1.0 INTRODUCTION

This Annual Report (Report) has been prepared by C2 REM on behalf of the Del Amo Respondents to summarize the Operations, Maintenance and Monitoring (OM&M) activities conducted at the Del Amo Waste Pits Operable Unit (Waste Pits) site, pursuant to requirements in the *Administrative Order (AO) for Remedial Action, Docket No. 99-08, Del Amo Waste Pits Operable Unit, Torrance, California*, United States Environmental Protection Agency (USEPA), May 3, 1999 and the *Operations, Maintenance and Monitoring Manual for the Del Amo Waste Pits Operable Unit, Torrance, California*, Parsons Engineering Science, March 12, 1999 (OM&M Manual). This Report provides a summation of the OM&M activities conducted from January 2007 through December 2007 at the Waste Pits during the eighth year of operation of the Phase I remedy (e.g., multi-layer cap, soil vapor monitoring probes) and the first year operation of the Phase II remedy (i.e., Soil Vapor Extraction/Insitu Biodegradation Technology System [SVE/IBT System]).

This Report includes discussions on:

- 1) Inspections (pursuant to both quarterly requirements and post rain events) of the cover system, drainage systems, Cap Gas Collection and Treatment System (Cap Gas System), SVE/IBT System and general physical site characteristics;
- 2) Monument survey results;
- 3) Assessments of field-observed benzene concentrations within the Cap Gas System;
- 4) Monthly perimeter well monitoring;
- 5) OM&M of the soil vapor treatment technology; and
- 6) Summaries of maintenance and repairs.

The remainder of this Report is outlined in the following sections:

- 2.0 Site History
- 3.0 Inspections
- 4.0 Monument Survey Event
- 5.0 Cap Gas System Operation and Monitoring
- 6.0 SVE/IBT Operation and Monitoring
- 7.0 Monthly Perimeter Well Monitoring
- 8.0 Routine Maintenance
- 9.0 Repairs
- 10.0 Conclusions and Recommendations
- 11.0 References

2.0 SITE HISTORY

The Waste Pits are located in Los Angeles County, California and include Lots 36 and 37 of the Los Angeles County Assessor's Map. The Waste Pits property is located between

Vermont Avenue (to the east) and Normandie Avenue (to the west) (see Figure 1.0). The northern boundary of the property is a Los Angeles Department of Water and Power easement, and the southern boundary is Del Amo Boulevard. One major petroleum and petrochemical pipeline corridor is located within the property on the southern boundary of the Waste Pits property.

The Waste Pits include two adjoining parcels of land (Lots 36 and 37), which contained six small rectangular pits (2-series pits) and three large rectangular impoundments (1-series pits) (see Figure 2.0). Both the 1-series and the 2-series pits were used for the disposal of wastes and waste liquids during operation of a synthetic rubber manufacturing facility. The 2-series pits were located on the western side of Lot 36 and the 1-series pits, 1-B and 1-C, were located on the eastern side of Lot 36. Immediately east of Lot 36 is Lot 37, which contains a former large, rectangular impoundment, designated as Pit 1-A. Impacted soils from Pit 1-A were excavated in four phases from 1982 –1984 to a depth of 6 feet at the east side of the pit and to a depth of 25 feet at the west side of the pit. This excavation process was completed under the direction of the California Department of Health Services, with jurisdiction for the Waste Pits under California Environmental Protection Agency's (CAL EPA) Department of Toxic Substances Control (DTSC).

As outlined in the *Remedial Design Work Plan, Del Amo Pits Operable Unit, Torrance, California*, Dames and Moore, June 30, 1998, the USEPA provided oversight for the construction and installation of the Phase I remedy including installation of the SVE wells (a component of the proposed Phase II remedy). The Phase I remedy, which was performed on the 2-series pits and 1-series pits 1-B and 1-C, consisted of a Resource Conservation and Recovery Act (RCRA) equivalent multi-layer cap, soil vapor monitoring probes, the Cap Gas System, security fences, deed restrictions, and surface and subsurface drainage features. During 2006, the treatment technology for site vapor was selected, designed, and installed. The Phase II Remedy, which is the SVE/IBT System, was placed into optimization testing and full-time operation in August 7, 2006.

3.0 INSPECTIONS

Quarterly inspections with the USEPA, DTSC, or their designee were conducted quarterly in accordance with the OM&M Manual (Section 4.0) on February 16, 2007, May 9, 2007, August 20, 2007 and December 20, 2007 for the cover system, the Cap Gas System, the SVE/IBT System, surface and subsurface water drainage systems, security fences, and access roads (see Appendix A).

Additionally, the SVE well heads, which are capped with blank tee flanges and are not currently connected to the SVE/IBT System, were inspected and monitored for leaks utilizing a Photo Ionization Detector (PID) calibrated to benzene. These inspections are conducted quarterly and will continue at this frequency throughout the SVE/IBT System's operations (see OM&M Manual, Section 6.2.1).

Finally, C2 REM conducted a post rain inspection event on December 3, 2007 to identify matters of concern or areas of needed repair. Post rain inspection events are conducted

following periods of “heavy rainfall,” defined as every rainfall of 1-inch or greater within a 24-hour period. The inspection forms used during this inspection are presented in Appendix A.

3.1 SUMMARY OF COVER SYSTEM INSPECTION EVENTS

During the cover system inspection events, no unusual or significant settlement, erosion, sediment build-up, slope instability, or shifting was observed. A few areas exhibited some evidence of burrowing animals, which were tended to during routine site maintenance. Additionally, some areas of the cover system exhibited stressed vegetation due to especially dry conditions in 2007. In response to stressed vegetation, a temporary above ground irrigation system was installed to assist with re-establishing the cover system vegetation. The results of the C2 REM cover system inspection events are presented in Table 1.0. Given that this is the eighth year of operation, a survey of the monuments shall not take place until 2010.

3.2 SUMMARY OF CAP GAS SYSTEM INSPECTION EVENTS

Inspection of the Cap Gas System included observations of the above ground components including: air intake and outlet collection headers, inlet and outlet valves, hoses and fittings, two 55-gallon carbon canisters, extraction blower, sampling ports, and a moisture separator canister. The results of the Cap Gas System inspection events are presented in Table 2.0. C2 REM did not observe any significant repair/maintenance issues with the Cap Gas System.

3.3 SUMMARY OF SURFACE AND SUBSURFACE DRAINAGE INSPECTION EVENTS

The concrete lined drainage swales, catch basins, and drainage culverts were checked by C2 REM to identify the presence of cracks, soil slumping, sediment build-up, separation, and the accumulation of vegetative debris (see Tables 3.0 and 4.0). The results of the surface and subsurface drainage inspection events show no significant issues with cracking, soil slumping, sediment build-up, separation, and accumulation of vegetation.

3.4 SUMMARY OF SECURITY FENCE AND ACCESS ROAD INSPECTION EVENTS

Visual inspections of the security fence and gates were performed to identify breaks, settlement damage, loose tension, and corrosion (see Table 5.0). The gravel access road was inspected to identify dispersion of gravel, vegetation overgrowth, and excessive growth. C2 REM did not observe any significant repair issues regarding the access road (see Table 6.0). There was one event of excessive dispersion of gravel recorded on February 16, 2007, which was repaired during routine maintenance. Breaks, damage, and general signs of deterioration of the perimeter fence were repaired as part of routine maintenance.

3.5 SUMMARY OF SVE/IBT INSPECTION EVENTS

Inspection of the SVE/IBT System included visual assessments of system condition as well as mechanical assessments on an as-needed basis. Visual inspections were conducted on above ground components and included the following:

- SVE wellheads;
- Ball valves;
- Sampling ports;
- Fittings;
- Carbon absorber vessels;
- Blowers A & B;
- Oxygen generator; and,
- System sensors.

After the first three months of operations, inspections were conducted every quarter to ensure reliability of all SVE/IBT System components. C2 REM did not observe any significant repair issues regarding the SVE/IBT System and the components listed above except for a few of the system sensors which experienced sensor failures and calibration issues (see Table 7.0). Sensors that needed repair were returned to the manufactures and re-installed following corrective measures. (note: due to the location and type of sensor, the SVE/IBT System remained operational during sensor repair periods).

4.0 MONUMENT SURVEY EVENT

After completion of the final cover, eight survey monuments were installed at various locations to monitor and track historical ground movement and settlement. The general location of each survey monument is provided on Figure 2.0. C2 REM conducted the last monument survey event on January 10, 2005. These results were compared to the baseline event conducted in 2000 and the comparison showed the cap did not undergo any significant settlement or grade adjustments. Pursuant to the OM&M Manual, after primary consolidation has been reached, the monument survey frequency shall be every 5 years. Therefore, the next monument survey event is scheduled for the first quarter of 2010.

5.0 CAP GAS SYSTEM OPERATION AND MONITORING

5.1 OBJECTIVES

C2 REM conducted the Cap Gas System monitoring activities pursuant to the requirements as approved by the USEPA and as presented in the report entitled *Cap Gas Collection and Treatment Baseline Monitoring and Long-term Monitoring Recommendations Report, Del Amo Waste Pits Operable Unit, Los Angeles County, California*, C2 REM, December 2000. These monitoring activities were conducted to assess the efficiency of the Cap Gas System in the collection and treatment of fugitive

soil vapor emissions from the sand layer within the cap. The Cap Gas System operates for 4 hours a day, 5 days a week.

5.2 BI-MONTHLY CAP GAS SYSTEM MONITORING RESULTS

In an effort to assess the efficiency and performance of the carbon units of the Cap Gas System, bi-monthly monitoring was conducted from four sample locations (i.e., system influent [#1], effluent of the lead carbon vessel [#2], effluent of the secondary carbon vessel [#3], and system effluent [#4]). During bi-monthly monitoring, a site-dedicated PID (calibrated to benzene) was used to measure total Volatile Organic Compound (VOC) concentrations at each of the four sample locations. As indicated in Table 8.0, influent sample readings ranging from 0.4 parts per million (ppm) to 10.2 ppm, and system effluent readings ranging from 0.0 ppm to 2.5 ppm were recorded during 2007. As outlined in the OM&M Manual and the USEPA-approved carbon bed change-out protocol, system effluent readings greater than 5 ppm require action to assure that the Cap Gas System is operating in compliance. The low concentrations detected at the Cap Gas System effluent demonstrate that the carbon is efficient in controlling VOC emissions (see Figure 3.0). The forms used to record results of the bi-monthly Cap Gas System monitoring events are presented in Appendix B.

The guidelines established for carbon change-out of the Cap Gas System state that when VOC concentrations at the effluent are greater than 5 ppm and/or when the lead vessel efficiency (in relation to the system influent) falls within Zone 2 for two consecutive monitoring events or Zone 3 (see Figure 4.0), carbon shall be replaced. Based on the aforementioned protocol, the carbon did not need to be changed out in 2007.

5.3 CONFIRMATION SAMPLING

C2 REM, with the approval of the USEPA (December 4, 2002), has modified the scope and frequency of the Cap Gas System annual confirmation sampling event. The frequency of the confirmation sampling event has been changed from an annual program to once every 5 years. In addition, South Coast Air Quality Management District (SCAQMD) Method 25.1 has been eliminated from the required list of analyses for collected Cap Gas System samples due to the lack of relevant information obtained from the method, as well as the redundancy of using both SCAQMD Method 25.1 and USEPA Method TO14 (the latter of which provides an adequately detailed analysis of site Constituents of Concern (COC) and other related compounds).

Based on the approved scope and frequency for confirmation sampling, the next sampling event will be conducted during the second quarter of 2010 (to coincide with the second 5-year review) and thereafter in 2015.

6.0 SVE/IBT OPERATION AND MONITORING

6.1 OVERVIEW

The SVE/IBT System was placed into optimization testing and full-time operation in August 7, 2006. C2 REM conducted SVE/IBT System monitoring activities pursuant to the requirements, as approved by the USEPA and as presented in the Report entitled *SVE/IBT Operations, Maintenance and Monitoring Manual*, C2 REM, January 2006. Additional information regarding the design and construction of the SVE/IBT System can be found in the following documents:

- *Remedial Design Work Plan Addendum*, C2 REM 2005
- *SVE/IBT Pre-Final Design Report Addendum*, C2 REM 2005
- *Process Hazard Analysis Report*, Webb, Murray, & Associates 2005
- *SVE/IBT Operations, Maintenance, & Monitoring Manual*, C2 REM 2006
- *SVE/IBT Final Design Report*, C2 REM 2006
- *SVE/IBT Construction Quality Assurance Plan*, C2 REM 2006
- *SVE/IBT Remedial Action Workplan*, C2 REM 2006

6.2 SVE/IBT SYSTEM

The SVE/IBT System treatment technology combines extraction, re-injection, biodegradation, and adsorption to meet the Record of Decision objectives which:

- Protect groundwater from contaminants that migrate out of the pits;
- Protect groundwater from contaminants that migrate out of the vadose zone soil below the pits, and;
- Protect groundwater from contaminants in the soils below the pits in the event that the water table rises into contaminated soil.

The SVE/IBT System final design includes injection at four SVE wells (3, 4, 8, and 9) and extraction at nine SVE wells (1, 2, 5, 6, 7, 10, 11, 12, and 20A) in sequence to enhance the natural aerobic degradation observed within the vadose zone.

Construction of the SVE/IBT System began on February 27, 2006 and was completed on April 28, 2006. The pre-system startup period occurred from May 1, 2006 through August 4, 2006. Pre-system startup activities included testing and troubleshooting as well as diagnosis of any malfunction or non-responsiveness of the system's Programmable Logic Controller (PLC) unit and machinery such as the blowers, oxygen generator, automated check valves, sensors, and devices.

On August 7, 2006, Short-Term OM&M activities began, which included operation and full-scale monitoring of the SVE/IBT System. The SVE/IBT System normally operates 8 hours per day (8:00 am – 4:00 pm), 5 days per week (Monday – Friday). The SVE/IBT System is controlled via a PLC System with capabilities for remote start and stop as well

as alarm/emergency shutdown protocols. The results of both the pre-system and short-term operations are presented in the *Summary of SVE/IBT Pre-System Startup Operations Technical Memorandum*, C2 REM, February 2007 and the *Summary of SVE/IBT 3-Month Short-Term Operations Technical Memorandum*, C2 REM, December 2006.

On November 8, 2006, Short-Term Operations ended and the SVE/IBT System has been in long-term OM&M since that date. The frequency of monitoring the SVE/IBT System was weekly in 2007 with monthly lab results taken from the four SVE/IBT System sample stations.

The four SVE/IBT System sample stations are as follows:

- Station 1 - Influent: the inlet (the combined flow of the nine extraction wells);
- Station 2 - Post Ambient Air: the diversion loop (to the Granulated Activated Carbon [GAC] beds) just after the ambient air intake;
- Station 3 - Carbon Vessel 1 (C₁): at the effluent of the primary GAC bed; and
- Station 4 - Effluent: the effluent stack.

These four measurement points were monitored for VOCs, Oxygen (O₂), Carbon Dioxide (CO₂), and flow rate using hand-held monitoring equipment, and corresponding inline measurements from the PLC System were also recorded where applicable.

Based on laboratory results, the benzene concentrations at the inlet ranged from 9,300 to 33,000 ppm with an average of 22,664 ppm. The benzene concentrations at post ambient air ranged from non-detected (ND) to 5,400. The benzene concentrations at the outlet of C₁ ranged from 2.9 to 3,600 ppm. The benzene concentrations at the effluent ranged from ND to 3.4 ppm with all but one sample reporting below laboratory detection limits (see Table 9.0). Benzene concentrations at Stations 1-4 demonstrated that the SVE/IBT System was effective in controlling lower explosive limit (LEL) conditions and maintaining acceptable emission limits (i.e., less than 50 ppm) (see Figure 5.0).

Additionally, full-scale monitoring was conducted quarterly from all cluster, vacuum performance wells, and SVE injection and extraction wells for pressure, LEL, VOCs, O₂, and CO₂ using hand-held monitoring equipment. A more detailed discussion regarding the OM&M activities for the SVE/IBT System can be found in the *1-Year SVE/IBT Operations Technical Memorandum*, which is included in Appendix C of this Report for completeness.

7.0 MONTHLY PERIMETER WELL MONITORING

C2 REM conducted monthly field monitoring of the perimeter monitoring wells in 2007. The procedures for monitoring the perimeter wells included measuring well pressure (inches of water), purging the appropriate pore volume (see Table 10.0), analyzing vapors from each well with a PID calibrated to benzene and a RKI Eagle that measures O₂, LEL, CO₂, and Hydrogen Sulfide. Oxygen concentrations ranged from 9.5 to 20.9% with an average of 18.0%. Carbon Dioxide concentrations ranged from 0.0 to 9.3% with an

average of 3.2%. Pressures ranged from -0.5 to 0.08 inches of water with an average of -0.03 inches of water (see Table 11.0). VOC concentrations measured with a PID ranged from 0.0 to 11.1 ppm with an average of 0.18 ppm. The VOC concentration of 11.1 ppm was detected at Perimeter Monitoring Well C on May 17, 2007. The VOC concentrations detected at Perimeter Monitoring Well C during other monthly monitoring events in 2007 ranged from 0.0 to 0.2 ppm, most likely indicating that the observed May 17, 2007 concentration was an anomaly.

The continued low concentrations of VOC's detected at the perimeter wells indicate good control of injected air volumes, the cover system is performing as designed, and the contaminated soil vapors are not migrating beyond the cap boundaries (see Figure 6.0).

8.0 ROUTINE MAINTENANCE

8.1 OBJECTIVES

C2 REM conducted routine system maintenance to: 1) assure that the integrity of the completed containment system is maintained; 2) reduce the probability of malfunction; 3) provide a mechanism for early detection of system failures; 4) repair identified system failures; and 5) ensure the efficient management of OM&M activities (see Appendix D for Field Daily Reports/Completed Maintenance Forms).

8.2 COVER SYSTEM

Routine maintenance of the cover system included control of weeds, vegetation (turf height), and burrowing animals. Regularly scheduled mowing of the California grass mix on the cap and the surrounding areas has maintained the required turf height (maximum grass height of one foot) and helped control potential fire outbreaks by eliminating the build-up of dry grass thatch. The occurrence of burrowing animals has been regulated via pest control companies in order to prevent damage to the cover system. Due to a particularly dry year, the issues of stressed vegetation were addressed with the installation of an above ground irrigation system in July 2007 which has been operated routinely.

8.3 GAS COLLECTION AND TREATMENT SYSTEM

C2 REM conducted bi-monthly visual observations of the Cap Gas System's above ground components and onsite system enclosure to identify potential maintenance requirements and/or repairs. Routine maintenance items conducted on the Cap Gas System included painting system components that regularly exhibit rust build-up, replacement of sample ports, and change-out of carbon canisters. Additionally, C2 REM staff routinely accessed and viewed the PLC viewer to assure that the mechanical components of the blower motor and control unit are operating as designed to reduce the probability of malfunction.

8.4 SVE/IBT SYSTEM

C2 REM conducted weekly visual observations of the SVE/IBT System above ground components and onsite system enclosure to identify potential maintenance requirements and/or repairs. Routine maintenance items conducted on the SVE/IBT System included replacement of sample ports, change-out of carbon vessels, and the calibration of in-line sensors. Additionally, C2 REM staff routinely accessed and viewed the PLC viewer to assure that the mechanical components of the blow motor, oxygen generator, automated check valves, and in-line sensors are operating as designed to reduce the probability of malfunctions.

8.5 SURFACE AND SUBSURFACE DRAINAGE SYSTEMS

As part of the scheduled landscape and maintenance of the site cover system, the surface and subsurface drainage systems were routinely inspected for any cracking, spalling, settlement, and/or debris build-up. C2 REM regularly cleaned the surface drainage swales and catch basins of any vegetative debris or sediment build-up. Gravel dispersion observed during February 16, 2007 quarterly inspection was repaired as part of the normal property maintenance. No additional maintenance or repair of the surface and subsurface drainage systems was required in 2007.

8.6 ACCESS ROAD

The gravel access road was routinely inspected for the dispersion of gravel and/or vegetation overgrowth. The access road was regularly cleared of encroaching vegetative material during scheduled landscape maintenance activities. There was one event of excessive dispersion of gravel recorded on February 16, 2007, which was repaired during routine maintenance. No additional maintenance or repair of the existing gravel access road was required in 2007.

8.7 SECURITY AND PERIMETER FENCE

The perimeter fence was routinely inspected for damage as part of the normal property maintenance. C2 REM regularly repaired sections of the perimeter fence exhibiting breaks or structural damage in 2007.

8.8 ON-SITE TRAILERS

C2 REM observed several incidents of vandalism to the on-site trailer. The proper authorities were notified and the on-site trailer exterior was repaired and repainted. During this maintenance, unrelated to the vandalism that took place, C2 REM also repaired leaks and repainted the interior of the on-site trailer in 2007. Shortly after, four surveillance cameras were installed on property to provide additional security to equipment and employees on-site.

9.0 REPAIRS

9.1 OBJECTIVES

In an effort to ensure the integrity of the implemented remedy, C2 REM regularly identified and repaired failed or non-functional components of the Phase I & Phase II remedies pursuant to Section 10.0 of the OM&M Manual.

9.2 REQUIRED REPAIRS

The cover system as well as other systems subject to inspection and assessment did not require any significant repairs. Minor repair issues (i.e., fence repair, trailer repair, gravel dispersion, and system component repairs due to sensor malfunctions) were completed during routine and non-routine maintenance at the Waste Pits (see Appendix D). In-line sensors and components of the SVE/IBT System that required repair were returned to the manufacture and subsequently re-installed following corrective measures.

10.0 CONCLUSIONS AND RECOMMENDATIONS

Following the eighth year of operation of the Phase I remedy (e.g., multilayer cap, soil vapor monitoring probes) and the first year operation of the Phase II remedy (i.e., SVE/IBT System), the Waste Pits are in good condition and the implemented remedies are functioning as designed. Regularly scheduled inspections, monitoring, and maintenance activities have assisted in the early identification of possible repair issues with limited system operation interruption. Issues requiring action were quickly identified, assessed, and rectified in 2007. Minor concerns will continue to be closely monitored in 2008 during routine and non-routine inspections.

The current inspection requirements and bi-monthly monitoring frequency of the Cap Gas System appears appropriate and no modification is proposed. The cover system and the other associated systems have performed well during the eighth year of operation, and the required inspection requirements and monitoring frequency are adequate to assess whether the remedies for the Waste Pits are functioning as designed.

The analysis of the collected data indicates that the SVE/IBT System is performing at a level consistent with design parameters. A more detailed discussion regarding the OM&M activities for the SVE/IBT System and recommendations can be found in the 1-Year SVE/IBT Operations Technical Memorandum located in Appendix C of this Report.

Survey data suggests that primary consolidation has been reached; therefore, the next monument survey event is scheduled for the year 2010. Further inspections and monitoring activities for 2008 shall be conducted in accordance with the schedule provided on Table 12.0.

3 = Slight (Continue Observing)

2 = Moderate (Needs Scheduled Repair)

1 = Poor (Needs Immediate Repair)

Table 2.0
Cap Gas Collection Treatment Inspection Summary
Del Amo Waste Pits

Cap Gas Collection Treatment System					
Inspection Date	February 16, 2007	May 9, 2007	August 20, 2007	December 3, 2007	December 20, 2007
Inspection Type	1st Quarterly Inspection	2nd Quarterly Inspection	3rd Quarterly Inspection	Post Rain Inspection	4th Quarterly Inspection
Inspection Items					
<i>Collection System Valves</i>					
<i>Adequate Free Movement</i>	4	4	4	4	4
<i>Seals-Complete</i>	4	4	4	4	4
<i>Signs of Rust/Corrosion</i>	3	3	3	3	3
<i>Condensate Collection</i>					
<i>Air Moisture Separator</i>	4	4	4	4	4
<i>Carbon Adsorbers-Vessels</i>					
<i>Exterior Damage</i>	4	4	4	4	4
<i>FRP Grating and Mesh</i>	4	4	4	4	4
<i>Blower ⁽¹⁾</i>					
<i>General Motor Maintenance</i>	4	4	4	4	4
<i>Drive Maintenance</i>	4	4	4	4	4
<i>Bearing Maintenance</i>	4	4	4	4	4
<i>Lubrication</i>	4	4	4	4	4
<i>Structural Maintenance</i>	4	4	4	4	4

(1) Blower and motor are permanently lubricated and sealed units.

Conditions/Remarks Key:

4 = Satisfactory

3 = Slight (Continue Observing)

2 = Moderate (Needs Scheduled Repair)

1 = Poor (Needs Immediate Repair)

Table 3.0
Surface Water Drainage Inspection Summary
Del Amo Waste Pits

Surface Water Drainage					
Inspection Date	February 16, 2007	May 9, 2007	August 20, 2007	December 3, 2007	December 20, 2007
Inspection Type	1st Quarterly Inspection	2nd Quarterly Inspection	3rd Quarterly Inspection	Post Rain Inspection	4th Quarterly Inspection
Inspection Items					
<i>Washouts or Erosion of Contoured Grade</i>	4	4	4	4	4
<i>Ponding on Contoured Grade</i>	4	4	4	4	4
<i>Gullies and Ruts on Contoured Grade</i>	4	4	4	4	4
<i>Plugging of Drainage Culverts ⁽¹⁾</i>	3	4	4	4	4
<i>Holes and Cracks in Swales or Catch Basins</i>	4	4	4	4	4
<i>Sediment Build-Up in Swales or Catch Basins ⁽¹⁾</i>	4	3	4	4	4
<i>Surface Cracking of Swales/Catch Basins</i>	4	4	4	4	4
<i>Spalling of Swales/Catch Basins</i>	4	4	4	4	4
<i>Structural Failure of Swales/Catch Basins</i>	4	4	4	4	4

(1) Repair/maintenance completed during routine maintenance.

Conditions/Remarks Key:

4 = Satisfactory

3 = Slight (Continue Observing)

2 = Moderate (Needs Scheduled Repair)

1 = Poor (Needs Immediate Repair)

Table 4.0
Subsurface Drainage Inspection Summary
Del Amo Waste Pits

Subsurface Drainage					
Inspection Date	February 16, 2007	May 9, 2007	August 20, 2007	December 3, 2007	December 20, 2007
Inspection Type	1st Quarterly Inspection	2nd Quarterly Inspection	3rd Quarterly Inspection	Post Rain Inspection	4th Quarterly Inspection
Inspection Items					
<i>Holes and Cracks in Swales, Catch Basin</i>	4	4	4	4	4
<i>Plugging of Drainage Inlets</i>	3	4	4	4	4
<i>Sediment Build-Up or Debris in Catch Basin</i>	4	4	4	4	4
<i>Structural Failure of Catch Basin</i>	4	4	4	4	4

Note: Surface and subsurface drainage system components were regularly cleaned of any debris.

Conditions/Remarks Key:

4 = Satisfactory

3 = Slight (Continue Observing)

2 = Moderate (Needs Scheduled Repair)

1 = Poor (Needs Immediate Repair)

CZ REM FIELD DAILY REPORT

PROJECT NAME: DEL ANA PITS PAGE 1 OF 1
OBJECT NUMBER: 97-101 DATE: 2/16/07
WEATHER: Temperature ~75°F Winds: — Precipitation: —
DESCRIPTION OF THE WORK: 1ST QUARTERLY INSPECTION / SENSOR TROUBLESHOOTING

8:30 ARRIVE ONSITE WITH IAN YUSKO AND SHINTA AIZAWA
- MARC SMITH ARRIVES ON SITE
- JACK KEENR ARRIVES ON SITE
- BEGIN WORKING ON WIRING OF SENSORS
- ALL PRO FENCING ARRIVES ON SITE TO PUT UP A CANOPY OVER THE ENCLOSURE
- ABLE TO REWIRE AND RUN ALL SENSORS EXCEPT FOR FLOW METER 1 AT THE DIVERSION LOOP
- DECIDE TO SEND IN FLOWMETER 1 AT THE END OF THE DAY FOR RECALIBRATION OR POSSIBLY REPAIR

10:45 - ED BOURKE ARRIVES ON SITE WITH GEORGE LANDRETH
- SAFOUH SAYED ARRIVES ON SITE WITH ANOTHER DTSC REPRESENTATIVE
- CHRIS FROM CH2MHILL ARRIVES ONSITE
- ALL PRESENT GO ON A SITE WALK TO CHECK PERIMETER FENCE
- EVERYONE WALKS TO DEL ANO PARK TO CHECK ON SEWER REPAIR ACTIVITIES AT THAT SITE
- CONTINUE 1ST QUARTERLY INSPECTION OF SITE
- SEE RESULTS ON ATTACHED PAGE

12:00 LUNCH BREAK

13:00 BACK ONSITE
- TAKE FLOW METER 1 OFF PIPELINE AND SEAL CONNECTION
- TAKE FLOW METER 1 DIGITAL PANEL OFF

14:00 OFFSITE

FIELD DAILY REPORT

PROJECT NAME: DEL AMO PITS PAGE 1 OF 1
PROJECT NUMBER: 97-101 DATE: 5/9/2007
WEATHER: Temperature ~ 85° Winds: — Precipitation: —

DESCRIPTION OF THE WORK: MEET W/ CENTER ELECTRIC; 2nd Quarterly Site Inspection

9:15 ARRIVE ONSITE WITH IAN VUSKO

- CLEAN TRAILER OF LOOSE ITEMS ON FLOOR
- DRIVE TO FRONT OF SITE NEXT TO DRIVEWAY
- PUT AWAY HOSE OUTSIDE OF "SEA-TRAIN"

10:15 - CENTER ELECTRIC ARRIVES ON SITE

- JESSIE ASKS TO SEE WHICH LAMP POST IS OUT
- GO TO ENCLOSURE TO CHECK LAMP POST
- I GO TO THE TRAILER TO PURGE TEDLAR BAGS

- IAN ASSISTS JESSE WITH THE TALL LADDER NEEDED TO ACCESS THE LAMP
- JESSE INSPECTS LIGHTBULB AND WIRING

11:30 - ED BOURKE AND GEORGE LANDRETH ON SITE

- SITE WALK W/ ED BOURKE + GEORGE LANDRETH
- GEORGE LANDRETH ASKS QUESTION ABOUT THE SYSTEM

12:00 ED BOURKE AND GEORGE LANDRETH LEAVE SITE

- JESSIE SAYS THAT HE FIXED A LOOSE WIRE PROBLEM WITH THE LAMP POST AND THAT HE NEEDED TO PICK UP A LIGHT BULB FROM THE CENTER ELECTRIC OFFICE IN RIVERSIDE

12:30 CENTER ELECTRIC OFFSITE

DESCRIPTION OF THE WORK: 4th Quarter Site Inspection

9:00 am: arrive on-site and met Bill Broadlove CH2MHill to conduct 4th Quarter Inspection Event

- Conduct site walk and observe components of remedy system including:

- Cover System
- GCTS
- SUE/IBT System
- Perimeter Fence
- Access Road
- Subsurface/^{Surface} Drainage System

- No identified issues of concern. Component systems are in good shape and performing as designed.

- Field staff on-site conducting 4th Quarter Full Scale Monitoring Event

- As part of the 4th Quarter Monitoring Event all of the flanges of SUE Wells are snuffed with AFO (No issues)

C2 REM FIELD DAILY REPORT

PROJECT NAME: Del Amo Pits

PAGE 1 OF 2

PROJECT NUMBER: 97-101

DATE: 02/15/07

WEATHER: Temperature ~70° Winds: —

Precipitation: —

DESCRIPTION OF THE WORK: Bimonthly Monitoring / Troubleshooting of sensors.

10:30 RT/IY/SA arrive onsite.

RT/SA start checking inline sensors installed on 02/14/07.
IY start bimonthly monitoring of GCTS system.

[Bimonthly Monitoring]

- Vapor samples pulled using pump/Lung system and 1L of Tedlar bags from ports 1~4
- VOCs monitored with MINIRAE 2000 PID (1) calibrated to 50ppm benzene
- Flow rates monitored with Velocicalc
- Temperatures monitored with in-line gauge

Ports	VOCs	Flow	Temp.
4	0.4	inlet	152
3	0.8	outlet	188
2	0.9		
1	0.8		

[Troubleshooting of Sensors]

At station 1, O₂ sensors show 16~17% on its display, but PLC panel show 25% and does not move at all. LEL sensor show negative value.
At station 4, O₂ sensors ~~do~~ does not show anything on its display although PLC panel show some value.
At station 5, O₂ sensor has the same problem as at station 1

RT/SA check all wirings and connections.

Around 12:30 pm, We had blackout in the facilities. RA shut down PLC computer, Electricity backup around 2:30 pm.

DESCRIPTION OF THE WORK: INSTALL NEW PLC POWER SOURCE, ENCLOSURE MONITORING,
MEETING WITH GREG FROM AKINS ABOUT COMPUTER PROBLEMS

7.30 AM IY ARRIVE ONSITE TO MEET ROBERT FROM PRIME SYSTEMS. ROBERT INSTALLED NEW ALLEN BRADLEY POWER SOURCE.

8.15 AM SM ARRIVED ONSITE W/MONITORING EQUIPMENT.

9.00 AM STARTED THE SYSTEM AGAIN & EVERYTHING WORKING FINE, WITH THE EXCEPTION OF 2 INLINE O₂ SENSORS

10.00 AM IY, SM MONITORED THE ENCLOSURE GCTS & IBT SYSTEMS.

12.00 GREG FROM AKINS ONSITE TO TROUBLESHOOT COMPUTER, RECONNECT TO M-DRIVE & REBOOT COMPUTER FOR REMOTE SURVEILLANCE.

1 PM GREG off site.

2.30 SM off site.

IY REMAINED ONSITE TO WORK ON THE COMPUTER & TRY TO FIX THE O₂ SENSORS.

4.30 IY off site.

1-YEAR SVE/IBT OPERATIONS TM

TECHNICAL MEMORANDUM

SUBMITTED TO: Dante Rodriguez, US Environmental Protection Agency (USEPA)

SUBMITTED BY: Edmond Bourke, C2 REM

DATE: June 3, 2008

SOIL VAPOR EXTRACTION/INSITU BIODEGRADATION TECHNOLOGY 1-YEAR LONG-TERM OPERATIONS, MAINTENANCE AND MONITORING PERIOD DEL AMO WASTE PITS OU

1.0 INTRODUCTION

This Technical Memorandum has been prepared to present the summary of the 1-Year Long-Term Operations, Maintenance and Monitoring (OM&M) activities for the Soil Vapor Extraction/Insitu Biodegradation Technology System (SVE/IBT System) installed at the Waste Pits area of the Del Amo Superfund Site (Site) located in Torrance, California (see Figure 1.0). The SVE/IBT System utilizes the existing extraction/monitoring well network to extract vapors at the outer edges of the Waste Pits and inject re-circulated vapors along with generated oxygen gas to allow for enhanced vadose zone biodegradation, to comply with the Record of Decision (ROD). The ROD cleanup goal is to prevent the migration of contaminants, primarily benzene, from the Waste Pits such that they do not contribute a 0.5% increase in concentration to the existing impacted groundwater underlying the Waste Pits. While benzene is not the only constituent detected on the Site, it is detected in concentrations substantially above others (monthly laboratory results taken from the SVE/IBT system's inlet station for benzene average 22,664 parts per million [ppm] while ethylbenzene and toluene average 685 ppm and 464 ppm, respectively, during this period) and given that the current SVE/IBT System performance parameters are chemical specific, benzene was selected for this purpose.

For reporting purposes, the 1-Year Long-Term OM&M period for the SVE/IBT System began on November 9, 2006 and ended on December 31, 2007. The SVE/IBT System was operated in accordance with the design scenario presented in the *SVE/IBT Final Design Report* (C2 REM, 2006). The information collected during this period, includes field notes (see Attachment A), laboratory data (see Attachment B [CD ROM]), and in-line sensor data (see Attachment C [CD ROM]), which are discussed in detail in the following sections. The analysis of the collected information indicates that the SVE/IBT System is performing at a level consistent with design parameters.

2.0 LONG TERM OM&M OPERATING SUMMARY

During the 1-Year Long-Term OM&M period from November 9, 2006 through December 31, 2007, the SVE/IBT System operated for approximately 2096 hours with the oxygen (O₂) generator operating a total of 1177 hours. Total estimated operating parameters are as follows:

- Injected re-circulated air volume - approximately 5,206,464 standard cubic feet (scf) at an average flow rate of 41.4 standard cubic feet per minute (scfm).
- Generated oxygen gas injected - approximately 451,968 scf at an average flow rate of 6.4 scfm and 91% purity.
- Extracted air volume - approximately 6,791,040 scf at an average flow rate of 54 scfm.
- Treated air volume - approximately 1,584,576 scf at an average flow rate of 12.6 scfm.

Based on the results obtained from the 2006 respiration test (i.e., oxygen saturation and decreased O₂ utilization rates), C2 REM tested various operating scenarios during the 1-Year Long-Term OM&M period including:

- The O₂ generator was operated until the subsurface O₂ concentration, measured by an in-line O₂ meter at the inlet of the SVE/IBT system, was approximately 18.0 % to 19.0 % and then was shutoff in order to observe oxygen utilization rates at various oxygen levels. The objective of this testing was to determine what level of oxygen in the subsurface provides for the highest rates of oxygen utilization.
- The O₂ generator was pulsed with a 6-7 day on/off cycle for approximately 6 weeks during September and October 2007 to observe any significant changes in the oxygen utilization rate.
- The SVE/IBT system and O₂ generator were operated throughout a weekend in July 2007 to observe potential benefits of oxygen replenishment.

During the 1-Year Long-Term OM&M period, the SVE/IBT System operated in a manner consistent with design parameters and has effectively removed approximately 27,500 lbs (12,500 kg) of benzene via degradation (20,200 lbs [9,200 kg]) and adsorption (7,300 lbs [3,300 kg]). Table 1.0 provides the parameters and calculations used to estimate the total mass of benzene removed through degradation and adsorption. Based on in-line sensor treatment rate data, the SVE/IBT System is adsorbing approximately 28 lbs/day (12.6 kg/day) of benzene through the carbon beds, and is degrading approximately 48 lbs/day (22 kg/day) of benzene *insitu* (as measured by O₂ utilization).

This estimated adsorbed mass is supported by the carbon change-out frequency and weight differentials. Approximately 7,400 lbs of Volatile Organic Compounds (VOCs) (of which about 95% is benzene) were adsorbed on both the primary and secondary vessels. Nine carbon change-outs were conducted during this period for an average of 822 lbs of VOCs adsorbed per carbon change-out (see Table 2.0). Based on the carbon

vendor data, an expected 4:1 carbon to benzene ratio was used to develop a cost estimate for budgeting purposes. It was observed during this period that carbon usage was closer to a 5:1 carbon to benzene ratio.

3.0 LONG TERM OM&M ACTIVITIES

On November 9, 2006, Long-Term OM&M activities began and included system operation, weekly enclosure monitoring, monthly perimeter well monitoring, and quarterly [full-scale] monitoring of the SVE/IBT System (see Attachment A for field notes and observations). The SVE/IBT System generally operated for approximately 8 hours per day [8:00 am – 4:00 pm], 5 days per week (Monday – Friday). The SVE/IBT System is controlled via a Programmable Logic Controller System (PLC System) with capabilities for remote start and stop as well as alarm/emergency shutdown protocols. The SVE/IBT System did not operate during the respiration test (December 7, 2006 through January 2, 2007) and several additional days for system maintenance such as trouble shooting of the PLC, sensor calibrations, and carbon change-out.

During the 1-Year Long-Term OM&M period, all perimeter, cluster, vacuum performance, and SVE wells were monitored quarterly for pressure, VOCs, O₂, and Carbon Dioxide (CO₂) using hand-held monitoring equipment. Perimeter wells were monitored monthly for VOCs, O₂, and CO₂ to ensure that soil vapors do not migrate out beyond the cap boundaries (see Figure 2.0 for well locations).

During the 1-Year Long-Term period, measurements were taken weekly from the SVE/IBT System enclosure (see Figure 3.0) as follows:

- Station 1 - Influent: the inlet (combined flow of the 9 extraction wells);
- Station 2 - Post Ambient Air Inlet: the diversion loop (to the Granulated Activated Carbon [GAC] beds) just after the ambient air intake (Note: ambient air is introduced to the contaminant stream to dilute the concentration below the lower explosive limit [LEL] for safety reasons);
- Station 3 - Carbon Vessel 1 (C₁): at the effluent of the primary GAC bed; and
- Station 4 – Effluent: the effluent stack.

These four measurement points were monitored for VOCs, O₂, CO₂, and flow rate using hand-held monitoring equipment. Corresponding in-line measurements from the PLC System were also recorded where applicable. Along with the field monitoring that was conducted, samples were also obtained from the SVE/IBT enclosure at the four stations once a month and analyzed for VOCs using USEPA Method 8260B and for fixed gases using American Society of Testing and Materials (ASTM) Method 1946.

4.0 LONG TERM OM&M MONITORING RESULTS

The following sections describe the results obtained during each of the above mentioned monitoring protocols.

4.1 PERIMETER WELL RESULTS

Field data collected from perimeter monitoring wells demonstrate that the SVE/IBT System is effective in the mitigation of offsite migration of Constituents of Concern (COCs) (see Table 3.0). VOC concentrations ranged from 0.0 to 11.1 ppm with an average of 0.18 ppm.

VOC volumes have not increased from historical levels. The results of perimeter well monitoring indicate good control of injected air volumes, that the cover system is performing as designed, and that contaminated soil vapors are not migrating significantly beyond the cap boundaries. Samples of the other perimeter wells for laboratory analysis were not collected during this period; however, they were collected at the end of the 3-Month Short-Term Operations period and the results and detailed discussion are presented in the *Summary of SVE/IBT 3-Month Short-Term Operations TM (C2 REM, 2006)*.

4.2 VACUUM PERFORMANCE WELL RESULTS

The primary function of the vacuum performance wells is to assess radius of influence of the SVE/IBT System. The nature of the SVE/IBT System (e.g., air re-circulation) makes this observation difficult in subareas 1 and 2, and as such C2 REM's use of these wells was to assess the oxygen and vapor distribution between extraction and injection points. In subarea 3, where extraction well 20A is located, no injection is occurring in the vicinity; therefore, the radius of influence from this extraction well was calculated using the following equation:

$$ROI=R_w*EXP\left\{\ln\left(\frac{r}{R_w}\right)*\left(\frac{P_{atm}^2 - P_w^2}{P_r^2 - P_w^2}\right)\right\},$$

where:

- ROI = radius of influence where pressure is equal to preset value;
- R_w = well radius of the vapor extraction well;
- r = radial distance from the vapor extraction well;
- P_{atm} = atmospheric pressure or a preset value;
- P_r = pressure at a radial distance, r , from the vapor extraction well; and
- P_w = pressure at the vapor extraction well.

Two monitoring locations (I'-1 and J') were used to calculate the radius of influence for extraction well 20A. The results are 37.37 ft and 51.52 ft, respectively (see Table 4.0).

The field data collected from the vacuum performance wells during this operation period is presented in Table 5.0. VOC concentrations ranged from 0.0 to greater than 9,999 ppm with an average greater than 2,015 ppm. Due to the limitations of field equipment (i.e., 0-9,999 ppm) the field results for VOCs are presented herein for completeness only.

4.3 CLUSTER WELL RESULTS

The field data collected from the cluster wells during this operation period are presented in Table 6.0. O₂ concentrations ranged from 0.0 to 28.5% with an average of 15.3%. CO₂ concentrations ranged from 0.0 to 22.8% with an average of 5.75%. VOC concentrations ranged from 0.0 to greater than 9,999 ppm with an average greater than 2,070 ppm. Due to the limitations of field equipment (i.e., 0-9,999 ppm) the field results for VOCs are presented herein for completeness only (see Table 6.0).

Results from the 2003 baseline and 2006 laboratory confirmation sampling event are compared with field results obtained during the 1-Year Long-Term OM&M period and presented in Figure 4.0 through 6.0. O₂ levels in 2007 continue to show increases compared to the 2003 O₂ levels demonstrating that the SVE/IBT System is effective in mixing of subsurface airflow and increasing the O₂ available for biodegradation.

Cluster well samples for laboratory analysis were not collected during this period; however, they were collected in the end of the 3-Month Short-Term Operations period and the results and detailed discussion are presented in the *Summary of SVE/IBT 3-Month Short-Term Operations TM*.

4.4 SVE EXTRACTION WELL RESULTS

The field data collected from the SVE wells during this operation period are presented in Table 7.0. O₂ concentrations ranged from 0.0 to 29.3% with an average of 8.4%. CO₂ concentrations ranged from 1.6 to 21.6% with an average of 11.5%. VOC concentrations ranged from 0.0 to greater than 9,999 with an average greater than 6,141 ppm. Due to the limitations of field equipment (i.e., 0-9,999 ppm) the field results for VOCs are presented herein for completeness only (see Table 7.0).

4.5 SVE/IBT SYSTEM MONITORING RESULTS

During the Long-Term OM&M period, system inlet, post ambient air, outlet of C₁, and system effluent locations in the enclosure were sampled using 1-liter Tedlar bags on a weekly basis and analyzed using field instruments (see Attachment A). Samples were also taken monthly to the laboratory for USEPA 8260B and ASTM 1946 analysis.

Based on laboratory results, the benzene concentrations at the inlet ranged from 9,300 to 33,000 ppm with an average of 22,664 ppm. The benzene concentrations at post ambient air ranged from 300 to 5,400 ppm. The benzene concentrations at the outlet of C₁ ranged from 2.9 to 3,600 ppm. The benzene concentrations at the effluent ranged from 0.0 to 3.4 ppm with an average of less than 1.8 ppm (see Table 8.0). Benzene concentrations at Stations 1-4 demonstrated that the SVE/IBT System was effective in controlling lower explosive limit (LEL) conditions and maintaining acceptable emission limits (i.e., less than 50 ppm) (see Figure 7.0). Oxygen concentration at the inlet ranged from 9.2 to 21.0% with an average of 16.7%. Carbon dioxide concentration at the inlet ranged from 8.0 to 11.0 % with an average of 9.2 %.

The field data collected from the SVE/IBT System are presented in Table 9.0. Due to the limitations of field equipment (i.e., 0-9,999 ppm) the field results for VOCs are presented herein for completeness only.

4.5 SVE/IBT SYSTEM OPERATING SCENARIOS RESULTS

During the 1-Year Long-Term OM&M period, C2 REM tested various operating scenarios to assess the optimal conditions for O₂ utilization. The O₂ generator was operated until the subsurface O₂ concentration was approximately 18.0% to 19.0% and then was shut-off in order to observe O₂ utilization rates at various levels (see Table 10.0). The rates of O₂ utilization were calculated for each O₂ level to determine the optimal oxygen level. Based on the O₂ in-line sensor at Station 1 during this period, the highest average O₂ utilization rate was 0.0020 at an O₂ concentration of 15%. However, the calculated O₂ utilization rates at an O₂ concentration of 15% varied considerably, and therefore will be further refined with additional testing.

Additional operating scenarios tested during this period included pulsing the O₂ generator on a 6-7 day on/off cycle for approximately 6 weeks and operating the SVE/IBT system and O₂ generator throughout a weekend. The results of these different operating scenarios did not result in any significant changes in oxygen utilization rates and oxygen replenishment.

5.0 CONCLUSIONS

During the Long-Term OM&M period, the SVE/IBT System was performing at a level consistent with the design performance parameters. Data collected from the PLC unit, laboratory data, and field data support the overall conclusion that the SVE/IBT System is effective and that biodegradation of Site COCs is occurring.

The current estimate is that the SVE/IBT System is degrading approximately 48 lbs (21.9 kgs) of benzene per day and adsorbing approximately 28 lbs (12.6 kgs) of benzene per day. Based on the 2007 results, the carbon expenditure has been improved and is closer to the model estimates. The current optimal O₂ concentration for O₂ utilization is 15%, however, the O₂ utilization rates varied considerably and therefore should be confirmed with additional pulsing of O₂ generator.

C2 REM recommends the frequency of field monitoring of the SVE/IBT System be modified from once a week to twice per month and that perimeter well monitoring be modified from monthly to quarterly. The frequency of lab samples taken from the SVE/IBT System as well as full scale monitoring of cluster, vacuum performance, and SVE wells will remain the same.

Table 1.0
1-Year Long-Term
OMM Period SVE/IBT System Operation Summary
Comparison of Design to Actual Operations
Del Amo Waste Pits

Parameter	Original Design	Performance Based on Inline Monitoring Devices
Vapor Injection Rate (CFM)	50	47.8
System Operation Time (hours per day)*	8	7.94
O2 Injection Rate (CFM)	5	6.4
O2 Percentage (%)	100%	91%
O2 Utilization 1st Order Rate Constant (1/hr) **	0.0021	0.0021
Extracted Vapor Concentration (ppmv)	15,000	22,664
Extraction Rate (CFM) ⁽¹⁾	60	54
Treatment Rate (CFM)	15	12.6
Time for Pore Volume (days)	7.09	7.41
Injected O2 Concentration 1st Order	27%	30%
Benzene Degradation (kg/day)	20	21.9
Benzene Degradation (kg/year)	7,355	9,169
Benzene Removal (kg/day)	10	12.6
Benzene Removal (kg/year)	3,626	3,328
Total Benzene Removed/Degraded (kg/day)	30	35
Total Benzene Removed/Degraded (kg/year)	10,981	12,497
Carbon to Benzene Ratio	4:1	5:1
Projected Carbon Required (lbs/day)	87	111
Projected Annual Carbon Required (lbs/year)	31,906	29,289
1 Year Actual Carbon Use (lbs)		36,124

* In the beginning of the short-term period, the system was operated more than 8 hours, including weekends, for testing.

** 0.0021 of design value was used for oxygen utilization constant.

(1) Extraction rate is derived from the sum of the treatment rate and the recycle rate.

The calculation used for this estimate

$$Q = (\text{O}_2 \text{ Injection rate} + \text{Recycle rate})$$

$$[\text{O}_2] = (\text{Term1} \cdot 0.20 + \text{Term2} \cdot 0.91) / \{1 - \text{Term3} \cdot \text{Exp}(-k \cdot t_{pv})\}$$

$$\hat{\eta} = 1 - \text{Exp}(-k \cdot t_{pv})$$

$$f_{bio} = 1 - (0.0035/k)$$

$$\text{Term1} = \text{FT4}/Q \cdot (\text{Excess Vapor Extraction rate}) / (\text{Treatment rate} + \text{Recycle rate})$$

$$\text{Term2} = \text{O}_2 \text{ injection rate}/Q$$

$$\text{Term3} = \text{Recycle rate} / (\text{Treatment rate} + \text{Recycle rate})$$

$$t_{pv} (\text{Time for Pore Volume}) = 8505/Q$$

$$k = 0.0021$$

$$[\text{Benzene}] = 22664$$

$$\text{Mass Degraded} = Q \cdot [\text{O}_2] \cdot \hat{\eta} \cdot f_{bio} \cdot 5.8864$$

$$\text{Mass Treated} = \text{Treatment rate} \cdot [\text{Benzene}] \cdot 0.000044148$$

$$\text{Mass Total} = \text{Mass Degraded} + \text{Mass Treated}$$

**Table 2.0
Carbon Change-Out Frequency and Usage
Del Amo Waste Pits**

Date	Operational Days Between Change-Outs	Fresh & Spent Carbon Weights for Each Period	lbs Adsorbed
10/30/2006	NR	Spent Carbon - 5240 lbs Fresh Carbon - 4040 lbs (Primary: 2019lbs, Secondary: 2021lbs) Lead Vessel is still A.	968
11/20/2006	21	Spent Carbon - 5008 lbs Fresh Carbon - 4040 lbs (Primary: 2019 lbs, Secondary: 2021 lbs) Lead Vessel is still A.	716
12/8/2006	13.8	Spent Carbon - 4756 lbs (Primary: 2375 lbs, Secondary: 2381 lbs) Fresh Carbon - 4056 lbs (Primary: 2019 lbs, Secondary: 2037 lbs) Lead Vessel is still A.	928
3/16/2007	43.5	Spent Carbon - 4984 lbs (Primary: 2605 lbs, Secondary: 2379 lbs) Fresh Carbon - 3666 lbs (Primary: 1813 lbs, Secondary: 1853 lbs) Lead Vessel is still A.	928
4/25/2007	25.5	Spent Carbon - 4594 lbs (Primary: 2207 lbs, Secondary: 2387 lbs) Fresh Carbon - 4057 lbs (Primary: 2097 lbs, Secondary: 1960 lbs) Lead Vessel is still A.	885
5/21/2007	17.1	Spent Carbon - 4942 lbs (Primary: 2608 lbs, Secondary: 2334 lbs) Fresh Carbon - 4007 lbs (Primary: 2005 lbs, Secondary: 2002 lbs) Lead Vessel is still A.	940
6/22/2007	17.3	Spent Carbon - 4947 lbs (Primary: 2452 lbs, Secondary: 2495 lbs) Fresh Carbon - 4078 lbs (Primary: 2100 lbs, Secondary: 1978 lbs) Lead Vessel is now B.	632
8/6/2007	31.6	Spent Carbon - 4710 lbs (Primary: 2492 lbs, Secondary: 2218 lbs) Fresh Carbon - 4030 lbs (Primary: 2010 lbs, Secondary: 2020 lbs) Lead Vessel is still B.	678
9/28/2007	38.1	Spent Carbon - 4708 lbs (Primary: 2335 lbs, Secondary: 2373 lbs) Fresh Carbon - 4150 lbs (Primary: 2050 lbs, Secondary: 2100 lbs) Lead Vessel is still B.	726
12/21/2007	62.5	Spent Carbon - 4876 lbs (Primary: 2457 lbs, Secondary: 2419 lbs) Fresh Carbon - 3985 lbs (Primary: 1974 lbs, Secondary: 2011 lbs) Lead Vessel is still B.	NA
Total	270.4	Spent Carbon - 48792 lbs Fresh Carbon - 40109 lbs (primary: 20106, Secondary:20003)	7401
Average	30.0	Average operational days - Average spent carbon weights (lbs)	822

NA: The weight adsorbed is unknown until next carbon change-out

1-Year Long-Term Period (November 9, 2006 - December 31, 2007)
Del Amo Waste Pits

Monitoring Well	P _{atm}	P _w (in H ₂ O) ⁽¹⁾	P _w (atm)	P _r (in H ₂ O) ⁽¹⁾	P _r (atm)	R _w (ft)	r (ft)	ROI (ft)
20a - I"-1	1	-6.05	1.014829	-0.018	1.000043	0.17	36.79	37.37
20a - J'	1	-6.05	1.014829	-0.023	1.000055	0.17	50.44	51.52

$$(P_r^2 - P_w^2) = (P_{atm}^2 - P_w^2) * \{\ln(r/R_w) / \ln(ROI/R_w)\}$$

$$(P_r^2 - P_w^2) / (P_{atm}^2 - P_w^2) = \ln(r/R_w) / \ln(ROI/R_w)$$

$$\ln(ROI/R_w) = \ln(r/R_w) * (P_{atm}^2 - P_w^2) / (P_r^2 - P_w^2)$$

$$ROI/R_w = \text{EXP}\{\ln(r/R_w) * (P_{atm}^2 - P_w^2) / (P_r^2 - P_w^2)\}$$

$$ROI = R_w * \text{EXP}\{\ln(r/R_w) * (P_{atm}^2 - P_w^2) / (P_r^2 - P_w^2)\}$$

P_{atm} = atmospheric pressure or a preset value

P_w = pressure at the vapor extraction well

P_r = pressure at a radial distance r from the vapor extraction well

r = radial distance from the vapor extraction well

R_w = well radius of the vapor extraction well

ROI = radius of influence where pressure is equal to preset value

(1) Pressure measurements are average during long-term OM&M period (November 9, 2006 - December 31, 2007)

NA: 53 ppm and 67 ppm of benzene were detected on 7/26 and 11/29. C2 REM suspects that there were some errors in sample collection and these concentrations were not used for calculation of the average.

ND: Benzene Concentration <1.6 of Reporting Limit

ND: Carbon Monoxide Concentration <0.1 of Reporting Limit

ND: Methane Concentration <0.1 of Reporting Limit

FIELD MONITORING NOTES

C2 REM FIELD DAILY REPORT

PROJECT NAME: VAPOR TREATMENT PAGE 1 OF 1
PROJECT NUMBER: 99-106 DATE: 1/31/07
WEATHER: Temperature ~ 75°F Winds: — Precipitation: —
DESCRIPTION OF THE WORK: PERIMETER AND ENCLOSURE MONITORING

10:30 ARRIVE WITH IAN YUSKO

- PREPARE ALL MONITORING EQUIPMENT AND PURGE TEDLAR BAGS
- ENTER ENCLOSURE TO CHECK IF SYSTEM IS RUNNING

[PERIMETER MONITORING]

- WELLS PURGED W/ PUMP AT A RATE OF 0.3 SCFM FOR ~ 30 SECONDS EACH WELL
- SAMPLES THEN TAKEN FROM WELL HEADS DIRECTLY
- PRESSURE MONITORED WITH MAGNAHELIC (0-10 H₂O IN. RANGE)
- VOCs MONITORED WITH MINIRAE 2000 P.I.D.(2) CALIBRATED TO 50 PPM BENZENE
- O₂, CO₂, LEL, AND H₂S MONITORED WITH RKI EAGLE

[ENCLOSURE MONITORING]

- SAMPLES PULLED FROM INLET, POST AMBIENT AIR, C1, AND OUTLET USING PUMP/LUNG DEVICE AND 1L TEDLAR BAGS
- VOCs MONITORED WITH MINIRAE 2000 P.I.D.(2) CALIBRATED TO 50 PPM BENZENE AND INLINE SENSORS
- LEL, O₂, CO₂ MONITORED BY RKI EAGLE AND INLINE SENSORS
- FLOW MONITORED BY INLINE SENSORS

FIELD DAILY REPORT

PROJECT NAME: Del Amo Pits.

PAGE _____ OF _____

PROJECT NUMBER: 97-101

DATE: 02/21/2007

WEATHER: Temperature ~65° Winds: slight

Precipitation: _____

DESCRIPTION OF THE WORK: Perimeter and Enclosure monitoring, Adjustment of SVE/IBT system.

11:30 IY/SA arrive onsite.

12:00 start the system.

At station 5, 4, 1, and 3, O₂ sensor's red lights were flashing and then red lights were cleared followed by green lights except for station 3.

At station 5 and 4, O₂ sensors read 12~13%, but PLC readings are 15~16%.

When increased blower B, monitoring port @ station 4 was shooting water (~1L)

Flow @ manifold were monitored with ~~the~~ the valves completely opened.

@ 3 → 18 @ 4 → 13 scfm

@ 8 and 9 → 15 scfm

@ 7 → 10 scfm

@ other wells → over.

[Enclosure Monitoring]

- sample taken from ~~inlet~~ inlet, post dilution, C1, and outlet.
- pump/Lung box and 1L of Tedlar bags were used.
- VOCs monitored with MINIRAE 2000 PID calibrated to 50 ppm benzene.
- O₂, CO₂, CH₄ LEL, monitored with RKI EAGLE
- Pressures monitored with Magnehelic @ inlet and outlet.
- Flow rates monitored with velocalc.

[Perimeter Monitoring]

- Perimeter wells A~L were monitored. at well head.
- Pressures monitored with Magnehelic.
- VOCs monitored with MINIRAE 2000 PID (1).
- O₂, CO₂, CH₄ LEL, monitored with RKI EAGLE
- PID seems malfunctioning, and stop using it @ J, K, L.

4:15 PM OFFsite.

FIELD DAILY REPORT

PROJECT NAME: Del Amo Pits PAGE _____ OF _____

PROJECT NUMBER: 97-101 DATE: 03/08/2007

WEATHER: Temperature ~70° Winds: — Precipitation: —

DESCRIPTION OF THE WORK: Bimonthly and Enclosure Monitoring

10:00 AM RT/IY/DR/SA arrive on site.

Prepare instruments.

[Bimonthly Monitoring]

- Vapor samples pulled using pump/Lung system and 1L of Tedlar bags from ports 1~4 (inlet, c1, c2, outlet)
- VOCs monitored with MINIRAE 2000 PID (1) calibrated to 50 ppm benzene.
- Flow rates monitored with Velocicalc.
- Temperatures monitored with in-line gauge.

Ports	VOCs	Flow	Temp.
4	0.3	185	117°
3	0.2	—	—
2	0.2	—	—
1	0.5	162	65°

[Enclosure Monitoring]

- Vapor samples pulled from inlet, post ambient air, c1, and outlet using pump/Lung system and 1L of Tedlar bags.
- VOCs monitored with MINIRAE 2000 PID (1) calibrated to 50 ppm benzene.
- O₂, CO₂, LEL, and H₂S monitored with RKL Eagle.
- O₂, ~~CO~~, LEL, Flow monitored with inline sensors.
- Flow monitored with Velocicalc ~~at inlet~~.
- Pressure monitored with Magnehelic at inlet.

DESCRIPTION OF THE WORK: 1ST QUARTERLY FULL SCALE MONITORING EVENT / GRAFFITI POLICE REPORT

- 9:30 ARRIVE ONSITE W/ IAN YUSKO, SHINTA AIZAWA, AND SEAMUS McGEONGH
- I TAKE PICTURES OF GRAFFITI ON SOUTH SIDE OF THE TRAILER AND "SEA-TRAIN"
 - SHINTA AND I BEGIN TO REWIRE/REINSTALL FLOWMETER 1
 - IAN AND SEAMUS BEGIN MONITORING PERIMETER WELLS

[FULL SCALE MONITORING]

- ALL WELLS PURGED FOR ~30 SECONDS USING A PUMP AND CARBON VESSEL
- SAMPLES PULLED FROM EXTRACTION/INJECTION, PERIMETER, VACUUM PRESSURE & PERFORMANCE, AND CLUSTER WELLS DIRECTLY
- PRESSURE MONITORED WITH MAGNAHELIC (0-2 IN. H₂O)
- LEL (METHANE), O₂, CO₂, AND H₂S MONITORED WITH RKI EAGLE
- VOCs MONITORED WITH MINIRAE 1000 P.I.D.(Z) CALIBRATED TO 50 PPM BENZENE

* SEE RESULTS ON ATTACHED

- FINISHED WIRING DEVICE & CHECKED IF IT WAS READING CORRECTLY

12:30 OFFSITE FOR LUNCH

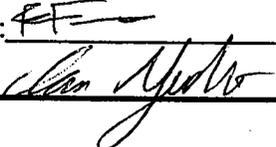

1:30 BACK ONSITE

- MEET WITH LOS ANGELES SHERIFF REPRESENTATIVE
- IAN SPEAKS WITH OFFICER AND GIVES HIM HIS TESTIMONY OF WHAT HAPPENED IN THE MORNING WHEN HE DISCOVERED THE GRAFFITI
- CONTINUE FULL SCALE MONITORING EVENT

C₂ REM FIELD DAILY REPORT

PROJECT NAME: Del Amo Pits PAGE 1 OF 1

PROJECT NUMBER: 97-101 DATE: 3/16/07

WEATHER: Temperature ~70° Winds: — Precipitation: —

DESCRIPTION OF THE WORK: Measurement of flows at SVE wells to determine purge volume.

9:00 SA/SM arrive onsite.

~1:00 Carbon charge out was conducted.

[Measurement of flows at SVE wells]

- At manifold, all extraction valves were opened.

- Injection valves were ~~not~~ closed.

- The system was turned on

- Blower A: 100%

- Blower B: 0%

- V1: 100%

- V3: 0%

- V2: 50% (~~is~~ Ambient Air)

- Flows at SVE 1~12, and 20A, monitored with Velocicalc.

PROJECT NAME: DeLAmo Pits PAGE 1 OF 1

PROJECT NUMBER: 97-101 DATE: 3/16/2007

WEATHER: Temperature ~70° Winds: — Precipitation: —

DESCRIPTION OF THE WORK: Enclosure Monitoring.

9:00 AM SA / SM arrive onsite

~1:00 PM Conducted carbon charge out.

~15:00 PM conducted flow measurements at sVE wells.

[Enclosure Monitoring]

- Vapor samples pulled from inlet, Post Ambient Air, CI, and outlet. Using pump/Lug system and 1L of Tedlar bags.

- VOCs monitored with MINIRAE 2000 PID (1) calibrated to 50 ppm benzene.

- O₂, CO₂, LEL, and H₂S monitored with RKI EAGLE

- O₂, LEL, Flows, and VOC @ outlet monitored with inline sensors.

- Flows monitored with Velocicalc.

- Pressures monitored with Magnahelic at inlet and outlet.

3:45 offsite

PROJECT NAME: Del Amo Pits PAGE 1 OF 1

PROJECT NUMBER: 97-101 DATE: 3/22/2007

WEATHER: Temperature ~80° Winds: — Precipitation: —

DESCRIPTION OF THE WORK: SVE/IBT Enclosure Monitoring.

10:15 RT/IY/SA arrive onsite.

Prepare materials and instruments.

- Samples taken from inlet, post dilution, C1, and outlet using pump/Lugs box and 7L of Tedlar bags.
- VOCs monitored with MINIRAE 2000 PID(1) calibrated to 50 ppm benzene.
- O₂, CO₂, CH₄ LEL, and H₂S monitored with RKL EAGLE
- Pressures monitored with Magnehelic @ inlet and outlet.
- Flow rates monitored with Velocicalc.
- O₂, LEL, Flow, and VOC @ outlet monitored with inline sensors.
- Lab samples also taken from inlet, post dilution, C1, outlet.

Flow @ ~~FT1~~ FT1 = 14.5 with Velocicalc.

O₂ sensors @ 5B shows 3%, but PLC panel shows 8%
(2.7%)

The same issue is found in O₂ sensors @ 4B and 1B.

PROJECT NUMBER: 97-101 DATE: 03/28/07

WEATHER: Temperature 69°F Winds: 10 mph Precipitation: None

DESCRIPTION OF THE WORK: SVE/IBT MONITORING, EXTERMINATOR QUOTE

9:20 AM - ARRIVE ON-SITE WITH RT

9:30 AM - PREPARE INSTRUMENTS AND MATERIALS
- VISUALLY CHECK SYSTEM: LOOKS TO BE OPERATING PROPERLY

10:00 AM - PERFORM SVE/IBT ENCLOSURE MONITORING
- PULL BAG SAMPLES W/ PUMP LONG FROM INLET, POST AMBIENT, C₂, & EFFLUENT.
- TAKE READINGS FROM BAGS USING PID (1) & RIKI EAGLE FOR VOCs, LEL, O₂, & CO₂.
- TAKE FLOW READINGS USING VELOCICALC
- RECORD ANY CORRESPONDING DATA FROM PLC DISPLAY FOR COMPARATIVE ANALYSIS

11:00 AM - COMPLETE SVE/IBT ENCLOSURE MONITORING
- PACK-UP EQUIPMENT & ORGANIZE SITE
- PURGE TEDLAR BAGS WITH NITROGEN

11:30 AM MEET WITH THE BOBMAN EXTERMINATOR
DISCUSS OPTIONS & WALK SITE FOR MEASUREMENTS
IDENTIFY CAP AREA & AREAS WHERE GOPHERS HAVE BURROWED

12:00 AM DEPART SITE WITH RT

C₂ REM FIELD DAILY REPORT

PROJECT NAME: Del Amo Pits. PAGE 1 OF 1

PROJECT NUMBER: 97-101 DATE: 04/27/2007

WEATHER: Temperature ~75° Winds: — Precipitation: —

DESCRIPTION OF THE WORK: Enclosure Monitoring

9:15 AM SA/SM arrive onsite.

Prepare instruments, equipments.

- Samples taken from inlet, post dilution, and outlet using pump/Lung box and 1L of Tedlar bags.

- VOCs monitored with MINIRAE 2000 PID (1) calibrated to 50 ppm benzene.

- O₂, CO₂, CH₄ *LEL, and H₂S monitored with RKI Eagle.

- Pressures monitored with Magnehelic @ inlet and outlet.

- Flow rates monitored with Velocicalc.

- O₂, LEL, Flow, and VOC @ outlet monitored with inline sensors.

- Sample @ Carbon 1 was not taken because the pump/Lung box does not have strong vacuum enough to pull vapors.

- Flow @ FT1 = 20 scfm with velocicalc.

- @ Post Ambient Air (Post Dilution), lots of moisture exist.

10:45 AM OFF-SITE.

PROJECT NUMBER: DEL AMO PITS DATE: 7-26-07
WEATHER: Temperature 87° Winds: Precipitation:

DESCRIPTION OF THE WORK: Site maintenance & Enclosure Monitoring & Lab Samples

9:45am MA + SM onsite. Turn on Sprinklers.
Replace bolts in all well leads.
SEARCHED for MISSING LIDS but did NOT find any.
Changed sprinklers to irrigate other sections of the cap.

11AM BUC MAN & LANDSCAPING CREW ONSITE.

2pm STARTED ENCLOSURE MONITORING
TOOK LAB SAMPLES
TURNED off water for irrigation.

3:30pm off Site (SM + MA).

PROJECT NUMBER:

DATE: 10/04/2007

WEATHER: Temperature ~68° Winds: -

Precipitation: -

DESCRIPTION OF THE WORK: Enclosure Monitoring

11:30 SM/SA arrive on site.

Prepare for enclosure monitoring.

12:00 Conduct enclosure monitoring.

Flow, LEL, VOCs, O₂ monitored from inline sensors.

Samples are taken from 4 stations, inlet, post ambient air, CI and effluent, and monitored for VOCs, O₂, CO₂, LEL, with RKI Eagle and MiniRae 2000 PID.

Pressures monitored at inlet and effluent.

Flows monitored with velocicalc at inlet, post ambient air, and effluent.

Purged Tedlar bags and checked well lids.

1:30 PM. OFFsite.

C2 REM FIELD DAILY REPORT

PROJECT NAME: DEL AMO

PAGE _____ OF _____

PROJECT NUMBER: 97-101

DATE: 10-18-2007

WEATHER: Temperature _____ Winds: _____

Precipitation: 0

DESCRIPTION OF THE WORK: Weekly monitoring

9 AM TT & SM arrive on site.

Turn on irrigation system.

9.30 Calibrate instruments
Begin monitoring

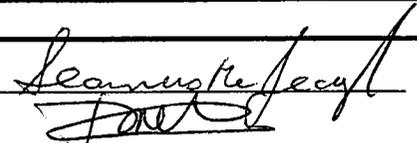

10.30 TROUBLE SHOOT the Surveillance system.
Get system working again.

11.45 Down load data from PLC system.

12.45 TT & SM off site.

DESCRIPTION OF THE WORK: WEEKLY + Bi WEEKLY MONITORING / MONTHLY LAB SAMPLES

9 AM TT + SM arrive on site.

Start irrigating the cap.

9:30 Begin monitoring GCTS system.
(PID, + Velocicube + Temp gauges).

10 AM Monitor the SUE / IRT system.

10:45 Take LAB SAMPLES.

11:30 TT + SM off site. Turn off IRRIGATION.

PAGE 1 of 1

PROJECT NUMBER: 97-101

DATE: 11/1/2007

WEATHER: Temperature: 62 Winds: none Precipitation: none

DESCRIPTION OF THE WORK: SVE/IBT Enclosure monitoring, Testing inline flow sensors, and irrigation the land

Time Line	
1:30 PM	IY, SA arrive onsite Prepare monitoring devices
1:50 PM	Conducted Enclosure Monitoring, Turn on irrigation system Flows, LEL, VOCs, O ₂ were monitored from inline sensors
	Samples were taken from 4 stations (inlet, post ambient air, carbon 1, and effluent) using pump/lung system and 1L of tedlar bags.
	Samples were analyzed for VOCs, O ₂ , CO ₂ , LEL, with MiniRae 2000 PID and Rkl Eagle.
	Pressures reading were taken from each station with magnehelic
	Flows were monitored with velocicalcat inlet, post ambient air, effluent and diverted flow.
	Testing inline flow sensors
	Swap flow sensor FT4 for FT5 (FT4 is now at point of extraction) Normal Operation --> FT4 (extraction rate) = 40~43 (Velocicalc=43~45)
	Swap FT2 for FT1 Normal Operation --> FT2 (treatment rate) = 5~6 (velocicalc=3~4)
	Velocical Readings for normal operation treatment rate=3~4, recycle rate=38~40, extraction rate=46~48
16:20	Turn off irrigation system and offsite

PROJECT NUMBER:

DATE: 11/29/2007

WEATHER: Temperature: ~70° Winds: Slight Precipitation: None

DESCRIPTION OF THE WORK: SVE/IBT Enclosure&Perimeter Monitoring, Calibration of inline O2/LEL sensors

Time Line	
10:15 AM	IY, SM, TT, SA arrive on-site
	Prepared monitoring equipments
10:30 AM	SM, TT conducted Perimeter Monitoring
	IY, SA Conducted SVE/IBT Enclosure Monitoring
10:45 AM	Flows, LEL, VOCs, O2 were monitored from inline sensors
	Samples were taken from inlet, post ambient air, carbon 1, and effluent using 1l of tedlar bags and pump/lung system
	Samples were analyzed for VOCs, O2, CO2, and LEL with MiniRae 200 PID and RKI Eagle
	Pressures were taken with Magnehelic
	Flows were monitored with velocalc at inlet, post ambient air, divergent flow and effluent
11:30 PM	IY, SA conducted calibration of Inline O2/LEL sensors
	IY, SM Off-site
	TT, SA continued calibration
	AT3B O2: Zero gas --> 164. Span gas -->302
	AT2B O2: Zero gas --> 168. Span gas -->323
	AT5B O2: asked span gas first, initial -->3134. Tried again
	2nd Try--> Again span gas first, initial -->3088 --> gas applied --> fluctuated +/-15 and slowly increased to 3150. Zero gas --> fluctuated +/-10 --> slowly decreased to 1632
	AT4B O2: Span gas first, initial --> 6420, gas applied, final --> 6421. Sero gas --> 6445, then "calibration Error" on the display.
	AT5A and AT4A do not have adjusting knob PT1 and PT2, Calibration was done, adjusting PT3 only. Calibration of AT1A could not be completed, need recalibration.
5:15 PM	offsite

SVE 7 = NA, reduced valve --> 7.5
SVE 12 = NA, reduced valve --> 6.5
SVE 10 = ~6, reduced valve --> 9.0 Valve can't be moved well
SVE 1 = NA, reduced valve --> 7.5
SVE 2 = 7.5~9.0
SVE 11 = 6.0~7.0
SVE 5 = NA, reduced valve --> ~8.5 Valve can't be moved well
NA: moisture present, velocicalc reading is "Over"
Blower B = 65%, Blower A = 100%, V2 = 40%, V1 = V3 = 100%, F1 = 12~16, FT4 = 41, FT5 = 21~26 (33), AT2A = 4%
Veloci calc reading and inline sensor reading do not match most of time, The position of FT1 might influence velocicalc reading, so FT1 is taken out of the system and flow was monitored with velocicalc, --> no effect observed
5:15 PM Offsite

FIELD DAILY REPORT

PROJECT NAME: VAPOR TREATMENT PAGE 1 OF 1
PROJECT NUMBER: 99-106 DATE: 1/9/2007
WEATHER: Temperature ~ 80°F Winds: — Precipitation: —
DESCRIPTION OF THE WORK: AUTOMATED SENSOR CALIBRATION

8:30 A.M. ARRIVE ONSITE WITH IAN YUSKO AND SHINTA AIZAWA

- JACK KEENER ARRIVES ONSITE

- PREPARE FOR CALIBRATION: ALL MATERIALS GATHERED, AMMETER SET UP ON LEL SENSOR AT-01

- SETUP FOR CALIBRATION IS AS FOLLOWS:

- DISCONNECT J1-2 FROM CONTROLLER (BLACK WIRE)

- ATTACH DISCONNECTED SIGNAL WIRE (BLACK WIRE) TO ONE END OF THE AMMETER

- OBTAIN A LOOSE PIECE OF BLACK JUMPER WIRE AND ATTACH IT TO THE J1-2 EMPTY SLOT

- ATTACH THE LOOSE END OF THE JUMPER WIRE TO THE OTHER END OF THE AMMETER, COMPLETING THE CIRCUIT

- APPLIED ZERO GAS TO LEL METER AT-01

- LEL METER DID NOT RESPOND (WILL SEND METER BACK TO CONSPEC FOR MAINTENANCE)

- SET UP CALIBRATION @ AT-02

- APPLIED ZERO GAS TO LEL METER AT-02

- ADJUSTED PT-1 SCREW ON CONTROLLER UNTIL AMMETER READ CLOSE TO 4.000 mA

- APPLIED SPAN GAS TO LEL METER AT-02

- ADJUSTED PT-2 SCREW UNTIL AMMETER READ 13.8 mA

- CALIBRATED ALL LEL METERS THIS WAY

- USED AUTOMATIC CALIBRATION OF O₂ SENSORS

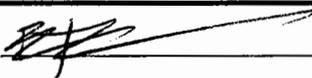

- SENDING BACK 3 O₂ SENSORS AND 2 LEL SENSORS

PROJECT NAME: Del Amo Pits

PAGE _____ OF _____

PROJECT NUMBER:

DATE: 02/20/2007

WEATHER: Temperature ~65° Winds: _____

Precipitation: _____

DESCRIPTION OF THE WORK: Trouble shooting sensors / Pressure Test

10:00 IY/SA arrive onsite

Prepare materials equipments.

[Pressure Test Conveyence system from manifold For leaks]

- Valves at well heads of SVE wells were closed.
- Valves at manifold were closed.
- purged system enclosure.
- using a compressor and pressure gauge, Air is introduced upto 5 PSI.
- Loss of PSI was monitored for each manifold.
- No substantial loss was observed.
- some valves can't be 100% closed (due to contaminants?)
- Large amount of water seem to exist in the manifold.
- when valves were opened ^{after} each test, large amount of water run in the pipes.
- At the end, valves at wellhead were opened, and water is running in the pipes at 20A, and 12.

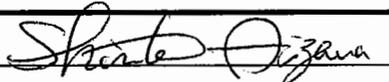

[Sensors Troubleshooting]

12:30 meet with ~~Delic~~ Delic from SC Control / Conspec

12:35 meet with Jack Keener.

- Test Amp outlet and no problem was found.
- Adjust alarm levels
 - Alarm level 1 → 100 (originally 200)
 - ' 2 → 110 (180)
- Error flashing light was cleared.

WEATHER: Temperature 69°F Winds: 10 mph Precipitation: None

DESCRIPTION OF THE WORK: SVE/IBT MONITORING, EXTERMINATOR QUOTE

9:20 AM - ARRIVE ON-SITE WITH RT

9:30 AM - PREPARE INSTRUMENTS AND MATERIALS
- VISUALLY CHECK SYSTEM: LOOKS TO BE OPERATING PROPERLY

10:00 AM - PERFORM SVE/IBT ENCLOSURE MONITORING
- PULL BAG SAMPLES W/ PUMP LONG FROM INLET, POST AMBIENT, C₂, & EFFLUENT.
- TAKE READINGS FROM BAGS USING PID (1) & R1K1 BAGLE FOR VOCs, LEL, O₂, & CO₂.
- TAKE FLOW READINGS USING VELOCICALC
- RECORD ANY CORRESPONDING DATA FROM PLC DISPLAY FOR COMPARATIVE ANALYSIS

11:00 AM - COMPLETE SVE/IBT ENCLOSURE MONITORING
- PACK-UP EQUIPMENT & ORGANIZE SITE
- PURGE TEDLAR BAGS WITH NITROGEN

11:50 AM MEET WITH THE BOBMAN EXTERMINATOR
DISCUSS OPTIONS & WALK SITE FOR MEASUREMENTS
IDENTIFY CAP AREA & AREAS WHERE GOPHERS HAVE BURROWED

12:00 AM DEPART SITE WITH RT

FIELD DAILY REPORT

PROJECT NAME: DEL AMO PITS

PAGE _____ OF _____

PROJECT NUMBER: 97-101

DATE: 7-10-07

WEATHER: Temperature 80° Winds: LIGHT

Precipitation: NONE

DESCRIPTION OF THE WORK: Replace Water Pressure Regulator, PUT LIDS ON WELLS

8.30 am SM+ MA MEET with JK at the Site.

Replaced Water Pressure Regulator
No leaks.

Adjusted Sprinklers by Replacing
Nozzles with finer Spray.
THIS Resulted in More Coverage
from the Sprinkler Heads.

10 AM Changed watering pattern so
that each area was watered for
about 45 mins.

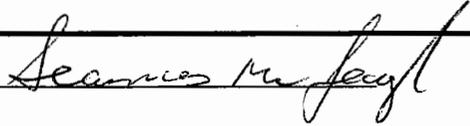

10.30am Started Replacing the lids on the
perimeter ~~water~~ monitoring wells.
4 wells missing lids

11.45 SM MA off Site for lunch.

12.45 SM MA Back on Site, finished
Replanning LIDS, SOME BOLTS STILL
NEEDED. ALSO 3 MONITORING PORTS
too high to PUT LID ON.

2 PM SM MA off Site.

PAGE 1 OF 1

PROJECT NUMBER: 97-101
WEATHER: Temperature 90° Winds: 5 mph

DATE: 7/23/07

Precipitation: None

DESCRIPTION OF THE WORK:

- Cleaned out Sea Train

- Took inventory of major tools/devices
Stored in the Sea Train

- Ran the migration system
10AM - 4pm

Precipitation: _____

DESCRIPTION OF THE WORK: Install Relative Humidity Meter, Irrigation

8.30 AM SM/MA ON Site

8.45 AM SK onsite to install Humidity Meter.

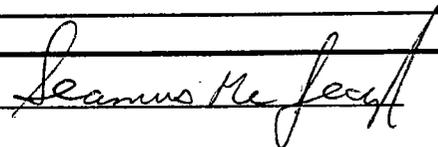

Meter installed however display needs to be changed to accommodate new meter.

10.30 SK off site.

SM/MA adjust & increase water coverage. install extra piping to extend irrigation segment at the front of the property.

2 PM SM/MA off site.

PAGE _____ OF _____

PROJECT NUMBER: 97-101

DATE: 7-30-2007

WEATHER: Temperature 80° Winds: 0

Precipitation: 0

DESCRIPTION OF THE WORK: Install Humidity Meter / Irrigate Cap.

8.30 SM & MA arrived on site.
Started irrigating the cap.

9.00 JK arrived on site.
Humidity Meter was installed.
However we need Phone Systems
to set up display Reading for
Humidity on the PLC unit.

10.30 JK off site.

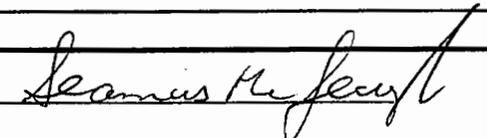

11.00 We extended the irrigation
run at the Del Amo Blvd end
of the property to get more
coverage.

12.00 lunch.

1 PM Continue to adjust Sprinklers
but water pressure too low to
run all of the units.

2 PM off site (SM & MA).

Prepared by: SEAMUS Mc Geough.

DATE: 8-1-07

WEATHER: Temperature 87° Winds: 0

Precipitation: _____

DESCRIPTION OF THE WORK: Irrigate the cap.

8.30. Arrived on site

8.45 MA ARRIVED ONSITE.

ASSEMBLED Valve connections for
Sprinklers + Reinstalled Sprinkler heads.

Irrigated the cap for about
2 hours.

11 AM MA + SM offsite.

DESCRIPTION OF THE WORK: Site Visit

8.30am DR & SM ON site, MA already there.

System not running.

Calibrate PID & Entered enclosure.

Called ADINS to solve VNC problems

I'm able to restart system from the office. System running & VNC up & operating normally.

MA Investigated the CAP.

10.15am DR, SM, MA off site!

PROJECT NUMBER: 97-101

DATE: 8-14-2007

WEATHER: Temperature 86° Winds: MODERATE

Precipitation: 0

DESCRIPTION OF THE WORK: Irrigate CAP, EXTEND SYSTEM, WRITE DOWNLOAD PROTOCOLS

12.30 IY + SM arrive on site.

STARTED Irrigation System at the Entrance.

STARTED Mobile Sprinkler at the Center of the Site.

Extended System for more Coverage in Sub AREAS I + II.

Winds reduce coverage in some areas + Help in other areas.

Download data from Surveillance System, write down PROTOCOL.

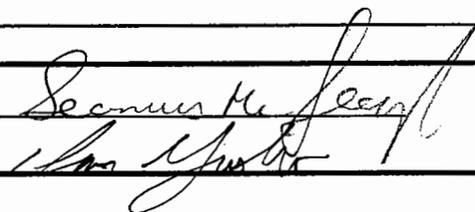

write down PROTOCOL for PLC Download.

4.45 SM + IY offsite.

PAGE 1 of 1

PROJECT NUMBER: 97-101

DATE: 10/30/2007

WEATHER: Temperature: 63 Winds: none Precipitation: none

DESCRIPTION OF THE WORK: Testing inline flow sensors

10:00 AM	IY, JS, SA, TT arrive onsite
	Recirculate all flow, V1=0%, V3=100%, ()=velocicalc readings
	Blower=30% --> FT5 = 23~24, FT4=23~24
	Blower=40% --> FT5 = 29~31, FT4=31~32, TT5A=62, TT4A=101, P5= -15 in H ₂ O, P4=4.5 in H ₂ O
	Blower=50% --> FT5 = 36~38, FT4=41~42, TT5A=62, TT4A=99, P5= -26 in H ₂ O, P4=7.5 in H ₂ O
	Blower=55% --> FT5 = 32~42 (44~45), FT4=44~46 (38~41), TT5A=62, TT4A=105, P5= -32 in H ₂ O, P4=7.8 in H ₂ O,
	Blower=65% --> FT5 = 55 FT4=45,
	Recirculate all flow, V1=0%, V3=100% (velocicalc readings) with ambient air from the manifold
	Blower 75% --> FT5=62~63, FT4=74~76, TT%A=66, TT5B=94
	Close ambient air from manifold
	Blower 75% --> FT5=225, FT4=66, sensor malfunctioning, probably moisture?
	Swap seensors FT4 for FT5 (FT4 is now at point of extraction and FT5 is at point of recycle), ()=velocicalc readings
	Blower=30% --> Extraction rate FT4=22 (20.1), Recycle rate FT5=25(21~25)
	Blower=40% --> Extraction rate FT4=31 (29.1), Recycle rate FT5=34 , TT5A=71, TT4A=82, P4= -5, P5=14.5
	Blower=50% --> Extraction rate FT4=39 (39.1), Recycle rate FT5=39~42 , TT5A=70, TT4A=90, P4= -8.5, P5=24
	Blower=55% --> Extraction rate FT4=43, Recycle rate FT5=41 , TT5A=70, TT4A=96, P4= -10, P5=30
	Blower=65% --> Extraction rate FT4=52 (73), Recycle rate FT5=37~59 , TT5A=67, TT4A=99, P5=40
	Swap sensors FT1 for FT5 (FT1 is now at point of extraction), ()= velocicalc readings,
	Blower=40% --> Extraction rate FT1=102 (40.3)
	Blower=30% --> Extraction rate FT1=60 (20.9),
	Blower=55% --> Extraction rate FT1=173 (45.1),
Special Notes	
	some liquid accumulation is suspected in the system, and flow sensors can't read properly when the blower increases enough to vacuume liquid

C2 REM FIELD DAILY REPORT

PROJECT NAME: _____ PAGE 1 OF 1

PROJECT NUMBER: _____ DATE: 12/11/07

WEATHER: Temperature 65° Winds: _____ Precipitation: _____

DESCRIPTION OF THE WORK: Site Visit / Troubleshoot In-line Sensors

1:00 pm: arrive onsite w/ Bill, Shanta, Tri to troubleshoot sensors

Initial Flow Sensor Readings:

FT05 25-28 scfm

FT04 44-46 scfm

FT01 15-17 scfm

- Switch location of sensors:

	Reading	Velocity
remove FT05 sensor and place in FT04 location:	35-40 scfm	41-46 scfm
" FT04 " " " " FT05 location:	30-32 scfm	36.5 scfm
FT01 in original correct position		6-23 scfm

remove FT05 sensor and place in FT01 location:	9 scfm	8-10 scfm
" FT01 " " " " FT05 location:	106 scfm	32-35 scfm
FT04 in correct place	44-46 scfm	46 scfm

- Collect Tedlar Bags from ~~the~~ Post-dilution location and observed that concentration was between 20-30 ppm. (much lower than typically is)

Need to continue to troubleshoot sensors / will return tomorrow
