Dear to whom it may concern,

I am writing on behalf of the Hydraulic Fracturing Study Plan. In my environmental science class we have been discussing the case study that is being created by the EPA. I think the study itself will be a failure because the industries that are releasing the data could very well like to make it sound like they are doing more and being more efficient than they actually are. My teacher informed us that companies only have to rid water of diesel oil before being dumped in the ground. Therefore, I think that you should test an areas dump site to understand what exactly they are putting back into the earth. However, this would not be considered a case study. If there was some way that data could be collected from a source no of the company I think that would lead to a more accurate end result.

Thank you
