Dear Shallal Suhair,

Based upon the discovery of 54 unregulated contaminants found in the Philadelphia, PA drinking water system, immediate attention to the impact and affect of drugs, antibiotics, caffeine, and other drug related chemicals at very low levels in drinking water is a MUST.

Are these very small doses of drugs and antibiotics partially responsible for the creation of Super Bugs??? ... because they mutate and become resistant to the minute presence of these antibiotics in the body?

You can also include bug-killing Mouthwashes and Soaps on that list.
