Subject: Fracking Study

As a people concerned with the environment and the world we live in, we do need to have more studies done on the effects of fracking on the drinking water reserves in our country. However, while that is important, it is also necessary that we look at other effects of Hydraulic Fracturing, such as waste removal. The fact that the waste water can be used as a de-icer is a tad scary. There needs to be some regulation by the government on the disposal of the toxic wastewater from fracking. Perhaps that should come next.
