remedial action, including a no-action alternative
- Determine what exposure pathways need to be remediated.

The overall goals of the RI are to characterize site conditions, collect sufficient data to determine the nature and extent of contamination, and to support informed risk management decisions regarding human health and the environment.

In order to meet these objectives, six separate evaluations specific to each of these environmental media were conducted in this HHRA:

1. On-facility soil from the former AMCO facility and off-facility soil from the surrounding large vacant lot, small vacant lot, and parking lot

2. Groundwater beneath the former AMCO facility and surrounding areas
3. Soil gas, ambient air, and crawlspace air at six adjacent residential properties
4. Soil gas and ambient air at South Prescott Park
5. Off-facility soil at six adjacent residential properties
6. Homegrown produce at four adjacent residential properties

A description of the Site, as well as operational history, can be found in Section 1 of the RI report.

## 1.1 Previous Health Studies

The primary objective of this HHRA is to evaluate the extent to which exposure to hazardous chemicals increases the likelihood of adverse effects occurring in adult and child residents, industrial workers, construction workers, and trench workers at the former AMCO facility. Several previous studies have evaluated potential health issues associated with the Site, as described below. A brief summary of previous health studies conducted at the Site is presented in the following sections to provide relevant background and site history.

### 1.1.1 Public Health Assessment

The California Department of Health Services (CDHS) prepared a Public Health Assessment (PHA) for the AMCO Chemical Superfund Site under a cooperative agreement with the Agency for Toxic Substances and Disease Registry (ATSDR) (CDHS 2005). ATSDR is a federal agency within the U.S. Department of Health and Human Services (DHHS) and is authorized by Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA or Superfund) to conduct PHAs at hazardous waste sites.

A PHA is conducted to evaluate potential adverse health impacts to people coming into contact with chemicals at hazardous waste sites. A health assessor derives an estimated dose of the substances that people in the community might be exposed to; this dose is compared to regulatory standards. A PHA may consider information from citizens about actual exposures, including any health data that might be available. CDHS collected community health concerns as part of the PHA process from a variety of sources including the South Prescott Street Neighborhood Association (SPNA), the Chester Street Block Club Association (CSBCA), and the West Oakland Alliance (WOA). The community expressed concerns including breathing problems, miscarriages, and cancer.

Using available data, CDHS concluded that the Site has four complete exposure pathways, two potentially complete exposure pathways, and four pathways that can be eliminated from consideration. The breathing of vapors from subsurface excavations by utility workers is considered a public health hazard. The potential present and future exposure to soil gas contamination at the facility office and abutting residences are considered indeterminate public health hazards. The potential future exposure to subsurface soil contamination at the Site is also considered an indeterminate public health hazard. On the basis of CDHS review of the site data and understanding of the neighborhood, CDHS is concerned that people may have already, or could potentially in the future, come into contact with chemicals at the

Site at levels that could result in adverse health effects. The concentrations of chemicals that remain at the Site could pose health risks to utility workers, on-facility workers, and neighboring residents in the future. Findings from the PHA helped define sampling areas of the HHRA.

### 1.1.2 National Air Toxics Assessment

In February 2006, EPA released the results of its national-scale assessment of 1999 air toxics emissions (<http://www.epa.gov/ttn/atw/nata1999/>). The purpose of the National Air Toxics Assessment (NATA) is to identify and prioritize air toxics, emission source types, and locations that could contribute most to population-wide health risks. A subset of 1999 NATA results for census tract 06001401900, which includes the vicinity of the former AMCO facility (Oakland, CA), is presented in Table 1 (note that all tables are located at the end of this report).

The national-scale assessment includes 177 air pollutants (a subset of the air toxics on the Clean Air Act's list of 187 air toxics plus diesel particulate matter). This study provides an indication of the background level for some chemicals of concern. Attribution of air pollution sources can be challenging in industrial areas such as West Oakland which have multiple potential release points. Despite this limitation, the NATA study provides an indication of the background level for some chemicals of relevance for the Site study area.

NATA is a screening level assessment, and is therefore most appropriately used as a relative indicator of air toxics concerns. NATA results are most accurate when comparing between census tracts and over large geographic areas. The NATA assessment includes the following four objectives:

1. Compiling a national emissions inventory of air toxics emissions from outdoor sources,
2. Estimating ambient concentrations of air toxics,
3. Estimating population exposures,
4. Characterizing potential public health risk due to inhalation of air toxics including both cancer and non-cancer effects.

EPA generally updates air toxics emissions inventories every 3 years. The data evaluated as part of this HHRA are from 1999 since these data are the most complete and up-to-date available. The next national-scale assessment, likely to be available in 2008, will focus on the 2002 emissions inventory which was completed in December 2005. The presentation of results for a single census tract is meant only to illustrate the magnitude of concentrations that may be expected in ambient air in the vicinity of the former AMCO facility, and the types of sources that may be contributing to those concentrations including potential sources coming from the facility.

Selected information from the 1999 National Emissions Inventory (NEI) for Alameda County is presented in Table 2. The NEI is a national database of air emissions prepared by EPA, based on input from State and local air agencies, tribes, and industry. The database includes estimates of annual emissions, by source, for every county in all 50 States, the District of Columbia, Puerto Rico, and the Virgin Islands.

With respect to the information presented below, it is important to note the following:

- Carbon tetrachloride is a global pollutant, with an atmospheric lifetime in excess of 50 years and minimal local sources throughout the United States. While sometimes considered a chemical of potential concern from a health perspective, the main contribution to ambient concentrations of carbon tetrachloride is global transport and nearly never local.
- Two other chemicals of potential concern, benzene and ethyl benzene, are emitted primarily by mobile sources, including on-road cars and trucks and non-road sources, such as aircraft, commercial marine, trains, lawn and garden, and construction equipment. While there could be impacts from local, stationary sources of these pollutants, the largest contribution to the widespread concentrations of these pollutants is likely to be mobile sources, especially in West Oakland, where there are several major freeways as well as truck, rail, and commercial marine vessels operating around the Port.
- Three of the chemicals of potential concern – chloroform, trichloroethylene (TCE), and vinyl chloride – are emitted nearly entirely by stationary sources, including both local contributions and long-range transport. Further information on the potential sources of these pollutants may be found in EPA's NEI (using EPA's Air Data web site, <http://www.epa.gov/oar/data/>) or California's state inventory (<http://www.arb.ca.gov/ei/emissiondata.htm>).

The top five stationary sources for vinyl chloride in Alameda County in 1999 (EPA 1999) include:

- Fiberboard Emeryville
- Crow Canyon Solid Waste Disposal Site (SWDS) (Hayward)
- Borden Chemical (Fremont)
- Christy Concrete Products (Fremont)
- Galbraith Golf Course (Oakland)

### 1.1.3 Preliminary Endangerment Assessment

In September 2001, the 7<sup>th</sup> Street McClymonds Corridor Neighborhood Improvement Initiative prepared a Preliminary Endangerment Assessment (PEA) for the Site (7<sup>th</sup> Street 2001). The objectives of the PEA included identification of potential pathways for human exposure, calculations of cancer risk and non-cancer health hazard for each of the contaminated media, and recommendations for further remedial action.

Based on the PEA results, exposure to contaminated groundwater represents nearly all the cancer risk and over 90% of the noncancer hazard. The primary contributor to risk is vinyl chloride. The potential excess cancer risk for the Site calculated using the California EPA Department of Toxic Substances Control (DTSC) PEA methodology is  $2.7 \times 10^{-1}$ , or nearly three cancers per ten persons with lifetime exposure to the Site. This is thousands of times higher than the target risk level of  $1 \times 10^{-6}$  (one per million persons with lifetime exposure). Similarly, the noncancer HI for the Site is calculated to be 940, nearly 1000 times higher than the noncancer threshold of 1.

### 1.1.4 Preliminary Assessment and Site Investigation Report

Community interest in the former AMCO facility began in 1996, when DTSC presented information on hazardous materials found on property related to the California Department of Transportation (Caltrans) Cypress Construction Project. Pacific Gas and Electric Company (PG&E) employees who had worked on the construction of a utility trench on Center Street in June of 1995 expressed concern over possible chemical exposure. Investigations conducted on behalf of PG&E and Caltrans in 1996 documented the presence of vinyl chloride and other chlorinated solvents in soil and groundwater at sample locations on 3<sup>rd</sup> Street, south of the former AMCO facility. Sampling conducted in 1996 on behalf of DC Metals documented the presence of vinyl chloride on the property (E&E 2001).

EPA Region 9 first became aware of the former AMCO facility in 1996, when DTSC requested assistance. To ensure that people living near the Site were protected, the EPA took immediate action under its Emergency Response program. The EPA conducted a Removal Assessment in October 1996 and initiated an Emergency Response action in December 1996, installing a groundwater and soil vapor treatment system that operated until July 1998. The treatment system was shut down in response to community concern over potential exposure to contaminants from the system's exhaust stack.

Following the shutdown of the treatment system, EPA conducted groundwater, soil, and air sampling in December 1998, September 1999, and April 2000 to verify that residents near the property were not at risk from contamination. The results of the investigation are presented in the Preliminary Assessment and Site Investigation [PA/SI] Report (E&E 2001). Additional sampling of groundwater, soil gas, and crawlspace air was conducted in August 2002 following the PA/SI.

The following are the most significant findings from EPA's investigation of the Site:

- Significant concentrations of chemicals have been found in soil on the on- and off-facility properties. However, the majority of the ground surface at these properties is covered with concrete. Therefore, the potential for workers and residents to come into direct contact with contaminated soil is minimized.
- Significant concentrations of vinyl chloride and other chemicals have been found in groundwater monitoring wells on and near the former AMCO facility that establish a release of chemicals to the regional groundwater. However, the regional groundwater is not used for drinking water, and there are no drinking water wells within 4 miles of the Site.
- A release to air of hazardous substances was observed in 1996, during the excavation of a trench for an on-facility treatment system. A sample collected at the time of the observed release documented that vinyl chloride, trichloroethene, and other volatile organic compounds (VOCs) were present in the vapor observed emanating from the trench.
- Sampling at nearby homes documented the presence of very low levels of vinyl chloride in crawlspace air and soil gas in September 1999. However, vinyl chloride was not detected in either soil gas or crawlspace air in sampling conducted in April 2000. The

EPA does not expect that the very low levels of vinyl chloride found in 1999 could affect the health of people living in the homes where samples were collected.

### 1.1.5 The West Oakland Environmental Indicators Project

The former AMCO facility is located in West Oakland, approximately one block south of the West Oakland BART Station. In 2002, a collaboration of grassroots advocacy groups, community residents, and a research organization released an independent report, "Neighborhood Knowledge for Change: The West Oakland Environmental Indicators Project". After in-depth discussion with a neighborhood-based steering committee, the Pacific Institute created a set of 17 indicators to track environmental conditions in West Oakland (Pacific Institute 2002).

The indicators look at issues ranging from air pollution and toxic contamination to gentrification and voting. The 17 indicators include: amount of air pollution released by large polluters, air pollution health risks to neighborhood residents, asthma rates, voting power, vulnerability to displacement/housing affordability, community stability/market trends, subsidized housing supply, new business development, illegal dumping, land use conflict, neighborhood toxic volumes, resident toxic exposure sensitive area toxic hazard exposure, lead poisoning, lead abatement, transit mobility, and bike-able streets.

The report states that residents of West Oakland face five times more toxic pollution per person than residents of the city of Oakland with nearly 82 percent living within 1/8 mile of an industrial area. Children in West Oakland were reportedly seven times more likely to be hospitalized for asthma than the average child in the state of California. In addition, only 31 percent of area residents can afford the median rent on available housing units.

### 1.1.6 Other Relevant Studies: Vulnerable Communities

In discussing the population near the Site, it is important to note that the socioeconomic profile for the surrounding community of West Oakland is characterized by low socioeconomic status and racial diversity (SES) (Census 2000). Characteristics of low SES include low income and associated conditions including poor housing and inadequate health care and education systems.

Research in the area of environmental justice suggests that chemical facilities that pose increased environmental health hazards are disproportionately located in communities characterized by low SES such as West Oakland (Arista et al. 2004). A proposed explanation for this discrepancy is the "diminished response capacity" among low-income and minority communities to resist toxic exposure or to participate in pollution production decisions (Heiman 1996). Based on exposure to chemical concentrations evaluated in the Preliminary Endangerment Assessment, the potential cancer risk for residents living near the Site is several orders of magnitude greater than the levels acceptable to the EPA.

In addition to having more exposure to toxic chemicals, it has been suggested that individuals in such communities are potentially more vulnerable to the effects of exposure to hazardous chemicals due to impaired body defenses. A recent study by deFur et al. (2007) evaluated factors that could hinder an individual's ability to resist adverse impacts associated with chemical exposures. Characteristics of an individual's household, their community and local institutions (e.g. schools and medical facilities) can impact an

individual's vulnerability to toxic agents. Typical stress factors associated with low SES neighborhoods include increased levels of family instability, crowding and incidents of violence and crime. Higher rates of disease and increased mortality among individuals living in low SES neighborhoods support the concept of increased vulnerability among these populations.

## 1.2 Methodology and Organization of the Risk Assessment

A health risk assessment is a formalized approach used to evaluate potential threats to human health or the environment that may result from exposure to contaminated soil, water, or air (EPA 1991b). Risk assessments are typically performed in following four steps:

1. Data collection and data evaluation
2. Exposure assessment
3. Toxicity assessment
4. Risk characterization

A summary of the four steps is presented below.

### 1.2.1 Data Collection and Data Evaluation

Samples of environmental media such as soil, water, air, and homegrown produce are collected in order to characterize the nature and extent of contamination at a site. The data evaluation step consists of reviewing and evaluating available data. Data evaluation allows for the identification of constituents of potential concern (COPCs). In addition to data collected for the RI, data from previous investigations were reviewed to gain a better understanding of the site characteristics. With the exception of residential soil sampling, homegrown produce sampling, and facility office crawlspace sampling, which were not included the original scope of the field investigation, the sampling activities were performed in accordance with the methods and rationale described in the SAP. EPA added sampling of residential soil, homegrown produce, and facility crawlspace air to the RI based on information collected during the course of the RI.

With the exception of groundwater data, data were evaluated separately for each of the on- and off-facility locations, as well as the residential locations. A quantitative evaluation was also performed for groundwater. A screening level risk evaluation was performed for residential soil gas, crawlspace air and ambient air, soil and homegrown produce.

All chemicals reported in at least one sample at concentrations greater than the sample detection limit were included as COPCs. Chemicals were not excluded based on comparison to background concentrations. The approach used to evaluate COPCs is appropriate for a conservative baseline HHRA.

### 1.2.2 Exposure Assessment

In the exposure assessment step, the potential exposure pathways for COPCs and the potential human populations that could be exposed to these constituents, either now or in the future are identified. Exposure point concentrations (EPCs) are estimated from measured or modeled concentrations, and pathway-specific intake (doses) are estimated for use in the subsequent risk calculations. People who might be exposed and how they are

exposed to each chemical are identified in this step. For the former AMCO facility, potential exposed populations included both current and future residents and workers.

### 1.2.3 Toxicity Assessment

The purpose of the toxicity assessment is to evaluate the potential for COPCs to cause adverse health effects. The derivation of toxicity values is a complex process which must evaluate many factors relating to toxicological data including the type of exposure route, duration of exposure, dose administered, physiology of the species tested, and the type of adverse health effect observed. In the toxicity assessment step, toxicity values are compiled that characterize potential adverse health effects from exposure to COPCs.

### 1.2.4 Risk Characterization

Risk characterization is the final step in the risk assessment process. It combines the results of the previous three steps to quantitatively characterize potential risks to human health associated with exposure to COPCs. Potential cancer risk, adverse non-cancer health effects, and an evaluation of potential effects from exposure to lead are estimated. Uncertainties associated with or inherent in risk assessments are also evaluated as part of the HHRA process. Section 6.0 presents a review of these uncertainties to provide context for interpreting the results of the HHRA. In addition, a screening level evaluation of potential exposure to contaminated soil gas and air (ambient and crawlspace), was performed for on- and off-facility locations as well as residential parcels adjacent to the former AMCO facility and South Prescott Park.

In the risk characterization, theoretical noncancer hazards and theoretical lifetime excess cancer risks (ELCR) associated with exposure to chemicals are estimated. Theoretical hazard for noncarcinogenic (i.e., not cancer causing) chemicals at a site are evaluated by comparison to a target-hazard index of 1 (unity). To evaluate cancer effects, EPA considers a target risk range of  $10^{-6}$  to  $10^{-4}$  to be "safe and protective of public health" (56 F.R. 3535), although EPA has discretion to take action in this range depending on site-specific circumstances. Even risks slightly greater than  $1 \times 10^{-4}$  may be considered adequately protective based on site-specific conditions, including any uncertainties about the nature and extent of contaminants and associated risks. The lifetime theoretical cancer excess cancer risk represents the additional, or excess, risk compared to the actual incidence of cancer that is unrelated to a site. The observed incidence of cancer cases in the United States is approximately 1-in-2 for men and 1-in-3 for women and is due to factors such as smoking, poor nutrition, excessive exposure to sunlight, and other causes including a person's genetics (American Cancer Society 2007).

### 1.2.5 Organization of the HHRA

Attachments to this document include the following:

- Attachment 1: Detailed Risk and Hazard Results for Exposure to Soil
- Attachment 2: Detailed Risk and Hazard Results for Exposure to Groundwater
- Attachment 3: Residential Neighborhood Screening Tables
- Attachment 4: ATSDR Toxicity Profiles for Compounds that Contribute the Most Risk/Hazard
- Attachment 5: Outputs from proUCL

## 2.0 Data Collection and Data Evaluation

---

Samples of environmental media such as soil, water, air, and homegrown produce are collected during the remedial investigation of a site in order to characterize the nature and extent of contamination. The data evaluation step consists of reviewing and evaluating available data.

This section describes the data collected to identify contaminant distribution at the former AMCO facility. A detailed discussion of the data collected for the site and used in this HHRA is presented in the RI Report. The analytical data were reviewed according to the data evaluation procedures specified in EPA guidance documents, including *Risk Assessment Guidance for Superfund Volume I: Human Health Evaluation Manual, Part A* (EPA 1989) and *Guidance for Data Usability in Risk Assessment* (EPA 1990b). These procedures include the evaluation of analytical methods, quantitation limits, qualified data, blank contamination, and background concentrations.

### 2.1 Chemicals of Potential Concern

All chemicals reported in at least one sample at concentrations greater than the sample detection limit were included as COPCs. Chemicals were not excluded based on comparison to background soil concentrations. Potential risks associated with ambient levels of metals in soil were also calculated to provide an understanding of the total risks at the Site (i.e., potential risks from site-related COPCs and ambient levels of metals). Screening criteria were used to focus on chemicals that would contribute the most to the risk and were not used to eliminate or screen out chemicals. The approach used to evaluate COPCs is appropriate for a conservative baseline HHRA. Section 5.1 of the RI Report, Screening Level Determination, provides the rationale for the screening criteria selected for this Site. Table 3 presents the COPCs for each media.

All chemicals reported in at least one sample from the data sets compiled for this risk assessment were included as COPCs, except calcium, magnesium, potassium, and sodium, which are known to be essential human nutrients. Elements considered to be essential human nutrients were eliminated as COPCs. EPA and DTSC guidance state that these elements can be deleted from the list of COPCs because of their low toxicity when detected at ambient concentrations (EPA 1989; DTSC 1992). Even if these constituents are present at concentrations slightly above naturally-occurring levels, they are eliminated as COPCs because they are toxic only at very high doses.

#### 2.1.1 Soil

Approximately 0.5 to 3.5 feet of concrete covers the soil in most areas of the on- and off-facility properties. Shallow soil samples were collected 0 to 2 feet below concrete, and deep samples were collected 2 to 7 feet below concrete. For this HHRA, soil samples were divided into the following four exposure areas:

- Former AMCO facility (includes 21 shallow and 11 deep samples),

- Parking lot (includes 3 shallow and 3 deep samples),
- Large vacant lot (includes 14 shallow and 9 deep samples),
- Small vacant lot (includes 2 shallow samples).

Sampling locations were approved by EPA prior to sample collection and were based on a 50-foot grid and historical aerial photographs. If contaminant concentrations greater than screening levels were detected, additional samples were collected to define the extent of contamination. The soil sampling locations for these four exposure areas are shown on Figure 2. Background concentrations for soil were obtained for naturally occurring metals from the city of Oakland (City of Oakland Urban Land Redevelopment Program 1995).

### 2.1.2 Groundwater

The groundwater sample results used for this HHRA are from first, third, and fourth quarters of 2005, and the first, second, and third quarters of 2006, and the grab groundwater samples (September 2004). VOC data from groundwater samples collected from second quarter 2005 were not used in the risk assessment data set due to quality issues (EPA 2006b). Groundwater samples were not collected from monitoring wells with floating non-aqueous phase liquids (NAPL) (MW-13 and MW-14). Evidence of NAPL was observed in the soil during the construction of on-facility wells in the central and south-central portion of the facility. Results of groundwater samples collected from locations with suspected NAPL were included in the data set that was used to calculate the exposure point concentrations used in the groundwater risk calculations. Groundwater sample locations are shown on Figure 3.

### 2.1.3 Residential Soil Gas, Crawlspace Air and Ambient Air

Soil gas sampling was conducted at six residential properties adjacent to or near the former AMCO facility. Air sampling (ambient and crawlspace) was also conducted at the six adjacent residences. Soil gas and ambient air samples were collected at South Prescott Park and at a background location within the South Prescott neighborhood. Two crawlspace air samples were collected in the office of 1414 3<sup>rd</sup> Street to evaluate current worker conditions. Soil gas and air sampling locations are shown on Figure 4.

### 2.1.4 Residential Soil and Homegrown Produce

Soil sampling was conducted at six residential properties adjacent to or near the facility. Soil sampling locations were sited either along the property boundary or in areas where produce was grown. Produce samples were collected from four of the residences with gardens. Produce samples were collected from backyards at 356 and 360 Center Street, and 1428 and 1432 3<sup>rd</sup> Street. No produce was present at 326 Center Street and 1428 3<sup>rd</sup> Street. No access was granted at 320 Center Street, therefore, no sampling was performed at this property. At each of the four residences where produce samples were collected, one sample was collected for each type of produce grown.

# 3.0 Exposure Assessment

---

Exposure assessment is the determination or estimation (qualitative or quantitative) of the magnitude, frequency, duration, and route of exposure. Exposure assessments may consider past, present, and future exposures, using varying assessment techniques for each phase. The objective of the exposure assessment is to estimate the type and magnitude of exposures to COPCs that are present at or migrating from a site.

The three primary steps in exposure assessment are site characterization, exposure pathway identification and quantification of exposure. A CSM is a tool used to assist with the identification of potential exposure media, human receptors, and exposure pathways.

## 3.1 Identification of People and Exposure Pathways

Exposure pathways are the different ways that a receptor may contact a chemical. Each of the following components must be present for an exposure pathway to be complete (EPA 1989):

- A potential source of a toxic substance in an environmental media, such as soil or air
- A potential receptor, such as a resident living near or on the potential source
- A contact point, such as a resident planting a garden in soil contaminated with some substance
- A route for the substance to enter the body, such as the inhalations of dust particles or the ingestion of soil particles by a resident working in a garden.

The exposure routes and pathways considered in this HHRA are described below. Figure 1 presents a CSM illustrating these exposure routes and pathways.

### 3.1.1 Exposed Populations

Potential exposed populations are members of a community who may be exposed to contaminated media during the course of daily living and working in the area of concern. The exposed populations evaluated in the HHRA were identified based on current land use and input from the South Prescott community via Spanish and English focus groups, the Technical Advisor Grant (TAG) recipient, and the technical advisor. Receptors evaluated quantitatively in the HHRA include adult and child residents who currently live immediately adjacent to the facility or may in the future live within the boundaries of the facility.

For the Site, use of a CSM (Figure 1) resulted in the identification of the following potential receptors:

- Future on-facility adult and child residents and current and future off-facility adult and child residents,
- Outdoor commercial/industrial workers,

- Construction workers, and
- Excavation/trench workers.

Potential exposure to workers is over a shorter period of time than residents. The assumed exposure for a worker is 250 days per year over 25 years, while a resident is assumed to be exposed for 350 days per year over 30 years. Based on the common assumption that workers take two weeks of vacation per year, EPA assumes that a resident will be away from home approximately 15 days per year.

Industrial, construction, and trench workers may be exposed to the same chemical concentrations as a resident (by the same pathways), but for a much shorter duration. Thus, the cumulative risk faced by workers from all exposure pathways might be significantly lower than residents for all exposure pathways and routes of exposure evaluated. Exposure assumptions for both future residents and workers are presented in Table 4 for exposure by workers and future residents to soil, Table 5 for exposure by future residents to groundwater, and Table 6 for exposure by trench workers to groundwater.

### 3.1.2 Exposure Pathways

An exposure pathway represents how a chemical moves through the environment from the source to a receptor. Exposure pathways are identified by analysis of the distribution of COPCs in the environment and the physical and chemical properties of each COPC. The following exposure pathways for residential, occupational, construction and trench worker scenarios at the Site are considered complete for this risk assessment:

- **Residential:** Current residents (adults and children) that are immediately adjacent to the former AMCO facility may be exposed to groundwater, soil, air, and produce that have been impacted by site-related chemicals. For future residents, this HHRA conservatively assumes that residential development would consist of single-family dwellings within the facility boundaries. This assumption is health-protective and yields conservative risk estimates that are greater than the risk estimates for multi-family dwellings such as apartments or condominiums.
- **Recreational:** Recreational exposure may occur in Prescott Park which is across the street from the former AMCO facility. Both adults and children visiting the park may be exposed to site-related chemicals by outdoor inhalation of VOCs that may emanate from groundwater and soil gas at the park.
- **Industrial:** Current commercial and industrial workers (non-construction) at the former AMCO facility may be exposed to site-related chemicals primarily through inhalation of VOCs emanating from soil, groundwater, and soil gas.
- **Construction/Trench worker:** Under current and future conditions, construction and excavation workers are assumed to be engaged in subsurface disturbance activities that may extend to 10 ft below ground surface (bgs). Such activities may include utility work, repairs, maintenance and construction. This is potentially the most significant exposure pathway for subsurface workers.
- **Ecological:** Under current conditions, birds and small mammals may be exposed to site-related chemicals that have been taken up by homegrown produce. This pathway, while

potentially complete, was not quantitatively evaluated in this HHRA but is considered to be insignificant compared to exposure by other pathways.

In addition, risks for unrestricted residential use of groundwater were also evaluated in accordance with input from the regulatory agencies and the community.

Residents/Workers could be exposed to COPCs through any of the following pathways:

- Incidental soil ingestion
- Dermal absorption due to direct soil contact
- Inhalation of airborne suspended soil particulates
- Inhalation of VOCs from soil or groundwater
- Ingestion of homegrown produce
- Dermal absorption due to direct groundwater contact (trench worker only)

**Incidental soil ingestion** by adults and children primarily occurs through hand-to-mouth contact as a result of hands and fingers being placed in the mouth after contact with soil while gardening or playing. This scenario assumes that adults ingest 100 milligrams of soil per day (mg/day), 350 days per year (EPA 1991a). A child resident that plays in the soil may ingest twice as much as the average adult (200 mg/day). Based on the common assumption that workers take two weeks of vacation per year, EPA assumes that a resident will be away from home approximately 15 days per year (EPA 1991a).

**Dermal absorption** of COPCs is a result of chemicals being absorbed into the body from soil particles after any direct skin contact with contaminated soil. Hands and fingers are typically the primary body parts in contact with soil. Chemicals absorbed through the skin are absorbed into the bloodstream. The soil adherence factor is based on gardening and play activities.

**Inhalation of airborne suspended soil particles** occurs when soil grains are picked up by the wind and dispersed into the air. Once these soil particles are airborne, people in the vicinity can inhale them. Particles typically less than 10 microns in size are inhaled. Once inhaled into the lungs, chemicals are absorbed from the soil particle and absorbed into the bloodstream. Larger particles do not reach the lungs but are coughed up and swallowed.

**Inhalation of VOCs** which volatilize from soil or groundwater into air can be absorbed into the bloodstream after being inhaled. Residents may be exposed to COPCs through **ingestion of homegrown produce**. Various types of produce are grown and consumed in the neighborhood adjacent to the former AMCO facility. Produce grown in the residential gardens include mint, figs, guava, cilantro, and grapes. Produce may take up COPCs into roots or have soil deposited on aboveground plant parts.

Oakland residents have their drinking water supplied by the East Bay Municipal Utility District. It is unlikely that residents would drink groundwater in the future; however, in accordance with input from the regulatory agencies and the community, groundwater use for drinking water and household use is included in the evaluation of future residential use of the AMCO property.

## 3.2 Exposure Point Concentrations

EPCs are representative of the concentration of the chemical of potential concern to which receptors may be exposed over a period of time. EPCs were calculated for on-facility soil and groundwater. Because a screening level risk evaluation was conducted on the residential soil, air, and soil gas sample results, UCLs were not required or calculated for these media. Detected concentrations from each sample/media were compared to their appropriate screening levels.

Exposure point concentration estimates do not include physical, chemical, or biological processes that could result in the reduction of chemical concentrations over time. The EPCs are assumed to remain constant at levels reflected in the analytical results. This general assumption of steady state conditions also applies to sources and contaminant release mechanisms. This assumption may result in a conservative evaluation of long-term exposure conditions.

### 3.2.1 Soil and Groundwater

The measure of exposure appropriate for a risk assessment is the average concentration of a contaminant throughout an area to which humans are exposed. The premise is based on the assumption that over a long enough period of time a receptor would contact all parts of the exposure area. A conservative estimate of the average concentration of a chemical across an exposure area is the 95 UCL on the mean; 95% UCLs were calculated for each dataset using ProUCL3 software (EPA 2004c). ProUCL outputs for each COPC in each medium are provided in Attachment 5.

ProUCL computes parametric UCLs based on normal, lognormal, or gamma distributions, and nonparametric UCLs using one of several nonparametric methods. The UCLs that are selected as the EPCs are based on the data distribution and the associated skewness. If the dataset contained two or fewer samples, the maximum sample concentration was used as the EPC because a 95% UCL could not be calculated. One-half of the sample quantitation limit was substituted as a proxy concentration for chemical concentrations reported as not detected. EPCs are the lesser of the maximum-detected concentration and the 95% UCL.

Table 7 summarizes the EPCs for each soil dataset. Table 8 summarizes the EPCs for the groundwater dataset.

### 3.2.2 Soil Gas, Crawlspace Air, and Ambient Air

Individual sample results were used for comparison to screening levels for soil gas, crawlspace air, and ambient air data. An ongoing assessment of the vapor intrusion pathway is being conducted, including continued monitoring. The results from the continued monitoring are being evaluated to assess whether a quantitative analysis risk approach is appropriate.

## 3.3 Estimation of Chemical Intake

Exposure (or intake) is defined as contact of an organism with a chemical. Intake is normalized for time and body weight and is expressed as milligrams of chemical per kilogram of body weight per day (mg/kg-day). Six basic factors are used to estimate intake:

chemical concentration, contact rate, exposure frequency, exposure duration, body weight, and averaging time.

Intake estimates are calculated for each COPC and exposure pathway. For noncarcinogenic effects, the intake is averaged over the period of time that receptors are exposed to the COPCs and is referred to as the average daily dose (ADD). For carcinogenic effects, the intake is averaged over a receptor's lifetime (i.e., assumed to be 70 years) and is referred to as the lifetime average daily dose (LADD).

The quantification of exposure intake considers chemical EPCs, as well as general exposure assumptions or parameters. The intake assumptions are based on information that is highly conservative in nature and are intended to overestimate exposure to be protective of sensitive members of the population such as children.

EPA guidance states that actions at Superfund sites should be based on an estimate of the "reasonable maximum exposure" (RME) (EPA 1989). The RME is defined as the "highest exposure that is reasonably expected to occur at a site." The intent of the RME is to estimate a conservative exposure case (i.e., well above the average case) that is still within the range of possible values. To the extent possible, the risk assessment has selected values for the exposure factors that result in an estimate of the RME scenario.

The parameters used to assess exposure in this HHRA are summarized in the sections below and are provided in Table 4 for soil and Tables 5 and 6 for groundwater (exposure by residents and trench workers, respectively). The parameters based on RME exposure are recommended values from EPA Region 9's *Preliminary Remediation Goals* (PRG) and California Department of Toxic Substances Control (DTSC) and Human and Ecological Risk Division (HERD) recommended default exposure factors for use in risk assessment at California Military Facilities (DTSC 2005).

### 3.3.1 General Exposure Assumptions

General exposure assumptions are used in the intake calculations for all exposure pathways evaluated in the HHRA. General exposure assumptions include exposure frequency, exposure duration, body weight, and averaging time. These assumptions are detailed below:

- **Exposure Frequency** – It was assumed that adult and child residents would be exposed to chemicals at the site 350 days per year (EPA 1991a). For workers the assumed exposure duration is 250 days per year (EPA 1991a).
- **Exposure Duration** – A total resident exposure of 30 years is assumed (i.e., 24 years for an adult and 6 years for a child). An industrial worker exposure of 25 years at the same location is assumed (EPA 1991a). The construction worker is assumed to be exposed for a period of 1 year.
- **Body Weight** – It was assumed that the body weight for an adult (for both resident and worker) is 70 kilograms (kg). A body weight of 15 kg is used for a child.
- **Averaging Time** – Intake calculations are averaged over a period of time. For noncarcinogenic effects, the averaging time is equal to the period of time that receptors are exposed to the COPC, or 365 days per year multiplied by the exposure duration. The

averaging time for noncarcinogenic effects for residential adults and children are 8,760 and 2,190 days, respectively (corresponding to 24 years for an adults and 6 years for a child). For workers, an averaging time of 1 year or 365 days, is assumed. For carcinogenic effects (for both resident and worker), the averaging time is equal to a receptor's lifetime of 365 days per year multiplied by 70 years. The averaging time for carcinogenic effects is 25,500 days.

### 3.3.2 Exposure Parameters and Equations for Soil Ingestion

To calculate intake by incidental ingestion of soil, soil ingestion rates were applied (Table 4). The soil ingestion rates identified for assessing a residential exposure are 100 mg/kg for an adult and 200 mg/kg for a child. Soil ingestion rates of 100 mg/kg and 330 mg/kg are assumed for the industrial worker and construction workers, respectively.

Chemical intake via ingestion of soil was estimated according to the following equation (EPA 1989):

Intake =

Where:

Intake	=	Intake, or dose for each chemical (mg/kg-day)
Cs	=	EPC in soil (mg/kg)
IngR	=	Ingestion Rate (mg/day)
EF	=	Exposure frequency (day/years)
ED	=	Exposure duration (years)
CF	=	Conversion factor ( $1 \times 10^{-6}$ kg/mg)
BW	=	Body weight (kg)
AT	=	Averaging time (days)

### 3.3.3 Exposure Parameters and Equations for Dermal Contact with Soil

Exposure assumptions used in the intake calculations for the dermal contact with soil exposure pathways include body surface area and soil adherence factor (Table 4). Chemical specific dermal absorption factors are also applied. These factors are detailed below:

- Body Surface Area** – The body surface area is the total amount of skin surface that can be exposed to contaminated soil. The adult resident was assumed to wear a short-sleeved shirt, shorts, and shoes with an exposed skin surface area of 5,700 cm<sup>2</sup> which included head, hands, forearm, and lower legs. The surface area for a child is 2,900 cm<sup>2</sup> which includes exposure to the head, hands, forearms, lower legs, and feet. Both industrial and construction workers are assumed to have an exposed skin surface area of 5,700 cm<sup>2</sup>.
- Soil-adherence Factor** – The soil-adherence factor is a measure of the amount of soil that can adhere to an area of skin surface. EPA's (2004b) recommended soil-adherence factor for adults is 0.07 mg/cm<sup>2</sup>. This is based on the body-part specific adherence factor presented in Kissel et al. (1996) and Holmes et al. (1999). The activity pattern selected to be representative of the average urban suburban resident is the outdoor gardener. This scenario is considered to represent the most common residential activities, since it included activities as weeding, pruning, picking fruit, digging small irrigation trenches,

and cleaning up. The recommended soil-adherence factor for a child resident is 0.2 mg/cm<sup>2</sup> (EPA 1999a), and is used to represent a sensitive population with activity patterns that could contribute to increased exposure. The age group/activity used to determine the adherence factor is children at play. The assumed soil-adherence factor for industrial workers is 0.2 mg/cm<sup>2</sup>; for construction workers, a soil-adherence factor of 0.8 mg/cm<sup>2</sup> is used.

- **Dermal-absorption Factor** – The dermal absorption factor is a chemical-specific factor that measures a chemical’s ability to be absorbed into the human body. An absorption factor of 0.1 assumes that 10 percent of the chemical will be absorbed into the body and be bioavailable to cause a toxic effect. Dermal-absorption factors were obtained for all chemicals from EPA (1999). Dermal-absorption factors are compiled in Table 1-4 (located in Attachment 1).

Chemical Intake via dermal contact with soil was estimated according to the following equation (EPA 1989):

$$\text{Intake} = \frac{Cs \times SA \times EF \times ED \times AF \times ABS \times CF}{BW \times AT}$$

Where:

Intake	=	Intake, or dose for each chemical (mg/kg-day)
Cs	=	EPC in soil (mg/kg)
SA	=	Body Surface area (cm <sup>2</sup> )
EF	=	Exposure frequency (day/years)
ED	=	Exposure duration (years)
AF	=	Soil-adherence factor (mg/cm <sup>2</sup> )
ABS	=	Absorption factor
CF	=	Conversion factor (1 × 10 <sup>-6</sup> kg/mg)
BW	=	Body weight (kg)
AT	=	Averaging time (days)

### 3.3.4 Exposure Parameters and Equations for Inhalation of Particulates and Volatiles from Soil

There are two types of exposure pathways evaluated in this HHRA to address inhalation of chemicals. One is inhalation of particulates in which nonvolatile chemicals of potential concern (i.e., DDT and lead) are sorbed to airborne dust and subsequently inhaled by receptors. The other pathway evaluated is inhalation of volatile compounds that have migrated from soil to air. Exposure assumptions used in the intake calculations for the inhalation of particulates and volatiles from soil include inhalation rate and exposure time. A particulate emission factor (PEF) and chemical specific volatilization factors are also applied. These factors are detailed below and summarized in Table 4.

- **Inhalation Rate** – For adults (both workers and residents) the inhalation was assumed to be 0.83 cubic meters per hour (m<sup>3</sup>/hr). For children 6 to 8 years of age, an inhalation rate of 0.42 m<sup>3</sup>/hr is recommended. This is the highest recommended inhalation rate for a child within the age range of 1 through 6 years.

- **Exposure Time**— Inhalation pathways are unique in that an exposure time parameter can be applied to the intake estimates to account for the amount of time during one day that a receptor can potentially inhale chemicals. The exposure time is assumed to be 24 hours for both the adult and child resident, which is conservative given that residents are typically not exposed all day to chemicals in soil at their homes. For workers, an exposure time of 8 hours is assumed.
- **Particulate-emission and Volatilization Factors**— The inhalation pathways incorporate a PEF for nonvolatile chemicals and a chemical specific volatilization factor (VF) for volatile chemicals. These factors relate chemical concentrations in soil to chemical concentrations in air that can be inhaled by receptors. A PEF of  $1.32 \times 10^9$  cubic meters per kilogram ( $m^3/kg$ ) was applied. It was derived by assuming a continuous and contact emission rate over an extended period of time. This PEF was used to evaluate inhalation of the nonvolatile chemicals. When available for volatile chemicals, chemical-specific VFs were used.

Chemical intake via inhalation of particulates from soil is estimated according to the following equation (EPA 1989):

$$\text{Intake} = \frac{Cs \times InhR \times EF \times ET \times ED}{PEF \times BW \times AT}$$

Chemical intake via inhalation of volatiles from soil is estimated according to the following equation:

$$\text{Intake} = \frac{Cs \times InhR \times EF \times ET \times ED}{VF \times BW \times AT}$$

Where:

Intake	=	Intake, or dose for each chemical (mg/kg-day)
Cs	=	EPC in soil (mg/kg)
InhR	=	Inhalation Rate ( $m^3/day$ )
EF	=	Exposure frequency (day/years)
ET	=	Exposure time (hours)
ED	=	Exposure duration (years)
PEF	=	Particulate-emission factor ( $m^3/kg$ )
VF	=	Volatilization factor ( $m^3/kg$ )
BW	=	Body weight (kg)
AT	=	Averaging time (days)

### 3.3.5 Exposure Parameters and Equations for Ingestion of Groundwater

Specific equations used to estimate chemical exposures for each complete pathway are presented in Table 5 for exposure by residents and Table 6 for exposure by trench workers.

Although groundwater beneath the Site is not currently used by residents as a drinking water source, risks were calculated for a hypothetical exposure assuming that future residents might use the groundwater at the Site for drinking and for household use. The groundwater ingestion rates identified for assessing a residential exposure were 2 L/day for an adult and 1 L/day for a child.

Chemical intake from ingestion of chemicals in groundwater was calculated using the following equation (EPA 1989):

$$\text{Intake} = \frac{C_{gw} \times \text{IngR} \times \text{EF} \times \text{ED}}{BW \times \text{AT}}$$

Where:

Intake	=	Intake, or dose for each chemical (mg/kg-day)
C <sub>gw</sub>	=	EPC in groundwater (mg/kg)
IngR	=	Ingestion Rate (L/day)
EF	=	Exposure frequency (day/years)
ED	=	Exposure duration (years)
BW	=	Body weight (kg)
AT	=	Averaging time (days)

### 3.3.6 Exposure Parameters and Equations for Dermal Contact with Groundwater

Dermal contact with groundwater used in the home as tap water could occur as a result of bathing or showering. Calculation of exposure through this pathway varies depending on the nature of the chemical involved as well as the length of the exposure and the amount of "lag time" assumed to occur following the exposure period.

The general chemical intake equation for dermal contact with groundwater is as follows (EPA 2004b):

$$\text{Intake} = \frac{DA_{event} \times SA \times \text{EF} \times \text{ED}}{BW \times \text{AT}}$$

Where:

Intake	=	Intake, or dose for each chemical (mg/kg-day)
DA <sub>event</sub>	=	Absorbed dose per event per area of skin exposed (mg/cm <sup>2</sup> -event)
SA	=	Body surface area (cm <sup>2</sup> )
EF	=	Exposure frequency (day/years)
ED	=	Exposure duration (years)
BW	=	Body weight (kg)
AT	=	Averaging time (days)

DA<sub>event</sub> is calculated differently for organic and inorganic chemicals.

For inorganic chemicals DA<sub>event</sub> is calculated as follows:

$$DA_{event} = K_p \times C_{gw} \times t_{event}$$

For organic chemicals DA<sub>event</sub> is calculated using the following equations:

If  $t_{event} > t^*$

$$DA_{event} = FA \times K_p \times C_{gw} \left[ \frac{t_{event}}{1+B} + 2t\tau \times \left( \frac{1+3B+3B^2}{(1+B)^2} \right) \right]$$

If  $t_{event} \leq t^*$

$$DA_{event} = 2 FA \times K_p \times C_{gw} \sqrt{\frac{6 \tau \times t_{event}}{\Pi}}$$

Where:

$C_{gw}$	=	EPC concentration in groundwater (mg/L)
FA	=	Fraction absorbed (unitless)
$K_p$	=	Skin permeability constant for chemicals in groundwater (cm/hour)
$t_{event}$	=	Exposure Time (hrs)
$t^*$	=	Time to reach steady state (hrs)
$\tau$	=	Lag time per event
$\Pi$	=	Pi
B	=	Dimensionless coefficient (cm/hr)

### 3.3.7 Exposure Parameters and Equations for Inhalation of Vapors from Groundwater

Assuming that groundwater under the former AMCO facility is used in the home as tap water, volatile chemicals within this water that became airborne could be inhaled by residents within their homes during bathing or showering. Assumptions regarding exposure duration and frequency are the same as those used for the soil inhalation pathway described above with the exception that the inhalation pathway is only assumed to occur for volatile chemicals and the VF for each of these chemicals is assumed to be 0.5.

Inhalation of chemicals in groundwater was calculated using the following equation:

$$\text{Intake} = \frac{C_{gw} \times \text{InhR} \times \text{VF} \times \text{ET} \times \text{EF} \times \text{ED}}{\text{BW} \times \text{AT}}$$

Where:

Intake	=	Intake, or dose for each chemical (mg/kg-day)
$C_{gw}$	=	EPC in groundwater (mg/L)
InhR	=	Inhalation Rate (m <sup>3</sup> /day)
VF	=	Volatilization factor (L/m <sup>3</sup> )
ET	=	Exposure time (hours)
EF	=	Exposure frequency (day/years)
ED	=	Exposure duration (years)
BW	=	Body weight (kg)
AT	=	Averaging time (days)

Since the groundwater is present at the Site at depths less than 10 feet bgs, trench workers may be exposed to groundwater under the former AMCO facility, based on the assumption of standing groundwater in the ditch during digging. For estimating steady-state concentrations of VOCs released to ambient air during trenching activity, the following equations (EPA 1988, EPA 1994, EPA 1995a) were applied:

The chemical specific gas-phase mass-transfer coefficient,  $k_{iG}$  for each groundwater COPC is derived as follows:

$$k_{iG} = \left(\frac{MW_{H_2O}}{MW_i}\right)^{0.335} \times \left(\frac{T}{298}\right)^{1.005} \times k_{G,H_2O}$$

Where:

- $K_{iG}$  = Chemical-specific gas-phase mass-transfer coefficient (cm/s)
- $MW_{H_2O}$  = Molecular weight of water (g/mol) 18
- $MW_i$  = Chemical-specific molecular weight (g/mol)
- $T$  = Average temperature (Kelvin)
- $k_{GH_2O}$  = Gas phase mass transfer coefficient for water vapor at 25 degrees Centigrade (cm/s) 8.33E-01 (EPA 1995a)

The chemical-specific liquid-phase mass-transfer coefficient,  $K_{iL}$  for each groundwater COPC is derived as follows:

$$k_{iL} = \sqrt{\frac{MW_{O_2}}{MW_i}} \times \frac{T}{298} \times k_{L,O_2}$$

Where:

- $K_{iL}$  = Chemical-specific liquid-phase mass-transfer coefficient, (cm/s)
- $MW_{O_2}$  = Molecular weight of oxygen (g/mol) 32
- $MW_i$  = Chemical-specific molecular weight (g/mol)
- $T$  = Average temperature (Kelvin)
- $k_{L,O_2}$  = Liquid phase mass transfer coefficient for oxygen at 25 degrees Centigrade (cm/s), 2.0E-03 (EPA 1995a)

The overall mass-transfer coefficient for each groundwater COPC is derived as follows:

$$\frac{1}{K_i} = \left(\frac{1}{k_{iL}}\right) + \left(\frac{RT}{H_i k_{iG}}\right)$$

Where:

- $K_i$  = Chemical-specific overall mass-transfer coefficient (cm/s)
- $k_{iL}$  = Chemical-specific liquid-phase mass-transfer coefficient (cm/s)
- $R$  = Gas constant, (atm-m<sup>3</sup>/mol-K), 8.2E-05
- $T$  = Average temperature (Kelvin)
- $H_i$  = Chemical-specific Henry's Law Constant (atm-m<sup>3</sup>/mol)
- $K_{iG}$  = Chemical-specific gas-phase mass-transfer coefficient (cm/s)

For a conservative risk evaluation, assume an infinite VOC source. At steady state, the emission rate for each VOC can be calculated as below:

$$E_i = K_i \times C_w \times A_w$$

Where:

$E_i$	=	Emission rate of the VOC (mg/s)
$K_i$	=	Overall mass-transfer coefficient (cm/s)
$C_w$	=	Concentration of VOC in groundwater (mg/cm <sup>3</sup> )
$A_w$	=	Bottom area of the trench covered with contaminated water (cm <sup>2</sup> )

The box model was used to estimate the concentration of VOCs in the breathing zone of the construction worker using the following equation:

$$C_{air} = \frac{E_i \times CF}{u \times H \times W}$$

Where:

$C_{air}$	=	Concentration of VOCs in breathing zone (µg/m <sup>3</sup> )
$E_i$	=	VOC emission rate within the trench (mg/s)
$CF$	=	Conversion factor (µg/mg)
$u$	=	Assumed velocity of air in the trench (m/s)
$H$	=	Mixing height, adult breathing zone (m)
$W$	=	Width of the trench perpendicular to wind direction (m)

Trench dimensions are assumed to be 10 ft (w) x 10 ft (l) with 70% water coverage in the bottom of the trench assuming dewatering. The mixing height is assumed to be 6 feet. With respect to wind speed in the trench, 0.152 m/s (30 ft/min) is a reasonable lower bound on air flow in the trench (EPA 1994).

# 4.0 Toxicity Assessment

---

The toxicity assessment seeks to develop a reasonable association between the degree of exposure to a chemical and the possibility of adverse health effects. A chemical may not cause adverse toxic effects in biological systems unless the agent, or its metabolic byproducts, reach critical receptor sites in the body at specific levels and for a period of time sufficient to elicit a particular effect. Whether a toxic response occurs depends on the chemical and physical properties of the toxic agent, the degree of exposure to the agent, and the susceptibility of an individual to the particular effect. To characterize the toxicity of a particular chemical, the type of effects it can produce, and how much is needed to produce those effects must be known.

The toxicity assessment consists of two components:

- **Hazard Identification** – The process of determining what adverse human health effects, if any, could result from exposure to a particular chemical.
- **Dose-response Evaluation** – A quantitative examination of the relationship between the level of exposure and the probability of adverse health effects in an exposed population.

## 4.1 Hazard Identification

Health effects are divided into two categories – noncancer and cancer effects. The division is based on the different mechanisms of action associated with each category. Chemicals with noncancer effects may have cancer effects as well. These chemicals are assessed in both categories.

### 4.1.1 Noncancer Effects

Noncancer or systemic effects are assumed to occur only after a finite level of exposure (i.e., toxic threshold) is exceeded. Exposure levels below the threshold can be tolerated by the organisms without causing an adverse health effect. Noncancer health effects include a variety of toxicological end points and may include effects on specific organs (e.g., pulmonary toxicants affect lungs) or systems (e.g., neurotoxicants affect the nervous system).

Noncancer health effects fall in two basic categories – acute effects and chronic effects. Acute toxicological effects typically occur after a short exposure, and the effects are usually observed within 1 to 7 days. Chronic toxicological effects usually occur after repeated exposure and are observed weeks, months, or years after the initial exposure.

### 4.1.2 Cancer Effects

Carcinogenesis is generally thought to be a phenomenon for which risk evaluation based on presumption of a threshold is inappropriate. For carcinogens, it is assumed that a small number of molecular events can evoke changes in a single cell that can eventually lead to cancer. This hypothesized mechanism for carcinogenesis is referred to as “non-threshold,”

because there is assumed to be essentially no level of exposure that does not pose a finite probability, however small, of generating a carcinogenic response.

EPA has developed a carcinogen classification system (EPA 1989) that uses a weight-of-evidence approach to classify the likelihood of a chemical being a human carcinogen. Information considered in developing the classification includes human studies that associate cancer incidence with exposure. Also considered are long-term animal studies under controlled laboratory conditions. Other supporting evidence considered includes short-term tests for genotoxicity, metabolic and pharmacokinetics properties; toxicological effects other than cancer; structure-activity relationships; and physical and chemical properties of the chemical.

EPA classifies the chemical into one of the following groups, according to the weight-of-evidence from epidemiologic and animal studies:

- Carcinogenic to Humans
- Likely to be Carcinogenic to Humans
- Suggestive Evidence of Carcinogenic Potential
- Inadequate Information to Assess Carcinogenic Potential
- Not Likely to be Carcinogenic to Humans

The CSFs for COPCs are presented in Table 9.

## 4.2 Dose-Response Evaluation

Toxicity values are quantitative expressions of the dose-response relationship for a chemical. These values are expressed as cancer slope factors and noncancer reference doses, both of which are specific to the route of exposure.

### 4.2.1 Toxicity Values for Noncancer Effects

The toxicity value used to describe the dose-response relationship for noncancer health effects is the reference dose (RfD). The EPA defines the RfD as:

“... an estimate (with uncertainty spanning perhaps an order of magnitude) of a daily exposure to the human populations (including sensitive subgroups) that is likely to be without an appreciable risk of deleterious effects during a lifetime” (EPA 1989).

The oral RfD is generally expressed in units of milligrams per kilogram of body weight per day (mg/kg-day). RfDs for effects associated with inhalation of a particular chemical are given as a reference concentration (RfC) (mg/m<sup>3</sup>) that can be converted to an intake (RfD in terms of mg/kg-day).

Dose-response criteria for assessing the potential for noncancer health effects from exposure to chemicals have been developed by EPA on the principle supported by scientific data that noncancer health effects occur only after a threshold dose is reached. A threshold dose is the dose below which most people can be exposed without adverse effects occurring. This threshold dose is usually estimated from the No Observed Adverse Effect Level (NOAEL) or the Lowest Observed Adverse Effect Level (LOAEL) determined from long-term chronic animal studies. The NOAEL is defined as the highest dose at which no adverse effects are

observed, while the LOAEL is defined as the lowest dose at which adverse effects are observed.

Uncertainty factors or safety factors are applied to the NOAEL or LOAEL determined from animal studies and sometimes enhanced with human epidemiologic information to establish RfDs. A chronic RfD represents the dose to which human populations are continuously exposed and are likely to be without significant risk of adverse health effects over a lifetime.

In most cases, the RfD is extrapolated using nontoxic exposure levels in animals to humans and reduced further using individual uncertainty factors ranging from 1 to 10. Uncertainty factors are used in an attempt to account for limitations in the quality or quantity of available dose-response data. An uncertainty factor of 1 to 10 is applied to account for the application of high-dose animal toxicity endpoints to low-dose human exposure. If the toxic endpoints are based upon animal studies, but applied to humans an additional factor of 1 to 10 is applied. Ideally, the RfD is based upon the NOAEL; in those cases where only the LOAEL is available, another factor of 1 to 10 is applied. Similarly, if only subchronic data are available, then an uncertainty factor of 1 to 10 is applied. Finally, RfDs can be adjusted using a modifying factor of 1 to 10 to account for the quality of the toxicological studies or results. The uncertainty factors and the modifying factors provide an inherently more conservative RfD. If all uncertainty and modifying factors are applied at their maximum value, then the endpoints observed in animal studies may be reduced by an overall factor of 10,000.

- For DDT, the experimental NOAEL is 0.05 milligrams per kilogram per day (mg/kg-day). A cumulative uncertainty factor of 100 was applied to this NOAEL (10 for the uncertainty of interspecies conversion and 10 for the protection of sensitive human subpopulations). This results in a RfD for DDT of 0.0005 mg/kg-day (EPA 2006a).
- For Aroclor-1254, the LOAEL is 0.005 mg/kg-day. An uncertainty factor of 300 was applied to this LOAEL, which results in an RfD of 0.00002 mg/kg-day.
- For naphthalene, the adjusted LOAEL is 71 mg/kg-day. An uncertainty factor of 3000 was applied to the NOAEL (10 for extrapolation from rats to humans, 10 for protection of sensitive humans, 10 for extrapolation from subchronic to chronic exposure, and 3 to account for database deficiencies including the lack of chronic oral exposure studies and 2-generation reproductive toxicity studies). The resulting RfD is 0.02 mg/kg-day.
- For vinyl chloride, the NOAEL reported is 0.09 mg/kg-day. An uncertainty factor of 30 was applied to this NOAEL (10 for protection of sensitive human subpopulations and 3 for animal-to-human extrapolation) resulting in an RfD of 0.003 mg/kg-day.

RfDs developed by EPA are used to evaluate noncancer health hazards in the HHRA. The RfDs were compiled from EPA's Integrated Risk Information System (IRIS) (EPA 2006a). The noncancer toxicity values for the chemicals of potential concern are listed in Table 9. This table also identifies the toxic endpoints observed in each investigation used to derive the RfD, as well as the cumulative uncertainty factor used to derive each RfD. Route-to-route extrapolations were frequently used when there were no toxicity values available for a given route of exposure. Oral reference doses (RfDo) were used for both oral and inhaled exposures for organic compounds lacking inhalation values. Inhalation reference doses (RfDi) were used for both inhaled and oral exposures for organic compounds lacking oral

values. Route extrapolations were not performed for inorganics due to portal of entry effects and known differences in absorption efficiency for the two routes of exposure. An additional route extrapolation is the use of oral toxicity values for evaluating dermal exposures. In general, dermal toxicity values are not listed in EPA databases and consequently must be estimated from oral toxicity information.

## 4.2.2 Toxicity Values for Carcinogens

The dose-response relationship for cancer effects is usually expressed as a cancer slope factor (CSF). Generally, the CSF is a plausible upper-bound estimate of the probability of a response per unit intake of a chemical over a lifetime. The CSF is usually, but not always, the upper 95 percent confidence limit of the slope of the dose-response curve and is expressed as the inverse of milligrams of chemical per kilogram of body weight per day ( $\text{mg}/\text{kg}\text{-day}$ )<sup>-1</sup>.

Chemical carcinogens are generally divided into two classes based upon the mechanism by which they cause cancer. The two classes are genotoxic agents (capable of causing DNA damage) and nongenotoxic (toxic through mechanism not related to DNA damage). For genotoxic carcinogens, it is generally assumed that no threshold exists below which the agent cannot cause cancer. In other words, no matter how small the dose, there is some carcinogenic response, even if that response cannot be measured in animal experiments or in an exposed human population. In contrast, nongenotoxic carcinogens are likely to have a threshold dose, below which no adverse toxicological impact would be expected to occur.

The dose-response curve used by regulatory agencies is typically derived using the linearized multistage (LMS) model, which extrapolates the tumor response in animals exposed to high doses to a theoretical cancer risk for human exposed to low doses. EPA acknowledges that this approach likely overestimates cancer risks:

“It should be emphasized that the linearized multistage procedure leads to a plausible upper limit to risk that is consistent with some proposed mechanisms of carcinogenesis. Such an estimate, however, does not necessarily give a realistic prediction of the risk. The true value of the risk is unknown and may be as low as zero. The range of risks defined by the upper limit given by the chosen model and the lower limit, which may be as low as zero, should be explicitly stated. An established procedure does not yet exist for making ‘most likely’ or ‘best’ estimated of risk within a range of uncertainty defined by the upper and lower limit estimates” (EPA 1986)

The linearized multistage procedure is used to develop chemical-specific CSFs. A CSF is a measure of the carcinogenic potency of a chemical. As the slope factor increases, the toxicity of the chemical also increases.

- For example, the CSF for vinyl chloride is  $1.5 (\text{mg}/\text{kg}\text{-day})^{-1}$  based on the assumption of continuous lifetime exposure from birth.
- For aldrin, a CSF of  $17 (\text{mg}/\text{kg}\text{-day})^{-1}$  was selected based on the geometric mean of 3 separated studies.
- For benzo[a]pyrene, a CSF of  $7.3 (\text{mg}/\text{kg}\text{-day})^{-1}$  was calculated based on a geometric mean of four slope factors obtained by different modeling procedures.

There is uncertainty and conservatism built into the risk extrapolation approach. Cancer risks estimated by this method produce an estimate that provides a rough but plausible upper limit of risk (i.e., it is not likely that the true risk would be much more than the estimated risk, but could be considerably lower) (EPA 1989).

### 4.2.3 Toxicity Values for Lead

Intakes of lead are assessed differently than for other chemicals. Currently, EPA has not established CSFs or RfDs for lead. Much of the toxicological data collected on the effects of lead on the human body relates exposure and effect in terms of the amount of lead in blood associated with an observed effect, expressed as micrograms of lead per deciliter of blood ( $\mu\text{g lead/dL blood}$ ). EPA and Centers for Disease Control and Prevention (CDC) have identified childhood blood levels of  $10 \mu\text{g/dL}$  as the level of concern above which significant health risks may occur (EPA 2003a).

Exposure to lead in soil was evaluated using DTSC's Lead Risk Assessment Spreadsheet Version 7, Lead Spread 7 (CalEPA 1999). This model calculates a screening level that represents a concentration of lead in soil for children that is protective for a combined exposure to lead in air, drinking water, food and soil. For the residential lead screening, the most conservative (health-protective) screening level available from the LeadSpread model was selected (99th percentile) based on protection of children's health.

Site-specific screening levels for lead in residential soil of  $194 \text{ mg/kg}$  including ingestion of homegrown produce and  $340 \text{ mg/kg}$  excluding homegrown produce were calculated, using local concentration for lead in ambient (outdoor) air and drinking water supply (Attachment 3, Table 3-50). No lead data was available for the Oakland Filbert Street Monitoring Station. The closest monitoring station to the AMCO neighborhood with ambient toxics data for lead is the San Francisco Arkansas Street station, approximately 15 miles west. The maximum lead concentration reported in the last 6 years,  $0.055 \mu\text{g/m}^3$ , was selected as representative of lead in air (Attachment 3, Table 3-51, Table 3-52, and Table 3-53). The East Bay Municipal Utility District's Annual Water Quality Report, Year 2006 (EBMUD 2007) presents chemical concentrations in drinking water for the City of Oakland. For purposes of reporting, the value for lead is below the detectable levels of  $5 \mu\text{g/L}$ .

For workers exposed to lead in soil, the screening level is assumed to be the Region 9 Industrial PRG of  $800 \text{ mg/kg}$ . EPA uses the Adult Lead Model to estimate PRGs for an industrial setting. This PRG is intended to protect a fetus that may be carried by a pregnant female worker. It is assumed that a cleanup goal that is protective of a fetus will also afford protection for male or female adult workers. The model equations were developed to calculate cleanup goals such that there would be no more than a 5% probability that fetuses exposed to lead would exceed a blood lead (PbB) of  $10 \mu\text{g/dL}$ . An updated screening level for soil lead at commercial/industrial (i.e., nonresidential) sites of  $800 \text{ mg/kg}$  is based on an analysis of the combined phases of NHANES III that chooses a cleanup goal protective of all subpopulations.

### 4.2.4 Sources of Toxicity Criteria

The hierarchy of human health toxicity values used by EPA follows Directive 9.85.7-53 issued by EPA's Office of Solid Waste and Emergency Response on December 5, 2003 (EPA 2003b):

- Tier 1 - EPA's IRIS database
- Tier 2 - EPA's Provisional Peer Reviewed Toxicity Value (PPRTV)
- Tier 3 - Health Effects Assessment Summary Tables (EPA 1997), EPA's National Center for Environmental Assessment (NCEA), CalEPA

Slope factors developed by California EPA's Office of Environmental Health Hazard Assessment (OEHHHA) and reference exposure levels developed by Air Toxics and Epidemiology Section of OEHHHA were used if they were more health-protective than the federal toxicity values.

For the AMCO HHRA, toxicity values presented in the EPA Region 9 PRG tables (EPA 2004a) were used if other toxicity values were not available.

# 5.0 Risk Characterization

---

Information presented in the exposure assessment and toxicity assessment is integrated in this section to characterize risks to workers, residents, and recreational users exposed to COPCs from the Site. Theoretical noncancer hazards and lifetime-excess carcinogenic health risks are characterized and discussed. The critical uncertainties affecting risk calculations are discussed in Section 6.0.

In this risk characterization, numerical risk estimates calculated for each COPC and exposure pathway were combined to estimate noncancer HIs and, for carcinogens, total ELCR. In keeping with the most recent guidance, professional judgment has been relied upon to select the most significant uncertainties (those that define and explain the risk estimates) for discussion in the risk characterization.

Under RME conditions, the calculated risks are not likely to be exceeded by any member of the exposed population because of the health-protective exposure assumptions used. A risk assessment does not measure the actual health effects that hazardous substances at a site have on people. Conservative safety margins are built into a risk assessment analysis to ensure protection of the public. Therefore, people will not necessarily be affected even if they are exposed to chemicals at higher dose levels than those estimated in the HHRA. In other words, the most vulnerable people (e.g., children) are carefully considered to make sure all members of the public will be protected.

## 5.1 Noncarcinogenic Hazard

Noncarcinogenic effects for each exposure route and chemical are evaluated by comparing the average dose over a specified time period. The ratio of the average daily dose to RfD is called a hazard quotient (HQ), which is calculated as follows:

$$HQ = \frac{ADD}{RfD}$$

Where:

- HQ = Theoretical noncancer hazard quotient for chemical and exposure pathway
- ADD = Average Daily Dose (mg/kg-day) for chemical and exposure pathway
- RfD = Reference Dose (mg/kg-day) for chemical and exposure pathway

The HQ assumes that there is a dose below which adverse health effects are unlikely (EPA 1989). If the average daily dose is below the threshold RfD (i.e., the ratio is less than 1), it is unlikely that noncarcinogenic effects would occur. To assess the overall potential for noncarcinogenic effects from a particular exposure scenario, HQ for the relevant individual soil exposure pathways (i.e., ingestion, dermal contact, and inhalation) and chemicals are summed to obtain the HI for the population evaluated:

$$HI = \text{Sum of HQs for chemicals and pathways}$$

When the total HI exceeds 1, a segregated HI analysis is used to further evaluate adverse noncancer health hazards associated with exposure to COPCs in soil and groundwater. Segregated HIs are prepared because adverse noncancer health effects of chemicals that affect different target organs are generally not additive (EPA 1989). Segregated HIs are the sums of chemical-specific HQs grouped according to affected target organ and corresponding to the lowest adverse-effect levels (that is, the critical effects) identified by EPA. A segregated HI that exceeds 1 indicates the potential for adverse noncancer health effects (EPA 1989). A segregated HI that does not exceed 1 indicates that no appreciable risk exists for adverse noncancer health effects.

For assessing noncancer hazards for a 30-year residential exposure, the child (6 year exposure) and adult (24-year exposure) residential HI are calculated separately. A 30-year exposure scenario is consistent with EPA national guidance, as explained in the Preamble to the NCP (55 Fed. Reg. 8710). The Preamble states that Superfund remedial projects will address lifetime excess cancer risks using a reasonable maximum exposure scenario. EPA national Superfund guidance calculates lifetime risk over 70 years based on a reasonable maximum exposure scenario, which is defined as a 30-year exposure in the case of residents and 25-year exposure in the case of workers. The concept of lifetime risk does not automatically imply exposure over an entire 70 year lifetime.

A HI at or below 1 indicates that there is unlikely to be any increased health risk even for sensitive populations. At the same time a HI greater than 1 does not necessarily indicate that adverse effects will occur, because the RfD used in the calculation contains substantial measure of conservatism. The RfD is conservative because it is typically derived by applying multiple safety factors to a level at which no adverse effects have been observed or to the lowest level at which effects have been observed in the most sensitive animal species that have been tested.

## 5.2 Cancer Risks

The theoretical lifetime-excess cancer risks associated with the lifetime average daily doses are calculated as the product of the LADD and the CSF for each chemical and exposure pathway as shown below:

$$\text{Risk} = \text{CSF} \times \text{LADD}$$

Where:

$$\begin{aligned} \text{Risk} &= \text{Theoretical lifetime-excess cancer risk for chemical and pathway} \\ \text{CSF} &= \text{Slope Factor for chemical and exposure pathway} \\ \text{LADD} &= \text{Lifetime Average Daily Dose for chemical and exposure pathway} \end{aligned}$$

The quantitative risk estimates for suspected carcinogens are expressed as the lifetime-theoretical-excess (or additional) risk of contracting cancer above the background incidence of cancer if no exposure to chemicals occurs. In the U.S. population, the likelihood of developing cancer over one's lifetime is approximately 1-in-2 males and 1-in-3 females (American Cancer Society 2007). The total upper-bound theoretical excess cancer risk is calculated by combining the risks across pathways and chemicals as follows:

$$\text{Total lifetime-theoretical-excess risk} = \text{Sum of risks for chemicals and pathways}$$

For assessing excess cancer risk for a 30-year residential exposure, the child (6-year exposure) and adult (24-year exposure) residential cancer risks are summed.

### 5.2.1 Cancer Risk Perspective

EPA has provided guidance on the role of the risk assessment in federal Superfund remedy selection (EPA 1991b). EPA considers a target lifetime-theoretical-excess risk range of  $10^{-6}$  to  $10^{-4}$ , to be “safe and protective of public health” (56 F.R. 3535), although EPA has discretion to take action in this range depending on site-specific circumstances.

According to EPA, where the cumulative lifetime-theoretical-excess cancer risk to an individual based on RME assumptions is less than  $10^{-4}$ , and the theoretical noncancer HI is less than 1, remedial action is generally not warranted unless there are other adverse environmental impacts or an applicable or relevant and appropriate requirement (ARAR) is exceeded. Even risks slightly greater than  $1 \times 10^{-4}$  may be considered adequately protective based on site-specific conditions, including any uncertainties about the nature and extent of contaminants and associated risks. Alternatively, on a case-by-case basis, action may be recommended for sites within the  $10^{-6}$  to  $10^{-4}$  risk range. Where remedial action is warranted, guidance for remedy selection is provided in the EPA directive entitled *Land Use in the CERCLA Remedy Selection Process* (EPA 1995b). The directive notes that it is not EPA’s intent that acceptable risk standards be based solely on categories of land use (i.e., with residential cleanup at a  $10^{-6}$  level or industrial at a  $10^{-4}$  level). Rather, the risk range provides the risk manager with the necessary flexibility to address technical and cost limitations, and performance and risk uncertainties in all site remediation efforts.

When it is stated that exposure to cancer-causing chemicals results in a cancer risk of one-in-a-million, it means that each individual exposed to that chemical, at that level over his or her lifetime, has a one-in-a-million chance above the background risk of getting cancer from that particular exposure. In order to take into account the uncertainties in the science, the risk numbers are calculated using conservative assumptions, which results in conservative estimates of risk. The risk is the plausible upper limit of the true risk. In actuality, the extra risk is probably somewhat less than those calculated and presented in the following sections.

## 5.3 Risk Characterization Results

In this section, the quantitative evaluations of theoretical noncancer hazards and lifetime-theoretical excess cancer risks are presented for each scenario evaluated in the HHRA. Quantitative risks and hazards were estimated under RME conditions for the soil, groundwater, and soil gas datasets described in Section 2, Data Collection and Data Evaluation. In addition to the risk and hazards estimated for these datasets, a screening level risk evaluation was conducted for adjacent residential properties and Prescott Park.

Attachment 1 (Tables 1-7 through 1-126) provides detailed risk and hazard results for exposure to soil; Attachment 2 (Tables 2-1 through 2-27) provides detailed risk and hazard results for exposure to groundwater; and Attachment 3 (Tables 3-1 through 3-58) summarizes the results of the residential screening risk evaluation. Results are also summarized for soil in Table 10 and for groundwater in Table 11.

## 5.4 Soil Risk Evaluation

Throughout the following sections, shallow soil risk refers to risk from exposure to soil contamination in the upper 2 feet of soil. Approximately 0.5 to 3.5 feet of concrete covers the soil in most areas of the on- and off-facility properties. Deep soil risk or subsurface risk refers to risk from exposure to contamination from surface to the maximum sample depth of approximately 7 feet. It is important to note that the on- and off-facility properties are mostly paved so the potential for contact with the soil is minimized. The evaluation of RME risk for both commercial/industrial and construction workers assumes no pavement. The evaluation of RME risk for the future on-facility resident assumes the on- and off-facility properties are developed for homes and are not paved.

To evaluate the on-facility soil, soil samples were divided into the following four exposure areas: former AMCO facility, parking lot, large vacant lot, and small vacant lot.

### 5.4.1 Former AMCO Facility

One-hundred-ten chemicals were detected in soil samples collected from the former AMCO facility, including 18 metals, 17 pesticides or polychlorinated biphenyls (PCBs), 30 semivolatile organic compounds (SVOCs), 30 VOCs and 15 dioxins or furans (Attachment 1, Table 1-1 and Table 1-2). At present, the former AMCO facility is paved, and concrete in some areas is present to a depth of approximately 3 feet. As with the other paved soil areas, it was assumed that no pavement would be present to preclude direct contact with soil. Theoretical excess lifetime-cancer risks and noncancer HI for all exposure scenarios are shown in Attachment 1, Table 1-109.

For the industrial worker RME scenario, the ELCR is  $1 \times 10^{-4}$  for the shallow soil and for deep soil is  $2 \times 10^{-4}$ . Both the shallow and deep soil HIs are 2.

For the construction worker RME scenario, the ELCR is  $1 \times 10^{-5}$  for the shallow soil. The ELCR calculated for deep soil is  $2 \times 10^{-5}$ . The shallow soil HI is 4 and deep soil HI is 5.

For the future on-facility residential RME scenario, for both shallow and deep soil, the ELCR is  $4 \times 10^{-4}$ . The HI for the child is 14 for the shallow soil and 15 for the deep soil. For the adult, both the shallow and deep soil HI is 3.

The lead exposure point concentration for shallow soil is 640 mg/kg and for deep soil 605 mg/kg (Attachment 1, Tables 1-5 and 1-6); both exceed the AMCO residential site-specific screening levels of 194 mg/kg including ingestion of homegrown produce and 340 mg/kg excluding homegrown produce. However, these lead concentrations are below the PRG for an industrial scenario (800 mg/kg).

The chemicals that contribute most to the risk include lead, arsenic, vinyl chloride, TCE, cis-1,2-dichloroethene, naphthalene, aldrin, and dieldrin (Attachment 1, Tables 1-11, 1-12, 1-17, 1-18, 1-23, 1-24, 1-29, and 1-30).

### 5.4.2 Parking Lot

In soil at the parking lot, there are 67 chemicals detected in soil, including 18 metals, 8 pesticides or PCBs, 18 SVOCs, 6 VOCs, and 17 dioxins or furans (Attachment 1, Table 1-1

and Table 1-2). At present the parking lot is paved. As with the other evaluated soil areas, it was assumed that no pavement would be present to preclude direct contact with soil.

For the industrial worker RME scenario, the ELCR is  $1 \times 10^{-4}$  for the shallow soil. The total ELCR for deep soil was  $2 \times 10^{-4}$ . Both the shallow and deep soil HI is 1.

For the construction worker RME scenario, the ELCR is  $2 \times 10^{-5}$ . The ELCR for deep soil was  $3 \times 10^{-5}$ . Both the shallow and deep soil HI is 4.

For the future on-facility residential RME scenario, the ELCR is  $4 \times 10^{-4}$  for shallow soil and  $5 \times 10^{-4}$  for deep soil. The HI for the child is 28 for the shallow soil and 27 for deep soil. For the adult, both the shallow and deep HI is 2.

The lead exposure point concentration for shallow soil is 2,170 mg/kg and for deep soil 1,450 mg/kg; both exceed the AMCO residential site-specific screening level for lead and the PRG for an industrial scenario (800 mg/kg) (Attachment 1, Tables 1-31 and 1-32).

The chemicals that contribute most to the risk include lead, arsenic, benzo(a)pyrene and antimony (Attachment 1, Tables 1-37, 1-38, 1-43, 1-44, 1-49, 1-50, 1-55, and 1-56).

### 5.4.3 Large Vacant Lot

In soil at the large vacant lot, there are 73 chemicals detected in soil, including 18 metals, 18 pesticides or PCBs, 23 SVOCs, and 14 VOCs (Attachment 1, Table 1-1 and Table 1-2).

At present the large vacant lot is paved. As with the other evaluated soil areas, it was assumed that no pavement would be present to preclude direct contact with soil.

For the industrial worker RME scenario, the ELCR is  $2 \times 10^{-4}$  for the shallow soil. The ELCR for deep soil is  $1 \times 10^{-4}$ . Both the shallow and deep soil HIs are less than 1.

For the construction worker RME scenario, the shallow soil ELCR is  $2 \times 10^{-5}$ . The ELCR for deep soil is  $2 \times 10^{-5}$ . The shallow soil HI is 3, and the deep soil HI is 2.

For the future on-facility residential RME scenario, the ELCR is  $6 \times 10^{-4}$  for shallow soil. The ELCR calculated for deep soil is  $4 \times 10^{-4}$ . The HI for the child is 11 for the shallow soil and 8 for the deep soil. For the adult, both the shallow and deep soil HIs are less than 1.

The lead EPC for shallow soil is 4,360 mg/kg and for deep soil 2,750 mg/kg; both exceed the AMCO site-specific residential screening level for lead and the PRG for an industrial scenario (800 mg/kg) (Attachment 1, Tables 1-57 and 1-58).

The chemicals that contribute most to the risk estimate are lead, arsenic, DDT, and benzo(a)pyrene (Attachment 1, Tables 1-63, 1-64, 1-69, 1-70, 1-75, 1-76, 1-81, and 1-82).

### 5.4.4 Small Vacant Lot

In soil at the small vacant lot property, there are 23 chemicals detected in soil, including 17 metals and 6 pesticides or PCBs (Attachment 1, Table 1-1). At present the small vacant lot is paved. As with the other evaluated soil areas, it is assumed that in the future no pavement would be present to preclude direct contact with soil. Only shallow soil samples were collected due to the shallowness of the water table at this location.

For the industrial worker RME scenario, the ELCR is  $1 \times 10^{-4}$  for the shallow soil. The HI is less than 1.

For the construction worker RME scenario, for shallow soil the ELCR is  $1 \times 10^{-5}$ . The shallow soil HI is 1.

For the potential on-facility residential RME scenario, the ELCR is  $3 \times 10^{-4}$  for shallow soil. The HI for the child is 12. For the adult, the HI is less than 1.

The lead exposure point concentration for shallow soil is 386 mg/kg (Attachment 1, Table 1-1), which exceeds the AMCO site-specific screening level of 194 mg/kg including ingestion of homegrown produce and 340 mg/kg excluding ingestion of homegrown produce. However, the EPC is below the PRG for an industrial scenario (800 mg/kg).

The chemicals that contribute most to the risk and HI are lead, arsenic, dieldrin, and DDT (Attachment 1, Tables 1-88, 1-89, 1-94, 1-95).

### 5.4.5 Background Soil Risk Evaluation

Many substances, such as metals, are naturally occurring elements in the environment and are commonly present in all environmental samples. For these constituents, it is important to determine what fraction of the concentration detected is due to the site-related contamination, and what fraction represents background for the former AMCO facility. Background refers to the average concentration of the chemical in similar nearby reference areas that have not been impacted by the Site.

Risks and hazards from exposure to background concentrations of metals in soil were estimated using the City of Oakland *Survey of Background Metal Concentration Studies* (City of Oakland 1995). For a child resident, the ELCR is  $2 \times 10^{-4}$ . Arsenic contributed over 99% of the total background risk. The HI is 10 for the child resident and 1 for the adult. Thallium contributed 89% to the total background HI.

For industrial workers the ELCR from exposure to background soil is  $6 \times 10^{-5}$ . The HI for industrial workers is less than 1. For construction workers the ELCR is  $9 \times 10^{-6}$ , and the HI is 3. As with the residential scenario, risks from exposure to background concentrations are driven by arsenic, while noncancer hazards are driven almost entirely by thallium.

Some naturally-occurring concentrations of metals (i.e., arsenic) in Oakland soils are higher than the thresholds calculated by risk-based models. In these cases, EPA typically conducts community outreach activities to educate and advise the community about the potential risks to the public and to communicate precautions that they might take to lower the risk from arsenic exposure. Superfund cleanups are not conducted where the sole or principal threat is from natural background sources.

## 5.5 Groundwater Risk Evaluation

Currently, residents are using drinking water supplied by the East Bay Municipal Utility District from Sierra Nevada. The groundwater underneath the Site is not being used for drinking or other potable uses. It is extremely unlikely that residents would drink groundwater underneath the Site in the future; however, in accordance with input from the

community and regulatory agencies the potential risk of using groundwater underneath the Site as drinking water is evaluated.

Total Dissolved Solids (TDS) is the water quality parameter typically used to determine whether groundwater is potentially of “beneficial use”. TDS concentrations over 3,000 mg/L are considered too high for “beneficial use” as drinking water (RWQCB 2004). Across the RI area, TDS concentrations ranged from 730 to 53,000 mg/L. With the exception of RMW-03-15, which had a TDS concentration of 3,600 mg/L, all samples north of 3<sup>rd</sup> Street were below the drinking water threshold of 3,000 mg/L. TDS concentrations in all wells south of 3<sup>rd</sup> Street were above 3,000 mg/L.

### 5.5.1 Shallow Groundwater

For the potential residential RME scenario, the excess lifetime cancer risk is  $1 \times 10^{-1}$  for groundwater. The HI for the child was 1,153, and the HI for the adult was 484 (Attachment 2, Table 2-22).

In addition, at the request of the community’s technical advisor, a trench worker’s risk from contact with groundwater underneath the Site is evaluated. For the trench worker RME scenario, the total lifetime-excess cancer risk was  $1 \times 10^{-4}$  for groundwater (Table 2-14). The HI for the trench worker was 34 (Attachment 2, Table 2-15).

The chemicals that contribute most to the risk through exposure to groundwater include vinyl chloride, arsenic, cis-1, 2-dichloroethene, benzo(a)pyrene, and aroclor-1260 (Attachment 2, Tables 2-10, 2-11, 2-14 and 2-15).

### 5.5.2 Residential Irrigation Well

One of the residents living adjacent to the facility owns a well located in his backyard shed. According to the property owner, the well is primarily used for backyard irrigation. The well is not used as a source of drinking water. The residential irrigation well was sampled on three occasions: September 2, 2004; June 24, 2005; and October 12, 2005. A summary of the results is presented in Table 12.

As indicated on this table, the only analyte that exceeds the MCL is lead. However, boron, manganese, mercury, and sodium are at concentrations that exceed their agricultural water quality limit (Ayers and Westcot 1985).

## 5.6 Residential Soil Gas, Ambient Air, and Crawlspace Air

Ambient air samples were collected to evaluate the potential for vapor intrusion. Soil gas and crawlspace air samples were collected to determine preferential migration pathways for VOCs and the potential for vapor intrusion into buildings or residences. The inhalation exposure pathway from vapor intrusion differs from other exposure pathways in several respects. EPA has a draft guidance on vapor intrusion. EPA vapor intrusion guidance recommends a 3-tier screening process to evaluate the vapor intrusion pathway (EPA 2002).

Tier 1 (primary screening) is designed to help quickly screen out sites at which the vapor intrusion pathway does not ordinarily need further consideration, and point out the sites that do typically need further consideration. This evaluation involves determining whether any potential exists at a site for vapor intrusion to result in unacceptable indoor inhalation

risks and, if so, whether immediate action may be warranted. Tier 2 (secondary screening) involves comparing available measured or reasonably estimated concentrations of COPCs in groundwater and/or soil gas to target concentrations. Tier 3 involves more detailed studies including foundation and/or indoor air sampling and vapor intrusion modeling.

Assessing the vapor intrusion pathway is more complex because it may involve the use of indirect measurements and modeling (e.g., using soil gas or groundwater data) to assess the potential for indoor inhalation risks at the Tier 3 level. Estimating human health risk from indoor air exposure depends upon human exposure to the vapors. If contaminant vapors do not enter the building, the exposure pathway from the source of contamination to a person (receptor) is not complete, and in such circumstances the person cannot be considered to be at risk from indoor air exposure due to vapor intrusion. In other situations, vapors may enter the building, but be present at such low levels that the risk is considered negligible. However, in some cases, vapors may enter into a building and accumulate at levels that may pose an unacceptable risk to human health.

The CSM identifies the indoor air pathway as potentially complete for the commercial/ industrial worker (including an indoor worker), the future on-facility resident and the current and future off-facility resident. For residential properties bordering the former AMCO facility, a Tier 2 type of approach was conducted by comparing soil gas to Region 9 ambient air PRGs multiplied by an attenuation factor of 10 (recommended by EPA in the OSWER Draft Guidance for Evaluating the Vapor Intrusion to Indoor Air Pathway from Groundwater and Soils - EPA 2002) and crawlspace air sample results to ambient air PRGs (EPA 2004a). A Tier 3 assessment was not conducted for this HHRA because results from the Tier 2 assessment were considered adequate for establishing COPCs and the presence of potential health risks.

The Tier 3 evaluation was not performed for the following reasons:

1. Crawlspace air sample results were used in the evaluation which may provide more accurate data than modeling VOC concentrations from groundwater to indoor air.
2. The Johnson & Ettinger Model for groundwater assumes that the groundwater is at least 5 feet below the ground surface. During the RI, the water table fluctuated between approximately 2.5 and 6.5 feet below ground surface (bgs). The majority of the water level measurements were shallower than 5 feet.
3. Based on the high groundwater VOC concentrations at the former AMCO facility and the VOCs found in the crawlspace, ambient air, and soil gas samples, it is clear that the VOCs are coming from the groundwater.

The screening level risk evaluation was conducted to assess whether there is an immediate health threat to residents and to determine whether the vapor intrusion pathway is significant. An ongoing assessment of the vapor intrusion pathway is being conducted, including continued monitoring. The results from the continued monitoring are being evaluated to assess whether a quantitative analysis risk approach is appropriate.

The screening level risk evaluation compares concentrations detected in ambient air, crawlspace air, and soil gas at the residential properties to screening levels. The exposure assumptions that were used to generate the screening levels for the exposure assessment are

for RME conditions (includes sensitive populations). Screening levels are specific concentrations of chemicals that are considered by EPA to be health protective for human populations. If a contaminant concentration is below the screening level, then no immediate action is necessary. If a contaminant is present at a concentration above the screening level, it does not necessarily mean that this chemical poses a significant health risk. However, further evaluation of possible exposure to that contaminant may be needed.

Screening levels for soil gas sample results were developed based on an attenuation factor of ten which is the recommended attenuation factor for shallow soil gas in the OSWER Draft Guidance for Evaluating the Vapor Intrusion to Indoor Air Pathway from Groundwater and Soils (Subsurface Vapor Intrusion Guidance) (EPA 2002). The attenuation factor represents the ratio between indoor air concentration and soil gas concentration, as follows:

$$\alpha = \frac{C_{\text{indoor}}}{C_{\text{soil gas}}}$$

Where:

$C_{\text{indoor}}$  = Indoor air concentration (ug/m<sup>3</sup>)

$C_{\text{soil gas}}$  = Soil gas concentration (ug/m<sup>3</sup>)

A complicating factor in evaluating the potential chronic risk from vapor intrusion is the potential presence of some of these same chemicals in background outdoor (ambient) air. Background ambient air samples were collected during each residential monitoring event to enable the comparison of the ambient and crawlspace air samples collected at residential properties, South Prescott Park, and the on-facility office to background ambient air concentrations.

Comparisons were made between the results of residential air sampling and the results background ambient or outdoor air sampling conducted the same day. Neighborhood background samples which were collected at 329 Lewis St. (upwind of the former AMCO facility) in the morning and afternoon of the same day the residential samples were collected to put the results in perspective. This location was selected because it is sufficiently close to the former facility property so that concentrations of VOCs in ambient air at this location would be representative of area-wide concentrations, but is sufficiently distant from the site so that any VOCs related to the former AMCO facility would be unlikely to bias the sample.

In addition, ambient air and crawlspace air sample results were compared to acute reference exposure levels (RELs) developed by the OEIHA (2000) and acute MRLs developed by ATSDR. Acute health effects (those occurring after only a very short exposure; e.g., hours or days) typically develop only in response to much higher exposure concentrations (usually 100-fold or greater) than do chronic effects. Therefore, measured exposure concentrations which are below chronic screening levels are not expected to pose significant acute health risks.

To evaluate seasonable variability, residential soil gas sampling was conducted three times – twice during the dry season (September 2004 and October 2006) and once during the wet season (May 2005).

### 5.6.1 1428 3rd Street Soil Gas, Ambient Air, and Crawlspace Air Sampling Results

Figure 5 shows the soil gas, ambient air, and crawlspace air sampling locations and results that exceed screening levels. Soil gas samples were collected from 1428 3<sup>rd</sup> Street in September 2004 and November 2006. Because of the high soil moisture content during the May 2005 sampling event, soil gas samples could not be collected at this residential property. During May 2005, groundwater was between approximately two and three feet bgs, whereas during the other two soil gas sampling events groundwater was between roughly three and five feet bgs. Soil gas sample results from 2004 indicated 1,1-dichloroethane, chloroform, PCE, and TCE above screening levels (Attachment 3, Table 3-24). Soil gas sample results from 2006 indicated chloroform, PCE, and TCE above screening levels (Attachment 3, Table 3-37). The exceedances of soil gas screening levels for chloroform, PCE, and TCE were greater than an order of magnitude.

Ambient air samples were collected in 2004 (Attachment 3, Table 3-3), 2005 (Attachment 3, Table 3-9), and 2006 (Attachment 3, Table 3-17). Ambient air sample results from 2004 indicated 1,2,4-trimethylbenzene, 1,3,5-trimethylbenzene, 1,4-dichlorobenzene, benzene, carbon tetrachloride, chloroform, PCE, and TCE above screening levels. The exceedances were generally slightly above screening levels. Crawlspace air samples indicated concentrations of benzene, carbon tetrachloride, chloroform, PCE, and TCE above screening levels (Attachment 3, Table 3-3). Of the nine VOCs detected above screening levels in ambient air and crawlspace air, neighborhood background air results for 2004 indicated four VOCs (benzene, carbon tetrachloride, chloroform, and TCE) above screening levels (Attachment 3, Table 3-2).

Ambient air samples in 2005 samples indicate 1,1,2,2-tetrachloroethane, benzene, carbon tetrachloride, chloroform, methylene chloride, and naphthalene above screening levels. Crawlspace air samples showed 1,4-dichlorobenzene, benzene, carbon tetrachloride, chloroform, methylene chloride, and TCE above screening levels (Attachment 3, Table 3-9). Of the six VOCs detected above screening levels, neighborhood background air results for 2005 indicated four VOCs (benzene, carbon tetrachloride, chloroform, and PCE) above screening levels (Attachment 3, Table 3-8).

Ambient air samples in 2006 samples indicate benzene, carbon tetrachloride, chloroform, PCE, and TCE above screening levels. Crawlspace air samples indicated 1,4-dichlorobenzene, benzene, carbon tetrachloride, chloroform, naphthalene, PCE, TCE, and vinyl chloride above screening levels (Attachment 3, Table 3-17). Vinyl chloride exceeded its screening level by two orders of magnitude in one of two crawlspace samples (1428CAc). Of the eight VOCs detected above screening levels, neighborhood background air results for 2006 indicated five VOCs (benzene, carbon tetrachloride, chloroform, TCE, and PCE) above screening levels (Attachment 3, Table 3-15). All detected VOCs were well below acute RELs and MRLs indicating no immediate health threats to residents.

### 5.6.2 1432 3rd Street Soil Gas, Ambient Air, and Crawlspace Air Sampling Results

Figure 6 shows the soil gas, ambient air, and crawlspace air sampling locations and results that exceed screening levels. Soil gas samples were collected from 1432 3<sup>rd</sup> Street in

September 2004 and November 2006. Soil gas sample results in 2004 indicated chloroform above screening levels (Attachment 3, Table 3-25) and in 2006 chloroform and PCE concentrations greater than screening levels (Attachment 3, Table 3-38). Chloroform was detected at concentrations ranging from 1.6 to 6.3  $\mu\text{g}/\text{m}^3$ , all exceeding the soil gas screening level for chloroform of 0.83  $\mu\text{g}/\text{m}^3$ . PCE was not detected in soil gas sample collected at this residence (reporting limit [RL] = 4.6  $\mu\text{g}/\text{m}^3$ ) in September 2004 but was detected at 11  $\mu\text{g}/\text{m}^3$  in November 2006, which is above the PCE screening level of 3.2  $\mu\text{g}/\text{m}^3$ .

Ambient air samples were collected in 2004 (Attachment 3, Table 3-4), 2005 (Attachment 3, Table 3-10), and 2006 (Table 3-18). Ambient air samples in 2004 indicated benzene, carbon tetrachloride, chloroform, PCE, and TCE above screening levels. Crawlspace air samples indicated 1,2,4-trimethylbenzene, 1,3,5-trimethylbenzene, 1,4-dichlorobenzene, benzene, carbon tetrachloride, chloroform, PCE, TCE, and vinyl chloride above screening levels. Of the nine VOCs detected above screening levels in the air samples collected at 1432 3<sup>rd</sup> Street, neighborhood background air results for 2004 indicated four of the VOCs (benzene, carbon tetrachloride, chloroform, and TCE) above screening levels (Attachment 3, Table 3-2).

Ambient air samples in 2005 samples indicate benzene, carbon tetrachloride, chloroform, and naphthalene above screening levels. Crawlspace air samples indicated 1,4-dichlorobenzene, benzene, carbon tetrachloride, and chloroform above screening levels (Attachment 3, Table 3-10). Of the five VOCs detected above screening levels, neighborhood background air results for 2005 detected four of them (benzene, carbon tetrachloride, chloroform, and PCE) above screening levels (Attachment 3, Table 3-8).

Ambient air samples in 2006 samples indicated benzene, carbon tetrachloride, chloroform, naphthalene, PCE, and TCE above screening levels. Crawlspace air samples indicated 1,4-dichlorobenzene, benzene, carbon tetrachloride, chloroform, naphthalene, PCE, TCE, and vinyl chloride above screening levels (Attachment 3, Table 3-18).

Neighborhood background air results for 2006 indicate benzene, carbon tetrachloride, chloroform, TCE, and PCE above screening levels (Attachment 3, Table 3-15). All detected VOCs were well below acute reference concentrations indicating no immediate health threats to residents.

### 5.6.3 1436 3rd Street Soil Gas and Air Sampling Results

Since this house is constructed with a 26-inch slab-on-grade foundation with no crawlspace, only ambient air and soil gas samples were collected at this location.

Figure 7 shows the soil gas and ambient air sampling locations and results that exceed screening levels. Soil gas samples were collected from 1436 3<sup>rd</sup> Street in September 2004 and November 2006. Soil gas sample results in 2004 indicated PCE above screening levels (Attachment 3, Table 3-26) and in 2006 chloroform concentrations exceeded screening levels (Attachment 3, Table 3-39). The soil gas concentration of chloroform (1.6  $\mu\text{g}/\text{m}^3$ ) was approximately 2 times the screening level (0.83  $\mu\text{g}/\text{m}^3$ ). PCE was detected in soil gas at 5.2  $\mu\text{g}/\text{m}^3$ , which is only slightly higher than the screening level of 3.2  $\mu\text{g}/\text{m}^3$ .

Ambient air samples were collected in 2004 (Attachment 3, Table 3-5), 2005 (Attachment 3, Table 3-11), and 2006 (Attachment 3, Table 3-19). Ambient air samples in 2004 indicated benzene, carbon tetrachloride, chloroform, and TCE above screening levels. All of the VOCs

detected in the ambient air samples above screening levels were also indicated in the neighborhood background air results for 2004 above screening levels (Attachment 3, Table 3-2).

Ambient air samples in 2005 indicated benzene, carbon tetrachloride, chloroform, methylene chloride, and naphthalene above screening levels. Five VOCs were detected above screening levels in neighborhood background air results for 2005 (benzene, carbon tetrachloride, chloroform, naphthalene, and PCE) (Attachment 3, Table 3-8).

Ambient air samples in 2006 indicated benzene, carbon tetrachloride, chloroform, methylene chloride, TCE, and vinyl chloride above screening levels. Neighborhood background air results for 2006 indicated benzene, carbon tetrachloride, chloroform, TCE, and PCE above screening levels (Attachment 3, Table 3-15). All detected VOCs were well below acute reference concentrations indicating no immediate health threats to residents.

#### 5.6.4 326 Center Street Soil Gas, Ambient Air, and Crawlspace Sampling Results

Figure 8 shows the soil gas, ambient air, and crawlspace air sampling locations and results that exceed screening levels. Soil gas samples were collected from 326 Center Street in September 2004 and May 2005. Access to this parcel was not secured during the November 2006 sampling event so soil gas, ambient air, and crawlspace air samples were not collected. Soil gas sample results in 2004 indicated chloroform, PCE, and TCE above screening levels (Attachment 3, Table 3-27). Soil gas sample results in 2005 indicated chloroform and PCE above screening levels (Attachment 3, Table 3-32). During the September 2004 sampling event, the soil gas results were significantly higher than screening levels. Although some compounds exceeded their crawlspace air and ambient air screening levels, the concentrations detected were within the same range as the screening levels.

Ambient air samples were collected in 2004 (Attachment 3, Table 3-6) and 2005 (Attachment 3, Table 3-12). Ambient air samples in 2004 indicated 1,4-dichlorobenzene, benzene, carbon tetrachloride, and chloroform above screening levels. In crawlspace air 1,4-dichlorobenzene, benzene, and carbon tetrachloride were detected above screening levels. Neighborhood background air results for 2004 indicated benzene, carbon tetrachloride, chloroform, and TCE above screening levels (Attachment 3, Table 3-2)

Ambient air samples collected in 2005 indicated benzene, carbon tetrachloride, chloroform, and hexachlorbutadiene above screening levels. The crawlspace of this residence is well ventilated so crawlspace samples were not collected. Neighborhood background air results for 2005 detected benzene, carbon tetrachloride, chloroform, and PCE above screening levels (Attachment 3, Table 3-8). All detected VOCs were well below acute reference concentration indicating no immediate health threats to residents.

#### 5.6.5 356 Center Street Soil Gas and Air Sampling Results

Figure 9 shows the soil gas and ambient air locations and results that exceed screening levels. Soil gas samples were collected from 356 Center Street in September 2004 (Attachment 3, Table 3-28), May 2005 (Attachment 3, Table 3-33), and November 2006 (Attachment 3, Table 3-40). There were no soil gas screening level exceedances in either September 2004 or May 2005 samples. In 2006, chloroform ( $1.2 \mu\text{g}/\text{m}^3$ ) and PCE ( $3.3 \mu\text{g}/\text{m}^3$ ) exceeded screening levels.

Ambient air samples were not collected at 356 Center Street because of the proximity of this residence to the ambient air sample collected at 360 Center Street.

### 5.6.6 360 Center Street Soil Gas and Ambient Air Sampling Results

Figure 10 shows the soil gas and ambient air sampling locations and results that exceed screening levels. Soil gas samples were collected from 360 Center Street in September 2004 (Attachment 3, Table 3-29), May 2005 (Attachment 3, Table 3-34), and November 2006 (Attachment 3, Table 3-41). Soil gas sample results in 2004 indicated benzene slightly above its screening level. Soil gas sample results in 2005 indicated 1,1,2,2-tetrachloroethene and chloroform slightly above screening levels. In 2006, the soil gas chloroform concentration was approximately 2 times its screening level.

Ambient air samples were collected in 2004 (Attachment 3, Table 3-7), 2005 (Attachment 3, Table 3-13) and 2006 (Attachment 3, Table 3-20). Ambient air samples in 2004 detected carbon tetrachloride above screening levels. Neighborhood background air results for 2004 indicated benzene, carbon tetrachloride, chloroform, and TCE above screening levels (Attachment 3, Table 3-2).

Ambient air samples in 2005 indicated benzene, carbon tetrachloride, and chloroform above screening levels. Neighborhood background air results for 2005 indicated these three compounds as well as PCE above screening levels (Attachment 3, Table 3-8).

Ambient air samples in 2006 indicated benzene, carbon tetrachloride, chloroform, PCE, and TCE above screening levels. Neighborhood background air results for 2006 indicated all these VOCs also above screening levels (Attachment 3, Table 3-15). All detected VOCs were well below acute reference concentrations indicating no immediate health threats to residents.

### 5.6.7 1414 3rd Street Crawlspace Air Sampling Results

Figure 11 shows the crawlspace air sampling locations and results that exceed residential and industrial screening levels. In 2006, crawlspace air samples were collected at 2 locations in the office (Attachment 3, Table 3-16). Crawlspace air samples indicated 1,1-dichloroethane, 1,4-dioxane, benzene, carbon tetrachloride, chloroform, cis-1,2-dichloroethene, naphthalene, PCE, TCE and vinyl chloride above residential screening levels. Crawlspace air samples indicated benzene, carbon tetrachloride, chloroform, cis-1,2-DCE, naphthalene, PCE, TCE, and vinyl chloride above industrial screening levels. All detected VOCs were well below acute reference concentrations indicating no immediate health threats to workers in the office.

### 5.6.8 Prescott Park Soil Gas and Ambient Air Sampling Results

Figure 12 shows the soil gas and ambient air sampling locations and results that exceed screening levels. Soil gas samples were collected from Prescott Park in September 2004 (Attachment 3, Table 3-30) and May 2005 (Attachment 3, Table 3-35). Soil gas sample results in 2004 indicated chloroform, PCE, and TCE above screening levels. Soil gas sample results in 2005 indicated 1,3-butadiene, benzene, chloroform, PCE, and TCE above screening levels.

Ambient air samples were collected in 2005 (Attachment 3, Table 3-14) and 2006 (Attachment 3, Table 3-21). In 2005, 1,4-dioxane, benzene, carbon tetrachloride, and

chloroform were detected slightly above screening levels. In 2006, benzene, carbon tetrachloride, chloroform, PCE, and TCE were detected slightly above screening levels. All detected VOCs were well below acute reference concentrations indicating no immediate health threats to children who play at the park.

## 5.7 Residential Screening Level Soil Evaluation

Subsequent to the collection of the residential soil samples during the RI investigation, a soil removal action was performed at residential properties adjacent to and near the former AMCO facility in August/September 2007. These properties include 1428, 1432, and 1436 3<sup>rd</sup> Street, and 320, 326, 356, 360, and 366/368 Center Street. The soil was generally excavated to a depth of approximately three feet; however, excavations were shallower in some areas if confirmation sampling indicated remaining lead concentrations were below screening levels. As a result, the soil samples collected during the RI are no longer representative of the soil conditions at these properties.

A screening level evaluation was performed on the soil data collected from the residential yards adjacent to or near the former AMCO facility. The concentrations detected in soil were compared to their respective screening levels to determine if they may pose a potential health risk. Screening levels are used to distinguish those substances that clearly do not pose a significant health threat because their concentrations in soil are low, from those that require additional evaluation for potential health risks. Screening levels selected for soil were Region 9 Residential PRGs.

The residential soil screening levels for arsenic are 0.062 mg/kg for cancer risks and 22 mg/kg for noncancer hazards. The noncancer screening level for arsenic was used in the residential screening evaluation because an arsenic level of 0.062 mg/kg is significantly less than what was found in background samples (14 mg/kg) (City of Oakland Urban Land Redevelopment Program 1995).

For mixtures of carcinogenic PAHs, the reference chemical is benzo(a)pyrene. Benzo(a)pyrene was chosen as the reference chemical because the toxicity of the chemical is well characterized. The toxicity equivalency factor for each carcinogenic PAH is an estimate of the relative toxicity (by an order of magnitude) of the congener compared to benzo(a)pyrene. A summary of PAH toxicity equivalence factors is provided below.

Carcinogenic PAHs	Toxicity Equivalency Factor*
Benzo(a)pyrene	1
Benzo(a)anthracene	0.1
Benzo(b)fluoranthene	0.1
Benzo(k)fluoranthene	0.1
Chrysene	0.01
Dibenzo(a,h)anthracene	0.4
Indeno(1,2,3-cd)pyrene	0.1

In the San Francisco Bay area, PAH cleanup levels of 0.9 mg/kg (DTSC 1998) and 1.8 mg/kg BaP Equivalents concentrations (U.S. Navy 2006) have been used for residential cleanup. These levels are considered safe for residential use.

Soil was sampled at six residential parcels in the immediate vicinity of the facility. Generally, within samples from each boring, the highest contaminant concentrations were observed in the shallow soil. VOCs were sparsely detected at concentrations below screening levels. Below is a brief summary of the findings by parcel.

### 5.7.1 1428 3rd Street

As described above, soil was removed from this property during the August/September 2007 removal action, therefore all exceedances discussed below are no longer representative of current conditions. Five locations were sampled at this residence, four locations along the property boundary and one in the center of the yard (Figure 13). The soil sampling at 1428 3rd Street indicated lead, PAHs, antimony, iron and 4,4'-DDT at levels above screening levels (Attachment 3, Table 3-43). The lead concentrations ranged from 224 to 4,170 mg/kg which is significantly above the site-specific screening levels (194 mg/kg for lead exposure including the homegrown produce pathway and 340 mg/kg without homegrown produce). Antimony and iron only exceeded in the shallow portion of two samples collected on the eastern boundary. Arsenic exceeded the noncancer screening level of 22 mg/kg in one sample at a concentration of 35.1 mg/kg. 4,4'-DDT slightly exceeded the screening level of 1.7 mg/kg in one shallow sample.

### 5.7.2 1432 3rd Street

As described above, soil was removed from this property during the August/September 2007 removal action, therefore all exceedances discussed below are no longer representative of current conditions. Three locations were sampled at this residence, two along the property boundary and one in the vegetable garden (Figure 14). The soil sampling at 1432 3rd Street indicated lead, PAHs, 4,4'-DDT, and iron at concentrations above screening levels (Attachment 3, Table 3-44). Lead concentrations range from 524 to 2,280 mg/kg which is significantly above the screening levels. Antimony, iron, and 4,4'-DDT slightly exceeded their screening levels in one shallow sample. BaP Equivalents exceeded its screening level in all the shallow samples.

### 5.7.3 1436 3rd Street

As described above, soil was removed from this property during the August/September 2007 removal action, therefore all exceedances discussed below are no longer representative of current conditions. Two locations were sampled at this residence, one in the vegetable garden and one next to the lemon tree (Figure 15). The soil sampling at 1436 3rd Street indicated lead, PAHs, dieldrin, and iron at levels above screening levels (Attachment 3, Table 3-45). Lead concentrations range from 216 to 3,630 mg/kg which is significantly above screening levels. Dieldrin significantly exceeds its screening level in one shallow sample and barely exceeds in the other shallow sample. Iron slightly exceeds its screening level in both shallow samples. BaP Equivalents exceeds its screening level in both shallow samples.

### 5.7.4 326 Center Street

As described above, soil was removed from this property during the August/September 2007 removal action, therefore all exceedances discussed below are no longer representative of current conditions. Five locations were sampled at this residence, four along the property boundary with the large vacant lot and one along the property boundary with the former facility (Figure 16). The soil sampling at 326 Center Street indicated lead, PAHs, dieldrin, 4,4'-DDT, 4,4'-DDE, iron, and arsenic at levels above screening levels (Attachment 3, Table 3-46). Lead was detected at concentrations ranging from 170 to 53,000 mg/kg. Three of the locations had samples with lead concentrations below the site-specific screening level of 390 mg/kg. However two of the locations had lead concentrations that significantly exceeded the screening level. Arsenic is also significantly above its screening level at one location (both shallow and deep). Iron is only slightly greater than its screening level in one shallow sample. 4,4'-DDE and dieldrin are slightly greater than their screening level in one shallow sample. 4,4'-DDT was detected at concentrations ranging from 0.59 to 11 mg/kg in two sample locations.

### 5.7.5 356 Center Street

As described above, soil was removed from this property during the August/September 2007 removal action, therefore all exceedances discussed below are no longer representative of current conditions. Three locations were sampled at this residence — one location was in a small yard behind the house, and two locations were in the dirt floor of a recently vacated chicken coop (Figure 17). The soil sampling at 356 Center Street indicated benzo(a)pyrene and lead at levels above screening levels (Attachment 3, Table 3-47). Lead was detected at concentrations ranging from 26.2 to 822 mg/kg. Of the six soil samples collected, five were above screening levels. Although three samples had benzo(a)pyrene that exceeded its screening level, none of the samples exceeded the BaP Equivalents criteria.

### 5.7.6 360 Center Street

As described above, soil was removed from this property during the August/September 2007 removal action, therefore all exceedances discussed below are no longer representative of current conditions. Two locations were sampled at this residence, one location along the northern parcel boundary, and one location in the southeastern corner (Figure 18). The soil sampling at 360 Center Street indicated lead, benzo(a)pyrene, Aroclor-1254, and heptachlor epoxide at levels above screening levels (Attachment 3, Table 3-48). Lead concentrations ranged from 193 to 2230 mg/kg which is significantly higher than the screening level. Aroclor-1254 (screening level of 0.22 mg/kg) was detected at 2.4 to 11 mg/kg at one location, and heptachlor epoxide (screening level of 0.53 mg/kg) was detected at 0.31 mg/kg in only the shallow sample at the same location.

### 5.7.7 Homegrown Produce Results

Four of the residents whose properties are adjacent to the former AMCO facility have gardens and fruit trees. The detection of TCE, PCE, and vinyl chloride in shallow groundwater and the potential for shallow groundwater to migrate into residential areas containing these gardens prompted concerns that contaminants from the Site could be taken up and transferred into edible fruit or vegetables. To evaluate the ingestion of the homegrown produce pathway, 15 fruits and vegetables from four gardens were collected

and analyzed for selected metals (arsenic, chromium, and lead) and VOCs. Because produce samples were analyzed for VOCs as well as metals, none of the produce were rinsed or washed before analysis. As a result, the metals concentrations could reflect soil and dust deposited on the plant surfaces and possible uptake from soil through the roots into the edible portions of the plants. Produce samples collected and analyzed include:

Fruit: Apple (2), Cactus, Blackberries, Pomegranate, Grapes, Fig, Lemon

Fruiting Vegetables: Tomatillo, Tomatoes (2), Red Chile, Green Chile, Bell Pepper

Leafy Vegetables and Herbs: Mint

Root Vegetables: Root vegetables were not collected because none were available in the gardens that were sampled.

Results of the produce analyses are presented in Attachment 3, Tables 3-55, 3-56, 3-57 and 3-58. In summary, of the 47 VOCs analyzed, only methyl acetate and styrene were detected. Methyl acetate was detected in figs, mint, and red chiles. Styrene was detected only in cactus. Both methyl acetate and styrene have been detected in ripening produce in concentrations ranging from 0.04 - 0.24 mg/kg. (Heikes et al. 1995). Volatile organic compounds like methyl acetate are naturally produced by ripening fruits at less than 1 mg/kg (Fountain et al. 1984).

Urban gardens have been assessed extensively since the 1970s and provide the foundation for evaluating metals in garden soil. Plants absorb various metals from different soils related to the metals properties, soil properties (pH, metal concentration in soil, organic matter, cation exchange capacity, and level of other metals in soil) and plant properties (plant age, species, type of crop edible portion (leafy, root or garden fruit). Some metals, like zinc, cadmium, and selenium are easily absorbed and transferred to food chain plant tissues. Some metals like lead, iron, mercury, and chromium are strongly bound or precipitated in soil or in the root fibers and are not transferred to plant foliage in unsafe amounts even when soils are greatly enriched. Other metals like copper, nickel and arsenic are easily absorbed and transferred to plant foliage but phytotoxicity to the crop may limit plant levels of the metal. (Chaney et al 1984). Important to note; plants with higher surface areas green leafy vegetables such as lettuce, collard greens and swiss chard tend to easily attach dust and soil which may remain after rinsing.

Lead concentrations in the soil samples collected in the residential garden areas adjacent to the former AMCO facility ranged from 1,060 to 2,910 mg/kg with corresponding lead produce concentrations from 0.16 to 8.47 mg/kg. These lead concentrations reflect that none of the produce samples were rinsed or washed before analysis; thus, the lead concentrations could reflect dust or soil deposited on the plant surfaces in addition to lead that was taken up through the root system.

A study by Finster et al. (2003) investigated the relationship between lead concentrations in urban garden soils and homegrown produce grown in these soils, with a focus on the levels of lead detected in the edible portion of the plants. In this study, all produce were washed with water or detergent and detection limits were 10 mg/kg.

By comparison, the homegrown produce samples were not washed and the lead detection limits were 0.06 mg/kg. The lead soil concentrations in the Finster study ranged from 27 to 4,580 mg/kg. Concentrations of lead in residential shallow soils ranged from 167 to 28,600

mg/kg. The lead concentrations in the Finster study produce ranged from nondetect (ND) at 10 mg/kg to 81 mg/kg. The lead concentrations in the residential produce ranged from 0.15 to 8.47 mg/kg.

The risk posed by eating lead containing produce depends on the frequency and the amount of consumption. U.S. Food and Drug Administration (FDA) recommends Provisional Total Tolerable Intake Levels (PTTIL) for all age groups, which are defined at 6 µg lead/day for children up to 6 years of age, 15 µg lead/day for children 7 years and older, 25 µg lead/day for pregnant women and 75 µg lead/day for other adults (FDA 1993).

The highest lead concentrations in produce were detected in mint at 8.47 mg/kg. Mint is an extremely strong herb with 1 gram of mint equal to approximately 20 leaves (U.S. Department of Agriculture [USDA] 2002). Only two leaves of fresh mint, weighing 0.1 g, are needed for tea. Consider tea made with mint - 2 leaves fresh mint weighs 0.1 g x 8.47 µg/g = 0.847 µg lead/day. Even if this mint were ingested from the garden unwashed, lead levels would be below PTTIL.

Other metals analyzed in produce include arsenic and chromium. Arsenic concentrations in produce range from 0.06 to 0.08 mg/kg, Arsenic is commonly found in most plants from 0.009 to 1.7 mg/kg dry weight. (Kabatas-Pendias et al 2001). Leafy vegetables like lettuce or spinach contain more arsenic than fruits. Mushrooms are found to be relatively high arsenic accumulators. Chromium concentrations in produce range from 0.39 to 1.07 mg/kg, Levels of chromium commonly found in plants range from 0.02 to 1.5 mg/kg dry weight (Kabatas-Pendias et al 2001). All produce collected from residential gardens adjacent to or near the former AMCO facility had chromium concentrations within this range.

# 6.0 Uncertainty Evaluation

---

A risk characterization incorporates information on the uncertainty associated with the risk assessment, including data gaps in toxicological or exposure assessment information and the conservative assumptions or scientific judgments used to bridge these data gaps (EPA 1992). These uncertainties, which are associated with every step in the risk assessment process, are evaluated to provide an indication of the relative degree of conservatism associated with a risk estimate. This section presents a qualitative discussion of the uncertainties associated with the overall assessment process.

Risk assessments are not intended to estimate actual risks to a receptor associated with exposure to chemicals in the environment. In fact, estimating actual risks is impossible because of the variability in the exposed or potentially exposed populations. Therefore, risk assessment is a means of estimating the upper bound probability that an adverse health effect (e.g., cancer) may occur in a receptor at some point in the future. The multitude of conservative assumptions used in the process ensures that the risk results are not likely to be underestimated.

Risk estimates are calculated by combining site data, assumptions about individual receptor's exposures to impacted media, and toxicity data. The uncertainties in this risk assessment can be grouped into three main categories that correspond to these steps:

- Uncertainties in environmental sampling and analysis
- Uncertainties in assumptions concerning exposure scenarios
- Uncertainties in toxicity data and dose-response extrapolations

## 6.1 Environmental Sampling and Analysis

This risk assessment is based on the sampling results obtained from the remedial investigations at the Site. Errors in sampling results can arise from the field sampling, laboratory analyses, and data analyses. Errors in laboratory analysis procedures are possible, although the impacts of these sorts of errors on the risk estimates are likely to be low. The environmental sampling at a site is one source of uncertainty in the evaluation. The number and location of samples at the Site are considered adequate for input in the risk assessment. The type of contaminants and exposure concentrations identified are also considered representative of site conditions.

Because of the long history of the Site's industrial use and the associated history of construction and filling, all primary sources may not have been identified. Hot spots and localized areas of contamination in soil or soil vapor that were not sampled may remain unknown in on-facility and off-facility areas. The existence of unknown contamination could lead to an increase in the health risks beyond what has been reported in this document. Data collected from known hot spots have been included in the risk assessment.

The number and location of samples at each exposure area are considered adequate for the calculation of EPCs at most of the industrial areas and for groundwater. However, for the

small vacant lot and the parking lot, the number of samples varied from 2 to 6 for each of the chemicals analyzed. This sample size is less than what is generally needed to calculate a 95 UCL; therefore, the maximum concentration was used to represent the EPCs where UCLs could not be calculated. A larger sample size would allow for the calculation of a more representative EPC and thus decrease uncertainty regarding chemical concentrations used for risk assessment at these locations.

### 6.1.1 Laboratory and Sampling Results

Potential laboratory errors can also result in uncertainty in the chemical concentrations used in the exposure assessment. For well-designed analysis methods there should be no significant systematic error. However, uncertainty in measured concentrations due to random errors cannot be eliminated. These random errors result from:

- Precision of analytical measurements
- Random fluctuations in equipment performance
- Normal variations in analytical technique

These errors are expected to be small but nonetheless will affect the overall uncertainty in the results.

### 6.1.2 Reporting Limits

During the project planning phase, analytical methods are selected that provide sufficient sensitivity to meet the project screening levels. Positive results for all analytes were reported above the method detection limit. Because of the uncertainty that a specific analyte will be detected at concentrations below the reporting limit, analytes not detected are reported as not detected at the method reporting limit, generally 2 to 5 times higher than the method detection limit. In general, there are two reasons that the final analyte result is reported as not detected at a concentration above the screening limit:

1. The best available analytical methods does not provide the necessary sensitivity;
2. The sample contains high concentrations of one or more target analytes that require dilution, raising the final reporting limit for non-detected analytes above the screening level.

In both cases, some uncertainty exists whether the actual analyte concentration exceeds the screening level. The level of uncertainty is smaller in cases where the screening level is only slightly lower than the reporting limit. In addition, the level of uncertainty is mitigated in part because all positive results are reported to the method detection and in general, the method detection limit (MDL) is two to five times less than the reporting limit. As discussed in the following sections by media, this uncertainty is associated with a small number of analytes and there should be little or no effect on the final outcome of the risk assessment.

#### Soil

The failure to achieve the screening levels was due to both high concentrations of some target analytes in the sample that required dilution and percent moisture adjustments, raising the final reporting limit for non-detected analytes. However, three analytes were reported as not detected at a minimum reporting limit that exceeded the screening levels:

benzo(a)pyrene, dibenz(a,h)anthracene, and N-nitroso-di-n-propylamine. This is a method limitation because of the low concentration screening limit.

### Groundwater

The failure to achieve the screening levels was primarily due to high concentrations of some target analytes in the sample that required dilution, thereby raising the reporting limit above the screening levels. Table 13 lists the minimum analyte reporting limits that were above the applicable groundwater screening level.

For 1,1,1,2-tetrachloroethane, 1,2,3-trichloropropane, bis(2-chloroethyl)ether, dibenz(a,h)anthracene, and N-nitroso-n-propylamine the required analytical method cannot achieve the screening levels. For the remaining analytes, dilution was required in many cases which elevated the reporting limit above the screening levels.

### Air

The failure to achieve the screening levels for ambient air and crawlspace air samples was primarily due to method sensitivity limitations with respect to the very low concentration screening levels. Table 14 lists the minimum analyte reporting limits that were above the applicable ambient/crawlspace air screening level. Where the percentages are lower than 100 percent, the target analyte was detected in several of the samples.

Table 15 presents the results for residential soil gas. The screening level for soil gas is set as 10 times the ambient air/crawlspace air screening level based on a conservative attenuation factor. A number of soil gas results were reported as not detected above the screening level, but it should be noted that all of the soil gas samples were analyzed at a dilution. The dilution factor applied to these analyses ranged from 3 to 8.

## 6.2 Exposure Pathways and Assumptions

Risk assessments are designed to provide a margin of safety to protect public health and the environment by using conservative assumptions that assure risks are not underestimated. Actual human exposures and associated risks are likely to be less than those calculated for the risk assessment because each input value is conservative. Uncertainties can arise from the types of exposures examined, the points of potential human exposure, the concentrations of COPCs at the points of human exposure, and the intake assumptions.

- The exposure parameters – exposure frequency, exposure duration, soil ingestion rates, and skin surface areas – are selected as reasonable maximum exposure assumptions. To minimize the possibility of underestimating risk, such factors are generally conservative and represent the portion of the population with the greatest potential for exposure. For example, the potential future resident at the former AMCO facility is assumed to be present for 350 days of the year over a 30 years period including the sensitive childhood period from birth to the age of six. These potential residents are assumed to play or garden daily in the soil. Few people, including children, are likely to be home and in direct contact with the soil daily for the entire 30 years. The HHRA assumes that the potential resident lives in a home that has a backyard and is unpaved. However, the degree of direct soil exposure would be reduced if the potential resident lived in a condominium with a backyard that was paved.

- The selection of exposure pathways is a process, often based on professional judgment that attempts to identify the most probable potentially harmful exposure scenarios. In an evaluation, risks are sometimes not calculated for all of the exposure scenarios that may occur, possibly causing some underestimation of risk. In this evaluation, potential risks are estimated for residential and worker exposure scenarios at the Site. Risks to potential receptors are estimated for a number of different exposure pathways (e.g., inhalation of fugitive dust). While other exposure routes could exist for a particular activity, these exposures are expected to be lower than the risks associated with the pathways considered.
- The amount that each of the COPCs might be absorbed into the body may be quite different from the amount of chemical that is actually contacted (i.e., bioavailability). In this assessment, bioavailability of ingested and inhaled chemicals is conservatively assumed to be 100 percent. Actual chemical- and site-specific values are likely to be much less than this conservative default value.
- Many factors contribute to the uncertainty of dermal contact exposure in risk assessment. There are uncertainties associated with each of the input parameters used in the equations to estimate risk. Additional uncertainties originate from factors that are not sufficiently characterized to be included in the risk equations. These include issues related to the degree and uniformity with which soil adheres to skin, exposed body surfaces, the frequency and duration of exposure, and the rate and amount of contaminant absorption.
- The method for estimating resuspended dust from soil concentrations using a PEF introduces large uncertainties in the resulting air concentrations and subsequent risk estimates. The assumption that the dust concentration remains constant may overestimate the amount of dust in the air over time and, consequently, the concentration of contaminants present in dust. This could result in an overestimate of the inhalation as a particulate.

## 6.3 Toxicity Criteria and Factors

The availability and quality of toxicological data is another source of uncertainty in the risk assessment. Carcinogenic criteria are classified according to the amount of evidence available that suggests human carcinogenicity. In the establishment of the non-carcinogenic criteria, conservative multipliers, known as uncertainty and modifying factors, are used.

### 6.3.1 Uncertainties in Animal and Human Studies

Extrapolation of toxicological data from animal tests is one of the largest sources of uncertainty in a risk assessment. There may be important, but unidentified, differences in uptake, metabolism, and distribution of chemicals in the body between the test species and humans. For the most part, these uncertainties are addressed through use of conservative assumptions in establishing values for RfDs and CSFs, which results in the likelihood that the risk is overstated.

Typically, animals are administered high doses (e.g., maximum tolerated dose) of a chemical in a standard diet or in air. Humans may be exposed to much lower doses in a highly variable diet, which may affect the toxicity of the chemical. In these studies, animals,

usually laboratory rodents, are exposed daily to the chemical agent for various periods of time up to their 2-year lifetimes. Humans are assumed to have an average 70-year lifetime and may be exposed either intermittently or regularly for an exposure period ranging from months to a full lifetime. Because of these differences, extrapolation error is a large source of uncertainty in a risk assessment.

### 6.3.2 Non-Carcinogenic Toxicity Criteria

In the establishment of the non-carcinogenic criteria, conservative multipliers, known as uncertainty factors, are used. Most of the chronic non-carcinogenic toxicity criteria that were located in the IRIS database have uncertainty factors of 1,000. This means that the dose corresponding to a toxicological endpoint (e.g., LOAEL was divided by 1,000). The purpose of the uncertainty factor is to account for the extrapolation of toxicity data from animals to humans and to insure the protection of sensitive individuals. However, in accomplishing these purposes, the uncertainty in the actual toxicity of the chemical in humans is greatly increased.

### 6.3.3 Carcinogenic Toxicity Criteria

For chemicals that are probable human carcinogens and lack human evidence of carcinogenicity, the EPA method for developing cancer slope factors extrapolates data from high-dose animal experiments to low-dose human exposures and thus is associated with a high potential for overestimating risk. Actual slope factors could be lower but are unlikely to be higher. The LMS assumes that there is no threshold for carcinogenic substances; that is, exposure to even one molecule of a carcinogen is sufficient to cause cancer. This is a highly conservative assumption because the body has several mechanisms to protect against cancer.

Toxicity values derived using the LMS are intended for chemicals with cancer risks below  $1 \times 10^{-2}$ . For scenarios producing risks greater than  $1 \times 10^{-2}$ , an alternative equation for calculating risk is suggested. The residential risk calculations from groundwater exceed  $1 \times 10^{-2}$  for arsenic and vinyl chloride, suggesting the use of an alternative risk characterization model. Use of such a model could slightly change the calculated ELCR. However, since the conclusions derived by using an alternate equation for these two chemicals would not change, the LMS method was retained (EPA 1989).

### 6.3.4 Additive vs. Synergistic vs. Antagonistic Properties of COPCs

When humans are exposed to more than one chemical in a medium, it is normally assumed that the adverse effects of the different chemicals are additive. However, in some cases, synergistic or antagonist interaction may occur. Although there are no data to suggest that synergistic or antagonist interactions occur between chemicals at this Site, this is a source of uncertainty in the HHRA. The term synergism describes the situation wherein the aggregated risks from simultaneous exposure to multiple chemicals is more than the sum of the risks from each alone. Antagonism is when the aggregated risks are less than the sum.

Synergism and antagonism represent complex interactions between two or more chemicals. Two chemicals may exert synergistic effects on one aspect of each other's toxicity, but not on other toxic effects. The synergy may be apparent within one range of exposure levels, but not within another range of exposure to the two chemicals. Addition of a third chemical may inhibit the synergy between the first two chemicals. Thus quantifying synergism or

antagonism in a risk assessment can be problematic and requires a thorough understanding of the potential interactions between multiple chemicals and the development of relevant risk/toxicity values.

Superfund risk assessment guidelines (RAGS, Part A, Section 8.4.2) notes that "[i]n the absence of adequate information, carcinogenic risks should be treated as additive and that non-cancer hazard indices should also be treated as additive." It is a goal of the EPA to incorporate synergistic and antagonistic effects into risk assessments when there is sufficient credible scientific evidence that either exists and appropriate risk assessment tools are available. However, there are very few data available on synergism or antagonism of specific mixtures that are useful in a risk assessment context.

### 6.3.5 TCE

Toxicity values are not currently available for TCE in EPA's Integrated Risk Information System (EPA 2006a). EPA withdrew its previously published toxicity values for TCE in 1988 because of uncertainties relating to the science of TCE toxicity. Thus, cancer risk TCE was estimated using an inhalation slope factor of  $0.4 \text{ (mg/kg-day)}^{-1}$  from the EPA National Center of Environmental Assessment (EPA 2001), which is a Tier 3 source of toxicity criteria in EPA guidance on selecting toxicity factor for Superfund risk assessments (EPA 2003b). The guidance lists Tier 1 as IRIS, Tier 2 as PPRTV, and Tier 3 as other sources including NCEA and OEHHA. A more current inhalation factor of  $0.007 \text{ (mg/kg-day)}^{-1}$  is available from another Tier 3 source (OEHHA 2006). This slope factor is nearly three orders of magnitude lower than the NCEA slope factor; thus the cancer risk would be correspondingly lower if the OEHHA TCE slope factor were used. As a conservative estimate, the NCEA slope factor of  $0.4 \text{ (mg/kg-day)}^{-1}$  was used for this HHRA.

### 6.3.6 Surrogates

A number of chemicals detected in Site media do not have established toxicity criteria. Where available, appropriate surrogate toxicity factors were used for detected chemicals without toxicity factors. Use of surrogate toxicity factors assumes the toxicity of structurally similar compounds is equivalent, which may result in under- or over-estimate of risks. If a surrogate chemical was not available, these chemicals were not evaluated quantitatively. A list of chemicals used as surrogates is presented in Table 16.

## 7.0 Summary and Discussion of Human Health Risk Assessment Results

---

The HHRA described in this appendix evaluated potential health risks to current and future workers, as well as hypothetical future adult and child residents from exposure to chemicals of potential concern in soil and groundwater at the former AMCO facility. In addition, a screening level risk evaluation was conducted on the soil, soil gas, air, and homegrown produce from residential lots that are occupying the same city block as the former AMCO facility. The risk assessment results will be one of the factors that EPA uses to determine if cleanup actions are warranted at the former AMCO facility. Possible remedial actions in areas that have unacceptable risks will be addressed in the FS for the former AMCO facility. The baseline HHRA provides estimates of the human health risks that the former AMCO facility could pose if no action were taken. Standard EPA risk assessment procedures were used in the risk assessment.

Consistent with the conceptual site model, the predominant exposure pathways for current and future workers at the former AMCO facility would be incidental ingestion of soil, inhalation of particulates and vapors, and dermal contact with soil. Current and future residents in the vicinity may potentially be exposed to contaminants through the same pathways as listed above for workers. In addition, residents could potentially be exposed by ingestion of contaminated groundwater and dermal contact with groundwater while showering. Residents were also evaluated for ingestion of homegrown produce and exposure to indoor air (using crawlspace air data).

For carcinogens, risks are generally expressed as the incremental probability of an individual developing cancer over a lifetime as a result of exposure to the carcinogen. These risks are probabilities that usually are expressed in scientific notation (e.g.,  $1 \times 10^{-6}$ ). An excess lifetime cancer risk of  $1 \times 10^{-6}$  indicates that an individual has a 1 in 1,000,000 chance of developing cancer as a result of site-related exposure. This is referred to as an “excess lifetime cancer risk” because it would be in addition to the risks of cancer an individual faces from other causes, such as smoking or exposure to too much sun. The chance of an individual developing cancer from all other causes has been estimated to be as high as one in three. EPA’s target risk range for site-related exposures is  $10^{-6}$  to  $10^{-4}$ . An excess lifetime cancer risk of  $10^{-4}$  is the point at which action is generally required at a site (EPA 1991b).

The cancer risk estimates and noncancer HI calculated for each exposure scenario are summarized in Attachment 1, Table 1-109. The risk estimates are based on reasonable maximum exposure concentrations and were developed by taking into account various conservative assumptions about the frequency and duration of exposure to contaminated materials as well as the toxicity of the chemicals of potential concern.

### 7.1 On-Facility Quantitative Soil Risk Estimates

Soil samples were divided into the following four exposure areas: former AMCO facility, parking lot, large vacant lot, and small vacant lot. An exposure area is a portion of the

property that is contacted on a regular basis by a worker or resident. Risk estimates are discussed for each exposure area below.

**Industrial Worker:** Estimated cancer risks were at the upper end of the risk range or exceeded  $1 \times 10^{-4}$  for exposure to either shallow or deep soil at each of the four exposure areas. HI exceeded the noncancer threshold of 1 only at the former AMCO facility.

**Construction Worker:** Estimated cancer risks were within the risk range of  $10^{-6}$  to  $10^{-4}$  for exposure to shallow or deep soil at each of the 4 exposure areas. HIs exceeded the non-cancer threshold of 1 at the former AMCO facility, parking lot, and large vacant lot.

**Residents:** Estimated cancer risks are within the risk range for exposure to shallow or deep soil at all four of the exposure areas. HIs exceed the noncancer threshold of 1 at all four exposure areas.

## 7.2 Groundwater Risk Estimates

The cancer risks and noncancer hazards are above the risk range when residential use of groundwater is considered. However, it is extremely unlikely that groundwater will be used as a source of drinking water.

## 7.3 Irrigation Well Results

During the RI, a previously unidentified well was discovered at a residence near the former AMCO facility. According to the property owner, the well is primarily used for backyard irrigation. The well is not a source of drinking water. The residential irrigation well was sampled on three occasions: September 2, 2004, June 24, 2005, and October 12, 2005. A summary of the results is presented in Table 12. As indicated in this table, the only analyte that exceeds the screening level is lead. However, boron, manganese, mercury, and sodium are at concentrations that exceed their agricultural water quality limit.

## 7.4 Screening Level Evaluation on Residential Media

**Air:** The screening level risk evaluation was conducted to assess whether there is an immediate health threat to residents and to determine whether the vapor intrusion pathway is significant. An ongoing assessment of the vapor intrusion pathway is being conducted, including continued monitoring. The results from the continued monitoring [are being evaluated](#) to assess whether a quantitative analysis risk approach is appropriate.

Three sampling events have been conducted at the residences adjacent to or near the former AMCO facility. All VOCs detected are below acute RELs and acute MRLs indicating no immediate health threat to residents. Several VOCs were detected above screening levels in the soil gas, ambient air, and crawlspace samples. Of the VOCs detected above screening levels, many are also detected at background locations, indicating that not all resident VOC exposure may be coming from the Site.

**Soil:** At each residential property, lead exceeds the site-specific residential screening level therefore; a soil removal action was conducted. PAHs, pesticides (DDT, DDE, dieldrin, and heptachlor epoxide), antimony, and iron also exceed screening levels in at least one property. Generally, within samples from each boring, the highest contaminant

concentrations were observed in the shallow soil. VOCs were sparsely detected at concentrations below screening levels. Benzo(a)pyrene and lead were detected at all residential parcels at concentrations above the screening level.

**Homegrown Produce:** The detection of TCE, PCE, and vinyl chloride in shallow groundwater and the potential for shallow groundwater to migrate into residential areas containing gardens prompted concerns that contaminants from the Site could be taken up and transferred into edible fruit or vegetables. To evaluate the ingestion of the homegrown produce pathway, 15 fruits and vegetables from four gardens located adjacent to the Facility were collected and analyzed for selected metals (arsenic, chromium, and lead) and VOCs. Arsenic concentrations in produce range from 0.06 to 0.08 mg/kg Chromium concentrations in produce range from 0.39 to 1.07 mg/kg. The lead concentrations in the homegrown produce ranged from 0.15 to 8.47 mg/kg.

Of the 47 VOCs analyzed for, only methyl acetate and styrene were detected. Methyl acetate was detected in figs, mint and red chilies. Styrene was detected only in cactus. The highest lead concentrations in produce were detected in mint at 8.47 mg/kg. However, even if this mint were ingested from the garden unwashed, lead levels would be below the FDA's PTTIL.

TABLE 1  
 1999 National Air Toxics Assessment, Predicted Ambient Air Concentrations for Census Tract 06001401900  
*Baseline Human Health Risk Assessment*  
*AMCO Chemical Superfund Site, Oakland, California*

	Predicted Concentration ( $\mu\text{g}/\text{m}^3$ )	Percent Contribution by Source Type				Back- ground
		Stationary Sources		Mobile Sources		
		Major	Area & Other	On-Road	Non-Road	
Chloroform	0.14	0.1%	67.6%	0.0%	0.0%	32.3%
1,4-Dichlorobenzene	0.13	1.1%	98.9%	0.0%	0.0%	0.0%
1,4-Dioxane	0.001	56.7%	43.3%	0.0%	0.0%	0.0%
Benzene	3.5	1.4%	5.6%	65.7%	14.0%	13.3%
Carbon tetrachloride	0.27	0.0%	0.3%	0.0%	0.0%	99.7%
Ethylbenzene	1.4	1.9%	10.6%	76.7%	10.8%	0.0%
Naphthalene	0.13	0.5%	46.0%	36.9%	16.6%	0.0%
Styrene	0.11	0.5%	3.0%	83.6%	12.9%	0.0%
1,1,2,2-Tetrachloroethane	0.098	9.2%	7.4%	0.0%	0.0%	83.3%
Toluene	9.8	7.7%	24.4%	60.6%	7.3%	0.0%
Trichloroethene	0.12	14.5%	23.9%	0.0%	0.0%	61.7%
Vinyl Chloride	0.12	18.3%	14.6%	0.0%	0.0%	67.2%
Xylenes	8.0	1.3%	12.2%	61.9%	22.5%	2.1%

Body Weight	BW	kg	70	15	$EPA, 1997$
Averaging Time for carcinogens	$AT_C$	days	25,550	25,550	$EPA, 1989$
Averaging Time for noncarcinogens	$AT_{NC}$	days	8,760	2,190	$EPA, 1989$

**Notes:**

$AT_C = 70$  years x 365 days/year  
 $AT_{NC} = ED$  (years) x 365 days/year  
RME = Reasonable maximum exposure.  
EPA, 1989: Risk Assessment Guidance for Superfund (RAGS) Volume I Human Health Evaluation Manual Part A.  
EPA, 1997: Exposure Factors Handbook. Volume I, General Factors. August.  
EPA, 2004<sup>a</sup>: RAGS Part E, Supplemental Guidance for Dermal Risk Assessment.  
EPA, 2004<sup>b</sup>: User's Guide and Background Technical Document for Preliminary Remediation Goals Table. Region 9. October.

$$DA_{event} = \frac{C_{gw} \times SA \times EF \times ED}{BW \times AT}$$

Where for Organics:

$$DA_{event} = FA \times K_p \times C_{gw} \left[ \frac{t_{event}}{1+B} + \tau \times \left( \frac{1+3B-3B^2}{(1+B)^2} \right) \right]$$

If  $t_{event} > t^*$

$$DA_{event} = 2 \times FA \times K_p \times C_{gw} \sqrt{\frac{6\tau \times t_{event}}{\pi}}$$

For Inorganics:

$$DA_{event} = K_p \times C_{gw} \times t_{event}$$

Table 6  
Groundwater Exposure Assumptions - Trench Workers  
Baseline Human Health Risk Assessment  
AMCO Chemical Superfund Site, Oakland, California

	Reasonable Maximum Exposure (RME) Scenario		Intake Equation
	Units	Trench Worker	
<b>Inhalation of VOCs in Groundwater While Working in a Trench</b>			
Concentration in Groundwater	$C_{gw}$	mg/L	Chemical specific
Concentration (VOCs) in breathing zone	$C_{air}$	$\mu\text{g}/\text{m}^3$	Chemical specific
Total emission rate	Ei	mg/s	Chemical specific
Inhalation Rate	InhR	$\text{m}^3/\text{hour}$	2.5
Assumed velocity of air in the trench	u	m/s	0.152
Mixing Height (adult breathing zone)	H	m	1.83
Width of trench perpendicular to wind direction	W	m	3.05
Overall mass transfer coefficient	Ki	cm/s	Chemical specific
Bottom area of the trench covered with contaminated water	$A_w$	$\text{cm}^2$	65,032
Exposure Time	ET	hours/day	8
Exposure Frequency	EF	days/year	90
Exposure Duration	ED	years	1
Conversion Factor <sub>1</sub>	$CF_1$	mg/ $\mu\text{g}$	0.001
Conversion Factor <sub>2</sub>	$CF_2$	$\mu\text{g}/\text{mg}$	1000
Body Weight	BW	kg	70
Averaging Time for carcinogens	ATc	days	25,550
Averaging Time for noncarcinogens	ATnc	days	365
<b>Dermal Contact with Groundwater While Working in a Trench</b>			
Concentration in Groundwater	$C_{gw}$	mg/L	Chemical specific
Absorbed dose per event per area of skin exposed	$DA_{event}$	$\text{mg}/\text{cm}^2\text{-event}$	Chemical specific
Event Duration	$t_{event}$	hours/event	8
Time to reach steady state groundwater	$t^*$	hours	Chemical specific
Lag time per event	$K_p$	cm/hour	Chemical specific
Dimensionless coefficient	$\tau$	hours/event	Chemical specific
Fraction Absorbed	B	cm/hour	Chemical specific
Skin Surface Area	FA	unitless	Chemical specific
Exposure Frequency	SA	$\text{cm}^2/\text{day}$	5,700
Exposure Duration	EF	days/year	90
Body Weight	ED	years	1
Averaging Time for carcinogens	BW	kg	70
Averaging Time for noncarcinogens	ATc	days	25,550
	ATnc	days	365

**Notes:**

RME = Reasonable maximum exposure.  
EPA, 1989: Risk Assessment Guidance for Superfund (RAGS) Volume I Human Health Evaluation Manual Part A.  
EPA, 2004: RAGS Part E, Supplemental Guidance for Dermal Risk Assessment.  
CalEPA, DTSC, HERD, 2005: Recommended DTSC Default Exposure Factors for Use in Risk Assessment at California Military Facilities.  
CalEPA, DTSC, HERD, 2006: Memorandum: Risk Assessment Issues, PAHs and Exposure Routes..., T.Taros, Staff Toxicologist, DTSC, 88110 Cal Center Drive, Sacramento, CA. August 11.

$$C_{air} \times InhR \times ET \times EF \times ED \times CF_1$$

$$BW \times AT$$

$$C_{air} = \frac{E_i \times CF_2}{u \times H \times W}$$

$$E_i = K_i \times A_w \times C_{gw}$$

$$\frac{DA_{event} \times SA \times EF \times ED}{BW \times AT}$$

For Organics:

$$DA_{event} = FA \times K_p \times C_{gw} \left[ \frac{t_{event}}{HB} + 2\tau \times \left( \frac{1 + 3\tau + 3\tau^2}{(HB)^2} \right) \right]$$

If  $t_{event} > t^*$

$$DA_{event} = 2 \times FA \times K_p \times C_{gw} \sqrt{\frac{6\tau \times t_{event}}{\Pi}}$$

For Inorganics:

$$DA_{event} = K_p \times C_{gw} \times t_{event}$$

**Notes:**

Only Organophosphorus Pesticides were analyzed for the sample collected on 10/12/2005 and none of the results were detected above the reporting limit.

Screening levels are the lower of the Federal or California Primary MCL, or EPA Region 9 tap water PRG, if a Primary MCL is not available.

Agricultural Water Quality Limit - suitability of water for irrigation of plants/crops (Ayers, R.S., and D.W. Westcot, 1985)

Results greater than the Screening Level are bolded.

- not analyzed
- NA not applicable
- NE not established
- µg/L micrograms per liter
- ND not detected above the reporting limit
- J estimated value

- SL - Screening Level

Notes:

- Screening levels are specific concentrations of chemicals that are considered health protective for human populations (including sensitive populations).
- Concentrations are only shown for locations that had result(s) exceeding the screening levels during at least one sampling event.

 SL - Screening Level

Notes:  
 1. Screening levels are specific concentrations of chemicals that are considered health protective for human populations (including sensitive populations).  
 2. Concentrations are only shown for locations that had result(s) exceeding the screening levels during at least one sampling event.  
 3. For arsenic, 22 mg/kg was used for screening because the cancer endpoint of 0.062 mg/kg is below background levels.  
 4. Lead screening level in soil was evaluated using Department Toxic Substance Control's Lead Risk Assessment Spreadsheet Version 7 (Lead Spread 7, Cal/EPA 1999). Lead screening level of 194 mg/kg includes homegrown produce pathway.

**Notes:**

EPC summary statistics are presented in Table 1-1.

**Table 1-6**  
**Exposure Point Concentrations - Deep Soil - Former AMCO Chemical Facility**  
*Baseline Human Health Risk Assessment*  
*AMCO Chemical Superfund Site, Oakland, California*

Chemical of Potential Concern	Units	Exposure Point Concentration (EPC)	EPC Basis
<b>Metals</b>			
Aluminum	mg/kg	1.25E+04	95% Student's-t UCL
Antimony	mg/kg	2.06E+01	99% Chebyshev (Mean, Sd) UCL
Arsenic	mg/kg	8.10E+00	95% Approximate Gamma UCL
Barium	mg/kg	5.55E+02	95% H-UCL
Beryllium	mg/kg	6.04E-01	95% Approximate Gamma UCL
Cadmium	mg/kg	1.74E+00	95% Chebyshev (Mean, Sd) UCL
Chromium	mg/kg	4.95E+02	95% Chebyshev (Mean, Sd) UCL
Cobalt	mg/kg	7.90E+00	95% Approximate Gamma UCL
Copper	mg/kg	1.45E+02	95% Approximate Gamma UCL
Iron	mg/kg	2.34E+04	95% Approximate Gamma UCL
Lead	mg/kg	6.05E+02	95% Approximate Gamma UCL
Manganese	mg/kg	8.43E+02	95% Chebyshev (Mean, Sd) UCL
Nickel	mg/kg	3.70E+01	95% Student's-t UCL
Selenium	mg/kg	3.30E+00	95% Chebyshev (Mean, Sd) UCL
Silver	mg/kg	7.75E-01	95% Approximate Gamma UCL
Thallium	mg/kg	2.88E+00	95% Chebyshev (Mean, Sd) UCL
Vanadium	mg/kg	4.05E+01	95% Approximate Gamma UCL
Zinc	mg/kg	4.41E+02	95% Approximate Gamma UCL
<b>Pesticides/PCBs</b>			
4,4'-DDD	mg/kg	8.40E+00	95% Hall's Bootstrap UCL
4,4'-DDE	mg/kg	5.64E+00	99% Chebyshev (Mean, Sd) UCL
4,4'-DDT	mg/kg	2.47E-01	99% Chebyshev (Mean, Sd) UCL
Aldrin	mg/kg	9.24E-01	99% Chebyshev (Mean, Sd) UCL
alpha-BHC	mg/kg	2.60E-02	Maximum Result
alpha-Chlordane	mg/kg	7.04E-02	99% Chebyshev (Mean, Sd) UCL
beta-BHC	mg/kg	3.50E-02	Maximum Result
delta-BHC	mg/kg	4.10E-03	Maximum Result
Dieldrin	mg/kg	2.08E+00	99% Chebyshev (Mean, Sd) UCL
Endosulfan sulfate	mg/kg	1.60E-03	Maximum Result
Endrin	mg/kg	4.60E-03	Maximum Result
Endrin aldehyde	mg/kg	1.10E-03	Maximum Result
Endrin ketone	mg/kg	1.20E-02	Maximum Result
gamma-BHC	mg/kg	2.50E-03	Maximum Result
gamma-Chlordane	mg/kg	8.75E-02	99% Chebyshev (Mean, Sd) UCL
Heptachlor	mg/kg	8.80E-03	Maximum Result
Methoxychlor	mg/kg	3.90E-03	Maximum Result
Aroclor-1260	mg/kg	9.80E-01	Maximum Result
<b>SVOCs/VOCs</b>			
1,2,4-Trichlorobenzene	mg/kg	1.05E+00	99% Chebyshev (Mean, Sd) UCL
1,2-Dichlorobenzene	mg/kg	4.02E+01	95% Hall's Bootstrap UCL
1,3-Dichlorobenzene	mg/kg	1.38E+00	99% Chebyshev (Mean, Sd) UCL

**Notes:**

EPC summary statistics are presented in Table 1-1.

**Table 1-7**  
**Risk Calculation Worksheet for Shallow Soil - Carcinogenic Effects - Residential Exposure Scenario - Future Adult Resident Receptor - Former AMCO Chemical Facility**  
*Baseline Human Health Risk Assessment*  
 AMCO Chemical Superfund Site, Oakland, California

Exposure Scenario Information	Residential	
	Exposure Scenario:	Chronic
Scenario Timeframe:	OnSite	Future Adult Resident
Exposure Medium:	Adult	
Exposure Point:		
Receptor Population:		
Receptor Age:		

Exposure Scenario/Exposure Area Description	
Site Risks	

Exposure Parameter	Variable	Value	Units
Exposure Frequency	EF	350	day/yr
Exposure Duration	ED	24	yr
Soil Ingestion Rate	IR	100	mg/day
Inhalation Rate (Soil Particulate Inhalation)	InR	20	m3/day
Skin Surface Area (Soil Contact, 1 event per day)	SA_s	5700	cm2/day [soil]
Body Weight	BW	70	kg
Averaging Time for carcinogens	ATc	70	yr
Averaging Time for noncarcinogens	ATnc	24	yr
Conversion Factor (yr to day)	CF3	2.74E-03	yr/day
Conversion Factor (mg to kg)	CF4	1.00E-06	kg/mg
Particulate Emission Factor	PEF	1.32E+09	m3/kg
Chemical Specific skin absorption defaults	ABS	0.00E+00	
Inorganics	ABSin	0.01	unitless
Pesticides	ABSpest	0.05	unitless
Semi-Volatiles (Organics)	ABSsvoc	0.1	unitless
Volatiles (Organics)	ABSvoc	0.1	unitless
PAHs and PCBs	ABSpah	0.15	unitless
Dioxins and Furans	ABSdioxin	0.03	unitless
Adherence Factor	AF	0.07	mg/cm2

**Notes:**  
 NA = no data; this toxicity value is not available in the standard U.S. EPA toxicity value databases.  
 RME = reasonable maximum exposure.  
 EPC = exposure point concentration.

		Total Risk (Hazard Index):			Total Risk (Hazard Index):			Total Risk (Hazard Index):			2.20	

**Notes:** NA = no data; this toxicity value is not available in the standard U.S. EPA toxicity value databases.

RME = reasonable maximum exposure.

EPC = exposure point concentration.

Total Estimated Non-Carcinogenic Risk (Hazard Index) Across All Exposure Routes :

3

Table 1-9  
 Risk Calculation Worksheet for Shallow Soil - Carcinogenic Effects - Residential Exposure Scenario - Future Child Resident Receptor - Former AMCO Chemical Facility  
 Baseline Human Health Risk Assessment  
 AMCO Chemical Superfund Site, Oakland, California

Exposure Scenario:	Residential
Scenario Timeframe:	Chronic
Exposure Medium:	Shallow Soil
Exposure Point:	OnSite
Receptor Population:	Future Child Resident
Receptor Age:	Child (6 years)
<b>Exposure Scenario/Exposure Area Description</b>	
Site Risks	

Exposure Parameter	Variable	Value	Units
Exposure Frequency	EF	350	day/yr
Exposure Duration	ED	6	yr
Soil Ingestion Rate	IR	200	mg/day
Inhalation Rate (Soil Particulate Inhalation)	InR	10	m3/day
Skin Surface Area (Soil Contact; 1 event per day)	SA_s	2900	cm2/day [soil]
Body Weight	BW	15	kg
Averaging Time for carcinogens	ATc	70	yr
Averaging Time for noncarcinogens	ATnc	6	yr
Conversion Factor (yr to day)	CF3	2.74E-03	yr/day
Conversion Factor (mg to kg)	CF4	1.00E-06	kg/mg
Particulate Emission Factor	PEF	1.32E+09	m3/kg
Chemical Specific skin absorption defaults	ABS		0.00E+00
Inorganics	ABSin	0.01	unitless
Pesticides	ABSpest	0.05	unitless
Semi-Volatiles (Organics)	ABSsvoc	0.1	unitless
Volatiles (Organics)	ABSvoc	0.1	unitless
PAHs and PCBs	ABSpah	0.15	unitless
Dioxins and Furans	ABSdioxin	0.03	unitless
Adherence Factor	AF	0.2	mg/cm2

**Total Estimated Carcinogenic Risk Across All Exposure Routes :**

**2E-04**

**Notes:**

NA = no data; this toxicity value is not available in the standard U.S. EPA toxicity value databases.

RME = reasonable maximum exposure.

EPC = exposure point concentration.

**Table 1-10 Risk Calculation Worksheet for Shallow Soil - Noncarcinogenic Effects - Residential Exposure Scenario - Future Child Resident Receptor - Former AMCO Chemical Facility**  
 Baseline Human Health Risk Assessment  
 AMCO Chemical Superfund Site, Oakland, California

Exposure Scenario Information	Exposure Scenario:	Residential
Scenario Timeframe:	Chronic	
Exposure Medium:	Shallow Soil	
Exposure Point:	OnSite	
Receptor Population:	Future Child Resident	
Receptor Age:	Child (6 years)	
<b>Exposure Scenario/Exposure Area Description</b>		
Site Risks		

Exposure Parameter	Variable	Value	Units
Exposure Frequency	EF	350	day/yr
Exposure Duration	ED	6	yr
Soil Ingestion Rate	IR	200	mg/day
Inhalation Rate (Soil Particulate Inhalation)	InR	10	m3/day
Skin Surface Area (Soil Contact; 1 event per day)	SA_s	2900	cm2/day [soil]
Body Weight	BW	15	kg
Averaging Time for carcinogens	ATc	70	yr
Averaging Time for noncarcinogens	ATnc	6	yr
Conversion Factor (yr to day)	CF3	2.74E-03	yr/day
Conversion Factor (mg to kg)	CF4	1.00E-06	kg/mg
Particulate Emission Factor	PEF	1.32E+09	m3/kg
Chemical Specific skin absorption defaults	ABS		0.00E+00
Inorganics	ABSin	0.01	unitless
Pesticides	ABSpest	0.05	unitless
Semi-Volatiles (Organics)	ABSsvoc	0.1	unitless
Volatiles (Organics)	ABSpvoc	0.1	unitless
PAHs and PCBs	ABSpah	0.15	unitless
Dioxins and Furans	ABSdioxin	0.03	unitless
Adherence Factor	AF	0.2	mg/cm2

**Risk Calculations**

**Notes:**

NA = no data; this toxicity value is not available in the standard U.S. EPA toxicity value databases.

RME = reasonable maximum exposure.

EPC = exposure point concentration.

**Total Estimated Carcinogenic Risk Across All Exposure Routes :**

**1E-04**

**Table 1-14**

<b>Notes:</b>											<b>1E-05</b>
NA = no data; this toxicity value is not available in the standard U.S. EPA toxicity value databases.											
RME = reasonable maximum exposure.											
EPC = exposure point concentration.											
<b>Total Estimated Carcinogenic Risk Across All Exposure Routes :</b>											

**Table 1-16 Risk Calculation Worksheet for Shallow Soil - Noncarcinogenic Effects - Construction Exposure Scenario - Future Construction Worker Receptor - Former AMCO Chemical Facility**  
 Baseline Human Health Risk Assessment  
 AMCO Chemical Superfund Site, Oakland, California

Exposure Scenario Information	Exposure Scenario:	Construction
Scenario Timeframe:	Chronic	
Exposure Medium:	Shallow Soil	
Exposure Point:	On-Site	
Receptor Population:	Future Construction Worker	
Receptor Age:	Adult	
<b>Exposure Scenario/Exposure Area Description</b>		
Site Risks		

Chemical of Potential Concern	RME Medium EPC Value, Cs [mg/kg]	Exposure Route = Oral			Exposure Route = Dermal			Exposure Route = Inhalation			Total Hazard Quotient [-]

**Notes:** NA = no data; this toxicity value is not available in the standard U.S. EPA toxicity value databases.

RME = reasonable maximum exposure.

EPC = exposure point concentration.

**Total Estimated Carcinogenic Risk Across All Exposure Routes :**

**Table 1-20**  
**Risk Calculation Worksheet for Deep Soil - Noncarcinogenic Effects - Residential Exposure Scenario - Future Adult Resident Receptor - Former AMCO Chemical Facility**  
*Baseline Human Health Risk Assessment*  
 AMCO Chemical Superfund Site, Oakland, California

Exposure Scenario Information	Residential	
	Exposure Scenario:	Chronic
Scenario Timeframe:	Deep Soil	
Exposure Medium:	OnSite	
Exposure Point:	Future Adult Resident	
Receptor Population:	Adult	
Receptor Age:		

Exposure Scenario/Exposure Area Description	
Site Risks	

Exposure Parameter (units)	Variable	Value	Units
Exposure Frequency	EF	350	day/yr
Exposure Duration	ED	24	yr
Soil Ingestion Rate	IR	100	mg/day
Inhalation Rate (Soil Particulate Inhalation)	InR	20	m3/day
Skin Surface Area (Soil Contact; 1 event per day)	SA_s	5700	cm2/day [soil]
Body Weight	BW	70	kg
Averaging Time for carcinogens	ATc	70	yr
Averaging Time for noncarcinogens	ATnc	24	yr
Conversion Factor (yr to day)	CF3	2.74E-03	yr/s/day
Conversion Factor (mg to kg)	CF4	1.00E-06	kg/mg
Particulate Emission Factor	PEF	1.32E+09	m3/kg
Chemical Specific skin absorption defaults	ABS	0.00E+00	unitless
Inorganics	ABSin	0.01	unitless
Pesticides	ABSpest	0.05	unitless
Semi-Volatiles (Organics)	ABSsvoc	0.1	unitless
Volatiles (Organics)	ABSvoc	0.1	unitless
PAHs and PCBs	ABSpah	0.15	unitless
Dioxins and Furans	ABSdioxin	0.03	unitless
Adherence Factor	AF	0.07	mg/cm2

**Notes:** Total Estimated Non-carcinogenic Risk (Hazard Index) Across All Exposure Routes :

NA = no data; this toxicity value is not available in the standard U.S. EPA toxicity value databases.

RME = reasonable maximum exposure.

EPC = exposure point concentration.

**Table 1-21**  
**Risk Calculation Worksheet for Deep Soil - Carcinogenic Effects - Residential Exposure Scenario - Future Child Resident Receptor - Former AMCO Chemical Facility**  
*Baseline Human Health Risk Assessment*  
 AMCO Chemical Superfund Site, Oakland, California

<b>Exposure Scenario Information</b>	Exposure Scenario: Residential
	Scenario Timeframe: Chronic
Exposure Medium: Deep Soil	OnSite
Exposure Point: Future Child Resident Receptor	Future Child Resident Receptor
Receptor Age: 6 years	Child (6 years)
<b>Exposure Scenario/Exposure Area Description</b>	
Site Risks	

Exposure Parameter	Variable	Value	Units
Exposure Frequency	EF	350	day/yr
Exposure Duration	ED	6	yr
Soil Ingestion Rate	IR	200	mg/day
Inhalation Rate (Soil Particulate Inhalation)	InR	10	m <sup>3</sup> /day
Skin Surface Area (Soil Contact, 1 event per day)	SA_s	2900	cm <sup>2</sup> /day [soil]
Body Weight	BW	15	kg
Averaging Time for carcinogens	ATc	70	yr
Averaging Time for noncarcinogens	ATnc	6	yr
Conversion Factor (yr to day)	CF3	2.74E-03	yr/day
Conversion Factor (mg to kg)	CF4	1.00E-06	kg/mg
Particulate Emission Factor	PEF	1.32E+09	m <sup>3</sup> /kg
Chemical Specific skin absorption defaults	ABS	0.00E+00	
Inorganics	ABSin	0.01	unitless
Pesticides	ABSpest	0.05	unitless
Semi-Volatiles (Organics)	ABSsvoc	0.1	unitless
Volatiles (Organics)	ABSvoc	0.1	unitless
PAHs and PCBs	ABSpah	0.15	unitless
Dioxins and Furans	ABSdioxin	0.03	unitless
Adherence Factor	AF	0.2	mg/cm <sup>2</sup>

**Notes:**

NA = no data; this toxicity value is not available in the standard U.S. EPA toxicity value databases.

RME = reasonable maximum exposure.

EPC = exposure point concentration.

**Total Estimated Carcinogenic Risk Across All Exposure Routes :**

**3E-04**

**Table 1-22**  
**Risk Calculation Worksheet for Deep Soil - Noncarcinogenic Effects - Residential Exposure Scenario - Future Child Resident Receptor - Former AMCO Chemical Facility**  
*Baseline Human Health Risk Assessment*  
 AMCO Chemical Superfund Site, Oakland, California

Exposure Scenario Information	Residential	
	Exposure Scenario: Chronic	Scenario Timeframe: Deep Soil
Exposure Point: Future Child Resident	Receptor Population: Child (6 years)	Receptor Age:

Exposure Scenario/Exposure Area Description
Site Risks

Exposure Parameter (units)	Variable	Value	Units
Exposure Frequency	EF	350	day/yr
Exposure Duration	ED	6	yr
Soil Ingestion Rate	IR	200	mg/day
Inhalation Rate (Soil Particulate Inhalation)	InR	10	m3/day
Skin Surface Area (Soil Contact; 1 event per day)	SA_s	2900	cm2/day [soil]
Body Weight	BW	15	kg
Averaging Time for carcinogens	ATc	70	yr
Averaging Time for noncarcinogens	ATnc	6	yr
Conversion Factor (yr to day)	CF3	2.74E-03	yr/day
Conversion Factor (mg to kg)	CF4	1.00E-06	kg/mg
Particulate Emission Factor	PEF	1.32E+09	m3/kg
Chemical Specific skin absorption defaults	ABS	0.00E+00	
Inorganics	ABSin	0.01	unitless
Pesticides	ABSpest	0.05	unitless
Semi-Volatiles (Organics)	ABSvoc	0.1	unitless
Volatiles (Organics)	ABSvoc	0.1	unitless
PAHs and PCBs	ABSpah	0.15	unitless
Dioxins and Furans	ABSdioxin	0.03	unitless
Adherence Factor	AF	0.2	mg/cm2

**Notes:** Total Estimated Non-carcinogenic Risk (Hazard Index) Across All Exposure Routes :

2

NA = no data; this toxicity value is not available in the standard U.S. EPA toxicity value databases.  
 RME = reasonable maximum exposure.  
 EPC = exposure point concentration.

**Table 1-27  
Risk Calculation Worksheet for Deep Soil - Carcinogenic Effects - Construction Exposure Scenario - Future Construction Worker Receptor - Former AMCO Chemical Facility  
Baseline Human Health Risk Assessment  
AMCO Chemical Superfund Site, Oakland, California**

Exposure Scenario Information		Exposure Scenario:	Construction
Scenario Timeframe:	Chronic		
Exposure Medium:	Deep Soil		
Exposure Point:	OnSite		
Receptor Population:	Future Construction Worker		
Receptor Age:	Adult		
Exposure Scenario/Exposure Area Description			
Site Risks			
Exposure Parameter	Variable	Value	Units
Exposure Frequency	EF	250	day/yr
Exposure Duration	ED	1	yr
Soil Ingestion Rate	IR	330	mg/day
Inhalation Rate (Soil Particulate Inhalation)	InR	20	m3/day
Skin Surface Area (Soil Contact; 1 event per day)	SA_s	5.70E+03	cm2/day [soil]
Body Weight	BW	7.00E+01	kg
Averaging Time for carcinogens	ATc	70	yr
Averaging Time for noncarcinogens	ATnc	1	yr
Conversion Factor (yr to day)	CF3	2.74E-03	yr/day
Conversion Factor (mg to kg)	CF4	1.00E-06	kg/mg
Particulate Emission Factor	PEF	1.32E+09	m3/kg
Chemical Specific skin absorption defaults	ABS		day/yr
Inorganics	ABSin	0.01	unitless
Pesticides	ABSpest	0.05	unitless
Semi-Volatiles (Organics)	ABSsvoc	0.1	unitless
Volatiles (Organics)	ABSvoc	0.1	unitless
PAHs and PCBs	ABSspah	0.15	unitless
Dioxins and Furans	ABSdioxin	0.03	unitless
Adherence Factor	AF	0.8	mg/cm2

**Notes:**  
 NA = no data; this toxicity value is not available in the standard U.S. EPA toxicity value databases.  
 RME = reasonable maximum exposure.  
 EPC = exposure point concentration.

**Total Estimated Carcinogenic Risk Across All Exposure Routes :**

**2E-05**

**Table 1-28**  
**Risk Calculation Worksheet for Deep Soil - Noncarcinogenic Effects - Construction Exposure Worker Receptor - Former AMCO Chemical Facility**  
 Baseline Human Health Risk Assessment  
 AMCO Chemical Superfund Site, Oakland, California

Exposure Scenario Information		Exposure Parameter (units)		Variable	Value	Units
Exposure Scenario: Construction		Exposure Frequency	EF		250	day/yr
Scenario Timeframe: Chronic		Exposure Duration	ED		1	yr
Exposure Medium: Deep Soil		Soil Ingestion Rate	IR		330	mg/day
Exposure Point: OnSite		Inhalation Rate (Soil Particulate Inhalation)	InR		20	m3/day
Receptor Population: Future Construction Worker		Skin Surface Area (Soil Contact; 1 event per day)	SA_s		5.70E+03	cm2/day [soil]
Receptor Age: Adult		Body Weight	BW		7.00E+01	kg
<b>Exposure Scenario/Exposure Area Description</b>  <b>Site Risks</b>		Averaging Time for carcinogens	ATc		70	yr
		Averaging Time for noncarcinogens	ATnc		1	yr
		Conversion Factor (yr to day)	CF3		2.74E-03	yr/day
		Conversion Factor (mg to kg)	CF4		1.00E-06	kg/mg
		Particulate Emission Factor	PEF		1.32E+09	m3/kg
		Chemical Specific skin absorption defaults	ABS			day/yr
		Inorganics	ABSin		0.01	unitless
		Pesticides	ABSpest		0.05	unitless
		Semi-Volatiles (Organics)	ABSsvoc		0.1	unitless
		Volatiles (Organics)	ABSvoc		0.1	unitless
		PAHs and PCBs	ABSpah		0.15	unitless
		Dioxins and Furans	ABSdioxin		0.03	unitless
		Adherence Factor	AF		0.8	mg/cm2

**Notes:**

NA = no data; this toxicity value is not available in the standard U.S. EPA toxicity value databases.

RME = reasonable maximum exposure.

EPC = exposure point concentration.

**Total Estimated Carcinogenic Risk Across All Exposure Routes :**

**1E-04**

**Table 1-34**  
**Risk Calculation Worksheet for Shallow Soil - Noncarcinogenic Effects - Residential Exposure Scenario - Future Adult Resident Receptor - Parking Lot**  
 Baseline Human Health Risk Assessment  
 AMCO Chemical Superfund Site, Oakland, California

Exposure Scenario:	Residential
Scenario Timeframe:	Chronic
Exposure Medium:	Shallow Soil
Exposure Point:	OnSite
Receptor Population:	Future Adult Resident
Receptor Age:	Adult
<b>Exposure Scenario/Exposure Area Description</b>	
<b>Site Risks</b>	

Exposure Parameter	Variable	Value	Units
Exposure Frequency	EF	350	day/yr
Exposure Duration	ED	24	yr
Soil Ingestion Rate	IR	100	mg/day
Inhalation Rate (Soil Particulate Inhalation)	InR	20	m3/day
Particulate Emission Factor	PEF	1.32E+09	m3/kg
Skin Surface Area (Soil Contact; 1 event per day)	SA_s	5700	cm2/day [soil]
Body Weight	BW	70	kg
Averaging Time for carcinogens	ATc	70	yr
Averaging Time for noncarcinogens	ATnc	24	yr
Conversion Factor (yr to day)	CF3	2.74E-03	yrs/day
Conversion Factor (mg to kg)	CF4	1.00E-06	kg/mg
Chemical Specific skin absorption defaults	ABS		day/yr
Inorganics	ABSin	0.01	unitless
Pesticides	ABSpest	0.05	unitless
Semi-Volatiles (Organics)	ABSsvoc	0.1	unitless
Volatiles (Organics)	ABSvoc	0.1	unitless
PAHs and PCBs	ABSspah	0.15	unitless
Dioxins and Furans	ABSdioxin	0.03	unitless
Adherence Factor	AF	0.1	mg/cm2

**Notes:** Total Estimated Non-Carcinogenic Risk (Hazard Index) Across All Exposure Routes :

NA = no data; this toxicity value is not available in the standard U.S. EPA toxicity value databases.

RME = reasonable maximum exposure.

EPC = exposure point concentration.

2

**Table 1-35**  
**Risk Calculation Worksheet for Shallow Soil - Carcinogenic Effects - Residential Exposure Scenario - Future Child Resident Receptor - Parking Lot**  
*Baseline Human Health Risk Assessment*  
 AMCO Chemical Superfund Site, Oakland, California

Exposure Scenario Information	Residential	
	Exposure Scenario: Scenario Timeframe: Exposure Medium: Exposure Point: Receptor Population: Receptor Age:	Chronic Shallow Soil OnSite Future Child Resident Child (0 to 6 yrs)
Exposure Scenario/Exposure Area Description		
Site Risks		

Exposure Parameter	Variable	Value	Units
Exposure Frequency	EF	350	day/yr
Exposure Duration	ED	6	yr
Soil Ingestion Rate	IR	200	mg/day
Inhalation Rate (Soil Particulate Inhalation)	InR	10	m3/day
Particulate Emission Factor	PEF	1.32E+09	m3/kg
Skin Surface Area (Soil Contact: 1 event per day)	SA_s	2900	cm2/day [soil]
Body Weight	BW	15	kg
Averaging Time for carcinogens	ATc	70	yr
Averaging Time for noncarcinogens	ATnc	6	yr
Conversion Factor (yr to day)	CF3	2.74E-03	yr/day
Conversion Factor (mg to kg)	CF4	1.00E-06	kg/mg
Chemical Specific skin absorption defaults	ABS		day/yr
Inorganics	ABSin	0.01	unitless
Pesticides	ABSpest	0.05	unitless
Semi-Volatiles (Organics)	ABSsvoc	0.1	unitless
Volatiles (Organics)	ABSpvoc	0.1	unitless
PAHs and PCBs	ABSpah	0.15	unitless
Dioxins and Furans	ABSDioxin	0.03	unitless
Adherence Factor	AF	0.2	mg/cm2

Chemical of Potential Concern	RME Medium EPC Value, Cs [mg/kg]	Exposure Route = Oral		
		Chronic Daily Intake [mg/kg/day]	Cancer Slope Factor, SF [mg/kg/day]-1	Cancer Risk [-]

Exposure Scenario Information	Residential
Exposure Scenario:	Chronic
Scenario Timeframe:	Shallow Soil
Exposure Medium:	OnSite
Exposure Point:	Future Child Resident
Receptor Population:	Child (0 to 6 yrs)
Receptor Age:	

Exposure Scenario/Exposure Area Description	Variable	Value	Units
Site Risks	Exposure Frequency	350	day/yr
	Exposure Duration	6	yr
	Soil Ingestion Rate	200	mg/day
	Inhalation Rate (Soil Particulate Inhalation)	10	m3/day
	Particulate Emission Factor	1.32E+09	m3/kg
	Skin Surface Area (Soil Contact; 1 event per day)	2900	cm2/day [soil]
	Body Weight	15	kg
	Averaging Time for carcinogens	70	yr
	Averaging Time for noncarcinogens	6	yr
	Conversion Factor (yr to day)	2.74E-03	yr/day
	Conversion Factor (mg to kg)	1.00E-06	kg/mg
	Chemical Specific skin absorption defaults	ABS	day/yr
	Inorganics	ABSin	unitless
	Pesticides	ABSpest	unitless
	Semi-Volatiles (Organics)	ABSsvoc	unitless
	Volatiles (Organics)	ABSvoc	unitless
	PAHs and PCBs	ABSpah	unitless
Dioxins and Furans	ABSdioxin	unitless	
Adherence Factor	AF	0.2	mg/cm2

**Risk Calculation Worksheet for Shallow Soil - Carcinogenic Effects - Construction Exposure Scenario - Future Construction Worker Receptor - Parking Lot**  
 Baseline Human Health Risk Assessment  
 AMCO Chemical Superfund Site, Oakland, California

Exposure Scenario Information	
Exposure Scenario:	Construction
Scenario Timeframe:	Chronic
Exposure Medium:	Shallow Soil
Exposure Point:	OnSite
Receptor Population:	Future Construction Worker
Receptor Age:	Adult
Exposure Scenario/Exposure Area Description	
Site Risks	

Exposure Parameter	Variable	Value	Units
Exposure Frequency	EF	250	day/yr
Exposure Duration	ED	1	yr
Soil Ingestion Rate	IR	330	mg/day
Inhalation Rate (Soil Particulate Inhalation)	InR	20	m3/day
Particulate Emission Factor	PEF	1.32E+09	m3/kg
Skin Surface Area (Soil Contact; 1 event per day)	SA_s	5700	cm2/day [soil]
Body Weight	BW	70	kg
Averaging Time for carcinogens	ATc	70	yr
Averaging Time for noncarcinogens	ATnc	1	yr
Conversion Factor (yr to day)	CF3	2.74E-03	yrs/day
Conversion Factor (mg to kg)	CF4	1.00E-06	kg/mg
Chemical Specific skin absorption defaults	ABS		day/yr
Inorganics	ABSIn	0.01	unitless
Pesticides	ABSpst	0.05	unitless
Semi-Volatiles (Organics)	ABSSvoc	0.1	unitless
Volatiles (Organics)	ABSVoc	0.1	unitless
PAHs and PCBs	ABSpah	0.15	unitless
Dioxins and Furans	ABSDioxin	0.03	unitless
Adherence Factor	AF	0.8	mg/cm2

**Notes:** Total Estimated Carcinogenic Risk Across All Exposure Routes : 2E-05

NA = no data; this toxicity value is not available in the standard U.S. EPA toxicity value databases.  
 RME = reasonable maximum exposure.  
 EPC = exposure point concentration.

**Table 1-42**  
**Risk Calculation Worksheet for Shallow Soil - Noncarcinogenic Effects - Construction Exposure Scenario - Future Construction Worker Receptor - Parking Lot**  
 Baseline Human Health Risk Assessment  
 AMCO Chemical Superfund Site, Oakland, California

Exposure Scenario Information		Exposure Parameter (units)		Variable		Value		Units	
Exposure Scenario:	Construction	Exposure Frequency	EF	250	day/yr				
Scenario Timeframe:	Chronic	Exposure Duration	ED	1	yr				
Exposure Medium:	Shallow Soil	Soil Ingestion Rate	IR	330	mg/day				
Exposure Point:	OnSite	Inhalation Rate (Soil Particulate Inhalation)	InR	20	m3/day				
Receptor Population:	Future Construction Worker	Particulate Emission Factor	PEF	1.32E+09	m3/kg				
Receptor Age:	Adult	Skin Surface Area (Soil Contact; 1 event per day)	SA_s	5700	cm2/day [soil]				
		Body Weight	BW	70	kg				
		Averaging Time for carcinogens	ATc	70	yr				
		Averaging Time for noncarcinogens	ATnc	1	yr				
		Conversion Factor (yr to day)	CF3	2.74E-03	yr/day				
		Conversion Factor (mg to kg)	CF4	1.00E-06	kg/mg				
		Chemical Specific skin absorption defaults	ABS		day/yr				
		Inorganics	ABSin	0.01	unitless				
		Pesticides	ABSpest	0.05	unitless				
		Semi-Volatiles (Organics)	ABSsvoc	0.1	unitless				
		Volatiles (Organics)	ABSvoc	0.1	unitless				
		PAHs and PCBs	ABSpah	0.15	unitless				
		Dioxins and Furans	ABSdioxin	0.03	unitless				
		Adherence Factor	AF	0.8	mg/cm2

**Notes:**

NA = no data; this toxicity value is not available in the standard U.S. EPA toxicity value databases.

RME = reasonable maximum exposure.

EPC = exposure point concentration.

**Total Estimated Carcinogenic Risk Across All Exposure Routes :**

**2E-04**

**Table 1-46**  
**Risk Calculation Worksheet for Deep Soil - Noncarcinogenic Effects - Residential Exposure Scenario - Future Adult Resident Receptor - Parking Lot**  
 Baseline Human Health Risk Assessment  
 AMCO Chemical Superfund Site, Oakland, California

<b>Exposure Scenario Information</b>	Exposure Scenario: Residential
	Scenario Timeframe: Chronic
<b>Exposure Scenario/Exposure Area Description</b>	Exposure Medium: Deep Soil
	Exposure Point: OnSite
	Receptor Population: Future Adult Resident
	Receptor Age: Adult
<b>Site Risks</b>	

Exposure Parameter (units)	Variable	Value	Units
Exposure Frequency	EF	350	day/yr
Exposure Duration	ED	24	yr
Soil Ingestion Rate	IR	100	mg/day
Inhalation Rate (Soil Particulate Inhalation)	InR	20	m3/day
Particulate Emission Factor	PEF	1.32E+09	m3/kg
Skin Surface Area (Soil Contact; 1 event per day)	SA_s	5700	cm2/day [soil]
Body Weight	BW	70	kg
Averaging Time for carcinogens	ATc	70	yr
Averaging Time for noncarcinogens	ATnc	24	yr
Conversion Factor (yr to day)	CF3	2.74E-03	yr/day
Conversion Factor (mg to kg)	CF4	1.00E-06	kg/mg
Chemical Specific skin absorption defaults	ABS		day/yr
Inorganics	ABSin	0.01	unitless
Pesticides	ABSpest	0.05	unitless
Semi-Volatiles (Organics)	ABSsvoc	0.1	unitless
Volatiles (Organics)	ABSvoc	0.1	unitless
PAHs and PCBs	ABSspah	0.15	unitless
Dioxins and Furans	ABSdioxin	0.03	unitless
Adherence Factor	AF	0.07	mg/cm2

**Notes:** Total Estimated Non-carcinogenic Risk (Hazard Index) Across All Exposure Routes :

NA = no data; this toxicity value is not available in the standard U.S. EPA toxicity value databases.  
 RME = reasonable maximum exposure.  
 EPC = exposure point concentration.

2

**Notes:**

NA = no data; this toxicity value is not available in the standard U.S. EPA toxicity value databases.  
 RME = reasonable maximum exposure.  
 EPC = exposure point concentration.

**Total Estimated Carcinogenic Risk Across All Exposure Routes :**  
**4E-04**

**Table 1-48**  
**Risk Calculation Worksheet for Deep Soil - Noncarcinogenic Effects - Residential Exposure Scenario - Future Child Resident Receptor - Parking Lot**  
*Baseline Human Health Risk Assessment*  
 AMCO Chemical Superfund Site, Oakland, California

Exposure Scenario Information	Residential	
	Exposure Scenario:	Chronic
Scenario Timeframe:	Deep Soil	
Exposure Medium:	OnSite	
Exposure Point:	Future Child Resident	
Receptor Population:	Child (0 to 6 yrs)	
Receptor Age:		

Site Risks	Exposure Scenario/Exposure Area Description

Exposure Parameter (units)	Variable	Value	Units
Exposure Frequency	EF	350	day/yr
Exposure Duration	ED	6	yr
Soil Ingestion Rate	IR	200	mg/day
Inhalation Rate (Soil Particulate Inhalation)	InR	10	m3/day
Particulate Emission Factor	PEF	1.32E+09	m3/kg
Skin Surface Area (Soil Contact; 1 event per day)	SA_s	2900	cm2/day [soil]
Body Weight	BW	15	kg
Averaging Time for carcinogens	ATc	70	yr
Averaging Time for noncarcinogens	ATnc	6	yr
Conversion Factor (yr to day)	CF3	2.74E-03	yr/day
Conversion Factor (mg to kg)	CF4	1.00E-06	kg/mg
Chemical Specific skin absorption defaults	ABS		day/yr
Inorganics	ABSin	0.01	unitless
Pesticides	ABSpest	0.05	unitless
Semi-Volatiles (Organics)	ABSsvoc	0.1	unitless
Volatiles (Organics)	ABSpvoc	0.1	unitless
PAHs and PCBs	ABSpah	0.15	unitless
Dioxins and Furans	ABSDioxin	0.03	unitless
Adherence Factor	AF	0.20	mg/cm2

**Notes:**

NA = no data; this toxicity value is not available in the standard U.S. EPA toxicity value databases.

RME = reasonable maximum exposure.

EPC = exposure point concentration.

**Total Estimated Carcinogenic Risk Across All Exposure Routes :**

**3E-05**

**Table 1-54**  
**Risk Calculation Worksheet for Deep Soil - Noncarcinogenic Effects - Construction Exposure Scenario - Future Construction Worker Receptor - Parking Lot**  
*Baseline Human Health Risk Assessment*  
 AMCO Chemical Superfund Site, Oakland, California

Exposure Scenario Information	Exposure Scenario/Exposure Area Description	
	Exposure Scenario:	Construction
Scenario Timeframe:	Chronic	
Exposure Medium:	Deep Soil	
Exposure Point:	OnSite	
Receptor Population:	Future Construction Worker	
Receptor Age:	Adult	
Site Risks		

Exposure Parameter (units)	Variable	Value	Units
Exposure Frequency	EF	250	day/yr
Exposure Duration	ED	1	yr
Soil Ingestion Rate	IR	330	mg/day
Inhalation Rate (Soil Particulate Inhalation)	InR	20	m <sup>3</sup> /day
Particulate Emission Factor	PEF	1.32E+09	m <sup>3</sup> /kg
Skin Surface Area (Soil Contact; 1 event per day)	SA_s	5700	cm <sup>2</sup> /day [soil]
Body Weight	BW	70	kg
Averaging Time for carcinogens	ATc	70	yr
Averaging Time for noncarcinogens	ATnc	1	yr
Conversion Factor (yr to day)	CF3	2.74E-03	yr <sup>2</sup> /day
Conversion Factor (mg to kg)	CF4	1.00E-06	kg/mg
Chemical Specific skin absorption defaults	ABS		day/yr
Inorganics	ABSin	0.01	unitless
Pesticides	ABSpest	0.05	unitless
Semi-Volatiles (Organics)	ABSsvoc	0.1	unitless
Volatiles (Organics)	ABSvoc	0.1	unitless
PAHs and PCBs	ABSph	0.15	unitless
Dioxins and Furans	ABSdioxin	0.03	unitless
Adherence Factor	AF	0.8	mg/cm <sup>2</sup>

Toluene	mg/kg	4.40E-02	95% Chebyshev (Mean, Sd) UCL
Trichloroethene	mg/kg	4.00E-03	Maximum Result
Vinyl chloride	mg/kg	1.00E-03	Maximum Result
Xylenes, total	mg/kg	9.09E-02	95% Chebyshev (Mean, Sd) UCL

**Notes:**

EPC summary statistics are presented in Table 1-1.

**Table 1-59**  
**Risk Calculation Worksheet for Shallow Soil - Carcinogenic Effects - Residential Exposure Scenario - Future Adult Resident Receptor - Large Vacant Lot**  
*Baseline Human Health Risk Assessment*  
 AMCO Chemical Superfund Site, Oakland, California

Exposure Scenario Information	Exposure Scenario:	Residential
	Scenario Timeframe:	Chronic
Exposure Medium:	Shallow Soil	
Exposure Point:	OnSite	
Receptor Population:	Future Adult Resident	
Receptor Age:	Adult	
Exposure Scenario/Exposure Area Description		
Site Risks		

Exposure Parameter	Variable	Value	Units
Exposure Frequency	EF	350	day/yr
Exposure Duration	ED	24	yr
Soil Ingestion Rate	IR	100	mg/day
Inhalation Rate (Soil Particulate Inhalation)	InR	20	m3/day
Skin Surface Area (Soil Contact; 1 event per day)	SA_s	5.70E+03	cm2/day [soil]
Body Weight	BW	7.00E+01	kg
Averaging Time for carcinogens	ATc	70	yr
Averaging Time for noncarcinogens	ATnc	24	yr
Conversion Factor (yr to day)	CF3	2.74E-03	yrs/day
Conversion Factor (mg to kg)	CF4	1.00E-06	kg/mg
Particulate Emission Factor	PEF	1.32E+09	m3/kg
Chemical Specific skin absorption defaults	ABS		
Inorganics	ABSin	0.01	unitless
Pesticides	ABSpest	0.05	unitless
Semi-Volatiles (Organics)	ABSsvoc	0.1	unitless
Volatiles (Organics)	ABSvoc	0.1	unitless
PAHs and PCBs	ABSpah	0.15	unitless
Adherence Factor	AF	0.07	mg/cm2

**Total Estimated Carcinogenic Risk Across All Exposure Routes :**

**4E-04**

**Notes:**

NA = no data; this toxicity value is not available in the standard U.S. EPA toxicity value databases.  
 RME = reasonable maximum exposure.  
 EPC = exposure point concentration.

**Table 1-62**  
**Risk Calculation Worksheet for Shallow Soil - Noncarcinogenic Effects - Residential Exposure Scenario - Future Child Resident Receptor - Large Vacant Lot**  
*Baseline Human Health Risk Assessment*  
*AMCO Chemical Superfund Site, Oakland, California*

<b>Exposure Scenario Information</b>	Exposure Scenario:	Residential
	Scenario Timeframe:	Chronic
	Exposure Medium:	Shallow Soil
	Exposure Point:	OnSite
	Receptor Population:	Future Child Resident
Receptor Age:	Child (6 years)	
<b>Exposure Scenario/Exposure Area Description</b>		
<b>Site Risks</b>		

Exposure Parameter	Variable	Value	Units
Exposure Frequency	EF	350	day/yr
Exposure Duration	ED	6	yr
Soil Ingestion Rate	IR	200	mg/day
Inhalation Rate (Soil Particulate Inhalation)	InR	10	m3/day
Skin Surface Area (Soil Contact; 1 event per day)	SA_s	2.90E+03	cm2/day [soil]
Body Weight	BW	1.50E+01	kg
Averaging Time for carcinogens	ATc	70	yr
Averaging Time for noncarcinogens	ATnc	6	yr
Conversion Factor (yr to day)	CF3	2.74E-03	yrs/day
Conversion Factor (mg to kg)	CF4	1.00E-06	kg/mg
Particulate Emission Factor	PEF	1.32E+09	m3/kg
Chemical Specific skin absorption defaults	ABS		
Inorganics	ABSin	0.01	unitless
Pesticides	ABSpest	0.05	unitless
Semi-Volatiles (Organics)	ABSsvoc	0.1	unitless
Volatiles (Organics)	ABSvoc	0.1	unitless
PAHs and PCBs	ABSpah	0.15	unitless
Adherence Factor	AF	0.2	mg/cm2

**Notes:** Total Estimated Carcinogenic Risk Across All Exposure Routes :

NA = no data; this toxicity value is not available in the standard U.S. EPA toxicity value databases.

RME = reasonable maximum exposure.

EPC = exposure point concentration.

**2E-04**

**Notes:**  
 NA = no data; this toxicity value is not available in the standard U.S. EPA toxicity value databases.  
 RME = reasonable maximum exposure.  
 EPC = exposure point concentration.

**Total Estimated Non-carcinogenic Risk (Hazard Index) Across All Exposure Routes : 0.7**

**Table 1-67**  
**Risk Calculation Worksheet for Shallow Soil - Carcinogenic Effects - Construction Exposure Scenario - Future Construction Worker - Large Vacant Lot**  
 Baseline Human Health Risk Assessment  
 AMCO Chemical Superfund Site, Oakland, California

Exposure Scenario Information		Exposure Parameter	Variable	Value	Units
Exposure Scenario: Construction		Exposure Frequency	EF	250	day/yr
Scenario Timeframe: Chronic		Exposure Duration	ED	1	yr
Exposure Medium: Shallow Soil		Soil Ingestion Rate	IR	330	mg/day
Exposure Point: OnSite		Inhalation Rate (Soil Particulate Inhalation)	InR	20	m3/day
Receptor Population: Future Construction Worker		Skin Surface Area (Soil Contact, 1 event per day)	SA_s	5.70E+03	cm2/day [soil]
Receptor Age: Adult		Body Weight	BW	70	kg
<b>Exposure Scenario/Exposure Area Description</b>		Averaging Time for carcinogens	ATc	70	yr
		Averaging Time for noncarcinogens	ATnc	1	yr
		Conversion Factor (yr to day)	CF3	2.74E-03	yr/day
		Conversion Factor (mg to kg)	CF4	1.00E-06	kg/mg
		Particulate Emission Factor	PEF	1.32E+09	m3/kg
		Chemical Specific skin absorption defaults	ABS		
		Inorganics	ABSin	0.01	unitless
		Pesticides	ABSpest	0.05	unitless
		Semi-Volatiles (Organics)	ABSsvoc	0.1	unitless
		Volatiles (Organics)	ABSvoc	0.1	unitless
		PAHs and PCBs	ABSpah	0.15	unitless
		Adherence Factor	AF	0.8	mg/cm2

**Notes:**  
 NA = no data; this toxicity value is not available in the standard U.S. EPA toxicity value databases.  
 RME = reasonable maximum exposure.  
 EPC = exposure point concentration.

**2E-05**

**Table 1-68**  
**Risk Calculation Worksheet for Shallow Soil - Noncarcinogenic Effects - Construction Exposure Scenario - Future Construction Worker - Large Vacant Lot**  
 Baseline Human Health Risk Assessment  
 AMCO Chemical Superfund Site, Oakland, California

Exposure Scenario Information	Exposure Scenario:	Construction
Scenario Timeframe:	Chronic	
Exposure Medium:	Shallow Soil	
Exposure Point:	OnSite	
Receptor Population:	Future Construction Worker	
Receptor Age:	Adult	
Exposure Scenario/Exposure Area Description

**Notes:** Total Estimated Non-carcinogenic Risk (Hazard Index) Across All Exposure Routes :

NA = no data; this toxicity value is not available in the standard U.S. EPA toxicity value databases.

RME = reasonable maximum exposure.

EPC = exposure point concentration.

Total Estimated Carcinogenic Risk Across All Exposure Routes :

1E-04

**Notes:**  
 NA = no data; this toxicity value is not available in the standard U.S. EPA toxicity value databases.  
 RME = reasonable maximum exposure.  
 EPC = exposure point concentration.

**Table 1-72**  
**Risk Calculation Worksheet for Deep Soil - Noncarcinogenic Effects - Residential Exposure Scenario - Future Adult Resident - Large Vacant Lot**  
*Baseline Human Health Risk Assessment*  
 AMCO Chemical Superfund Site, Oakland, California

Exposure Scenario Information	Residential	
	Exposure Scenario:	Chronic
Scenario Timeframe:	Deep Soil	
Exposure Medium:	OnSite	
Exposure Point:	Future Adult Resident	
Receptor Population:	Adult	
Receptor Age:		
Exposure Scenario/Exposure Area Description		
Site Risks		

Exposure Parameter (units)	Variable	Value	Units
Exposure Frequency	EF	350	day/yr
Exposure Duration	ED	24	yr
Soil Ingestion Rate	IR	100	mg/day
Inhalation Rate (Soil Particulate Inhalation)	InR	20	m3/day
Skin Surface Area (Soil Contact; 1 event per day)	SA_s	5.70E+03	cm2/day [soil]
Body Weight	BW	7.00E+01	kg
Averaging Time for carcinogens	ATc	70	yr
Averaging Time for noncarcinogens	ATnc	24	yr
Conversion Factor (yr to day)	CF3	2.74E-03	yr/day
Conversion Factor (mg to kg)	CF4	1.00E-06	kg/mg
Particulate Emission Factor	PEF	1.32E+09	m3/kg
Chemical Specific skin absorption defaults	ABS		
Inorganics	ABSin	0.01	unitless
Pesticides	ABSpest	0.05	unitless
Semi-Volatiles (Organics)	ABSsvoc	0.1	unitless
Volatiles (Organics)	ABSvoc	0.1	unitless
PAHs and PCBs	ABSpah	0.15	unitless
Adherence Factor	AF	0.07	mg/cm2

**Table 1-79**  
**Risk Calculation Worksheet for Deep Soil - Carcinogenic Effects - Construction Exposure Scenario - Future Construction Worker - Large Vacant Lot**  
 Baseline Human Health Risk Assessment  
 AMCO Chemical Superfund Site, Oakland, California

Exposure Scenario Information		Exposure Scenario:	Construction
Scenario Timeframe:	Chronic		
Exposure Medium:	Deep Soil		
Exposure Point:	OnSite		
Receptor Population:	Future Construction Worker		
Receptor Age:	Adult		
Exposure Scenario/Exposure Area Description			
Site Risks			

Exposure Parameter	Variable	Value	Units
Exposure Frequency	EF	250	day/yr
Exposure Duration	ED	1	yr
Soil Ingestion Rate	IR	330	mg/day
Inhalation Rate (Soil Particulate Inhalation)	InR	20	m3/day
Skin Surface Area (Soil Contact; 1 event per day)	SA_s	5.70E+03	cm2/day [soil]
Body Weight	BW	70	kg
Averaging Time for carcinogens	ATc	70	yr
Averaging Time for noncarcinogens	ATnc	1	yr
Conversion Factor (yr to day)	CF3	2.74E-03	yr/day
Conversion Factor (mg to kg)	CF4	1.00E-06	kg/mg
Particulate Emission Factor	PEF	1.32E+09	m3/kg
Chemical Specific skin absorption defaults	ABS		
Inorganics	ABSin	0.01	unitless
Pesticides	ABSpest	0.05	unitless
Semi-Volatiles (Organics)	ABSsvoc	0.1	unitless
Volatiles (Organics)	ABSvoc	0.1	unitless
PAHs and PCBs	ABSpah	0.15	unitless
Adherence Factor	AF	0.8	mg/cm2

Chemical of Potential Concern	RME Medium EPC Value, Cs [mg/kg]	Exposure Route = Oral			Exposure Route = Dermal			Exposure Route = Inhalation			Total Cancer Risk [-]
		Chronic Daily Intake [mg/kg/day]	Cancer Slope Factor, SF [mg/kg/day] <sup>-1</sup>	Cancer Risk [-]	Chronic Daily Intake [mg/kg/day]	Cancer Slope Factor, SF [mg/kg/day] <sup>-1</sup>	Cancer Risk [-]	Chronic Daily Intake [mg/kg/day]	Cancer Slope Factor, SF [mg/kg/day] <sup>-1</sup>	Cancer Risk [-]

**Notes:**  
 NA = no data; this toxicity value is not available in the standard U.S. EPA toxicity value databases.  
 RME = reasonable maximum exposure.  
 EPC = exposure point concentration.

**Total Estimated Carcinogenic Risk Across All Exposure Routes :**  
**2E-05**

**Table 1-80**  
**Risk Calculation Worksheet for Deep Soil - Noncarcinogenic Effects - Construction Exposure Scenario - Future Construction Worker - Large Vacant Lot**  
 Baseline Human Health Risk Assessment  
 AMCO Chemical Superfund Site, Oakland, California

Exposure Scenario Information	Exposure Scenario:	Construction
Scenario Timeframe:	Chronic	
Exposure Medium:	Deep Soil	
Exposure Point:	OnSite	
Receptor Population:	Future Construction Worker	
Receptor Age:	Adult	
Exposure Scenario/Exposure Area Description		
Site Risks		

Exposure Parameter (units)	Variable	Value	Units
Exposure Frequency	EF	250	day/yr
Exposure Duration	ED	1	yr
Soil Ingestion Rate	IR	330	mg/day
Inhalation Rate (Soil Particulate Inhalation)	InR	20	m3/day
Skin Surface Area (Soil Contact; 1 event per day)	SA_s	5.70E+03	cm2/day [soil]
Body Weight	BW	70	kg
Averaging Time for carcinogens	ATc	70	yr
Averaging Time for noncarcinogens	ATnc	1	yr
Conversion Factor (yr to day)	CF3	2.74E-03	yr/day
Conversion Factor (mg to kg)	CF4	1.00E-06	kg/mg
Particulate Emission Factor	PEF	1.32E+09	m3/kg
Chemical Specific skin absorption defaults	ABS		
Inorganics	ABSin	0.01	unitless
Pesticides	ABSpest	0.05	unitless
Semi-Volatiles (Organics)	ABSsvoc	0.1	unitless
Volatiles (Organics)	ABSvoc	0.1	unitless
PAHs and PCBs	ABSpah	0.15	unitless
Adherence Factor	AF	0.8	mg/cm2

**Table 1-111****Summary of Target Organ / Endpoint for Health Hazards***Baseline Human Health Risk Assessment**AMCO Chemical Superfund Site, Oakland, California*

<b>Chemical</b>	<b>Target Organ / Endpoint</b>	<b>Source</b>
1,2,4-Trimethylbenzene	Decreased body weight	PPRTV
1,3,5-Trimethylbenzene	Decreased body weight	PPRTV
2-Methylnaphthalene	Lungs	IRIS
4,4'-DDT	Liver	IRIS
Aldrin	Liver	IRIS
Aluminum	NA	PPRTV
alpha-Chlordane	Liver	IRIS
Antimony	Blood (glucose), Mortality	IRIS
Aroclor-1260*	Eyes	IRIS
Arsenic	Skin, Circulatory System	IRIS
Barium	Kidney	IRIS
Benzene	Immune system (decreased lymphocyte count)	IRIS
Beryllium	GI (Small intestinal lesions)	IRIS
Cadmium	Kidney	IRIS
Chlorobenzene	Liver	IRIS
Chloromethane	Brain (cerebellar lesions)	IRIS
cis-1,2-Dichloroethene	Decreased hematocrit and hemoglobin (Blood)	PPRTV
Copper	GI	HEAST
Dieldrin	Liver	IRIS
gamma-Chlordane	Liver	IRIS
Iron	Liver, Blood	NCEA
Manganese	CNS	IRIS
Mercury	CNS	IRIS
Naphthalene	Decreased body weight	IRIS
Nickel	Whole body	IRIS
Selenium	Respiratory system - selenosis	IRIS
Silver	Skin	IRIS
Tetrachloroethene	Kidney	OEHHA
Thallium**	Liver enzyme increase	IRIS
Toluene	Kidney	IRIS
Trichloroethene	Nervous system	NCEA
Vanadium	Respiratory system	NCEA
Vinyl chloride	Liver	IRIS
Xylenes, total	Decreased body weight, increased mortality	IRIS
Zinc	Red blood cells	IRIS

**Notes**

NA = Target organ data not available

\*Aroclor 1254 used as surrogate

\*\*Thallium chloride used as a surrogate

PPRTV = Provisional Peer Reviewed Toxicity Value

IRIS = Integrated Risk Information System

NCEA = National Center for Environmental Assessment

OEHHA = Office of Environmental Health Hazard Assessment

**Risk Calculation Worksheet for Groundwater - Carcinogenic Effects - Residential Exposure Scenario - Future Adult Resident**  
 Baseline Human Health Risk Assessment  
 AMCO Chemical Superfund Site, Oakland, California

Exposure Scenario Information	Exposure Scenario:		Residential Chronic Groundwater OnSite Future Adult Resident Adult
	Scenario Timeframe:	Receptor Age:	
	Exposure Medium:	Groundwater	
	Exposure Point:	OnSite	
	Receptor Population:	Future Adult Resident	
	Receptor Age:	Adult	
Exposure Scenario/Exposure Area Description			
	Exposure Frequency	EF	350 days/yr
	Exposure Time for dermal exposure	ET_d	0.58 hr/day
	Exposure Time for inhalation of volatiles	ET_i	24 hr/day
	Exposure Duration	ED	24 years
	Ingestion Rate	IngR	2 L/day
	Inhalation Rate	InhR	0.83 m <sup>3</sup> /hr
	Volatilization Factor	VFw	0.5 L/m <sup>3</sup>
	Skin Surface Area	SA	18000 cm <sup>2</sup>
	Body Weight	BW	70 kg
	Averaging Time for carcinogens	ATc	70 yr
	Averaging Time for noncarcinogens	ATnc	24 yr
	Conversion Factor 1	CF1	1.00E-03 L/cm <sup>3</sup>
	Conversion Factor 2	CF2	1.00E+06 cm <sup>3</sup> /m <sup>3</sup>
	Conversion Factor 3	CF3	2.74E-03 yr/day
	Constituent Specific Permeability Constant	Kp	Chemical Specific cm/hr

**Total Estimated Carcinogenic Risk Across All Exposure Routes : 8.2E-02**

**Notes:**  
 NA = One or more of the following: no toxicity value available in standard U.S. EPA toxicity value databases; no Kp value available; no Henry's Law constant.  
 RME = Reasonable maximum exposure.  
 EPC = Exposure point concentration.  
 NV = Chemical classified as Nonvolatile thus no CDI was calculated.

**Table 2-7**

Total Estimated Hazard Index Across All Exposure Routes : 484

**Notes:**  
 NA = One or more of the following: no toxicity value available in standard U.S. EPA toxicity value databases; no Kp value available; no Henry's Law constant  
 RME = Reasonable maximum exposure.  
 EPC = Exposure point concentration.  
 NV = Chemical classified as Nonvolatile thus no CDI was calculated.

**Table 2-8**  
**Risk Calculation Worksheet for Groundwater - Carcinogenic Effects - Residential Exposure Scenario - Future Child Resident**  
 Baseline Human Health Risk Assessment  
 AMCO Chemical Superfund Site, Oakland, California

Exposure Scenario Information	Residential
Exposure Scenario:	Chronic
Scenario Timeframe:	Groundwater
Exposure Medium:	OnSite
Exposure Point:	Future Child Resident
Receptor Population:	Child
Receptor Age:	
Exposure Scenario/Exposure Area Description	
Site Risks	

Exposure Parameter	Variable	Value	Units
Exposure Frequency	EF	350	days/yr
Exposure Time for dermal exposure	ET <sub>d</sub>	1.0	hr/day
Exposure Time for inhalation of volatiles	ET <sub>i</sub>	24	hr/day
Exposure Duration	ED	6	years
Ingestion Rate	IngR	1	L/day
Inhalation Rate	InhR	0.42	m <sup>3</sup> /hr
Volatilization Factor	Vf-w	0.5	L/m <sup>3</sup>
Skin Surface Area	SA	6600	cm <sup>2</sup>
Body Weight	BW	15	kg
Averaging Time for carcinogens	ATc	70	yr
Averaging Time for noncarcinogens	ATnc	6	yr
Conversion Factor 1	CF1	1.00E-03	L/cm <sup>3</sup>
Conversion Factor 2	CF2	1.00E+06	cm <sup>3</sup> /m <sup>3</sup>
Conversion Factor 3	CF3	2.74E-03	yr/day
Constituent Specific Permeability Constant	Kp	Chemical Specific	cm/hr

Total Estimated Carcinogenic Risk Across All Exposure Routes : 4.8E-02

**Notes:**  
 NA = One or more of the following: no toxicity value available in standard U.S. EPA toxicity value databases; no Kp value available; no Henry's Law constant.  
 RME = Reasonable maximum exposure.  
 EPC = Exposure point concentration.  
 NV = Chemical classified as Nonvolatile thus no CDI was calculated.

**Table 2-9**  
**Risk Calculation Worksheet for Groundwater - Noncarcinogenic Effects - Residential Exposure Scenario - Future Child Resident**  
 Baseline Human Health Risk Assessment  
 AMCO Chemical Superfund Site, Oakland, California

Exposure Scenario Information	Residential	
	Exposure Scenario: Chronic	Residential
Scenario Timeframe: Groundwater	Chronic	
Exposure Medium: OnSite	Groundwater	
Exposure Point: Future Child Resident	OnSite	
Receptor Population: Child	Future Child Resident	
Receptor Age:	Child	
<b>Exposure Scenario/Exposure Area Description</b>		
Site Risks		

Exposure Parameter	Variable	Value	Units
Exposure Frequency	EF	350	days/yr
Exposure Time for dermal exposure	ET_d	1	hr/day
Exposure Time for inhalation of volatiles	ET_i	24	hr/day
Exposure Duration	ED	6	years
Ingestion Rate	IngR	1	L/day
Inhalation Rate	InhR	0.42	m <sup>3</sup> /hr
Volatilization Factor	VfW	0.5	L/m <sup>3</sup>
Skin Surface Area	SA	6600	cm <sup>2</sup>
Body Weight	BW	15	kg
Averaging Time for carcinogens	ATc	70	yr
Averaging Time for noncarcinogens	ATnc	6	yr
Conversion Factor 1	CF1	1.00E-03	L/cm <sup>3</sup>
Conversion Factor 2	CF2	1.00E+06	cm <sup>3</sup> /m <sup>3</sup>
Conversion Factor 3	CF3	2.74E-03	yr/day
Constituent Specific Permeability Constant	Kp	Specific	cm/hr

			<b>Total Hazard Index:</b>	2.76E+02			1.48E+02			<b>Total Hazard Index:</b>	7.29E+02	1.15E+03

Notes: NA = One or more of the following: no toxicity value available in standard U.S. EPA toxicity value databases; no Kp value available; no Henry's Law constant. RME = Reasonable maximum exposure. EPC = Exposure point concentration. NV = Chemical classified as Nonvolatile thus no CDI was calculated.

<b>Total Estimated Carcinogenic Risk Across All Exposure Routes : 1.5E-04</b>										

**Total Estimated Carcinogenic Risk Across All Exposure Routes : 1.5E-04**

**Notes:**  
 NA = One or more of the following: no toxicity value available in standard U.S. EPA toxicity value databases; no Kp value available; no Henry's Law constant.  
 RME = Reasonable maximum exposure.  
 EPC = Exposure point concentration.

**Table 2-13**  
**Risk Calculation Worksheet for Groundwater - Noncarcinogenic Effects - Construction Exposure Scenario - Trench Worker**  
 Baseline Human Health Risk Assessment  
 AMCO Chemical Superfund Site, Oakland, California

Exposure Scenario/Exposure Area Description		Exposure Parameter	Variable	Value	Units

**ORGANICS**

If  $t_{event} \leq t^*$ :

$$DA_{event,1} = 2 \times FA \times K_p \times C_v \sqrt{\frac{6 \times \tau \times t_{event}}{\pi}}$$

If  $t_{event} > t^*$ :

$$DA_{event,2} = FA \times K_p \times C_v \left[ \frac{t_{event}}{1+B} + 2 \times \tau \times \left( \frac{1+3B+3B^2}{(1+B)^2} \right) \right]$$

**INORGANICS**

$$DA_{event} = K_p \times C_v \times t_{event}$$

$$DAD = \frac{DA_{event} \times EV \times ED \times EF \times SA}{BW \times AT \times 365 \text{ days/year}}$$

$$\log K_p = -2.8 + 0.66 \log K_{ow} - 0.0056 MW$$

$$B = K_p \frac{\sqrt{MW}}{2.6}$$

If  $B \leq 0.6$  then  $t^* = 2.4 \tau$

If  $B > 0.6$  then  $t^* = 6b \sqrt{b^2 - c^2} \tau$

$$b = \frac{2}{\pi} (1+B)^2 - c$$

$$c = \frac{1+3B+3B^2}{3(1+B)}$$

$$\log \frac{D_{sc}}{l_{sc}} = -2.80 - 0.0056 MW$$

$$\tau = \frac{l_{sc}^2}{6 D_{sc}}$$

**Table 2-17**  
 Model for Estimating Dermal Exposure from Contact with Chemicals in Water - Future Child Resident  
 Baseline Human Health Risk Assessment  
 AMCO Chemical Superfund Site, Oakland, California

Source: EPA, 2004, RAGS Part E

**ORGANICS**

If  $t_{event} \leq t^*$ :

$$DA_{eventL1} = 2 \times FA \times K_p \times C_v \times \sqrt{\frac{6 \times \tau \times \text{MW}}{\text{BW} \times AT \times 365 \text{ days/year}}}$$

If  $t_{event} > t^*$ :

$$DA_{eventL2} = FA \times K_p \times C_v \left[ \frac{t_{event}}{1+B} + 2 \times \tau \times \text{MW} \times \left( \frac{1+3B+3B^2}{(1+B)^2} \right) \right]$$

**INORGANICS**

$$DA_{event} = K_p \times C_v \times t_{event}$$

$$DAD = \frac{DA_{event} \times EV \times ED \times EF \times SA}{BW \times AT \times 365 \text{ days/year}}$$

$$\log K_p = -2.8 + 0.666 \log K_{ow} - 0.0056 MW$$

$$B = K_p \frac{\sqrt{MW}}{2.6}$$

If  $B \leq 0.6$  then  $t^* = 24 \tau$

If  $B > 0.6$  then  $t^* = 6 \left( b - \sqrt{b^2 - c^2} \right) \tau$

$$b = \frac{2}{\pi} (1+B)^2 - c$$

$$c = \frac{1+3B+3B^2}{3(1+B)}$$

$$\log \frac{D_{sc}}{I_{sc}} = -2.80 - 0.0056 MW$$

$$\tau = \frac{I_{sc}^2}{6 D_{sc}}$$

**ORGANICS**

If  $t_{event} \leq t^*$ :

$$DA_{event,1} = 2 \times FA \times K_p \times C_v \times \sqrt{\frac{6 \times \tau \times t_{event}}{\pi}}$$

If  $t_{event} > t^*$ :

$$DA_{event,2} = FA \times K_p \times C_v \times \left[ \frac{t_{event}}{1+B} + 2 \times \tau \times \sqrt{\frac{1+3B+3B^2}{(1+B)^2}} \right]$$

**INORGANICS**

$$DA_{event} = K_p \times C_v \times t_{event}$$

$$DAD = \frac{DA_{event} \times EV \times ED \times EF \times SA}{BW \times AT \times 365 \text{ days/year}}$$

$$\log K_p = -2.8 + 0.66 \log K_{ov} - 0.0056 MW$$

$$B = K_p \frac{\sqrt{MW}}{2.6}$$

$$\text{If } B \leq 0.6 \text{ then } t^* = 2.4 \tau$$

$$\text{If } B > 0.6 \text{ then } t^* = 6 \left( b - \sqrt{b^2 - c^2} \right) \tau$$

$$b = \frac{2}{\pi} (1+B)^2 - c$$

$$c = \frac{1+3B+3B^2}{3(1+B)}$$

$$\log \frac{D_{sc}}{I_{sc}} = -2.80 - 0.0056 MW$$

$$\tau = \frac{I_{sc}^2}{6 D_{sc}}$$

**Table 2-19**  
**Emissions to Air from Standing Water**  
 Baseline Human Health Risk Assessment  
 AMCO Chemical Superfund Site, Oakland, California

Source: CalEPA, DTSC, 2004.

Emissions equation:

$$E_i = K_i \times A_w \times C_w$$

$E_i$	Emissions from liquid surface (mg/s)
$K_i$	Overall mass transfer coefficient (cm/s)
$C_w$	Concentration in liquid phase (mg/cm <sup>3</sup> )
$A_w$	Bottom area of the trench covered with contaminated water (cm <sup>2</sup> )

Overall Mass Transfer Coefficient:

$$\frac{1}{K_i} = \frac{1}{k_{iL}} + \frac{RT}{k_{iG} H_i}$$

$K_i$	overall mass transfer coefficient (cm/s)
$k_{iL}$	liquid-phase mass transfer coefficient (cm/s)
$k_{iG}$	gas-phase mass transfer coefficient (cm/s)
R	gas constant, 8.25x10 <sup>5</sup> (atm-m <sup>3</sup> /mol-K)
T	average temperature (K)
$H_i$	Henry's Law constant (atm-m <sup>3</sup> /mol)

Chemical	Concentration in Water (mg/L)	Concentration in Water (mg/cm <sup>3</sup> )	Henry's Law Constant (atm-m <sup>3</sup> /mol)	$k_{iL}$	$k_{iG}$	1/ $K_i$	$K_i$ (cm/s)	E (mg/s)

## Notes:

<sup>a</sup> Trench dimensions are assumed to be 10 ft x 10 ft with 70% water coverage in the bottom of the trench

- The Henry's Law Constant value for 1,2,4-trichlorobenzene was used for 1,2,3-trichlorobenzene.

- The Henry's Law Constant value for m-xylene was used for m,p-xylenes.

- The Henry's Law Constant value for 1,3-dichloropropene was used for cis-1,3-dichloropropene and trans-1,3-dichloropropene.

**Table 2-20**  
**Mass Transfer Coefficient Calculations - Water to Air**  
 Baseline Human Health Risk Assessment  
 AMCO Chemical Superfund Site, Oakland, California

Liquid-phase mass transfer coefficient

Gas-phase mass transfer coefficient

$$k_{iL} = \sqrt{\frac{MW_{O_2}}{MW_i}} \times \frac{T}{298} \times k_{L,O_2}$$

$$k_{iG} = \left(\frac{MW_{H_2O}}{MW_i}\right)^{0.335} \times \left(\frac{T}{298}\right)^{1.005} \times k_{G,H_2O}$$

MW <sub>O<sub>2</sub></sub>	Molecular Weight of Oxygen, g/mol	3.20E+01
MW <sub>i</sub>	Chemical specific molecular weight, g/mol	chemical specific
T <sup>a</sup>	Average Temperature, K	298
k <sub>L,O<sub>2</sub></sub>	Liquid-phase mass transfer coefficient for oxygen at 25°C, cm/s	0.002

<sup>a</sup> The average temperature is assumed to be 25°C.

MW <sub>H<sub>2</sub>O</sub>	Molecular weight of water, g/mol	18
MW <sub>i</sub>	Chemical specific molecular weight, g/mol	chem specific
T <sup>a</sup>	Average Temperature, K	298
k <sub>G,H<sub>2</sub>O</sub>	Gas phase mass transfer coefficient for water vapor at 25°C, cm/s	8.33E-01

<sup>a</sup> The average temperature is assumed to be 25°C.

**Table 2-21**  
**Calculation of Concentration in Air from Emissions from Water**  
 Baseline Human Health Risk Assessment  
 AMCO Chemical Superfund Site, Oakland, California

Source: CalEPA, DTSC, 2004.

Description	Symbol	Value	Units	Comments
Mixing Height (adult breathing zone)	H	1.83	m	DTSC, 2006
Assumed velocity of air in the trench	u	0.152	m/s	DTSC, 2006
Width of trench perpendicular to wind direction	W	3.05	m	DTSC, 2006
Conversion factor	CF	1000	ug/mg	

$$C_{air} = \frac{E_i \times CF}{u \times H \times W}$$

Chemical	Total emission rate, E <sub>i</sub> (mg/s)	Concentration of VOCs in breathing zone, C <sub>air</sub> (ug/m <sup>3</sup> )

NA = Target organ data not available

- 1) Total Hazard Index includes all chemicals evaluated including those chemicals not shown. Only the top ten contributors are presented.
- 2) For chemicals having multiple target organ or system effects, only the first target organ/endpoint listed was used to calculate cumulative effects.

**Notes:**

Results greater than the screening level are bolded.

1 Screening levels are specific concentrations of chemicals that are considered health protective for human populations (including sensitive populations). See Table 3-1 (Ambient and Crawlspace Air Screening Levels) for source of screening levels.

2 Acute Reference Exposure Levels developed by Office of Environmental Health Hazard Assessment as of May 2000

3 West Oakland background results are from the Oakland-Filbert Street ambient air sampling station monitored by the Bay Area Air Quality Management District, located at 2419 Filbert Street (approximately one mile northeast, or crosswind, of the AMCO site); the result is from December 2002.

4 Neighborhood background results are from samples collected at 329 Lewis Street (upwind of the AMCO site) in the morning and afternoon of the same day.

FD field duplicate  
 ND not detected above the laboratory's reporting limit shown in parentheses  
 NE not established  
 J estimated value

**Notes:**

Results greater than the screening level are bolded.

1 Screening levels are specific concentrations of chemicals that are considered health protective for human populations (including sensitive populations). See Table 3-1 (Ambient and Crawlspace Air Screening Levels) for source of screening levels.

2 Acute Reference Exposure Levels developed by Office of Environmental Health Hazard Assessment as of May 2000

3 West Oakland background results are from the Oakland-Filbert Street ambient air sampling station monitored by the Bay Area Air Quality Management District, located at 2419 Filbert Street (approximately one mile northeast, or crosswind, of the AMCO site); the result is from December 2002.

4 Neighborhood background results are from samples collected at 329 Lewis Street (upwind of the AMCO site) in the morning and afternoon of the same day.

**Notes:**

Results greater than the screening level are bolded.

1 Screening levels are specific concentrations of chemicals that are considered health protective for human populations (including sensitive populations). See Table 3-1 (Ambient and Crawlspace Air Screening Levels) for source of screening levels.

2 Acute Reference Exposure Levels developed by Office of Environmental Health Hazard Assessment as of May 2000

3 West Oakland background results are from the Oakland-Filbert Street ambient air sampling station monitored by the Bay Area Air Quality Management District, located at 2419 Filbert Street (approximately one mile northeast, or crosswind, of the AMCO site); the result is from December 2002.

4 Neighborhood background results are from samples collected at 322 Lewis Street (upwind of the AMCO site) in the morning and afternoon of the same day.

**Notes:**

Results greater than the screening level are bolded.

<sup>1</sup>Screening levels are specific concentrations of chemicals that are considered health protective for human populations (including sensitive populations). See Table 3-1 (Ambient and Crawlspace Air Screening Levels) for source of screening levels.

<sup>2</sup>Acute Reference Exposure Levels developed by Office of Environmental Health Hazard Assessment as of May 2000

<sup>3</sup>West Oakland background results are from the Oakland-Filbert Street ambient air sampling station monitored by the Bay Area Air Quality Management District, located at 2419 Filbert Street (approximately one mile northeast, or crosswind, of the AMCO site); the result is from December 2002.

<sup>4</sup>Neighborhood background results are from samples collected at 322 Lewis Street (upwind of the AMCO site) in the morning and afternoon of the same day.

ND not detected above the laboratory's reporting limit shown in parentheses

**Notes:**

Results greater than the screening level are bolded.

<sup>1</sup>Screening levels are specific concentrations of chemicals that are considered health protective for human populations (including sensitive populations). See Table 3-1 (Ambient and Crawlspace Air Screening Levels) for source of screening levels.

<sup>2</sup>Acute Reference Exposure Levels developed by Office of Environmental Health Hazard Assessment as of May 2000

<sup>3</sup>West Oakland background results are from the Oakland-Filbert Street ambient air sampling station monitored by the Bay Area Air Quality Management District, located at 2419 Filbert Street (approximately one mile northeast, or crosswind, of the AMCO site); the result is from December 2002.

<sup>4</sup>Neighborhood background results are from samples collected at 322 Lewis Street (upwind of the AMCO site) in the morning and afternoon of the same day.

**Notes:**

Results greater than the screening level are bolded.

1 Screening levels are specific concentrations of chemicals that are considered health protective for human populations (including sensitive populations). See Table 3-1 (Ambient and Crawlspace Air Screening Levels) for source of screening levels.

2 Acute Reference Exposure Levels developed by Office of Environmental Health Hazard Assessment as of May 2000

3 West Oakland background results are from the Oakland-Filbert Street ambient air sampling station monitored by the Bay Area Air Quality Management District, located at 2419 Filbert Street (approximately one mile northeast, or crosswind, of the AMCO site); the result is from December 2002.

4 Neighborhood background results are from samples collected at 322 Lewis Street (upwind of the AMCO site) in the morning and afternoon of the same day.

Soil Gas Screening Levels  
 Human Health Risk Assessment  
 AMCO Chemical Superfund Site, Oakland, California

Analyte	Screening Level	Units	Source	Notes
<b>Volatile Organic Compounds</b>				
n-Heptane	2,100	µg/m <sup>3</sup>	Surrogate	n-Hexane was used as the surrogate
n-Propylbenzene	1,500	µg/m <sup>3</sup>	10 x EPA Region 9 Ambient Air PRG	
Styrene	11,000	µg/m <sup>3</sup>	10 x EPA Region 9 Ambient Air PRG	
Tetrachloroethene	3.2	µg/m <sup>3</sup>	10 x EPA Region 9 Ambient Air PRG	
Tetrahydrofuran	9.9	µg/m <sup>3</sup>	10 x EPA Region 9 Ambient Air PRG	
Toluene	4,000	µg/m <sup>3</sup>	10 x EPA Region 9 Ambient Air PRG	
Total hexanes	2,100	µg/m <sup>3</sup>	Surrogate	n-Hexane was used as the surrogate
trans-1,2-Dichloroethene	730	µg/m <sup>3</sup>	10 x EPA Region 9 Ambient Air PRG	
trans-1,3-Dichloropropene	4.8	µg/m <sup>3</sup>	10 x EPA Region 9 Ambient Air PRG	
Trichloroethene	0.17	µg/m <sup>3</sup>	10 x EPA Region 9 Ambient Air PRG	
Vinyl acetate	2,100	µg/m <sup>3</sup>	10 x EPA Region 9 Ambient Air PRG	
Vinyl chloride	1.1	µg/m <sup>3</sup>	10 x EPA Region 9 Ambient Air PRG	
Xylenes, total	1,100	µg/m <sup>3</sup>	10 x EPA Region 9 Ambient Air PRG	

**Notes:**

EPA Region 9 ambient air PRGs were last updated in October 2004 and are based on target cancer risk level of 10<sup>-6</sup> or a noncancer hazard quotient of 1.

Screening levels for soil gas are calculated by multiplying ambient air PRGs by an attenuation factor of 10 (EPA 2002).

NDRI not detected in soil gas during the Remedial Investigation phase

PRG Preliminary Remediation Goal

µg/m<sup>3</sup> micrograms per cubic meter

**TABLE 3-23**

Residential Soil Gas Results Summary (September 2004)  
Human Health Risk Assessment  
*AMCO Chemical Superfund Site, Oakland, California*

---

<b>Analyte</b>	<b>Units</b>	<b>Backyard Soil Gas Levels</b>	<b>Screening Levels<sup>(1)</sup></b>
1,1-Dichloroethane	µg/m <sup>3</sup>	< 2.8 - 17	12
Benzene	µg/m <sup>3</sup>	2.2 - 3.6	2.5
Chloroform	µg/m <sup>3</sup>	< 3.3 - 32	0.83
Tetrachloroethene	µg/m <sup>3</sup>	< 4.6 - 680	3.2
Trichloroethene	µg/m <sup>3</sup>	< 0.15 - 230	0.17

---

**Notes:**

Only compounds detected above screening levels are shown

<sup>(1)</sup> Screening levels for soil gas are calculated by multiplying ambient air PRGs by an attenuation factor of 10 (Attenuation factor for shallow soil gas is taken from EPA Draft Guidance for Evaluating the Vapor Intrusion to Indoor Air Pathway from Groundwater and Soils, November 2002, page 28).

µg/m<sup>3</sup> micrograms per cubic meter

**TABLE 3-31**

Residential Soil Gas Results Summary (May 2005)  
Human Health Risk Assessment  
*AMCO Chemical Superfund Site, Oakland, California*

---

<b>Analyte</b>	<b>Units</b>	<b>Backyard Soil Gas Levels</b>	<b>Screening Levels<sup>(1)</sup></b>
1,1,2,2-Tetrachloroethane	µg/m <sup>3</sup>	< 0.2 - < 0.52	0.33
Chloroform	µg/m <sup>3</sup>	1.1 - < 12	0.83
Tetrachloroethene	µg/m <sup>3</sup>	< 5 - 46	3.2

---

**Notes:**

Only compounds detected above screening levels are shown

<sup>(1)</sup> Screening levels for soil gas are calculated by multiplying ambient air PRGs by an attenuation factor of 10 (Attenuation factor for shallow soil gas is taken from EPA Draft Guidance for Evaluating the Vapor Intrusion to Indoor Air Pathway from Groundwater and Soils, November 2002, page 28).

µg/m<sup>3</sup> micrograms per cubic meter

**TABLE 3-36**

Residential Soil Gas Results Summary (November 2006)  
Human Health Risk Assessment  
*AMCO Chemical Superfund Site, Oakland, California*

---

<b>Analyte</b>	<b>Units</b>	<b>Backyard Soil Gas Levels</b>	<b>Screening Levels<sup>(1)</sup></b>
Chloroform	µg/m <sup>3</sup>	< 0.64 - 9	0.83
Tetrachloroethene	µg/m <sup>3</sup>	0.84 - 42	3.2
Trichloroethene	µg/m <sup>3</sup>	0.041 - 98	0.17

---

**Notes:**

Only compounds detected above screening levels are shown

<sup>(1)</sup> Screening levels for soil gas are calculated by multiplying ambient air PRGs by an attenuation factor of 10  
(Attenuation factor for shallow soil gas is taken from EPA Draft Guidance for Evaluating the Vapor  
Intrusion to Indoor Air Pathway from Groundwater and Soils, November 2002, page 28).

µg/m<sup>3</sup> micrograms per cubic meter

**TABLE 3-44**

1428 3rd Street Analytical Results - Soil (October 2006)  
Human Health Risk Assessment  
AMCO Chemical Superfund Site, Oakland, California

**Notes:**

Results greater than the screening level are bolded.

1 Screening levels are specific concentrations of chemicals that are considered health protective for human populations (including sensitive populations). See Table 16b (Soil Screening Levels) for source of screening levels.

2 Oakland background results are from background metal concentration studies conducted by the Lawrence Berkeley National Laboratory Environmental Restoration Program, 1995. Samples were taken from locations representing the Colluvian and Fill geologic unit.

3 1ft bgs samples were collected between 0.5 and 1ft bgs

4 3ft bgs samples were collected between 2.5 and 3 ft bgs

5 For Arsenic, 0.062 mg/kg is the cancer endpoint; 22 mg/kg is the noncancer endpoint.

FD field duplicate

ft bgs feet below ground surface

mg/kg milligrams per kilogram

ND not detected above the laboratory's reporting limit shown in parentheses

J estimated value

J+ estimated value, possible high bias

R rejected for failure to meet quality control requirements

**TABLE 3-45**

1432 3rd Street Analytical Results - Soil (October 2006)  
Human Health Risk Assessment  
AMCO Chemical Superfund Site, Oakland, California

**Notes:**

Results greater than the screening level are bolded.

1 Screening levels are specific concentrations of chemicals that are considered health protective for human populations (including sensitive populations). See Table 16b (Soil Screening Levels) for source of screening levels.

2 Oakland background results are from background metal concentration studies conducted by the Lawrence Berkeley National Laboratory Environmental Restoration Program, 1995. Samples were taken from locations representing the Colluvian and Fill geologic unit.

3 1ft bgs samples were collected between 0.5 and 1ft bgs

4 3ft bgs samples were collected between 2.5 and 3 ft bgs

5 For Arsenic, 0.062 mg/kg is the cancer endpoint; 22 mg/kg is the noncancer endpoint.

FD field duplicate

ft bgs feet below ground surface

mg/kg milligrams per kilogram

ND not detected above the laboratory's reporting limit shown in parentheses

J estimated value

J+ estimated value, possible high bias

R rejected for failure to meet quality control requirements

**TABLE 3-46**

1436 3rd Street Analytical Results - Soil (October 2006)  
Human Health Risk Assessment  
AMCO Chemical Superfund Site, Oakland, California

**Notes:**

Results greater than the screening level are bolded.

1 Screening levels are specific concentrations of chemicals that are considered health protective for human populations (including sensitive populations). See Table 16b (Soil Screening Levels) for source of screening levels.

2 Oakland background results are from background metal concentration studies conducted by the Lawrence Berkeley National Laboratory Environmental Restoration Program, 1995. Samples were taken from locations representing the Colluvian and Fill geologic unit.

3 1ft bgs samples were collected between 0.5 and 1ft bgs

4 3ft bgs samples were collected between 2.5 and 3 ft bgs

5 For Arsenic, 0.062 mg/kg is the cancer endpoint; 22 mg/kg is the noncancer endpoint.

ft bgs feet below ground surface

mg/kg milligrams per kilogram

ND not detected above the laboratory's reporting limit shown in parentheses

J estimated value

J+ estimated value, possible high bias

**TABLE 3-47**

326 Center Street Analytical Results - Soil (October 2006)  
Human Health Risk Assessment  
AMCO Chemical Superfund Site, Oakland, California

**Notes:**

Results greater than the screening level are bolded.

1 Screening levels are specific concentrations of chemicals that are considered health protective for human populations (including sensitive populations). See Table 16b (Soil Screening Levels) for source of screening levels.

2 Oakland background results are from background metal concentration studies conducted by the Lawrence Berkeley National Laboratory Environmental Restoration Program, 1995. Samples were taken from locations representing the Colluvian and Fill geologic unit.

3 1ft bgs samples were collected between 0.5 and 1ft bgs

4 3ft bgs samples were collected between 2.5 and 3 ft bgs

5 For Arsenic, 0.062 mg/kg is the cancer endpoint; 22 mg/kg is the noncancer endpoint.

FD field duplicate

ft bgs feet below ground surface

mg/kg milligrams per kilogram

ND not detected above the laboratory's reporting limit shown in parentheses

J estimated value

J+ estimated value, possible high bias

R rejected for failure to meet quality control requirements

**TABLE 3-48**

356 Center Street Analytical Results - Soil (October 2006)  
Human Health Risk Assessment  
AMCO Chemical Superfund Site, Oakland, California

**Notes:**

Results greater than the screening level are **bolded**.

1 Screening levels are specific concentrations of chemicals that are considered health protective for human populations (including sensitive populations). See Table 16b (Soil Screening Levels) for source of screening levels.

2 Oakland background results are from background metal concentration studies conducted by the Lawrence Berkeley National Laboratory Environmental Restoration Program, 1995. Samples were taken from locations representing the Colluvian and Fill geologic unit.

3 1ft bgs samples were collected between 0.5 and 1ft bgs

4 3ft bgs samples were collected between 2.5 and 3 ft bgs

5 For Arsenic, 0.062 mg/kg is the cancer endpoint; 22 mg/kg is the noncancer endpoint.

FD field duplicate

ft bgs feet below ground surface

mg/kg milligrams per kilogram

ND not detected above the laboratory's reporting limit shown in parentheses

J estimated value

J- estimated value, low bias

J+ estimated value, possible high bias

R rejected for failure to meet quality control requirements

**TABLE 3-49**

360 Center Street Analytical Results - Soil (October 2006)  
Human Health Risk Assessment  
AMCO Chemical Superfund Site, Oakland, California

**Notes:**

Results greater than the screening level are bolded.

1 Screening levels are specific concentrations of chemicals that are considered health protective for human populations (including sensitive populations). See Table 16b (Soil Screening Levels) for source of screening levels.

2 Oakland background results are from background metal concentration studies conducted by the Lawrence Berkeley National Laboratory Environmental Restoration Program, 1995. Samples were taken from locations representing the Colluvian and Fill geologic unit.

3 1ft bgs samples were collected between 0.5 and 1ft bgs

4 3ft bgs samples were collected between 2.5 and 3 ft bgs

5 For Arsenic, 0.062 mg/kg is the cancer endpoint; 22 mg/kg is the noncancer endpoint.

ft bgs feet below ground surface

mg/kg milligrams per kilogram

ND not detected above the laboratory's reporting limit shown in parentheses

J estimated value

J+ estimated value, possible high bias

Lead **	mg/kg	26.2 - 53000	194 / 340
Naphthalene	mg/kg	0.021 - 2.8	1.7

**Notes:**

Only compounds detected above screening levels are shown

<sup>(1)</sup> EPA Region 9 Preliminary Remediation Goals for soil, October 2004.

\* For Arsenic, 0.062 mg/kg is the cancer endpoint; 22 mg/kg is the noncancer endpoint.

\*\* For Lead: Lead screening level in soil was evaluated using Department Toxic Substance Control's Lead Risk Assessment Spreadsheet Version 7 (Lead Spread 7, Cal/EPA 1999). Screening level including homegrown produce pathway: 194 mg/kg. Screening level excluding homegrown produce pathway: 340 mg/kg.

mg/kg milligrams per kilogram

**TABLE 3-55**

Residential Produce and Adjacent Soil Results Summary (October 2006)  
Human Health Risk Assessment  
*AMCO Chemical Superfund Site, Oakland, California*

<b>Analyte</b>	<b>Units</b>	<b>Residential Produce Levels</b>	<b>Screening Levels<sup>(1)</sup></b>
Arsenic *	mg/kg	0.06 - 0.08	0.062 / 22
Chromium	mg/kg	0.39 - 1.07	210
Lead **	mg/kg	0.15 - 8.47	194 / 340

Notes:

<sup>(1)</sup> EPA Region 9 Preliminary Remediation Goals for residential soil, October 2004.

\* For Arsenic, 0.062 mg/kg is the cancer endpoint; 22 mg/kg is the noncancer endpoint.

\*\* For Lead: Lead screening level in soil was evaluated using Department Toxic Substance Control's Lead Risk Assessment Spreadsheet Version 7 (Lead Spread 7, Cal/EPA 1999). Screening level including homegrown produce pathway: 194 mg/kg. Screening level excluding homegrown produce pathway: 340 mg/kg.

mg/kg milligrams per kilogram

**TABLE 3-56**

1432 3rd Street Analytical Results - Produce and Adjacent Soil Samples (October 2006)

Human Health Risk Assessment

*AMCO Chemical Superfund Site, Oakland, California*

## Notes:

Deep samples were collected between 2.5 and 3 ft below ground surface.

\* For Arsenic, 0.062 mg/kg is the cancer endpoint; 22 mg/kg is the noncancer endpoint.

\*\* For Lead: Lead screening level in soil was evaluated using Department Toxic Substance Control's Lead Risk Assessment Spreadsheet Version 7 (Lead Spread 7, Cal/EPA 1999). Screening level including homegrown produce pathway: 194 mg/kg. Screening level excluding homegrown produce pathway: 340 mg/kg.

Produce results were compared to Soil Screening Levels.

Results greater than the screening level are bolded.

Screening levels are specific concentrations of chemicals that are considered health protective for human populations (including sensitive populations). See Soil Screening Level table for source of screening levels.

Shallow samples 1ft bgs samples were collected between 0.5 and 1ft below ground surface.

mg/kg milligrams per kilogram

NA not analyzed

NC not collected

ND not detected above the laboratory's reporting limit shown in parentheses

J estimated value

J+ estimated value, possible high bias

R rejected for failure to meet quality control requirements

**TABLE 3-57**

1436 3rd Street Analytical Results - Produce and Adjacent Soil Samples (October 2006)

Human Health Risk Assessment

*AMCO Chemical Superfund Site, Oakland, California*

## Notes:

Deep samples were collected between 2.5 and 3 ft below ground surface.

\* For Arsenic, 0.062 mg/kg is the cancer endpoint; 22 mg/kg is the noncancer endpoint.

\*\* For Lead: Lead screening level in soil was evaluated using Department Toxic Substance Control's Lead Risk Assessment Spreadsheet Version 7 (Lead Spread 7, Cal/EPA 1999). Screening level including homegrown produce pathway: 194 mg/kg. Screening level excluding homegrown produce pathway: 340 mg/kg.

Produce results were compared to Soil Screening Levels.

Results greater than the screening level are bolded.

Screening levels are specific concentrations of chemicals that are considered health protective for human populations (including sensitive populations). See Soil Screening Level table for source of screening levels.

Shallow samples 1ft bgs samples were collected between 0.5 and 1ft below ground surface.

FD field duplicate

mg/kg milligrams per kilogram

NA not analyzed

NC not collected

ND not detected above the laboratory's reporting limit shown in parentheses

J estimated value

R rejected for failure to meet quality control requirements

J+ estimated value, possible high bias

tert-Butyl alcohol	ND (0.21) R	ND (0.065)	ND (0.056)	13,000	mg/kg
Tetrachloroethene	ND (0.023)	ND (0.0032)	ND (0.0028)	0.48	mg/kg
Toluene	ND (0.02)	ND (0.0032)	ND (0.0028)	520	mg/kg
trans-1,2-Dichloroethene	ND (0.029)	ND (0.0032)	ND (0.0028)	69	mg/kg
trans-1,3-Dichloropropene	ND (0.018)	ND (0.0032)	ND (0.0028)	0.78	mg/kg
Trichloroethene	ND (0.039)	ND (0.0032)	ND (0.0028)	0.053	mg/kg
Vinyl chloride	ND (0.043)	ND (0.0032)	ND (0.0028)	0.079	mg/kg
Xylenes, total	ND (0.038)	ND (0.0065)	ND (0.0056)	270	mg/kg

**TABLE 3-59**

360 Center Street Analytical Results - Produce and Adjacent Soil Samples (October 2006)

Human Health Risk Assessment

*AMCO Chemical Superfund Site, Oakland, California*

## Notes:

Deep samples were collected between 2.5 and 3 ft below ground surface.

\* For Arsenic, 0.062 mg/kg is the cancer endpoint; 22 mg/kg is the noncancer endpoint.

\*\* For Lead: Lead screening level in soil was evaluated using Department Toxic Substance Control's Lead Risk Assessment Spreadsheet Version 7 (Lead Spread 7, Cal/EPA 1999). Screening level including homegrown produce pathway: 194 mg/kg. Screening level excluding homegrown produce pathway: 340 mg/kg.

Produce results were compared to Soil Screening Levels.

Results greater than the screening level are bolded.

Screening levels are specific concentrations of chemicals that are considered health protective for human populations (including sensitive populations). See Soil Screening Level table for source of screening levels.

Shallow samples 1ft bgs samples were collected between 0.5 and 1ft below ground surface.

CS composite

FD field duplicate

mg/kg milligrams per kilogram

NA not analyzed

NC not collected

ND not detected above the laboratory's reporting limit shown in parentheses

J estimated value

J+ estimated value, possible high bias

R rejected for failure to meet quality control requirements
