Subject: hydrofracting

I have been informed that we can email you with our concerns over the environmental impact of hydrofracting. As rural residents of upstate New York with a well for our drinking water, we are indeed concerned about the possibilities of contamination of any drilling in the area. My understanding is that this method of drilling injects large amounts of chemicals into the ground. We have heard reports of the problems some homeowners in Pennsylvania are having with their wells being contaminated by drilling in that area. Our water supply is certainly more vital than gas. Please take this into consideration.
