

Navajo Nation Average Annual Precipitation from 1971-2000 PRISM

Data format: Shapefile

File or table name: NN_Precipitation

Coordinate system: Geographic

Theme keywords: Precipitation

Abstract: This data set is based upon spatially gridded average annual precipitation for the climatological period 1971-2000. Distribution of the point measurements to a spatial grid was accomplished using the PRISM model, developed and applied by Chris Daly of OSU PRISM Group. This data was further processed. Gridded data was contoured using a 2 inch contour interval. These were used to create polygons that encompass a 2 inch range of precipitation.

Description:

Abstract:

This data set is based upon spatially gridded average annual precipitation for the climatological period 1971-2000. Distribution of the point measurements to a spatial grid was accomplished using the PRISM model, developed and applied by Chris Daly of OSU PRISM Group.

This data was further processed. Gridded data was contoured using a 2 inch contour interval. These were used to create polygons that encompass a 2 inch range of precipitation.

Purpose:

Display and or analyses requiring spatially distributed monthly or annual precipitation for the climatological period 1971-2000.

Supplemental information:

There are many methods of interpolating climate from monitoring stations to grid points. Some provide estimates of acceptable accuracy in flat terrain, but few have been able to adequately explain the extreme, complex variations in climate that occur in mountainous regions. Significant progress in this area has been achieved through the development of PRISM (Parameter-elevation Regressions on Independent Slopes Model). PRISM is an analytical model that uses point data and an underlying grid such as a digital elevation model (DEM) or a 30 yr climatological average (e.g. 1971- 2000 average) to generate gridded estimates of monthly and annual precipitation and temperature (as well as other climatic parameters). PRISM is well suited to regions with mountainous terrain, because it incorporates a conceptual framework that addresses the spatial scale and pattern of orographic processes. Grids were modeled on a monthly basis. Annual grids of temperature are produced by averaging the monthly grids, and summing for precipitation.

Data Quality Information:

Logical consistency report:

All data were based on the same averaging period (1971-2000). Similar quality assurance procedures were used with all input data sets.

Completeness report:

Point estimates of precipitation originated from some or all of the following sources: 1) National Weather Service (NWS) Cooperative (COOP) stations, 2) Natural Resources Conservation Service (NRCS) SNOTEL, 3) United States Forest Service (USFS) and Bureau of Land Management (BLM) RAWS Stations, 4) Bureau of Reclamation (AGRIMET) stations, 5) California Data Exchange Center (CDEC) stations, 6) Storage gauges, 7) NRCS Snowcourse stations, 8) Other State and local station networks, 9) Estimated station data, 10) Canadian stations, 10) Upper air stations, and 11) NWS Federal Aviation Administration (FAA) Automated surface observation stations (ASOS). All COOP station data were subjected to quality control checks by the National Climatic Data Center (NCDC). All COOP, SNOTEL and other data were subjected to further quality control checks by the PRISM Group.

Positional accuracy:

Horizontal positional accuracy:

Horizontal positional accuracy report:

Accuracy of this data set is based on the original specification of the Defense Mapping Agency (DMA) 1 degree digital elevation models (DEM). The stated accuracy of the original DEMs are 130 m circular error with 90% probability.

Quantitative horizontal positional accuracy assessment:

Horizontal positional accuracy value: 130 m with 90%

Horizontal positional accuracy explanation:

Process step:

Process description:

Data was imported into ESRI GRID format and reprojected. Grid was clipped to the area of the Navajo Nation. Grid values were converted from "Millimeters times 100" to inches. A Vector contour coverage was created at a 2 inch contour interval starting at zero inches. Vector contours were closed using the edge of the Navajo Nation study area to build polygons representing a 2 inch range of precipitation for every polygon. Each polygon was attributed with its range in the attribute PPT_RANGE. Coverage was exported to a shapefile.
