Subject: re. revision of radiation regulations

Mr. Hanlon,

With everything that's going on around us with the continued crisis at Chernobyl and now the multiple meltdown disaster that continues to smolder at Fukushima, it's clear that our world is becoming MORE radioactive all the time to our great peril. Now is the time to enact even more stringent regard to radiation and human health. Study after study shows that even at low doses, radioactive exposure increases chances for cancer and other physical damage over time. With the nuclear power industry now in it's end-of-life stages, we can lay the ground work that future generations can really be proud of since it's their lives we'll be saving.

With regards,  
Dave Parrish
