Dear Ms. Bassett:

Enclosed is the quality assurance review of the analytical data for the analyses of the soil samples that were collected on October 8, 9, 15, and 16, 2008, in association with the ARCO Yerington Mine Site. The samples were analyzed for radium-226, radium-228, total thorium, and total uranium.

Based on this quality assurance review, one total thorium result was qualified as estimated due to out-of-criteria matrix spike/matrix spike duplicate precision. Two radium-228 results were qualified as estimated due to field duplicate imprecision. In addition, a few radium-226 and radium-228 results were qualified as estimated because the positive results were reported between the method detection limit and the reporting limit.

If you have any questions or comments, please do not hesitate to call.

Sincerely,

Konstadina Vlahogiani, M.S.

1.0 Introduction

This quality assurance (QA) review is based upon a rigorous examination of all data generated from the analyses of the soil samples that were collected by Brown and Caldwell on October 8, 9, 15, and 16, 2008, in association with the ARCO Yerington Mine Site. The samples included in this QA review are specified on Table 1.

This review has been performed with guidance from the "National Functional Guidelines for Inorganic Data Review" (US EPA, 2/94). This document is not entirely applicable to the type of analyses and analytical protocols performed on the samples evaluated in this QA review, but it has been used with professional judgment to aid the data reviewer in the interpretation of the QC analysis results and in the overall evaluation of the sample data deliverables. It should also be noted that results affected by blank contamination will be designated with a "UJ" qualifier (not the "U" qualifier typically used when following the National Functional Guidelines) in order to be consistent with historical project validation protocols and the current project database.

The reported analytical results are presented as a summary of the data in Section 2. Data were examined to determine the usability of the analytical results and the compliance relative to the requirements specified in the published analytical methods, the Quality Assurance Project Plan (QAPjP) for the Atlantic Richfield Company Yerington Mine Site, Revision 1 (May 2007), and the Technical Requirements For Environmental Laboratory Analytical Services BP Global Contract Lab Network (GCLN) (5/22/02, Revision 08). Qualifier codes have been placed next to results to enable the data user to quickly assess the qualitative and/or quantitative reliability of any result. This critical QA review identifies data quality issues for specific samples and specific evaluation criteria. The data qualifications allow the data's end-user to best understand the usability of the analytical results. Data not qualified in this report should be considered valid based on the QC criteria that have been reviewed. Details of this QA review are presented in Section 1 of this report. This report was prepared to provide a critical review of the laboratory analyses and reported analytical results. Rigorous QA reviews of laboratory-generated data routinely identify various problems associated with analytical measurements, even from the most experienced and capable laboratories.

2.0 Findings

Complete support documentation for this radiological analysis QA review is presented in Section 8.0 of this report.

A. Total Uranium and Total Thorium Analyses

Forty-five samples (including quality control [QC] samples) were analyzed for total uranium and total thorium by TestAmerica SOP RL-MT-004. The findings offered in this report for this fraction are based on the items on the following table.

Item Reviewed	Acceptable	Acceptable With Discussion	Acceptable With Qualification	Not Acceptable
Holding Times	√			
Blank Results	√			
LCS Recoveries	√			
MS/MSD Recoveries	√

MS/MSD Recoveries and Precision: A high relative percent difference (RPD > 35%) was observed between the results for total thorium in the associated MS/MSD analyses in Lot Number J8J180141 for analytical batch 8311385. The reported positive result for total thorium in Lot Number J8J180141 sample OU4-UEP-08B-SC should be considered estimated and has been flagged "J" on the data tables.

B. Radium-226 and Radium-228 Analyses

Forty-two samples (including QC samples) were analyzed for radium-226 and radium-228 by TestAmerica SOP RL-GAM-001. The findings offered in this report for this fraction are based on the items on the following table.

Item Reviewed	Acceptable	Acceptable With Discussion	Acceptable With Qualification	Not Acceptable

Field Duplicate Precision: A high replicate error ratio (RER > 2) was observed for the radium-226 results reported in Lot Number J8J240197 sample OU4-UEP-38B-SC and its field duplicate, sample OU4-UEP-38B-SC-FD. The positive results for radium-226 in the field duplicate samples should be considered estimated and have been flagged “J” on the data tables.

Quantitation of Results: All positive results reported at concentrations greater than the method detection limit (MDL) but less than the reporting limit (RL) were qualified as estimated and have been flagged “J” on the data tables.

3.0 Qualifier Summary Tables

A. Total Uranium and Total Thorium Analyses

Analyte	Lot Number	Sample	Validation Qualifier	Reason for Qualification
total thorium	J8J180141	OU4-UEP-08B-SC	J	5 – MS/MSD precision outside of limits

B. Radium-226 and Radium-228 Analyses

Analyte	Lot Number	Samples	Validation Qualifier	Reason for Qualification
radium-226	J8J240197	OU4-UEP-38B-SC and OU4-UEP-38B-SC-FD	J	8 – Field duplicate precision outside of limits

All positive results reported between the MDL and RL have been flagged “J.” (Valid Reason Code: T)

4.0 Overall Assessment

Based on this quality assurance review, one total thorium result was qualified as estimated due to out-of-criteria MS/MSD precision. Two radium-228 results were qualified as estimated due to field duplicate imprecision. In addition, a few radium-226 and radium-228 results were qualified as estimated because the positive results were reported between the MDL and the RL.

5.0 Inorganic and Radiological Data Qualifiers and Valid Reason Codes

Inorganic and Radiological Data Qualifiers

- U Analyte not detected at the detection limit concentration.
- J Reported value is an estimated concentration.
- UJ Analyte not detected at an estimated detection limit concentration.
- R These data were rejected and were not used for any purposes.
- UR The analyte was not detected. The detection limit is unreliable and may be representative of a false negative. These data were rejected and are not usable for any purpose.

Valid Reason Codes

1	Holding time violation
2	Method blank contamination
3	Surrogate recovery
4	Matrix spike/matrix spike duplicate recovery
5	Matrix spike/matrix spike duplicate precision outside limits
6	Laboratory control sample recovery
7	Field blank contamination
8	Field duplicate precision outside limits
9	Other deficiencies (including cooler temperature)
A	Absence of supporting QC
S	ICV, CCV or column performance check problem
Y	Initial and continuing calibration blank problem
M	Interference check samples problem
O	Post-digestion spike outside of 85-115%
F	MSA correlation coefficient <0.995, or MSA not done
G	Serial dilution problem
K	DFTPP or BFB tuning problem
Q	Initial calibration problem
X	Internal standard recovery problem
V	Second source standard calibration verification problem
L	Low bias
Z	Retention time problem
N	Counting time error (radionuclide chemistry)
W	Detector instability (radionuclide chemistry)
C	Co-elution of compounds
E	Value exceeds linear calibration range
I	Interferences present during analysis
T	Trace level compound, poor quantitation
P	1C/2C precision outside of limits
B	LCS/LCSD precision outside limits
D	Lab Dup/Rep precision outside limits
H	High bias

You're right! I completely forgot that these batches had more than one lot in them. I'll send out the corrected page.

Thank you for letting me know!

Just to let you know that the same LCS (with recovery 0%) is in Lot J8J180141. I don't need anything further but maybe Penny needs a corrected LCS page for Lot J8J180141 for her records.

The LCS recovery for Uranium is reported as 0%. Could you please check the numbers?

Thanks

SDG Number	:	38605

CASE NARRATIVE

I. Introduction

On October 14, 2008, twenty-one soil samples were received at TestAmerica's Richland laboratory for radiochemical analysis. Upon receipt, the samples were assigned TestAmerica identification numbers as described on the cover page of the Analytical Data Package report form. The samples were assigned to Lot Number J8J180141.

II. Sample Receipt

The samples were received in good condition. Total Thorium and Uranium were initially omitted from the original chain-of-custody. The client requested by email to add the analysis on October 20, 2008.

III. Analytical Results/Methodology

The analytical results for this report are presented by laboratory sample ID. Each set of data includes sample identification information; analytical results and the appropriate associated statistical uncertainties.

The analysis requested was:

ICP-MS

Total Thorium and Total Uranium by method RL-MT-004

Gamma Spectrometry

Gamma by method RL-GAM-001 (RICH-RC-5017)

IV. Quality Control

The analytical result for each analysis performed includes a minimum of one laboratory control sample (LCS), and one reagent blank sample analysis. Any exceptions have been noted in the "Comments" section.

V. Comments

ICP-MS

Total Uranium:

The samples were processed in two analytical batches; 8311377 and 8311385. The interference check was not performed because the isotopes reported are not within the range of the A and B solutions. The QC sections in the raw data are not applicable due to the software error identified. Thus, the results were hand calculated. Due to the elevated activity of the samples the LLCCV is not applicable.

Batch 8311377: The recovery yields of the matrix spike and matrix spike duplicate were outside limits due to the elevated sample activity that overwhelmed the spiked levels. Except as noted, the LCS, batch blank, matrix spike, matrix spike duplicate, sample and sample duplicate results are within analytical requirements.

Batch 8311385: The recovery yields of the matrix spike and matrix spike duplicate were outside limits due to the elevated sample activity that overwhelmed the spiked levels. Except as noted, the LCS, batch blank, matrix spike, matrix spike duplicate, sample and sample duplicate results are within analytical requirements.

Gamma

Gamma:

The samples were processed in two analytical batches; 8296312 and 8296315. The LCS, batch blank, samples and sample duplicate results are within analytical acceptance limits.

I certify that this Certificate of Analysis is in compliance with the SOW, both technically and for completeness, for other than the conditions detailed above. The Laboratory Manager or a designee, as verified by the following signature has authorized release of the data contained in this hard copy data package.

Uncertainty Estimation

TestAmerica Richland has adopted the internationally accepted approach to estimating uncertainties described in "NIST Technical Note 1297, 1994 Edition". The approach, "Law of Propagation of Errors", involves the identification of all variables in an analytical method which are used to derive a result. These variables are related to the analytical result (R) by some functional relationship, $R = \text{constants} * f(x,y,z,...)$. The components (x,y,z) are evaluated to determine their contribution to the overall method uncertainty. The individual component uncertainties (u_i) are then combined using a statistical model that provides the most probable overall uncertainty value. All component uncertainties are categorized as type A, evaluated by statistical methods, or type B, evaluated by other means. Uncertainties not included in the components, such as sample homogeneity, are combined with the component uncertainty as the square root of the sum-of-the-squares of the individual uncertainties. The uncertainty associated with the derived result is the combined uncertainty (u_c) multiplied by the coverage factor (1,2, or 3).

When three or more sample replicates are used to derive the analytical result, the type A uncertainty is the standard deviation of the mean value (S/\sqrt{n}), where S is the standard deviation of the derived results. The type B uncertainties are all other random or non-random components that are not included in the standard deviation.

The derivation of the general "Law of Propagation of Errors" equations and specific example are available on request.

Report Definitions

Action Lev	An agreed upon activity level used to trigger some action when the final result is greater than or equal to the Action Level. Often the Action Level is related to the Decision Limit.
Batch	The QC preparation batch number that relates laboratory samples to QC samples that were prepared and analyzed together.
Bias	Defined by the equation $(\text{Result}/\text{Expected})-1$ as defined by ANSI N13.30.
COC No	Chain of Custody Number assigned by the Client or TestAmerica.
Count Error (#s)	Poisson counting statistics of the gross sample count and background. The uncertainty is absolute and in the same units as the result. For Liquid Scintillation Counting (LSC) the batch blank count is the background.
Total Uncert (#s) u_c - Combined Uncertainty.	All known uncertainties associated with the preparation and analysis of the sample are propagated to give a measure of the uncertainty associated with the result, u_c the combined uncertainty. The uncertainty is absolute and in the same units as the result.
(#s), Coverage Factor	The coverage factor defines the width of the confidence interval, 1, 2 or 3 standard deviations.
CRDL (RL)	Contractual Required Detection Limit as defined in the Client's Statement Of Work or TestAmerica "default" nominal detection limit. Often referred to the reporting level (RL)
Lc	Decision Level based on instrument background or blank, adjusted by the Efficiency, Chemical Yield, and Volume associated with the sample. The Type I error probability is approximately 5%. $Lc = (1.645 * \text{Sqrt}(2 * (\text{BkgrndCnt}/\text{BkgrndCntMin})/\text{SCntMin})) * (\text{ConvFct}/(\text{Eff} * \text{Yld} * \text{Abn} * \text{Vol})) * \text{IngrFct}$. For LSC methods the batch blank is used as a measure of the background variability. Lc cannot be calculated when the background count is zero.
Lot-Sample No	The number assigned by the LIMS software to track samples received on the same day for a given client. The sample number is a sequential number assigned to each sample in the Lot.
MDC/MDA	Detection Level based on instrument background or blank, adjusted by the Efficiency, Chemical Yield, and Volume with a Type I and II error probability of approximately 5%. $MDC = (4.65 * \text{Sqrt}((\text{BkgrndCnt}/\text{BkgrndCntMin})/\text{SCntMin}) + 2.71/\text{SCntMin}) * (\text{ConvFct}/(\text{Eff} * \text{Yld} * \text{Abn} * \text{Vol})) * \text{IngrFct}$. For LSC methods the batch blank is used as a measure of the background variability.
Primary Detector	The instrument identifier associated with the analysis of the sample aliquot.
Ratio U-234/U-238	The U-234 result divided by the U-238 result. The U-234/U-238 ratio for natural uranium in NIST SRM 4321C is 1.038.
Rst/MDC	Ratio of the Result to the MDC. A value greater than 1 may indicate activity above background at a high level of confidence. Caution should be used when applying this factor and it should be used in concert with the qualifiers associated with the result.
Rst/TotUcert	Ratio of the Result to the Total Uncertainty. If the uncertainty has a coverage factor of 2 a value greater than 1 may indicate activity above background at approximately the 95% level of confidence assuming a two-sided confidence interval. Caution should be used when applying this factor and it should be used in concert with the qualifiers associated with the result.
Report DB No	Sample Identifier used by the report system. The number is based upon the first five digits of the Work Order Number.
RER	The equation Replicate Error Ratio = $(S-D)/[\text{sqrt}(\text{TPUs}^2 + \text{TPUd}^2)]$ as defined by ICPT BOA where S is the original sample result, D is the result of the duplicate, TPUs is the total uncertainty of the original sample and TPUd is the total uncertainty of the duplicate sample.
SDG	Sample Delivery Group Number assigned by the Client or assigned by TestAmerica upon sample receipt.
Sum Rpt Alpha Spec Rst(s)	The sum of the reported alpha spec results for tests derived from the same sample excluding duplicate result where the results are in the same units.
Work Order	The LIMS software assign test specific identifier.
Yield	The recovery of the tracer added to the sample such as Pu-242 used to trace a Pu-239/40 method.

Review Item	Yes (✓)	No (✓)	N/A (✓)	2 nd Level Review (✓)
A. Initial Calibration				
1. Performed at required frequency with required number of levels?	✓			
2. Correlation coefficient within QC limits?	✓			
3. Initial calibration verification (ICV) analyzed immediately after calibration and results within QC limits?	✓			
4. Initial calibration blank (ICB) analyzed immediately after ICV and concentrations of all parameters ≤ reporting limit?	✓			
B. Continuing Calibration				
1. CCV analyzed at required frequency and all parameters within QC limits?	✓			
2. CCB analyzed at required frequency and all results ≤ reporting limit?	✓			
C. Sample Analysis				
1. Were any samples with concentrations above the linear range for any parameter diluted and reanalyzed?	✓			
2. Were all sample holding times met?	✓			
D. QC Samples				
1. All results for the preparation blank below limits?	✓			
2. MS or MS/MSD recoveries within QC limits and %RPD (for MSD) acceptable?		✓		
3. LCS percent recovery within QC limits and %RPD (for LCSD) acceptable?	✓			
4. Analytical spikes within QC limits where applicable?	✓			
5. ICP only: One serial dilution performed per SDG?			✓	
6. ICP only: CRDL standard (CRI or CRA) analyzed at required frequency?			✓	
7. ICP only: Interference check samples (ICSA, ICSAB) and HICAL analyzed at the required frequencies and within QC limits?			✓

Method/Test/Parameter: Metals, ICP/MS				
Review Item	Yes (✓)	No (✓)	N/A (✓)	2 nd Level Review (✓)
A. Initial Calibration				
1. Performed at required frequency with required number of levels?	✓			
2. Correlation coefficient within QC limits?	✓			
3. Initial calibration verification (ICV) analyzed immediately after calibration and results within QC limits?	✓			
4. Initial calibration blank (ICB) analyzed immediately after ICV and concentrations of all parameters ≤ reporting limit?	✓			
B. Continuing Calibration				
1. CCV analyzed at required frequency and all parameters within QC limits?	✓			
2. CCB analyzed at required frequency and all results ≤ reporting limit?	✓			
C. Sample Analysis				
1. Were any samples with concentrations above the linear range for any parameter diluted and reanalyzed?	✓			
2. Were all sample holding times met?	✓			
D. QC Samples				
1. All results for the preparation blank below limits?	✓			
2. MS or MS/MSD recoveries within QC limits and %RPD (for MSD) acceptable?		✓		
3. LCS percent recovery within QC limits and %RPD (for LCSD) acceptable?	✓			
4. Analytical spikes within QC limits where applicable?	✓			
5. ICP only: One serial dilution performed per SDG?			✓	
6. ICP only: CRDL standard (CRI or CRA) analyzed at required frequency?			✓	
7. ICP only: Interference check samples (ICSA, ICSAB) and HICAL analyzed at the required frequencies and within QC limits?			✓	

Review Item	Yes (✓)	No (✓)	N/A (✓)	2 nd Level Review (✓)
E. Other	✓			
1. Are all nonconformances included and noted?				
2. Is the correct date and time of analysis shown?	✓			
3. Did the analyst sign and date the front page of the analytical run?	✓			
4. Correct methodology used?	✓			
5. Transcriptions checked?	✓			
6. Calculations checked at minimum frequency?	✓			
7. Units checked?	✓

Review Item	Yes (✓)	No (✓)	NA (✓)
A. Sample Analysis			
1. Are the sample yields within acceptance criteria?			✓
2. Is the sample Minimum Detectable Activity < the Contract Detection Limit?	✓		
3. Are the correct isotopes reported?	✓		
B. QC Samples			
1. Is the Minimum Detectable Activity for the blank result ≤ the Contract Detection Limit?	✓		
2. Does the blank result meet the Contract criteria?	✓		
3. Is the blank result < the Contract Detection Limit?	✓		
4. Is the blank result > the Contract Detection Limit but the sample result < the Contract Detection Limit?			✓
5. Is the LCS recovery within contract acceptance criteria?	✓		
6. Is the LCS Minimum Detectable Activity ≤ the Contract Detection Limit?	✓		✓
7. Do the MS/MSD results and yields meet acceptance criteria?			✓
8. Do the duplicate sample results and yields meet acceptance criteria?	✓		
C. Other			
1. Are all Non-conformances included and noted?			✓
2. Are all required forms filled out?	✓		
3. Was the correct methodology used?	✓		
4. Was transcription checked?	✓

General Comments(1)*

This Standard Reference Material (SRM), which has been developed in cooperation with member laboratories of the International Committee for Radionuclide Metrology, consists of approximately 90 grams of air-dried, pulverized soil⁽²⁾ in a polyethylene bottle. The sample was collected from Rocky Flats, Colorado. This SRM is intended for use in tests of measurements of environmental radioactivity contained in matrices similar to the sample^(3,4,5).

Working samples of this SRM should be dried in air at 40°C for at least 24 hours prior to weighing. The material has been tested extensively for homogeneity and the results are summarized in⁽⁶⁾. Based on over 70 plutonium measurements, the sample contains typically one or two "hot" particles in each bottle. As described in Note (5), by judicious handling of user data, the effect of the "hot" particles upon estimates of deduced user analytical error can be made negligible for most applications.

Concentrations and uncertainties, EXCLUDING HOT PARTICLES, are quoted in the following table.

When additional data become available, it is expected that other radioactivity concentrations will be certified and purchasers will be notified. To aid in these certifications, users are requested to send their measurement results for uncertified radioactivities together with the methods used to NBS⁽¹⁾.

- (2) The soil was pulverized with a "pancake" style air jet mill. The average particle size for the resulting powder is 8 μm . More than 99 percent, by weight, of the particles are less than 20 μm in diameter (VFI80).
- (3) Semi-quantitative mineralogical composition by x-ray diffraction measurements (performed by Dr. H. Tourtelot, U.S. Geological Survey, Denver, CO):

<u>Mineral</u>	<u>Percent by Weight</u>
Quartz	55 - 60
Clays	25 - 30
Alkali Feldspars	5 - 10
Plagioclase	5

- (4) See attached sheets: Semi-quantitative emission spectrographic analysis and Gamma-ray spectrum for SRM 4353.
- (5) Suggested handling of data to obtain estimate of user analytical error for plutonium 239+240 measurements.

A. For each sample measurement, consider the difference between it and the certified $^{239+240}\text{Pu}$ concentration of $8.03 \times 10^{-3} \text{ Bq g}^{-1}$. Classify each measurement according to whether the difference is too negative to be attributed to measurement error (outside the sum of the user and NBS uncertainties at the 3s estimated standard deviation level), too positive to be attributed to measurement error, or in between. The user uncertainty for a single measurement should be taken to be larger than 10 percent (1s), the uncertainty of the certifying laboratories. This 10 percent may reflect some inhomogeneity in the material.

B. If all sample measurements are in between take no action.

If any sample measurement is too low, the user's measurements process is suspect.

If no measurements are too low but k out of a total of n sample measurements are too high, calculate the probability of k or more being caused by hot particles and decide accordingly. The probability of at least one hot particle in a sample is given by $p = 1 - e^{-\alpha w}$, where $\alpha = 0.02$ with a 95 percent confidence interval of $0.004 < \alpha < 0.047$, and w is the sample weight in grams. Thus, the probability of k or more samples with hot particles is given by

$$\sum_{i=k}^n \frac{n!}{(n-i)! i!} p^i (1-p)^{n-i}$$

This probability has been calculated for a few typical examples and is given on the next page.

(6) Summary of homogeneity measurements

- A. Fourteen 100g bottled samples were examined for inhomogeneities in their gamma-ray-emission rates by counting them in a 5-in NaI(Tl) well detector coupled to a multichannel analyzer. The count rates from each bottle were compared over each of twelve selected energy regions and also over the total gamma-ray spectrum (0.04-2.05 MeV). The net sample-to-sample inhomogeneities in the gamma-ray-emission rates are summarized below:

Energy Region (MeV)	Standard deviation of the mean (%)
0.04 - 0.11	0.70
0.11 - 0.16	1.81
0.16 - 0.19	0.57
0.19 - 0.27	0.59
0.27 - 0.31	2.21
0.31 - 0.45	1.37
0.45 - 0.79	0.76
0.79 - 1.03	0.73
1.03 - 1.28	1.06
1.28 - 1.62	0.58
1.62 - 1.95	1.05
1.95 - 2.05	4.08
0.04 - 2.05	0.35

- B. Inhomogeneities of ^{90}Sr and ^{137}Cs are less than 2 percent for 10g samples.

- C. Inhomogeneities of alpha-particle emitting radionuclides, excluding "hot" particles, are less than 3 percent.

- (7) Certified values are those measured by two or more methods and/or two or more laboratories.
- (8) The random and systematic uncertainties have been combined in quadrature at a level corresponding to a standard deviation of the mean. The stated overall uncertainties are three times this value.
- (9) Analytical Methods (References in parentheses)
1. HF-HNO₃ or HF-HNO₃-HClO₄ dissolution
 2. KF-pyrosulfate fusion (BPH80, MAR79, SHA79)
 3. HCl, HNO₃ or HCl-HNO₃ leaching # (HAR80, LMB75, WNB70)
 4. HCl-NaOH leaching (HAR80)

UNCERTIFIED VALUES

The following activities are uncertified because there are no corroborative measurements with which to compare them, or because, as is the case for $^{239}\text{Pu}+^{240}\text{Pu}$ the value has been measured directly by only one laboratory (EML). The quoted $^{239}\text{Pu}+^{240}\text{Pu}$ value, below, is deduced from measurements on smaller samples and agrees, within estimated uncertainties with the EML value. A 90 g sample contains an average of 1.8 hot particles, each with an average activity of about 0.04 Bq.

Radionuclide	Activity concentration (Bq g ⁻¹)	Laboratory	Method Code
^{55}Fe	2.49×10^{-3}	WHOI	3f
^{235}U	1.9×10^{-3}	RESL	2c
$^{239}\text{Pu}+^{240}\text{Pu}$ (total in a large sample)	8.8×10^{-3}	Refer to certification page

Date Received at Lab	:	October 21, 2008
Project Name	:	OU4 Phase 1
Project Number	:	136259
Sample Type	:	Eighteen (18) Soil Samples
SDG Number	:	38657

CASE NARRATIVE

I. Introduction

On October 21, 2008, eighteen soil samples were received at TestAmerica's Richland laboratory for radiochemical analysis. Upon receipt, the samples were assigned TestAmerica identification numbers as described on the cover page of the Analytical Data Package report form. The samples were assigned to Lot Number J8J240197

II. Sample Receipt

The samples were received in good condition, the custody seals were in tact, signed and dated. No anomalies were noted during check-in. ✓

III. Analytical Results/Methodology

The analytical results for this report are presented by laboratory sample ID. Each set of data includes sample identification information; analytical results and the appropriate associated statistical uncertainties.

The analysis requested was:

ICP-MS

Total Thorium and Total Uranium by method RL-MT-004

Gamma Spectrometry

Gamma by method RL-GAM-001 (RICH-RC-5017)

IV. Quality Control

The analytical result for each analysis performed includes a minimum of one laboratory control sample (LCS), and one reagent blank sample analysis. Any exceptions have been noted in the "Comments" section.

V. Comments

ICP-MS

Total Uranium:

The interference check was not performed because the isotopes reported are not within the range of the A and B solutions. The QC sections in the raw data are not applicable due to the software error identified. Thus, the results were hand calculated. Due to the elevated activity of the samples the LLCCV is not applicable. ✓

The recovery yields of the matrix spike and matrix spike duplicate were outside limits due to the elevated sample activity that overwhelmed the spiked levels. Except as noted, the LCS, batch blank, matrix spike, matrix spike duplicate, sample and sample duplicate results are within analytical requirements. ✓

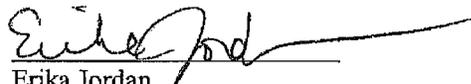

Gamma

Gamma:

The LCS, batch blank, samples and sample duplicate results are within analytical acceptance limits.

I certify that this Certificate of Analysis is in compliance with the SOW, both technically and for completeness, for other than the conditions detailed above. The Laboratory Manager or a designee, as verified by the following signature has authorized release of the data contained in this hard copy data package.

Uncertainty Estimation

TestAmerica Richland has adopted the internationally accepted approach to estimating uncertainties described in "NIST Technical Note 1297, 1994 Edition". The approach, "Law of Propagation of Errors", involves the identification of all variables in an analytical method which are used to derive a result. These variables are related to the analytical result (R) by some functional relationship, $R = \text{constants} * f(x,y,z, \dots)$. The components (x,y,z) are evaluated to determine their contribution to the overall method uncertainty. The individual component uncertainties (u_i) are then combined using a statistical model that provides the most probable overall uncertainty value. All component uncertainties are categorized as type A, evaluated by statistical methods, or type B, evaluated by other means. Uncertainties not included in the components, such as sample homogeneity, are combined with the component uncertainty as the square root of the sum-of-the-squares of the individual uncertainties. The uncertainty associated with the derived result is the combined uncertainty (u_c) multiplied by the coverage factor (1,2, or 3).

When three or more sample replicates are used to derive the analytical result, the type A uncertainty is the standard deviation of the mean value (S/\sqrt{n}), where S is the standard deviation of the derived results. The type B uncertainties are all other random or non-random components that are not included in the standard deviation.

The derivation of the general "Law of Propagation of Errors" equations and specific example are available on request.

Report Definitions

Action Lev	An agreed upon activity level used to trigger some action when the final result is greater than or equal to the Action Level. Often the Action Level is related to the Decision Limit.
Batch	The QC preparation batch number that relates laboratory samples to QC samples that were prepared and analyzed together.
Bias	Defined by the equation $(\text{Result}/\text{Expected})-1$ as defined by ANSI N13.30.
COC No	Chain of Custody Number assigned by the Client or TestAmerica.
Count Error (#s)	Poisson counting statistics of the gross sample count and background. The uncertainty is absolute and in the same units as the result. For Liquid Scintillation Counting (LSC) the batch blank count is the background.
Total Uncert (#s) u_c - Combined Uncertainty.	All known uncertainties associated with the preparation and analysis of the sample are propagated to give a measure of the uncertainty associated with the result, u_c the combined uncertainty. The uncertainty is absolute and in the same units as the result.
(#s), Coverage Factor	The coverage factor defines the width of the confidence interval, 1, 2 or 3 standard deviations.
CRDL (RL)	Contractual Required Detection Limit as defined in the Client's Statement Of Work or TestAmerica "default" nominal detection limit. Often referred to the reporting level (RL)
Lc	Decision Level based on instrument background or blank, adjusted by the Efficiency, Chemical Yield, and Volume associated with the sample. The Type I error probability is approximately 5%. $Lc = (1.645 * \text{Sqrt}(2 * (\text{BkgrndCnt}/\text{BkgrndCntMin})/\text{SCntMin})) * (\text{ConvFct}/(\text{Eff} * \text{Yld} * \text{Abn} * \text{Vol})) * \text{IngrFct}$. For LSC methods the batch blank is used as a measure of the background variability. Lc cannot be calculated when the background count is zero.
Lot-Sample No	The number assigned by the LIMS software to track samples received on the same day for a given client. The sample number is a sequential number assigned to each sample in the Lot.
MDC MDA	Detection Level based on instrument background or blank, adjusted by the Efficiency, Chemical Yield, and Volume with a Type I and II error probability of approximately 5%. $MDC = (4.65 * \text{Sqrt}((\text{BkgrndCnt}/\text{BkgrndCntMin})/\text{SCntMin}) + 2.71/\text{SCntMin}) * (\text{ConvFct}/(\text{Eff} * \text{Yld} * \text{Abn} * \text{Vol})) * \text{IngrFct}$. For LSC methods the batch blank is used as a measure of the background variability.
Primary Detector	The instrument identifier associated with the analysis of the sample aliquot.
Ratio U-234/U-238	The U-234 result divided by the U-238 result. The U-234/U-238 ratio for natural uranium in NIST SRM 4321C is 1.038.
Rst/MDC	Ratio of the Result to the MDC. A value greater than 1 may indicate activity above background at a high level of confidence. Caution should be used when applying this factor and it should be used in concert with the qualifiers associated with the result.
Rst/TotUcert	Ratio of the Result to the Total Uncertainty. If the uncertainty has a coverage factor of 2 a value greater than 1 may indicate activity above background at approximately the 95% level of confidence assuming a two-sided confidence interval. Caution should be used when applying this factor and it should be used in concert with the qualifiers associated with the result.
Report DB No	Sample Identifier used by the report system. The number is based upon the first five digits of the Work Order Number.
RER	The equation Replicate Error Ratio = $(S-D)/[\text{sqrt}(\text{TPUs}^2 + \text{TPUd}^2)]$ as defined by ICPT BOA where S is the original sample result, D is the result of the duplicate, TPUs is the total uncertainty of the original sample and TPUd is the total uncertainty of the duplicate sample.
SDG	Sample Delivery Group Number assigned by the Client or assigned by TestAmerica upon sample receipt.
Sum Rpt Alpha Spec Rst(s)	The sum of the reported alpha spec results for tests derived from the same sample excluding duplicate result where the results are in the same units.
Work Order	The LIMS software assign test specific identifier.
Yield	The recovery of the tracer added to the sample such as Pu-242 used to trace a Pu-239/40 method.

1.0 COC

1.1 Is the ICOC page complete; includes all applicable analysis, dates, SOP numbers, and revisions? Yes No N/A

✓ Yes No N/A

2.0 QC Batch

2.1 Do the Summary/Detailed Reports include a calculated result for each sample listed on the QC Batch Sheet? Yes No N/A

✓ Yes No N/A

2.2 Are the QC appropriate for the analysis included in the batch? Yes No N/A

✓ Yes No N/A

2.3 Is the Analytical Batch Worksheet complete; includes as appropriate, volumes, count times, etc? Yes No N/A

✓ Yes No N/A

2.4 Does the Worksheets include a Tracer Vial label for each sample? Yes No N/A

✓ Yes No N/A

3.0 QC & Samples

3.1 Is the blank results, yield, and MDA within contract limits? Yes No N/A

✓ Yes No N/A

3.2 Is the LCS result, yield, and MDA within contract limits? Yes No N/A

✓ Yes No N/A

3.3 Are the MS/MSD results, yields, and MDA within contract limits? Yes No N/A

✓ Yes No N/A

3.4 Are the duplicate result, yields, and MDAs within contract limits? Yes No N/A

✓ Yes No N/A

3.5 Are the sample yields and MDAs within contract limits? Yes No N/A

✓ Yes No N/A

4.0 Raw Data

4.1 Were results calculated in the correct units? Yes No N/A

✓ Yes No N/A

4.2 Were analysis volumes entered correctly? Yes No N/A

✓ Yes No N/A

4.3 Were Yields entered correctly? Yes No N/A

✓ Yes No N/A

4.4 Were spectra reviewed/meet contractual requirements? Yes No N/A

✓ Yes No N/A

4.5 Were raw counts reviewed for anomalies? Yes No N/A

✓ Yes No N/A

5.0 Other

5.1 Are all nonconformances included and noted? Yes No N/A

✓ Yes No N/A

5.2 Are all required forms filled out? Yes No N/A

✓ Yes No N/A

5.3 Was the correct methodology used? Yes No N/A

✓ Yes No N/A

5.4 Was transcription checked? Yes No N/A

✓ Yes No N/A

5.5 Were all calculations checked at a minimum frequency? Yes No N/A

✓ Yes No N/A

5.6 Are worksheet entries complete and correct? Yes No N/A

✓ Yes No N/A

6.0 Comments on any No response:

The sample was re-counted on a different detector in order to proved a duplicate.

Review Item	Yes (✓)	No (✓)	NA (✓)
A. Sample Analysis			
1. Are the sample yields within acceptance criteria?			✓
2. Is the sample Minimum Detectable Activity < the Contract Detection Limit?	✓		
3. Are the correct isotopes reported?	✓		
B. QC Samples			
1. Is the Minimum Detectable Activity for the blank result ≤ the Contract Detection Limit?	✓		
2. Does the blank result meet the Contract criteria?	✓		
3. Is the blank result < the Contract Detection Limit?	✓		
4. Is the blank result > the Contract Detection Limit but the sample result < the Contract Detection Limit?			✓
5. Is the LCS recovery within contract acceptance criteria?	✓		
6. Is the LCS Minimum Detectable Activity ≤ the Contract Detection Limit?	✓		
7. Do the MS/MSD results and yields meet acceptance criteria?			✓
8. Do the duplicate sample results and yields meet acceptance criteria?	✓		
C. Other			
1. Are all Non-conformances included and noted?			✓
2. Are all required forms filled out?	✓		
3. Was the correct methodology used?	✓		
4. Was transcription checked?	✓		
5. Were all calculations checked at a minimum frequency?	✓		
6. Were units checked?	✓

General Comments(1)*

This Standard Reference Material (SRM), which has been developed in cooperation with member laboratories of the International Committee for Radionuclide Metrology, consists of approximately 90 grams of air-dried, pulverized soil⁽²⁾ in a polyethylene bottle. The sample was collected from Rocky Flats, Colorado. This SRM is intended for use in tests of measurements of environmental radioactivity contained in matrices similar to the sample^(3,4,5).

Working samples of this SRM should be dried in air at 40°C for at least 24 hours prior to weighing. The material has been tested extensively for homogeneity and the results are summarized in⁽⁶⁾. Based on over 70 plutonium measurements, the sample contains typically one or two "hot" particles in each bottle. As described in Note (5), by judicious handling of user data, the effect of the "hot" particles upon estimates of deduced user analytical error can be made negligible for most applications.

Concentrations and uncertainties, EXCLUDING HOT PARTICLES, are quoted in the following table.

When additional data become available, it is expected that other radioactivity concentrations will be certified and purchasers will be notified. To aid in these certifications, users are requested to send their measurement results for uncertified radioactivities together with the methods used to NBS⁽¹⁾.

- (2) The soil was pulverized with a "pancake" style air jet mill. The average particle size for the resulting powder is 8 μm . More than 99 percent, by weight, of the particles are less than 20 μm in diameter (VFI80).
- (3) Semi-quantitative mineralogical composition by x-ray diffraction measurements (performed by Dr. H. Tourtelot, U.S. Geological Survey, Denver, CO):

<u>Mineral</u>	<u>Percent by Weight</u>
Quartz	55 - 60
Clays	25 - 30
Alkali Feldspars	5 - 10
Plagioclase	5

- (4) See attached sheets: Semi-quantitative emission spectrographic analysis and Gamma-ray spectrum for SRM 4353.
- (5) Suggested handling of data to obtain estimate of user analytical error for plutonium 239+240 measurements.

A. For each sample measurement, consider the difference ^{482 Bq/g} between it and the certified $^{239+240}\text{Pu}$ concentration of $8.03 \times 10^{-3} \text{ Bq g}^{-1}$. Classify each measurement according to whether the difference is too negative to be attributed to measurement error (outside the sum of the user and NBS uncertainties at the 3s estimated standard deviation level), too positive to be attributed to measurement error, or in between. The user uncertainty for a single measurement should be taken to be larger than 10 percent (1s), the uncertainty of the certifying laboratories. This 10 percent may reflect some inhomogeneity in the material.

B. If all sample measurements are in between take no action.

If any sample measurement is too low, the user's measurements process is suspect.

If no measurements are too low but k out of a total of n sample measurements are too high, calculate the probability of k or more being caused by hot particles and decide accordingly. The probability of at least one hot particle in a sample is given by $p = 1 - e^{-\alpha w}$, where $\alpha = 0.02$ with a 95 percent confidence interval of $0.004 < \alpha < 0.047$, and w is the sample weight in grams. Thus, the probability of k or more samples with hot particles is given by

$$\sum_{i=k}^n \frac{n!}{(n-i)! i!} p^i (1-p)^{n-i}$$

This probability has been calculated for a few typical examples and is given on the next page.

(6) Summary of homogeneity measurements

A. Fourteen 100g bottled samples were examined for inhomogeneities in their gamma-ray-emission rates by counting them in a 5-in NaI(Tl) well detector coupled to a multichannel analyzer. The count rates from each bottle were compared over each of twelve selected energy regions and also over the total gamma-ray spectrum (0.04-2.05 MeV). The net sample-to-sample inhomogeneities in the gamma-ray-emission rates are summarized below:

Energy Region (MeV)	Standard deviation of the mean (%)
0.04 - 0.11	0.70
0.11 - 0.16	1.81
0.16 - 0.19	0.57
0.19 - 0.27	0.59
0.27 - 0.31	2.21
0.31 - 0.45	1.37
0.45 - 0.79	0.76
0.79 - 1.03	0.73
1.03 - 1.28	1.06
1.28 - 1.62	0.58
1.62 - 1.95	1.05
1.95 - 2.05	4.08
0.04 - 2.05	0.35

B. Inhomogeneities of ^{90}Sr and ^{137}Cs are less than 2 percent for 10g samples.

C. Inhomogeneities of alpha-particle emitting radionuclides, excluding "hot" particles, are less than 3 percent.

- (7) Certified values are those measured by two or more methods and/or two or more laboratories.
- (8) The random and systematic uncertainties have been combined in quadrature at a level corresponding to a standard deviation of the mean. The stated overall uncertainties are three times this value.
- (9) Analytical Methods (References in parentheses)
1. HF-HNO₃ or HF-HNO₃-HClO₄ dissolution
 2. KF-pyrosulfate fusion (BPH80, MAR79, SHA79)
 3. HCl, HNO₃ or HCl-HNO₃ leaching # (HAR80, LMB75, WNB70)
 4. HCl-NaOH leaching (HAR80)

UNCERTIFIED VALUES

The following activities are uncertified because there are no corroborative measurements with which to compare them, or because, as is the case for $^{239}\text{Pu}+^{240}\text{Pu}$ the value has been measured directly by only one laboratory (EML). The quoted $^{239}\text{Pu}+^{240}\text{Pu}$ value, below, is deduced from measurements on smaller samples and agrees, within estimated uncertainties with the EML value. A 90 g sample contains an average of 1.8 hot particles, each with an average activity of about 0.04 Bq.

Radionuclide	Activity concentration (Bq g ⁻¹)	Laboratory	Method Code
^{55}Fe	2.49×10^{-3}	WHOI	3f
^{235}U	1.9×10^{-3}	RESL	2c
$^{239}\text{Pu}+^{240}\text{Pu}$ (total in a large sample)	8.8×10^{-3}	Refer to certification page
