Report of Study for Anomalies @ Aerojet Facility

Dear Dameon & Bruce,

Herein lies the report of anomaly scan at Rancho Cordova project last week.

The site appeared dry and long grass covered a hill and hummock sloping from north down to the road. A dirt track boarded the eastern limit.

In the interest of safety long boots protected from possible snakes and long sleeved shirts from ticks and the sun. Water breaks were taken each hour for 10 minutes; no shade was available.

Using an electro-magnetic transmitter we determined that phone lines ran approximately 3ft to 8 ft west of the track in north/south direction. A dry creek ran east to west near the north portion of an area to survey of approximately 4 acres.

After scanning the area in six foot intervals using reflective induction we had determined five or six anomalies.

Each area of concern was then checked using ground penetrating radar and determinations made and noted on site.

These included: 1) Buried coil of wire 2) buried sign board 3) discarded vehicle part and unknown small items only determined by visible checking

None of the anomalies had signatures typical of underground storage tanks (UST).
